A Tumor ariſing from the Deſcent of the Omentum into the Proceſs of the Peritonæum, or Scrotum, is termed an Epiplocele. The Diagnoſtic of this Diſtemper is ſomewhat difficult; however, we may conclude it to be preſent, when we find an unequal, ſoft, and ſlippery Tumor, not greatly increaſed by holding the Breath, or ſtraining for a Stool, about the Proceſs of the Peritonæum, or ſometimes extending from them to the Scrotum; upon a Preſſure of the Fingers, there is no Noiſe, nor is there any ſuch Hardneſs, or Inflation, as we obſerved in an Enterocele. Sometimes the Omentum may be return'd, ſometimes it adheres ſo firmly to the neighbouring Parts, or ſwells ſo exceſſively, that it cannot. I found an Inſtance of both theſe Caſes in the Diſſection of a Man after his Death; though ſome deny, or doubt the Reality of theſe Herniæ. The Tumor is not ſo large or dangerous in an Epiplocele as in an Enterocele; but the Patient may, with little Pain, and few Medicines, tranſact his Buſineſs; and this, indeed, ſeldom happens, as the Omentum in general is ſo ſmall, that it cannot reach the Proceſs of the Peritonæum, much leſs deſcend into it. Some, indeed, have miſtaken a Tumor of that Part from an extraordinary Diſtention of the Membrana Adipoſa in that Part, for an Epiplocele. I learnt formerly from *Ruyſch*, and have ſince read in *Dionis* and *Garengeot*, that there have been Examples of an Epiplocele, exactly reſembling an Enterocele, not only in the Symptoms, but likewiſe in the Conſequences and Danger; ſo that an Inciſion has been found neceſſary, tho' nothing but the Omentum afterwards appear'd to be fallen down.

In the Cure of an Epiplocele, after returning the Omentum, if that is practicable, apply a Bandage proper for Ruptures, as in the Inguinal or Scrotal Rupture: If the Omentum cannot be reduced, and yet the Patient ſuffers no great Pain, it is better to refrain from the Operation, than torture him by a Remedy worſe than the Diſeaſe. But as ſoon as the fallen Omentum ſwells, and induces an Inflammation, Pains, Fever, and Vomiting, which is common in incarcerated Ruptures of the Inteſtines, you muſt have recourſe to the Knife, as we adviſed for an incarcerated Hernia of the Inguen or Scrotum; always obſerving, not to reduce the thick corrupted Part of the Cawl, but tying it with a Thread, to cut it off, and only return the ſound Part, as we ordered in Wounds of the Abdomen; or you may wait for the ſpontaneous Separation of it, without a Ligature. See many remarkable Obſervations on this Diſorder, in *Le Dran's Chirur. Tom.* 2.

When the Inteſtines fall down, together with the Omentum, it is term'd an Entero-epiplocele, but it is ſcarcely diſcernible from a ſimple Enterocele. But the Diſtinction, indeed, is very immaterial, ſince they are both attended with the ſame Dangers, and require the ſame Cure. When the Tumor in a Ramex now-and-then vaniſhes or decreaſes, leaving only a ſmall ſoft Swelling, we may, with great Probability, conjecture there is an Entero-epiplocele; but it is manifeſt, this is leſs dangerous than an Enterocele, inaſmuch as the Fat prevents the Inteſtines from being compreſſed by the Annuli of the abdominal Muſcles, as they would have been, had they deſcended alone. In the Cure of this Diſorder, the Surgeon ſhould firſt reduce the Inteſtines and Omentum; and after the Agglutination of the Wound, ſecure them with a Bandage, as for an Enterocele.

Of SPURIOUS HERNIÆ.

A SARCOCELE.

We have already ſaid, that Tumors of the Scrotum are call'd *ſpurious*, or *falſe*, when neither the Inteſtine nor Omentum falls down, but they proceed either from a Scirrhus of the Teſticle, or Humours collected therein, or a Swelling of the ſpermatic Veſſels. And it is peculiarly term'd a *Sarcocele*, when the Tumor of the Teſticle is remarkably hard, and like a Scirrhus, or when there is a preternatural Excreſcence of Fleſh in it, which is attended with acute Pains, and ſometimes exulcerates, and, by degrees, becomes cancerous. We may immediately diſtinguiſh between an Inflammation of the Teſticle, and a Sarcocele, becauſe the latter is very ſlow in its Progreſs, and, at firſt, gives but little Pain; whereas the former, as in all Inflammations, is quick in its Progreſs, and begins with violent Pains and Heat. This Diſorder has many Cauſes: For, when the Teſticle is tumefied with any Degree of Hardneſs, we aſcribe the Sarcocele to the ſame Origin which produces a Scirrhus. If there is an Excreſcence of Fleſh, it is attributed to a Contuſion, or ſome ſuch external Force; though I once attended a Patient, labouring under this laſt kind, who never remember'd to have felt any external Violence. The Size is various, and, in the Opinion of ſome Surgeons, never larger than an Hen's Egg; though I have cur'd Men, whoſe Teſticles were bigger than my Fiſt; as a Proof of which I have preſerv'd ſome ſuch in Spirits. The moſt diſtinguiſhing Mark of a Sarcocele is Hardneſs, and particularly of the Teſticle; for other Ruptures are ſoft, and the Teſticle perceptible to the Fingers. I have learnt, both from *Wepfer*, and my own Experience, that, unleſs the Tumor is timely reſolv'd, a Sarcocele will degenerate into a Cancer, or, at leaſt, become very troubleſome from its Bulk and Pain, and affect, or entirely take away, the Power of Generation, eſpecially if both Teſticles are vitiated. If the Tumor aſcends through the Inguen to the Belly, the Attempt of a Cure by the Knife is ineffectual, and attended with Death, becauſe the Corruption has reach'd the internal Parts: It is, therefore, better to refrain from it.

* *Garengeot* ſays, in *Oper. Chirur. Tom.* 1. *p.* 320. *Edit.* 11. that the Teſticle is ſometimes confounded with the fallen Inteſtine, but this ſeldom happens, becauſe it is included in a peculiar Sack.

† Some adviſe a total Extirpation of the Teſticle, if it adheres to the Inteſtine, but it is better to tear off a ſmall Portion; for ſuch a Wound may, and does often, heal again.

When a Sarcocele is recent, it may ſometimes be reſolv'd by internal and external diſperſing Medicines. *Matthiolus*, *Aquapendente*, and *Sculletus*, recommend the Powder of the Root of Reſt-harrow, giving the Patient one Dram in Wormwood-wine, and applying externally the following Plaiſter:

Take of Gum Galbanum, Ammoniac, and Bdellium, each half an Ounce; diſſolve them in Vinegar, and add, of Duck's Fat, melted and ſtrain'd, an Ounce and an half; of yellow Wax, two Ounces; Oil of Lilies, and the Marrow of an Ox's Leg-bone, each ten Drams: Make a Plaiſter.

Spread this on Linen, and renew it every Day. *Dionis* recommends a Plaiſter of the Diabotanum Divinum, and that of *Vigo*, mixt, which he has us'd with Succeſs. Some prefer the *Emplaſtrum Norimbergenſe*, alone, as a good Digeſtive; or mixt with the preceding: Others, the Fomentations directed for the Cure of a Scirrhus. But I am convinced, from long Experience, that internal Remedies are moſt efficacious, as a Decoction of the Woods, and Mercurial Remedies; eſpecially if the Patient takes them every Morning, with a ſudorific Regimen; and a Mercurial Purge every third or fourth Day.

When all theſe Medicines prove ineffectual, and the Tumor and Pains increaſe, and become very troubleſome, and ſeem to threaten a Cancer, if the Diſorder has not reach'd the Annulus, there is but one Remedy, and that a deſperate one, to prevent its aſcending to the Abdomen, and becoming incurable: This is, to extirpate the tumefied Teſticle, or both, if they are affected, with an Inciſion-knife; which is term'd *Caſtration*.

This muſt be perform'd almoſt in the ſame manner as Celotomy by the Empirics; though we ſhould be more circumſpect than the Generality of them are; nor, after the Inciſion into the Skin and Scrotum, ſhould the Teſticle be rudely and violently torn out, leſt it occaſion great Pains and Convulſions, but looſen'd with the utmoſt Tenderneſs from the Parts to which it adheres, by a Knife, or Sciſſars, as the Caſe requires; firſt tying the ſpermatic Veſſels near the Inguen or Abdomen, and then dividing them; this will leſſen the Patient's Agony; laſtly, heal the Wound by the uſual Method of curing Herniæ. Since, upon the Diviſion of the ſpermatic Veſſels, now much diſtended, altho' they are tied, yet the Hæmorrhage is ſometimes ſo copious as almoſt to exhauſt the Patient, ſome, for this Reaſon, uſe a double Ligature, one under another; or, after looſening the Teſticle from the Scrotum, only make a Ligature upon the ſpermatic Veſſels, without immediately extirpating it; but, ſome Days afterwards, when it decays and putrefies, which is a Proof, that the ſpermatic Veſſels are properly tied up, they divide them; for then the Uſe of the Knife is not attended with Danger, or a Profuſion of Blood. If the Teſticle does not decay, it is plain the firſt Ligature is not tight enough: You muſt, therefore, make a ſecond, more tight. *Le Dran*, with good Reaſon, adviſes to perforate the Part which is to be tied, with a Needle and double Thread, and afterwards tie up each Half with theſe Threads, as a more certain way of preventing the Hæmorrhage. *Aquapendente*, *Sculletus*, and others, after having divided the Teſticle, apply a Cautery to the ſpermatic Veſſels, as moſt conducive to this End: But I prefer the former Method. To cure, then, a dangerous Sarcocele, which tends to a Cancer, we may, and, indeed, ſometimes muſt, caſtrate; for otherwiſe the Patient will ſcarcely ever be reſtor'd to his former Health; and the remaining Teſticle will ſuffice for Generation. I am ſenſible, that ſome looſen the Nerves from the ſpermatic Veſſels, before they bind them up, leſt the Ligature ſhould cauſe Spaſms, or Convulſions: But I am certain this is unneceſſary; for I cannot conceive a Poſſibility of looſening theſe ſmall Nerves from the ſpermatic Veins, with which they are ſo wondefully interwoven; to ſay nothing of the Improbability of Spaſms proceeding from the Ligature, when the Nerves, as I juſt now ſaid, are ſo very ſmall, and ſurpriſingly intermix'd with the other Parts. As for the reſt, lay Lint, or a ſmall Compreſs, below the Ligature; then take off the Teſticle about an Inch below it.

If there is a painful Excreſcence of the Teſticle, which Medicines will not diſperſe, and the Teſticle ſtill continues ſound, it may be remedied, and the Teſticle preſerv'd, by opening the Scrotum, and cutting off the Excreſcence *. But if it has affected the Teſticle, the prominent Parts cannot be taken off without violent Torture: Then you muſt remove the whole Teſticle, or ſome Part of it, in the manner already propos'd. The Skin, likewiſe, of the Scrotum, which is uſeleſs after the Loſs of the Teſticle, ſhould be extirpated with the Sciſſars; for this will promote the Healing of the Wound, and render the Scrotum more uniform. We muſt obſerve one Thing in regard to the Dreſſing; that you firſt lay on Lint and Compreſſes, with the Faſcia Inguinalis, call'd *Spica*; next, to mitigate the Inflammation, which generally happens in this Caſe, apply diſperſing Cataplaſms; laſtly, heal the Wound with digeſtive Ointment, and vulnerary Balſam, as after Celotomy. You may ſee ſome Obſervations on Caſtration in *Tulpius's Obſ. Lib.* 4. *Cap.* 32. and *Saviard's Obſ. Chirurg.* 125.

Of an HYDROCELE.

An Hydrocele is a ſurpriſing Diſtention of the Scrotum, proceeding from ſome Humour; and, though it gives no Pain, it is very troubleſome. This Tumor is as big as an Egg, a Fiſt, a Head, and ſometimes larger; it uſually affects one Side only, though ſometimes both. Every Age, young, as well as old, are liable to this Diſorder; and ſome Children are born with it, or have it preſently after their Birth. This pernicious Humour does not always appear in the ſame Part, tho' it is commonly collected in the vaginal Coat, that is, between the Teſticle and the Coat next it, ſo that the Teſticle, as it were, ſwims in it, and is imperceptible to the Touch; then it ſeems to ariſe from the Eroſion or Burſting the lymphatic Veſſels of the Teſticle; tho' it is found under the Skin of the Scrotum, as *Celſus* long ago obſerv'd, eſpecially in new-born Children, or dropſical Perſons: Then it encompaſſes both Teſticles; but this is, by ſome, call'd a Dropſy of the Scrotum, and diſtinguiſh'd from an Hydrocele. Some Authors tell us of a preternatural Collection of Liquor † in the Proceſs of the Peritonæum above the Teſticle; and farther, that, in the Diſſection of a dead Body, they have found a great Quantity, in the Production of the Peritonæum, occaſion'd by an inteſtinal Rupture. Sometimes the Liquor is of a ſanguine Colour; or Blood itſelf is found in the Cavity of the Scrotum. This was not unknown to *Celſus*, as appears from *Lib.* 7. *Cap.* 9. We may properly call this an Hæmatocele, or Bloody Rupture, of which more hereafter.

An Hydrocele then may be known and accurately diſtinguiſh'd, 1. From a Dropſy of the Scrotum; for in this a Preſſure of the Finger leaves a Pit, as in tumefied Legs; the Skin is ſmooth, and the Penis commonly very much ſwell'd; whereas, on the contrary, in a true Hydrocele, the Penis contracts, the Skin is rough, and the Finger leaves no Pit. Beſides, in an Hydrocele the Tumor never ſubſides entirely; and it is ſoft, unleſs there is a great Plenty of the Humour; but then it makes a Reſiſtance like an inflated Bladder tied cloſe. The Veins too in the Scrotum are inflated, and the Humour gives way to the Fingers, and increaſes the Size of that Part which is not preſſed. 2. An Hydrocele is diſtinguiſh'd from an Enterocele, or Epiplocele, principally by the following Symptom: The Lymph encompaſſes the tumefied Teſticle to ſuch a Degree, that it is imperceptible to the Sight or Touch; but, in the latter, it may be perceiv'd on one Side. 3. Between a Sarcocele and Hydrocele (the Difficulty of diſtinguiſhing of which has miſguided many experienc'd Surgeons) this is the principal Difference: The latter often grows to a prodigious Magnitude, and appears (which is the moſt infallible Sign) like a Bladder diſtended with Water, while the former is very hard, but ſeldom of any extraordinary Bulk. Some, I know, adviſe to take the Patient in the Dark, and place a Candle behind the Scrotum; for they judge an Hydrocele to be then tranſparent, and that you may ſee through it as you may through a Bladder fill'd with Water, in the ſame Situation. But ſince this Water, as *Celſus*, *Ægineta*, myſelf, and others, have obſerv'd, is often turbid, and as black as Coffee, or bloody, every judicious Perſon will eaſily acknowledge there is no certain Dependence upon this. It is certain, when there is ſuch an Appearance, that there is an Hydrocele; but any other Appearance will not aſſure us, without further Reaſons, that there is no Hydrocele, as the Humours may be bloody. An Hydrocele is rather troubleſome than dangerous; for the Patient, if it is of any Size, can neither ride nor walk without Difficulty; and, when it is left within too long, there is Reaſon to fear the Teſticle may be corrupted, and grow callous, and, conſequently, a Scirrhus, or Sarcocele, or Cancer, enſue; though I have known Perſons live to a very great Age, without any ill Conſequence, more than the Inconvenience caus'd by the Bulk of it. But, as the Quantity of the Fluid unnaturally contracts the Penis, and hides it under the Tumor, the Act of Generation is render'd very troubleſome, if not entirely impeded. Though the Cure of an Hydrocele, either by Medicines, or the Inciſion-knife, is difficult; yet young Men are ſooner freed from it than old. When it is attended with a Dropſy, remove that firſt.

* *Dionis*, and others, recommend corroſive Medicines, for making a Wound in the Scrotum, and taking off the ſuperfluous Parts of the Teſticle, which is often ſucceſsful; but the Cure by the Knife ſeems more ſafe and expeditious.

† *Wideman*, *Lib. de Litho & Celotomia*, p. 84. and *Boerhaave*, *Aphor. Pract.* § 1227. and *Garengeot*, in *Chirurg. Operat.* and *Le Dran*, *Tom.* 2. *Obſ.* 75. ſay, that they have found Caſes of an Hydrocele, where the Teſticle might be touch'd with the Finger, and that the Swelling and Humour was then in the Proceſs of the Peritonæum above the Teſticle: But that the contrary ſometimes happens in an Enterocele, the Inteſtines, as I have obſerv'd, penetrate into the vaginal Coat, through that natural Septum which diſtinguiſhes the Teſticle from the Proceſs of the Peritonæum. But the Caſes, mention'd by theſe Authors, muſt be very uncommon; for I have cur'd many, both of an Enterocele and Hydrocele; yet never met with any thing of this kind.

Sometimes

Sometimes the ſame Perſon labours under this, a Sarcocele, and Hydrocele, at the ſame time.

Diſperſing and corroborating Medicines, applied internally and externally, often work a Cure of an Hydrocele, in young Men. Externally, Compreſſes, dipt in Wine, or Spirit of Wine, in which Roſemary, Sage, Chamomile, Fennel, Cumin, Marjoram, and the like, have been boil'd, being laid warm on the Tumor ſeveral times in a Day, are of great Service; nor is it amiſs to add, as ſoon as you take it off the Fire, Lime-water, and Spirit of Wine, or a ſmall Quantity of the latter by itſelf. The beſt Remedy for new-born Infants is, for a Man in good Health, and faſting, to chew ſome Nutmeg, and breathe often, every Day, for ſome time, upon the affected Scrotum. I the more readily recommend this, as I have frequently ſeen the good Effects of it; in the mean time we do not deſpiſe the holding Spirit of Wine in the Mouth, and, at the ſame time, breathing upon the Scrotum. If both theſe fail, lay the Cumin-plaiſter, ſpread upon Linen, ſeveral times in a Day, upon the Tumor, warm; or apply a Compreſs, moiſten'd with Spiritus Matricalis, warm likewiſe. As for internal Remedies, frequent Purging, particularly in Infants, is beſt; at the ſame time giving ſtrengthening, diſperſing, and diuretic Medicines. The Arcanum duplicatum of *Ludovicus* was eſteem'd wonderfully efficacious for the Hydrocele in Adults, as a few Doſes of it, according to him, with external diſcutient and nervous Medicines, will cure the Diſorder in a few Days. But I think it will do more Service in a Dropſy, than in an Hydrocele. If theſe diſappoint you, have recourſe to Inciſion; though that Operation, in Adults, is not always ſucceſsful. If an Inflammation be joined with an Hydrocele, forbear the Knife, till that is abated.

There are two Kinds of Cure, by Operation, one perfect or radical, the other palliative or imperfect: For the Surgeon has two Views in the Management of an Hydrocele; 1. To extract the noxious Fluid out of the Scrotum; 2. To prevent a Return of it: And, as the perfect Cure is ſuitable to both Deſigns, ſo the imperfect only extracts the collected Humour; and, as the firſt Method confines the Patient to his Bed for ſome Weeks, and expoſes him to Pain and Danger, while the other may be perform'd more readily, and repeated with leſs Inconvenience and Hazard, it is no Wonder the laſt is prefer'd: Wherefore I ſhall firſt conſider the palliative Cure.

The Antients, in performing the palliative Cure, uſed a Lancet, for the Perforation of the Scrotum; this they extracted after the Operation, then inſerted a Tube, through which the Humour was diſcharged: The modern and more commodious Practice is, to uſe a Trocar (ſee *Tab.* XLV. *Fig.* 1.). The Method is this: The Patient ſtands or ſits on the Edge of a Chair; then the internal Humour is preſſed downwards, from the ſuperior Part of the Scrotum, to diſtend the inferior, and kept thus by a flat Ligature; next, the Trocar, about a Finger's-breadth long, ſufficient to perforate the diſtended Integuments, which, in an inveterate Diſorder, are generally thick, is introduc'd into the lower Part of the Scrotum, and directed outwards, that the Teſticle may receive no Injury. When the Scrotum is thus perforated, the Needle is drawn out, and the Tube left behind, through which the collected Humours are diſcharged: After this, the Tube is extracted, and then the Operation is complete. Nor is the Scrotum only immediately contracted again, but the Wound alſo heals, without Plaiſter or Medicine; and the Patient may walk, and do his Buſineſs, without the leaſt Inconvenience; tho' the Practice of thoſe, who, after the Completion of their Work, involve the Scrotum in thick Compreſſes, dipt in Spirit of Wine and Lime-water, is by no means to be condemn'd. But, if the Humour is collected above the Teſticle, it muſt be extracted by a new Inciſion. Further, as, after this Operation, the Scrotum generally fills again in ſome Months, you muſt repeat it, leſt the Serum there collected ſhould, by contracting an Acrimony, corrupt the internal Parts, and, principally, the Teſticle; whence the Diſorder becomes much more dangerous: This is ſometimes repeated, two, three, or four times in a Year; and, ſometimes, not for ſeveral Years, according to the quick or ſlow Increaſe of the Humour. By theſe means, Perſons afflicted with this Diſtemper continue often in good Health, with little Inconvenience, and live to a great Age, as I have often ſeen: For, when the Water is once extracted, ſome robuſt Men are ſo happily cured, that they never have a Return; though, as this is not common, the Reaſon for terming it a palliative Cure is very manifeſt. When the Humour is turbid or thick, or when it is thick and tenacious, as ſome ſay it is, after many repeated Operations, and cannot be extracted by the Needle and Tube, but, inſenſibly, contracts a fetid Smell and obſcure Colour, not unlike Blood, you muſt, immediately, attempt the perfect Cure, leſt the Corruption and Diſorder increaſe. So, likewiſe, if an Hæmorrhage attends the Wound, *Garengeot* adviſes to open the Scrotum with a Knife, to ſearch for the injured Vein, and, when found, to tie it. But this never occurred to me.

When the above-mention'd Accidents happen, or when the Teſticle is corrupted, or the Patient deſires to enjoy perfect Health; the perfect Cure may be undertaken in one of the following Methods: Firſt, The Patient is laid on his Back, upon a Table or Bed, and either ſecured by four or five ſtrong Men, or, if it ſeems neceſſary, bound both Hand and Foot, as we ſaid before in Celotomy; then a lateral Inciſion is made with a Knife, (ſee *Tab.* XXII. G or I) about the ſuperior Part of the Scrotum, where the noxious Humour is contain'd; next, introduce into the Wound the Director, or, rather, the fore Finger of your Left-hand; and divide the Scrotum, to the very Bottom, with an Inciſion-knife or Sciſſars; by this means, the corrupted Humour will find an eaſier Paſſage: When that is diſcharged, examine the Teſticle: If it proves ſound and unaffected, fill the whole Wound with Lint; laying on a Compreſs, and the T Bandage: When theſe are taken off, fill it with digeſtive Ointment upon Lint, and apply the Bandage, that the hard and callous Coats of the Bag may be brought to a Suppuration, and ſeparated, and, conſequently, the Veins, whence the noxious Humour flow'd, be extirpated, and a Relapſe prevented. But, if theſe Membranes are very thick and hard, the digeſtive Unguent will not be ſufficient; but you muſt mix red Precipitate with it, or lay on the Precipitate, with that over it: If this diſappoints you, remove as much as you can, with the Inciſion-knife, or Sciſſars; then eat off what remains, with red Precipitate, burnt Alum, and a Digeſtive: After this, apply a vulnerary Balſam, and bind up the Wound, till it is cleanſed and healed. An adipoſe Excreſcence is ſometimes found in the Scrotum of one troubled with an Hydrocele: This muſt be removed, as we juſt now directed for callous Membranes, partly by Inciſion, and partly by corroſive Medicines. Though, upon opening the Scrotum, the ſeminal Veſſels may appear tumefied, do not, after the Advice and Practice of ſome, inconſiderately remove the Teſticle as uſeleſs and noxious; for Nature alone often cures theſe Tumors; but the ſpermatic Veſſels muſt be tied with a Thread, and the Teſticle taken away, as we have ſhewn under the Article SARCOCELE, when the ſeminal Veins are remarkably indurated, and the Patient feels extreme Pains. You muſt, likewiſe, examine very accurately, whether the tumefied Teſticle contains, internally, any Fluid; for this ſometimes happens; and, if you perceive any by your Touch, you may conclude, it is Water or Pus: Nor is this a ſufficient Reaſon for taking it off, as ſome do, ſince it may be cured by an Inciſion and Cleanſing only; but, if it be found very callous and corrupted, you muſt bind and extirpate it, as above, to prevent a Cancer. If the Humour is contain'd, as ſome Writers affirm it may be, in the upper Part of the Proceſs of the Peritonæum, and the Teſticle is not affected, though the Scrotum is diſtended; take particular Care, while you cut the hard Membranes, that the Teſticle receives no Damage.

Since many dread the Inciſion-knife, the Scrotum may be open'd by corroſive Medicines, and the Water extracted. For this Purpoſe, apply a Plaiſter with a long narrow Aperture to the external Side of the Scrotum; lay a cauſtic Stone, or ſome other proper Corroſive, on the Aperture; then cover it with an entire Plaiſter and Compreſs, and ſecure the Whole with the T Bandage. If the Cauſtic does not perforate the Coats of the Scrotum, the Eſchar muſt be divided by a Probe, Knife, or ſome other proper Inſtrument, the Water diſcharg'd, and the Cavity of the Wound fill'd with Lint; then proceed, as we directed before, till the Patient recovers: In this manner I have cured ſeveral. Here I muſt obſerve, that *Garengeot* dreads many ill Conſequences from the Cauſtic, as it may mix with the morbid Humour, and injure the Teſticle: But his Fear is groundleſs; for, as ſoon as that has perforated the Integuments of the Scrotum, the diſcharging Liquor repels and waſhes it off; or, if any ſhould find a Paſſage into the Scrotum, the Water will temperate it in ſuch a manner as to make it entirely inoffenſive: And I am confirm'd in this Opinion by Experience.

The third Method of performing the perfect Cure is this; a Piece of Tape, or a narrow Linen Cloth, in a large Needle, (as we recommended for a Seton, (ſee *Tab.* XXXIX. *Fig.* 12.) is paſſed through the ſuperior lateral Part of the Scrotum, ſo as not to injure the Teſticle, and brought out again at the Bottom. The Tape is left in, as in a Seton; and, after rubbing it with digeſtive Ointment, is drawn backwards and forwards twice or thrice every Day: This not only promotes the Diſcharge of the noxious Humour, but prevents an Inflammation, and cauſes an internal Suppuration; ſo that the corrupted Veins and Integuments are ſeparated from the ſound Parts. In twenty Days, or more, when the Suppuration is complete, and little or no Humour diſcharges, extract the Tape, and heal the Wound. If the Suppuration does not ſucceed by rubbing the digeſtive Ointment on the Tape, mix with it ſome red Precipitate. However, ſince the preceding Methods do more commodiouſly extract the noxious Humours, cleanſe the Sack, and diſcover whether the Teſticle is ſound or not, and whether there is a latent adipoſe Body, it is no Wonder they are preferr'd, as more ſafe and effectual than this: For if any putrid Matter, Scirrhus, or Corruption, has ſeized the Teſticle, it will be better to proceed by Celotomy; or, if the Membrane is adipoſe, to remove that, than, by leaving them, to render the Cure not only precarious, but expoſe the Patient to more and greater Dangers.

Marini, a modern *Italian* Surgeon, prefers the following Method to any other, as the moſt uſual (perhaps in *Italy*). The

Body

Body being prepar'd, the Scrotum is divided in its upper Part, immediately under the Inguen, by an Inciſion large enough to admit a Finger, and then a Tent of Wax, the Thickneſs of a Finger, and about three Fingers-breadth long; the Point of this muſt be ſomewhat crooked: This is rubbed with Ointment of Marſhmallows, and introduc'd into the Cavity of the Scrotum, where, after it has continu'd twenty-four Hours, the Part affected will be ſound. The Water is not evacuated, the Tent is gradually ſhorten'd, as the Cavity diminiſhes, and the Tumor diſperſed by an emollient Plaiſter. When there is a Suppuration, the Tent is dreſſed with the digeſtive Ointment of *Galen*, and Ointment of Roſes put into the Scrotum. In ſeven Days, the Tent is rub'd with compound Oil of St. John's-wort, the Sinus cleans'd, and, the Tumor being digeſted, the Wound gradually leſſens and heals; then the Tent is taken out, and the Cure completed by a proper Regimen. The Author forbids this Operation, while the Sun is in *Scorpio*, as that would protract the Cure; but this is mere Superſtition. *Ruyſch* deſcribed much the ſame Method before that Author. If you attempt a Cure, ſays he, by opening the Scrotum in the ſuperior Part, on one Side, then fill the Wound with an oblong Tent, rubbed with Ointment of Roſes mixt with red Precipitate, till a gentle Inflammation, and a ſmall ſucceeding Suppuration, has putrefied the Membranes; then extract them with a Forceps. I have known many perfectly cured by this Way. Obſerve, that the Practice of theſe Authors will be effectual only when the Teſticle is ſound: On the contrary, if we ſuſpect, or know, that to be corrupted, we muſt have recourſe to the firſt or ſecond Method of a perfect Cure.

Some itinerant Quacks perſuade themſelves, they have ſtill a more ready and ſafe Method: They make an Inciſion into the Inguen, make a Ligature upon the Proceſs of the Peritonæum and Teſticle, as they do in an Enterocele; then tear it out, tho' it is ſound. I am ſo far from approving of this, that, I think, they deſerve the ſevereſt Puniſhment for their Barbarity, who cruelly deprive a Man of a Part ſo neceſſary for the Continuation of the Species, when it might be ſaved. To conclude, the perfect Cure will be more ſucceſsful in young and robuſt Perſons, than thoſe advanced in Years, and infirm: I would, therefore, recommend the palliative Cure for them. In a word, the utmoſt Care is neceſſary, not to miſtake an Enterocele for an Hydrocele, leſt the Patient ſhould be deſtroy'd by wounding the Inteſtine, while we deſign only to make an Inciſion into the Scrotum.

An Explanation of the forty-sixth Table.

Fig. 1. Repreſents a latent Inciſion-knife, (Gall. *Biſtouri herniaire cachée*) for dividing the Parts in incarcerated Ruptures, and cutting Fiſtulæ in the Anus: The acute Part A is elevated out of the Groove, and cuts, when the Handle B is depreſſed; C C C is the Groove, which conceals the Knife, till it is elevated: D D the Handle of the whole Inſtrument; E the Screw, or Hinge, about which the Knife is moved, upon depreſſing the Handle: F the Spring, which returns the Knife into its Groove, when B is not depreſſed.

Fig. 2. A B repreſent almoſt the ſame Inſtrument, but out of the Groove C C: The inferior Part is furniſhed with a Plate, in the Form of an Heart, D, which prevents the Inteſtines, in the Operation for an incarcerated Rupture, from riſing above the Knife, and being wounded: E a different kind of Handle from the former; the Hinge and Spring likewiſe vary.

Fig. 3. A is the Scrotum, moderately diſtended, on the Right Side, by an Enterocele. B exhibits the Manner in which the Inteſtine C C deſcends, and is reduplicated in the Scrotum (which is here divided). This Figure is taken from *Berengere's French* Treatiſe on Ruptures.

Fig. 4. A ſhews the Proceſs of the Peritonæum, near the Inguen, as yet cloſed; but, at its other Parts, B B B B open'd by the Knife: C is the Teſticle, with the ſpermatic Veſſels E: D the Sacculus, which is the inferior Coat of the Peritonæum, diſtended and lengthen'd by a Deſcent of the Inteſtines, or Omentum, or both, here extended almoſt down to the Teſticle.

Fig. 5. 6. *&c.* to 15. Repreſent various ſorts of Truſſes, for retaining the reſtored Inteſtines. Some of theſe (*Fig.* 6. 12. and 13.) are made of Cotton, eſpecially for Infants; or of Leather, for Adults: Others (*Fig.* 5. 7. 8. and 15.) of Steel, cover'd with Leather: Some of Steel Plates, with moveable Joints, (as *Fig.* 15.) ſo as to be more commodious: Some are deſign'd for Ruptures on both Sides (as *Fig.* 8. and 9.): Some for a Rupture on the Right Side only (as *Fig.* 6. 7.): Others on the Left (as *Fig.* 5. 10. 13. 14. and 15.): Some are faſten'd to the Body with Tapes (as *Fig.* 9. 10. 13.): Others with Straps and Buckles (as *Fig.* 6. 9. 13.): Others with Hooks and Eyes (as *Fig.* 5. 7. 8. 15.): Others again with different Contrivances (as *Fig.* 11. 12.). A ſhews the Bolſter in each Truſs, which ought to be ſomewhat hard; and is applied to the Ring of the abdominal Muſcles, after the Rupture is reduced: The Belt B B encompaſſes the Belly, and is faſten'd with Strings C C, paſſed through the Apertures D D; or with Buttons, (*Fig.* 6. and 14.) E E; or with Hooks and Eyes (*Fig.* 5. 7. 8. 15. *a a*). In moſt of theſe Truſſes, beſides the Belt ſurrounding the Belly, there is one which hangs down, as (*Fig.* 5. 6. 10. 11. 12. 13. and 14.) F F: This is carried between the Legs, and faſten'd on the oppoſite Side, with Buttons, Hooks, *&c.* *Fig.* 10. *a* exhibits the oppoſite Part of the Bolſter A, made of Leather. *Fig.* 11. *b c* is the anterior Part of a Wooden Bolſter, *d* the poſterior, where it is convex: This is laid on the Rupture, and faſten'd with the Button *e e*, at the three Extremities G, H, I, where the triangular Holes are. There is a great Variety of Truſſes; but I have only exhibited thoſe which ſeem beſt adapted to the Cure.

Of the Hæmatocele.

When, inſtead of Serum or Water, the Scrotum is diſtended with Blood, or a bloody Humour, it is called an Hæmatocele. This Diſorder has been obſerved by myſelf, and ſeveral Moderns, as well as by *Celſus* and *Paulus*, among the Antients. This is diſcovered by the ſame Indications as the aqueous Rupture; but, if the Scrotum is nicely examined by a Candle, it is ſo far from being tranſparent, that it is rather dark, and inclined to black. The moſt certain Symptom is, when, upon a Perforation of the Scrotum by the Trocar, a bloody Humour is diſcharged inſtead of a Serum.

The Cauſe is generally ſome external Violence, as a Contuſion, Laceration, or Rupture of the Veins in the Scrotum, by which the Blood is diſcharged into the Scrotum; and, if it continues long there, is corrupted, and injures the Teſticle, the Conſequences are very bad.

The proper Treatment is, to open the entire Scrotum on the affected Side, and diſcharge the bloody Humour; then to cleanſe it well, and, if the Teſticle is ſound, conſolidate the broken Veſſel, and heal the Wound with Balſamics. But, when the Teſticle, and ſpermatic Veſſels, are corrupted, but the Corruption has not reach'd into the Abdomen, the Veſſels ſhould be tied in the Inguen, and the vitiated Teſticle ſhould be taken off.

Of a Dropſy of the Pudenda.

We call it a Dropſy of the Pudenda, when they are diſtended by any noxious or redundant Humours, ſo that they retain the Print of a Finger, whilſt the Skin is ſmooth, and the Penis not drawn back. In this Caſe, the Humour is generally lodged in the exterior Coats of the Scrotum, eſpecially in the cellular Membrane, which diſtinguiſhes it from an Enterocele, and Hydrocele. This happens ſometimes whilſt the reſt of the Body is unaffected; at other times, the Whole is, at the ſame time, ſwelled; and then you can never hope for a Cure, till the general Diſorder is removed. When the Pudenda only are ſwelled, an internal and external Application of the digeſtive and corroborating Medicines, recommended for an Hydrocele, join'd with a proper Diet, will be very ſerviceable. If this will not ſuffice, it is often proper to ſcarify the Scrotum and Penis in Men, and Labia Pudendorum in Women, that the Humour may gradually diſcharge itſelf through thoſe Parts. Great Advantages may accrue from a warm Fomentation of Lime-water, either alone, or ſtrengthened with the Lapis Medicamentoſus of *Crollius*; and from a frequent Application of Compreſſes, moiſtened with Spirit of Wine, and other Medicines recommended for an Oedema. *Garengeot* prefers, above all, laying on the ſcarified Part the *Norimberg* Plaiſter, full of ſmall Holes, through which the Humour may flow: The Plaiſter of Cumin and Diaphoretic Plaiſter of *Mynſicht* are proper for the ſame Purpoſe. When the Scarification unites, or grows dry, it may be diſcretionally repeated; but, if the Scarification alone will not work a Cure, make a kind of Seton in the loweſt Parts of the Pudendum.

Of the Hydro-sarcocele.

An Hydro-ſarcocele is diſtinguiſhed from a ſimple Hydrocele, by the Perception of a Humour fluctuating about the hard Body of the Teſticle; and ſtill better, if the Teſticle continues preternaturally diſtended and indurated, after a Diſcharge of the Humour; for, when the Scrotum is enlarged by Water, it is very difficult to know one from the other, as the Teſticle is imperceptible to the Touch, unleſs the Quantity of Water be very ſmall. If the Patient therefore is only deſirous of being freed from the redundant Humour, it may be eaſily done in the manner directed in the ſimple Hydrocele. But when the Teſticle is greatly enlarged, callous, and painful, and the Patient willing to try the perfect Cure, you muſt remove the Hydrocele and Sarcocele by the ſame Operation. Firſt open the Proceſs of the Peritonæum; next tie up the ſpermatic Veſſels, and Tunica Vaginalis, which is contiguous to the Proceſs of the Peritonæum; and then extirpate the vitiated Teſticle. Thus, by removing the corrupted Coats, and Veins of the Teſticle, with the Teſticle itſelf, they are both cured.

Of an Hydro-enterocele.

We know an Hydro-enterocele, by a Tumor ſtill remaining on the ſame Side of the Teſticle, after the Reduction of the Inteſtine. But, when the Hydrocele is on one Side, and the Enterocele on the other, they are two diſtinct Diſorders, and therefore to be treated in two different Methods. In the firſt,

firſt, the Inteſtines are to be returned into the Abdomen, and ſecured by a proper Bandage; in the ſecond, the Humours are to be diſcharged, and this by the perfect or palliative Cure, according to the Surgeon's Diſcretion, and the Patient's Inclination. But great Care ſhould be taken, not to open the Scrotum, till the Inteſtine is reſtored, and retained by an Aſſiſtant, leſt, in dividing the former, you wound the latter; and, inſtead of Relief, bring infallible Death. When theſe Diſeaſes are on different Sides of the Scrotum, the Danger is not ſo great.

Of the Pneumatocele, *or* Flatulent Rupture.

Several Writers aſſure us, there is ſuch a Diſtemper as the Pneumatocele, though, in my Opinion, it does not appear either from Reaſon or Obſervation: I am rather inclin'd to think an Hydrocele or Enterocele, cured by Medicines, or ſpontaneouſly returning into the Abdomen, have been miſtaken for this Diſorder; and am confirmed in my Opinion, by the Reſemblance it bears to an Hydrocele, both in the Symptoms, and Method of Cure. I myſelf have attended Patients, whom others thought afflicted with a Pneumatocele, when it was only one of the former. Thus that experienced Surgeon *Meekren* intitles *Cap.* 15. *in Obſ. Chirurg. de Paracenteſi Scroti in Hernia Flatulenta:* Whence any one would imagine, that there really was a flatulent Rupture; but, upon Peruſal of the whole Chapter, he will find the ſole Diſcharge to be Water, without any Flatus.

The Signs, by which theſe Authors pretend to diſcover a Pneumatocele, are, 1. The Scrotum ſeems to the Touch like an inflated Bladder. 2. Conſequently it is much lighter, than if it was replete with a Humour, and tranſparent at the Approach of a Candle. Laſtly, If it is ſtruck with the Finger, it ſounds like a Bladder diſtended with Wind. For my Part, I never met with this Rupture, though I have cured many other Sorts; and therefore believe it not ſo common, as ſome would inſinuate. However, if ſuch a Diſeaſe ſhould occur, it may be treated in the following manner: Apply externally the diſcutient Medicines, Fomentations, and Plaiſters, which we recommended for the Cure of an Hydrocele. Preſcribe internally Carminatives, and gentle Purges. But, if theſe will not remove the Tumor, and the Patient is willing to be cured by an Operation, introduce the Trocar, together with its Canula, into the Scrotum; when that is perforated, the Contents, whether Wind or Water, will diſcharge themſelves. I do not think this ever occurred to *Garengeot*, as he has not once mentioned it in all his Writings. In *Paulus Ægineta*'s time, it was taken for a dilated Artery; and therefore the Cure was never attempted, for fear of a mortal Hæmorrhage. See *Lib.* 6. *Cap.* 64.

Of the Hernia Varicosa, *or* Cirsocele.

Sometimes the ſpermatic Veins are preternaturally diſtended, immediately above the Teſticles, in the Proceſs of the Peritonæum, in the Bottom of the Scrotum, and ſometimes higher, even in the Inguen; ſo that they reſemble a Varix, the Inteſtines of a Bird, or a Quill, ſometimes with unequal Nodes, which are frequently pretty large; by which means the Teſticle hangs below its proper Situation. Phyſicians term this Diſorder, a Ramex varicoſus, Varicocele, and Cirſocele, though perhaps it may be more properly called Varices of the ſpermatic Veſſels. The Veins of the Scrotum, according to *Celſus*, are liable to Dilatation; but, with *Fabricius ab Aquapendente*, this may rather be termed Varices of the Scrotum, than a Rupture. However, they are often confounded, and eſteemed one and the ſame Diſeaſe.

Both theſe Diſorders are aſcribed, either to a Redundance, or too thick Conſiſtence, of the Blood; the Stagnation of which, in thoſe Veins, occaſions a painful Diſtention. Sometimes this Diſeaſe proceeds from an external Violence, whereby the Veins are contuſed or weakened, and the Circulation of the Blood ſtopt. I have obſerved it in the Scrotum of young Men, who are very libidinous, and too full of ſeminal Juices; for their Veins are dilated by an unuſual Quantity of Blood convey'd to the Teſticle; however, it gives no great Uneaſineſs, and cannot properly be accounted a Diſtemper: Not only Operations therefore, but Medicines, are unneceſſary; tho', when they are accompanied with Pain, the ſubſequent Method muſt be followed.

When this Diſorder ariſes in robuſt healthy Men, from too great a Quantity of Semen in the ſpermatic Veſſels, recommend Matrimony to them. If this will not cure them, or they are already married, or if it proceeds from external Violence, Medicines will be of very little Service; for they will ſcarcely reſtore the diſtended, weakened, or lacerated Veins, to their former Vigour; tho', as theſe Diſorders are known to ariſe principally from an Inſpiſſation of the Blood, diluting and corroborating Remedies may be proper. You may, after Bleeding, apply externally ſuch aſtringent and ſtrengthening Fomentations, as are recommended in an Hydrocele.

When the preceding Medicines were ineffectual, and both the Tumor and Pains increaſed, the Antients recommended a Cautery, or a Ligature of the Veins in the Coats of the Scrotum; but, as this Method has an Appearance of Cruelty, if the Varices are in the Coats of the Scrotum, I would adviſe to open the diſtended Veins, the whole Length of the Tumor, and let out ſome Ounces of Blood; then dreſs the Wound with Lint, and a vulnerary Plaiſter, ſecuring them with a proper Compreſs and Bandage. In the following Dreſſings uſe a vulnerary Balſam and Plaiſter, till the Wound is united; for this will not only free the Patient from the inſpiſſated Blood, and concomitant Pains, but ſtrengthen the lax Part of the Vein by a firm Cicatrix, ſo as to prevent a Relapſe. If the Diſorder is in the Scrotum, divide that, and the Proceſs of the *Peritonæum*; then proceed as before. In the mean time adviſe the Patient to drink plenty of thin Liquor, to uſe frequent Exerciſe, with attenuating Medicines, and bleed two or three times in a Year. On the contrary, prohibit all groſs and hard Food, and a ſedentary Life, as conducive to inſpiſſating the Blood. This Advice is neceſſary at the Beginning to prevent the Increaſe, or remove the Cauſe, of the Diſtemper. If the Swelling is very painful, ſome tie up the ſpermatic Veſſels, and Proceſs of the *Peritonæum*, in the Inguen; and extirpate the Teſticle with the varicoſe Veins. But, if the Veſſels are indurated to the Annulus, it is better to refrain from this Operation, as Death uſually attends it.

Hernia Humoralis.

A Hernia Humoralis is a painful and inflammatory Tumor of one or both Teſticles, ariſing generally from a Suppreſſion of a virulent Running in a Gonorrhœa, or from too ſtrong and ſtimulating Cathartics, eſpecially if the Patient happens to take the leaſt Cold during their Operation. The Cure of this Symptom muſt commence with Bleeding; and a Bag-Truſs muſt be immediately provided, which may ſupport the Weight of the Tumor, and contain and ſecure the proper Applications; among which none excels a Cataplaſm of Bean-meal, with ſimple Oxymel, adding to it a little of the Oil of Roſes, or Ointment of Elder, to preſerve it from hardening and drying. Or a Decoction may be prepared of the Flowers of Chamomile, Melilot, Elder, and red Roſes, which is to be inſpiſſated with Bean-meal, adding towards the Concluſion the Oxymel as above. Thus:

> Take of the Tops of the leſſer Centaury, one Handful; of the Flowers of Chamomile, Melilot, and Elder, each half an Handful: Boil in three Pints of Forge-water, to the Conſumption of half the Quantity; then ſtrain it, and, putting it a ſecond time on the Fire, let it be reduced to the Form of a Poultice, with Bean-meal, adding, towards the End, of ſimple Oxymel, four Ounces; and, of the Ointment of Elder, two Ounces: Preſerve for Uſe.

During theſe Applications, forbear all reſtringent or balſamic Medicines, and purge the Patient briskly with Calomel, and Pilulæ ex duobus; but particular Care muſt be taken, that he gets no Cold; by which Method the Swelling is uſually, in a few Days, diſperſed, and the Running again appears, which muſt be carried off by the ſame or the like Cathartic, repeated at proper Intervals.

But if, notwithſtanding this Method, the Pain and Fluxion ſtill increaſe, with Inflammation, threatening an Abſceſs, the Patient muſt be vomited with the Turpeth Mineral; ſuch Intervals being obſerved, as may prevent any Soreneſs of his Chaps, till the Tumor ſubſides; then purge off the Reliques; when, if any ſcirrhous Hardneſs ſhould remain, you may endeavour to diſperſe it with the *Emplaſtrum Diaſulphuris*, the *Emplaſtrum de Ranis cum Mercurio*, *de Cicuta cum Ammoniaco*, *ex Ammoniaco*, the *Diagalbanum*, or with a Suffumigation with Vinegar.

This is the Method propos'd by *Turner*, for the Cure of an Hernia Humoralis. But I muſt remark, that, as the Pilulæ ex Duobus is a Purge never eligible in any Sort or Stage of the Venereal Diſeaſe, ſo, particularly in this, it generally increaſes the Pain and Fluxion by its exceſſive Stimulation. And, upon the Whole, I think any ſort of Purging, in this Caſe, much better omitted, till the Pain ceaſes, and the Tumor ſubſides. Mean time, copious Bleeding, ſucceeded immediately by one or more Turpeth-vomits, in the very Beginning, or any Stage of the Diſorder, promiſe fairer to remove it, and prevent a Suppuration, or Induration of the Part.

But *Deſault*, a *French* Author, propoſes another Method of curing an Hernia Humoralis, which he lays great Streſs upon, and celebrates with conſiderable Encomiums. It is, to rub into the tumefied Teſticle, a ſufficient Quantity of Mercurial Ointment, made with three Parts Axungia, to one of Quickſilver; after copious Bleeding, adminiſtring a Purge of Jalap-root after it, and repeating it ſo as to keep up a perpetual artificial Diarrhœa, ſo long as the Uſe of the Ointment is continu'd. When a Tumor, ſays he, ſeizes one or both Teſticles with Pain and Pulſation, threatening Suppuration, I bleed the Patient copiouſly, and repeat it according to the Age of the Perſon, and as there is occaſion, till the Inflammation ſeems no more inclinable to ſuppurate. I fly quickly to Frictions and Purges, which make the Pain ceaſe after the third time.

The Doſe of the Ointment ought to be proportioned to the Number and Violence of the Complaints. I am not ſatisfied with applying it only upon the Parts aggrieved; I rub it in upon the neighbouring Places, and inner Parts of the Thigh. In proportion as the Diſorder is conſiderable, I employ ſix Drams, and even an Ounce of the Ointment. *Deſault.*

We have, in a Note above, taken ſome Notice of the Prior *de Cabrier*'s celebrated Method of curing an Enterocele, which was purchaſed by the King of *France*, for the Good of the Public. It is done by Spirit of Salt, mix'd with red Wine, in a Quantity ſuitable to the Age of the Patient; and thus drank for ſeven Mornings, faſting, the Patient remaining for four or ſix Hours afterwards without taking either Victuals or Drink: But if it ſhould happen not to agree with the Stomach, then it may be taken only every other Day. For a Child from two Years old to ſix, the Doſe is three or four Drops, in a Spoonful or two of red Wine; from ſix Years to ten, let a Dram of the Spirit be mix'd with a Pint of Wine, for ſeven Doſes. It is to be continued, if neceſſary, for a Fortnight longer, in the ſame manner. From ten to fourteen Years, the Quantity of the Spirit may be increas'd to two Drams; from fourteen to eighteen, to two Drams and an half; and after eighteen, to five Drams. During four Months, after this Courſe is begun, a Steel Truſs muſt be worn Night and Day, exactly fitted to the Rupture. The Patient ought never to ſit down, but either to ſtand, or lie, and neither run, ride, nor go in a Coach, taking great Care to commit no Error in Diet. Under the Truſs the following Plaiſter is applied to the Part, being firſt ſhav'd:

Take of Maſtich, half an Ounce; Labdanum, three Drams; Hypocyſtis, one Drams; three dried Cyprus-nuts; of ſeal'd Earth, one Dram; black Pitch, three Ounces; Venice Turpentine, one Dram; yellow Wax, one Ounce; dry Comfrey-root, half an Ounce: Make into a Plaiſter, according to Art. *Geoffroy.*

HERNIARIA.

The Characters are;

The Root is fibrous, the Calyx multifid, quadrifid for the moſt part, or quinquefid, expanded in form of a Star, and furniſhed with five Stamina. The Fruit grows to the Bottom of the Flower, and becomes a round, membraneous, ſtriated Capſule, divided into eight Cells, each containing one ſmall acuminated oval Seed.

Boerhaave mentions three Species of this Plant; which are,

1. Herniaria; glabra. *J. B.* 3. 378. *Tourn. Inſt.* 507. *Boerh. Ind. A.* 2. 69. *Herniaria.* Offic. Ger. 454. Emac. 569. Raii Synop. 96. Hiſt. 1. 214. *Millegrana major, ſive Herniaria vulgaris.* Park. Theat. 446. *Polygonum minus, ſive Millegrana major.* C. B. 281. RUPTUREWORT.

This is a ſmall low Plant, ſpreading its weak Branches on the Ground, ſcarce a Span long, with two little Leaves leſs than Mother of Thyme at each Joint. The Tops of the Stalks are loaded with a great Number of ſmall herbaceous Flowers, ſucceeded by ſmall Seed-veſſels full of very minute Seed. The Root grows deep in the Ground, having many Fibres. It grows in ſandy Ground, but is not very common; and flowers in *June* and *July*.

Rupturewort is cooling, drying and binding, and accounted a Specific for Ruptures of all kinds: It alſo provokes Urine, and is good for the Stone in the Kidneys and Bladder. It is, however, but ſeldom uſed.

Rupturewort gives a faint Tincture of Red to the blue Paper; it is acrid, and a little ſaltiſh: Its Salt does not appear different from that which is obtain'd from the Earth, without the Aſſiſtance of Fire: It gives almoſt the ſame Marks of Acidity with Sal Ammoniac; but, in this Plant, this Salt is united with a great deal of Sulphur and Earth. They affirm, that Rupturewort, apply'd as a Cataplaſm, cures Ruptures, eſpecially if one gives to drink, at the ſame time, the Juice, or diſtil'd Water of it: Some preſcribe a Dram of the Powder of it in an Opiate, or in Broth. They uſe this Plant alſo with Succeſs in a Retention of Urine, and nephritic Colic, adding a Dram of Marmalade of Orange-flowers to each Quart of the Piſan which they prepare. *Martyn's Tournefort.*

The Herb, or whole Plant, is uſed, and is of a refrigerating and drying Quality: Its principal Uſe is in curing an Hernia, in waſting the Stone in the Kidneys and Bladder, in inciding Mucoſities of the Stomach, and other Parts, and bringing them away, in evacuating Bile and Water, and conſequently curing the Jaundice. *Dale* from *Schroder.*

2. Herniaria; Alſines folio. *Tourn. Inſt.* 507. *Boerh. Ind. A.* 2. 96. *Arenaria,* Offic. *Paronychia, Alſines folio incana.* J. B. 3. 366. Raii Hiſt. 2. 1026. *Anthyllis maritima Alſines folio.* C. B Pin. 282. *Anthyllis maritima incana,* Park. Theat. 281. *Anthyllis altera.* Ger. 497. *Anthyllis marina incana Alſine-folia.* Ger. Emac. 622. SEA CHICKWEED.

It grows in maritime Places, and amongſt Vines, and flowers in Summer. The Herb, which is the Part uſed, cures a *Paronychia*, and the *Favi*, being rubbed thereon. *Dale* from *Dioſcorides.*

3. Herniaria; hirſuta. *J. B.* 3. 379. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 96.

HERODIUS. A Name in *Aldrovand. Ornithol.* for the *Chryſaetos*, or *Hierofalco*; that is, the Golden Eagle, or largeſt Species of Eagle, ſo call'd, becauſe it bears the Rank of Heroes in compariſon of other kinds of Eagles. *Caſtellus.*

HEROS. *Paracelſus, de Morb. Tartar.* after his ſublime Manner, calls the Spirit of Salt, *Heroem Coagulationis*, "the "Hero of Coagulations." *Caſtellus.*

HERPES, ἕρπης, from ἕρπω, to ſpread, is a bilious Puſtule, which, breaking out in different Manners upon the Skin, accordingly receives different Denominations.

If they appear ſingle, as they frequently do in the Face, the Baſe is inflamed, and the Top pointed; and, having diſcharged a Drop of Matter, the Redneſs and Pain go off, and they dry away.

There is another Sort more corroſive, and of greater Malignity, when a Cluſter of Puſtules riſe in a Ring, accompanied with Smart, and ſometimes great Itching. This Species is term'd *Serpigo*, and vulgarly, the Tetter, or Ringworm. It ſeizes the Face, Hands, and other Parts of the Body, is of an obſtinate Nature, eating into the Skin; and, forſaking the Place where it firſt appears, it ſpreads its Taint into the adjacent Parts. It neither forms Matter, nor comes to Digeſtion; but, when rubbed, will ſometimes emit a thin ſharp watry Humour; and excites Smart, Heat, and Itching.

Another Kind of this Diſeaſe appears in larger Cluſters upon the Neck, Breaſt, Loins, Hips, and Thighs, attended with a ſlight Fever and Inflammation. The Heads are white and mattery, which are ſucceeded by a ſmall round Scab, reſembling Millet-ſeed; whence its Name *Herpes Miliaris*, and is commonly called the Shingles. Both the two laſt Kinds are termed by the Antients, *Vermis repens & mordicans, Formica miliaris*, or (according to Mr. *Wiſeman*) *Ambulativa*; by *Celſus, Ignis Sacer*; which may rather mean the Eryſipelas.

Another Species, from its greater Degree of Virulence and Corroſion, is named ἕρπης ἐδιόμενος, *Herpes exedens, vel depaſcens.* See ULCUS.

The ſimple bilious Puſtle, which commonly riſes in the Face, requires but little Aſſiſtance from Medicine; for, tho' it burns, ſmarts, or itches a Day or two, yet it naturally comes to a Head, ſoon dries, and diſappears.

The Serpigo is ſometimes very difficult to be exterminated; and, after it appears dead, it will, at certain Seaſons of the Year, obſtinately break out again. Tho' Bleeding at firſt is by ſome condemned, yet repeated Purging, eſpecially with cholagogue Medicines, is univerſally approv'd: Theſe not ſucceeding, recourſe muſt be had to Mercurials, eſpecially if there be the leaſt Suſpicion of any old Venereal Taint remaining in the Blood. Having removed the Cacochymy, we may proceed to Topics. *Ambroſe Paré*, after general Evacuation, preſcribes the following:

Take of the Powder of Oak-galls, Pomgranate-peel, Balauſtines, and Armenian Bole, each half an Ounce; of Roſe-water, half an Ounce; of the ſharpeſt Vinegar, half an Ounce; of Gooſe-greaſe, and Oil of Myrtles, each ſix Drams; of Turpentine, half an Ounce: Make up into an Ointment for Uſe.

Or,

Take of Sulphur, calcin'd Vitriol, and Alum, of each one Dram: Macerate them in ſtrong Vinegar, which is to be ſtrain'd thro' a Linen Cloth, and uſed as a Lotion for the Tetters.

Or,

Take of Roſe-water, and Alum-water, each two Ounces; of Lime, two Drams; of Alum, three Drams; of Sublimate Mercury, four Scruples: Let them boil gently *in Balneo Mariæ*, and filtrate for a Lotion of the ſame Uſe with the former.

Or,

Take of the Oil of Tartar, two Ounces; and of common Soap, four Ounces: Mix for a Liniment.

Or,

Take of the Ointment of Elecampane, two Ounces; of Ceruſs, half an Ounce; of Quick-ſilver, three Drams; of the Juices of the Citron, and ſharp-pointed Dock, each half an Ounce: Incorporate them for an Ointment.

Galen commends the Juice of Plantain, or Nightſhade, mixt with Oxycrate.

Zacutus Luſitanus propoſes the following Preparation, which he calls a celebrated Remedy.

Take of the white Wool ſhorn off from Cloth. This, when burnt in an earthen Veſſel, acquires a highly black Colour; and, when triturated, and mixt with Roſe or Plantain-water, reſembles Ink. With this Liquor rub every Part of the Ulcer

Ulcer, by which it will be gradually dried up, and ſpread no farther.

Barbet imputes the Cauſe of the *Herpes* rather to the Lymph, than the Bile, and ſalt Phlegm blamed by the Antients. He orders the Patient to be firſt well purg'd, and kept to a Decoction of China-root. He directs faſting Spittle to be apply'd to the Part affected, which has certainly a deterſive and mundifying Property, as well as Urine. Some, ſays he, uſe Muſtard; to which others, not improperly, add Gun-powder. He commends the Unguentum Fuſcum of *Felix Wurtz*; and for an obſtinate Herpes, the following.

Take of the Ointment of *Felix Wurtz*, three Drams; of white Camphire, a Dram and an half; of Ceruſs, Sulphur, and Myrrh, each one Dram; of Litharge, a Dram and an half; of Mercurius Dulcis, and Verdegriſe, each half a Dram; and, of Oil of Roſes, a ſufficient Quantity.

Or,

Take of Sal Prunellæ, one Dram; Flowers of Sulphur, half an Ounce; Salt of Lead, a Dram and an half; and, of old Rape-ſeed Oil, a ſufficient Quantity.

Among the Simples uſeful in theſe Caſes, he reckons Plantain, Nightſhade, red Roſes, Balauſtines, Cypreſs-nuts, Pomgranate-rinds, Frankincenſe, Maſtich, Tutty, Ceruſs, Litharge, Red-lead, Burnt-lead, Sulphur, Pepper, Ginger, Mercury; to which may be added Vitriol, Alum, Tartar, Nitre. The Compoſitions he enumerates are, the *Unguentum Ægyptiacum*, the *Unguentum fuſcum*, the *Unguentum Diapompholygos*, the *Unguentum de Plumbo*, the *Unguentum de Minio*, the *Unguentum Griſeum*, and the *Emplaſtrum de Ranis cum Mercurio*.

Among other Remedies, the common People uſe Ink, which, by reaſon of its Compoſition, may probably ſucceed. Some, in Caſes of extraordinary Virulence, and ſpreading Corroſion, when other Applications have fail'd, have check'd the Diſeaſe, by lightly touching the Parts affected with Aqua-fortis, or Oil of Vitriol. But theſe Remedies are not to be uſed without particular Caution.

Bathing the Part with the following Water made hot, has been try'd ſucceſsfully, Univerſals firſt premiſed. The Receipt is taken from Dr. *Bates*'s *Pharmacopœia*.

Take of Alum, and white Vitriol, each an equal Quantity: After mixing them, boil in an earthen Veſſel over a ſlow Fire, till they become hard like a Stone: Put a Spoonful of this, reduced to Powder, into two Pints of boiling Water, till it is diſſolv'd; then filtrate for Uſe.

The Vinegar of Litharge, and of Alum, of the ſame Author, are uſeful Remedies, as are alſo his *Aqua Herpetica*, and *Unguentum ad Herpetem*; but the laſt muſt be uſed cautiouſly, and only in ſtubborn Caſes, on account of the Arſenic and Quick-lime in its Compoſition.

The Preparation of Aqua Herpetica is, by *Bates*, in his Diſpenſatory, directed in the following Manner:

Take of Alum, one Ounce, of white Vitriol, two Ounces; of the beſt Vinegar, one Pound; of the recent Roots of Elecampane, two Ounces; and, of the green Leaves of Tobacco, one Handful: Boil to a Conſumption of the third Part of the Vinegar; and add, to the ſtrain'd Liquor, half an Ounce of calcin'd Vitriol.

Apply Cloths, wet in this Preparation, to the Herpes, letting them remain till they become dry, for three or four times, till an Eſchar is produced, and a new Epidermis, or Scarf-skin, form'd.

Herpeticum Unguentum.

According to the ſame Author, this Ointment is prepar'd in the following Manner:

Take of Quick-lime, and Orpiment, each one Dram; of Tartar, common Salt, and black Soap of the common kind, each two Drams; and of the Oil of Elder, a ſufficient Quantity for making into an Ointment.

With this Preparation anoint the Part affected duly, ſuffering it to remain on it for twenty-four Hours. By this means an Eſchar will be form'd, which is to be remov'd with the white Ointment. But the moſt effectual and ſafe Method of curing an Herpes is ſaid to be by anointing it with Pomatum, mix'd up with the *Mercurius Præcipitatus Albus*.

The miliary Eruptions call'd *Shingles*, not bearing ſuch ſharp and exiccating Applications, are to be differently treated; and greater Care muſt be taken before the Uſe of Topics, that the bilious Cacochymy is purg'd off, the ſharp Humours contemperated, and the nobler Parts ſecur'd from their Recrements, or from the ſtriking in of Puſtules, which ſeem'd to be breaking out, but, happening to be reſorb'd by the capillary Veſſels, are ſometimes return'd into the Blood. The internal Preſcriptions for this Purpoſe are the ſame with thoſe for the Erysipelas; which ſee.

When the Puſtules are all ripen'd, their Heads may be cut off with a Pair of Sciſſars, and the Humours abſorb'd with a ſoft Rag, to prevent farther Corroſion. Then a Cerate of Oil and Wax may be laid over the Parts, and kept on with a Bandage, to prevent the Puſtules ſticking to the dry Linen; in the Declenſion, the *Unguentum Diapompholygos*, the *Unguentum de Minio*, *Unguentum de Calce*, and the *Unguentum album camphoratum*, are proper. The two laſt, becauſe of their great Refrigeration, may be a little ſuſpected. *Turner*'s Cerate of Lapis Calaminaris may be prefer'd, being moderately digeſting, and healing at the ſame time.

Some Authors have deliver'd a Prognoſtic, from which the Vulgar have taken the Hint, that, when the Dieaſe has got round the Body, it proves mortal. But the contrary of this has been obſerv'd; and the Danger is to be computed more from the Malignity of the Humour, and its Retroceſſion, than by the Number of Puſtules, or their Poſition in the Body. *Turner de Morb. cutaneis.*

HERPETON, ἑρπητὸν, ἑρπητικὸν, from ἕρπω, to creep, Reptile, in *Hippocrates*, ſignifies a creeping Ulcer, or Puſtule, and ſo is the ſame as Herpes. It is, alſo, a general Epithet of all Reptiles.

HESMIS. A Quarter of a Pound. *Rulandus. Johnſon.*

HESPERIS.

The Characters are;

It has a long, ſmooth, cylindrical, bivalve Pod, divided into two Capſules, or Cells, which are ſeparated by an intermediate Partition, and furniſh'd with cylindrical or globular Seeds.

Boerhaave mentions four-and-twenty Species of this Plant; which are,

1. Heſperis; hortenſis: flore purpureo. *C. B. P.* 202. *M. H.* 2. 251. *J. B.* 2. 877. *Viola hyemalis, purpurea.* Tab. Ic. 308. *Viola matronalis, flore purpureo.* H. Eyſt. Vern. o. 8. F. 3. Fig. 3.
2. Heſperis; hortenſis; flore candido. *C. B. P.* 202. *Heſperis, flore albo.* J. B. 2. 877. *Viola hyemalis, flore albo.* Tab. Ic. 308. *Viola, matronalis, flore candido.* H. Eyſt. Vern. o. 8. F. 3. Fig. 2.
3. Heſperis; hortenſis; flore purpureo, pleno. *H. R. Par.*
4. Heſperis; hortenſis; flore albo, pleno. *H. R. P.*
5. Heſperis; hortenſis; flore vario, pleno. *H. R. P.*
6. Heſperis; montana; pallida; odoratiſſima. *C. B. P.* 201.
7. Heſperis; Allium redolens. See Alliaria.
8. Heſperis; folio dentato; flore pallido; procumbens. *Draba alba, ſiliquoſa, repens.* C. B. P. 109.
9. Heſperis, lutea, ſiliquis ſtrictiſſimis. *T.* 222. *Draba lutea, ſiliquis ſtrictiſſimis.* C. B. P. 110. *Draba lutea, quibuſdam.* J. B. 2. 870.
10. Heſperis; Leucoii folio non ſerrato; ſiliqua quadrangula. *T.* 223. *Leucoium, luteum, ſylveſtre, anguſtifolium.* C. B. P. 202. *Leucoium ſylveſtre.* Tab. Ic. 310.
11. Heſperis; Leucoii folio ſerrato; ſiliqua quadrangula. *T.* 223. *Leucoium, luteum, montanum, ſerrato folio.* C. B. P. 202.
12. Heſperis; exigua; lutea; folio dentato, anguſto. *Ind.* 146.
13. Heſperis; flore albo; minimo; ſiliqua longa; folio profunde dentato. *Ind.* 147.
14. Heſperis; maritima; perfoliata; parva; flore cœruleo. *Pluk. Almag.* 183. *Leucoium, maritimum, latifolium.* C. B. P. 201.
15. Heſperis; maritima, latifolia; ſiliqua tricuſpide. *T.* 223. *Leucojo affine, Tripolium Anguillare, & Leucoium maritimum, Camerarii.* J. B. 2. 876.
16. Heſperis; hirſuta; flore purpureo vario; folio aſpero, parvo, Lavandulæ, ſiliquis Cornu Cervini diviſura. *Indic.* 174.
17. Heſperis; Chia; ſaxatilis; Leucoii folio ſerrato flore parvo. *T. C.* 16.
18. Heſperis; altiſſima; folio Leucoii anguſto, flore aureo, plurimo; ſiliquis longis, gracilibus.
19. Heſperis; maritima; anguſtifolia; incana. *T.* 223. *Leucoium maritimum, anguſtifolium.* C. B. P. 201. J. B. 2. 876.
20. Heſperis; folio craſſo, lato, rigido, dentato; floſculis violaceis; ſiliquis longis, ramoſe diſpoſitis.
21. Heſperis; folio anguſto; craſſo, ſerrato, caulem amplexo, floſculo purpureo, ſiliqua longa; Draba ſiliquoſa, repens, purpurea, Cretica. *H. Mauroc.* 68.
22. Heſperis; folio ſcabro, dentato, floſculo rubello; vix conſpicuo; ſiliqua quadrangula aſpera.
23. Heſperis; ſylveſtris; parvo flore. *C. B. P.* 102. *Prodr.* 103.
24. Heſperis; montana; pallida; odoratiſſima. *C. B. P.* 201. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 18.

The firſt, ſecond, third, fourth, and fifth Sorts are cultivated in Gardens; and flower in *April*, *May*, and *June*. The Parts in Uſe are the Herb and Seeds, which, as *Cluſius* ſays, cure Convulſions and Difficulty of Breathing; they alſo provoke Urine

and Sweat, and are inciſive, abſterſive, and digeſtive. *J. B.* As the Heſperis taſtes like Rocket, ſo it ſeems to be endow'd with much the ſame Virtues. *Dod. Dale.*

This Plant is antiſcorbutic and diaphoretic, and very ſerviceable in the Aſthma, Coughs, and Convulſions. The outward Uſe of it is recommended againſt Inflammations, Cancers, a Gangrene, Sphacelus, and contagious Diſeaſes. Bruis'd, it very potently reſiſts Putrefaction; and, applied to peſtilential Buboes in the Arm-pits, ripens and ſoftens them. It is highly commended by *Hildanus*, in his Treatiſe of Inflammations, Sphacelus, and Gangrene; and I myſelf have had Experience of its Virtues, in the following Inſtance: There was a Student, who, being on a Journey, had the Misfortune, not only to break, but very much bruiſe, both the Tibia and Fibula; and, before the Surgeons could be ready with their Aſſiſtance, the Parts were ſeiz'd with a Gangrene. When the Surgeons were come, and had view'd the Place, they ſent for me, becauſe they deſpair'd of a Cure: I bruis'd this Herb in Wine, and apply'd it to the Leg, which perfectly cur'd the Patient of his Gangrene. *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave*.

HESTIA, ἑστία. The ſame as Focus; which ſee. It is alſo the Name of a celebrated Plaiſter among the Antients, deſcrib'd by *Aetius, Tetrab.* 4. *Serm.* 3. *Cap.* 2. ſo call'd from the Number of Drams contain'd in the Ingredients, which amount to five hundred and ſixteen; the Number expreſs'd by the *Greek* Letters in the Word ἑστία· for σ ſignifies 200; τ, 300; ι, 10; α, 1; which, added together, make 516.

HETERORRHOPOS, ἑτερόῤῥοπος, from ἕτερος, importing Either, one of the two, and ῥέπω, to bend, or incline, this, or that Way, or either Way. Thus, 1. *Epidem.* ἐπάλμαλα ἢ παρὰ τὰ ὦτα πολλοῖσιν ἑτερόῤῥοπα ἦν· "Many were afflicted with "Swellings about the Ears, on one Side or the other." And, *Lib. eodem*, φλεγμοναὶ μετ' ὀδύνης εἰς ὄρχιν ἑτερόῤῥοπαι· "Inflamma-"tions, with Pain, affected one or other of the Teſtes." Thus, again, ἑτερόῤῥοπίαις κάμνουσι, in *Hippocrates*, are Patients on the Verge of a Diſorder, and inclining either to Death or Recovery; as, *Lib. de Rat. Vict. in Morb. acut.* he adviſes to take particular Obſervation of odd Numbers in Days; becauſe ſuch Days ἑτερόῤῥοπίας ποιοῦσι τοὺς κάμνοντας, "cauſe an Inclination in "the State of the Sick, either one Way or other;" that is, as *Galen* expounds the Place, make a conſiderable Alteration towards Death or Recovery. *Foeſius.* But I take this Word, when applied to Tumors, ſometimes to import ambiguous or doubtful, whether they will recede, or come forwards, and ſuppurate.

HETERORRYTHMOS, ἑτερόῤῥυθμος. See ARYTHMUS, and ENRYTHMUS.

HETICH *Americum.* Thevet. Lugd. *Hetich Indis & Æthiopibus.* Dalechamp. in Plin. *Rapum Americanum foliis Bryoniæ.* C. B. A Species of *American* Turnep, which has Leaves like Bryony, with a Root a Foot and an half in Length, and of the Bigneſs of two Fiſts; good to eat, and agreeable to the Taſte. It is eſteem'd aperitive. *Lemery des Drogues.*

HEXAGIUM, ἑξάγιον, from ἕξ, ſix. The Name of a Weight among the antient *Greeks*, being the ſame as the *Roman Sextula*; and ſo call'd, becauſe it was the ſixth Part of an Ounce, or four Scruples. *Arbuthnot.*

HEXAPHARMACUM, ἑξαφάρμακον, from ἕξ, ſix, and φάρμακον, a Medicine. The Name of a Plaiſter, deſcribed by *Ægineta, Lib.* 3. *Cap.* 79. and ſo called, becauſe it conſiſted of ſix Ingredients.

HEXIS, ἕξις, from ἔχω, to have; an Habit. Ἕξις ſignifies a firm and permanent Habitude; in oppoſition to σχέσις (*Scheſis*) and διάθεσις (*Diatheſis*); which imports no more than a Diſpoſition which is tranſient, or eaſily removed: Thus *Galen, ad Thraſyb.* and *Lib. de bono Habitu*, explains the Word. *Hippocrates, Lib. de Alimento*, oppoſes ἕξις to διάθεσις, where he ſays, διάθεσις ἀθλητικὴ ὑ φύσει, ἕξις ὑγιεινὴ χρεὼν ἐστιν, "An athletic Diſpoſition is "unnatural, a ſound Habit is better." *Hippocrates*, in *Mochlico*, among the Cauſes of Luxations, reckons ἕξις and σχέσις, or a Habit and Diſpoſition of Body more tumid than is requiſite; where by ἕξις he ſeems to mean the Structure and Compoſition of the ſolid Parts; and, by σχέσις, the Contexture of the Veſſels and Humours; or elſe, certainly, σχέσις there ſignifies an adventitious or acquired Habit of Body; as *Galen, Lib.* 3. *de Cauſ. Pulſ.* explains the Word from *Lib. de Artic.* and ἕξις means τὴν τοῦ σώματος κατασκευὴν, "The Structure of the Body," as Nature has completed it; and this is oppoſed by *Galen, Lib.* 4. *Salut.* to the *Genus venoſum* and Humours: But theſe Senſes of ἕξις and σχέσις are both comprehended, *Lib. de Artic.* under σχέσις, where it is ſaid, that the σχέσις of the Body, whether full and carnous, or lean and extenuated, makes a Difference, with reſpect to a Diſpoſition to Luxations. *Galen* alſo explains ἕξιν by τὴν τῶν μορίων κατασκευὴν, "The Structure of the Parts," when it is joined to the Word φύσις, "Nature," as in ſeveral Places of the Book *de Rat. Vict. in Morb. acut.* Laſtly, ἕξις (*Hexis*) ſignifies the Habit of Body, under which the ſolid Parts are comprehended: Whence a hectic Fever takes its Denomination, becauſe it is ſeated in thoſe Parts, and thus affects the Habit. "Thoſe Fevers (ſays *Galen, Lib.* 1. *de Diff. Feb.*) are "called ἑκτικοὶ, (*Hectic*) either becauſe they are permanent, and "difficult to be removed, in the Nature of a Habit; or becauſe "they have their Seat in the very Habit of the Body, by which "are uſually meant the ſolid Parts, as diſtinguiſhed from the "Fluids."

HIANTICILLA. The ſame as GALBULUS; which ſee.

HIATULA. The ſame as CHAMA; which ſee.

HIBERNICUS LAPIS. See TEGULA HIBERNICA.

HIBISCUS, a Name for the ALTHÆA.

HICESIA, ἱκεσία, ἱκέσιος, the Name of a Plaiſter among the Antients, very good for Strumæ and Abſceſſes of the Spleen and Joints, mention'd by *Galen, Lib.* 4. *de C. M. P. G.* and deſcribed by *Ægineta, Lib.* 7. *Cap.* 17. It is corruptly written in *Latin*, *Iceſii Emplaſtrum.*

HIDROA, ἱδρῶα, ἱδρῶϊα, from ἱδρὼς, Sweat. A kind of Puſtules, ariſing from bilious, and viſcid, ſaline Humours, irritating the Skin, and moſt troubleſome in the Summer-time; when they make their Eruption with the Sweat: They are reckon'd by *Hippocrates*, 3 *Aph.* 21. among the Diſeaſes attending the Summer.

HIDROCRITICA, ἱδροκριτικὰ, from ἱδρὼς, Sweat, and κρίνω, to judge. Signs taken from Sweat. *Blancard.*

HIDRONOSOS, ἱδρονόσος, from ἱδρὼς, Sweat, and νόσος, a Diſeaſe. The ſame with SUDOR ANGLICUS. *Blancard.*

HIDROPYRETOS, ἱδροπυρετὸς, from ἱδρὼς, Sweat, and πυρετὸς, a Fever, is the ſame as the preceding. *Blancard.*

HIDROS, ἱδρὼς, Sweat. See SUDOR.

HIDROTICA, ἱδρωτικὰ, Sudorifics. See SUDORIFICA.

HIDROTOPOEA, ἱδροποιία, from ἱδρὼς, Sweat, and ποιέω, to make or cauſe, is the ſame with the preceding Word. *Caſtellus.*

HIDUS. Flos Æris. *Rulandus. Johnſon.* See the *Flos Æris*, under the Article Æs.

HIERA DIACOLOCYNTHIDOS.

Take of Colocynth, Agaric, Germander, white Horehound, Stœchas, of each ten Drams; of Opopanax, Sagapenum, Parſley-ſeeds, round Birthwort-root, and white Pepper, of each five Drams; of Spikenard, Cinnamon, Myrrh, and Saffron, of each four Drams. Let the Gums be rubbed in a Mortar, and the reſt ſifted; then ſtir them into three Pounds, three Ounces, and five Drams, of deſpumated Honey, ſo as to make the Whole into an Electuary, *S. A.*

The Shops have not hitherto been accuſtomed to make it; becauſe not yet order'd in common Preſcription, nor ſeeming ever to deſerve Notice enough to make it; its Loathſomneſs rendering it unfit for any thing but Clyſters.

HIERA PICRA, ἱερὰ πικρὰ· in *Engliſh*, *Holy Bitter.*

This is made by a Mixture of the Species of Hiera Picra with deſpumated Honey, or Syrup of Violets, into an Electuary.

The *Species Hieræ Picræ* is thus prepared:

Take of Cinnamon, Zedoary, Aſarum, the leſſer Cardamom-ſeeds, and Saffron, of each ſix Drams; Cochineal, one Scruple; of the beſt Aloes, twelve Ounces; and let them all be made into a Powder together.

This is a Compoſition of long ſtanding, amongſt Diſpenſatory-writers; but, by them, it is generally order'd into an Electuary, with Honey; and, ſometimes, ſeems to have been deſign'd for little other Uſe than Clyſters; as it appears, from the Annotations of *Zwelfer*, in the *Auguſtan* Diſpenſatory: But the latter Practice hath very much experienced it, in a Tincture, commonly called the *Tinctura Sacra*, the *Holy Tincture*, as the Name of the Species itſelf imports an *Holy Bitter.* There are larger and more perplex'd Compoſitions, under this Title, as one of *Nicolaus Myrepſus*, called *Hiera Logadii*, and another of *Nicolaus Alexandrinus*, which *Scribonius Largus, de Compoſit. Med. Cap.* 27. aſcribes to *Pachius*, and extols prodigiouſly for its Virtues.

The *Tinctura Hieræ*, or *Tinctura Sacra*, popularly called *Hiera Picra*, is thus prepared:

Take of the Species of Hiera Picra, one Ounce; of White-wine, one Pint: Digeſt, and then ſtrain off the fine Liquor. After the ſame manner may it be made with *French* Spirits.

This was not in the former Diſpenſatory, but in *Shipton's* Additions to it, under the Title of *Tinctura Sacra, ſeu Hiera*, with ſome ſmall Variations, as the Cochineal; which has no regard to the Medicine, but as it heightens the Colour: The Proportion of the Species, likewiſe, is but half there to what it is here; which made a requiſite Doſe, to ſome Perſons, more than the Quantity of Wine or Spirit therein was agreeable to, eſpecially if taken in a Morning. It is indeed doubted by ſome, whether the Menſtruum will take up above a certain Quantity of the Ingredients, eſpecially of the Aloes, which if rightly order'd, the

former of *Shipton* may be as ſtrong as this; but it does not ſeem probable, becauſe the Aloes is capable of Solution and Impregnation, to a very great Quantity, in almoſt any Liquor: This may be ſo managed, as to become a good Alterant. It is generally given over Night, from two to three Ounces; and, ſometimes, in the Quantity of one Spoonful only, at Night, with excellent Effects, in a Cachexy, Chloroſis, and Obſtructions of the Menſes.

HIERABOTANE, ἱερᾶβότανη, from ἱερὸς, holy, and βοτάνη, an Herb, Holy Herb, in *Dioſcorides*, is a Species of VERBENA; which ſee.

HIERACANTHA. A Name, in *Boerhaave*, for the *Carlina*; *Sylveſtris*; *vulgaris*.

HIERACITES, ἱερακίτης, the Name of a Stone; or, according to *Pliny*, a Gem: So called from its Colour, which reſembles that of the *Hierax*, or Hawk. It is recommended by *Paulus Ægineta*, for repreſſing the Hæmorrhoids. *L.* 7. *C.* 3.

HIERACIUM. Hawkweed.

The Characters are;

The Stalks are full of Branches, ſlender, and elegant; the Leaves are diſpoſed alternately; the Calyx is thick, firm, and expanded; the Seeds are ſmooth and angulous, or ſtriated.

Boerhaave mentions forty Species of this Plant; none of which have any medicinal Virtues aſcribed to them, except the 13. 16. 18. and 29.

The thirteenth Species is thus diſtinguiſh'd:

Hieracium; Folio Chondrillæ; caule vimineo, lævi. *Boerh. Ind. A.* 86. *Hieracium minus.* Offic. *Hieracium Leporinum.* Ger. 233. *Hieracium minus ſive Leporinum.* Ger. Emac. 296. *Hieracium minus præmorſa radice, ſive Fuchſii.* J. B. 2. 1031. Raii Hiſt. 1. 230. *Hieracium Chondrillæ folio glabro, radice ſucciſa majus.* C. B. 127. Tourn. Inſt. 470. THE LESSER HAWKWEED.

It grows every-where in Paſture-grounds, and flowers in *June* and *July*. The Leaves are uſed, but the Juice ſeldom or never: It is effectual for the ſame Purpoſes as the *Sonchus repens multis, quibuſdam Hieracium majus*; which ſee. Taken inwardly, it ſharpens the Sight, and expels black Bile: It has the Virtues of the *Sonchus*, only is a little more bitter, and much ſuperior to it. *Dale.*

The ſixteenth Sort is thus diſtinguiſhed:

Hieracium; Alpinum; latifolium; maculatum; hirſutie incanum; flore magno. *C. B. P.* 128. *Boerh. Ind. A.* 86. *Tourn. Inſt.* 472. *Herba Coſta.* Offic. *Hieracium* 1. *Cluſii.* Ger. 237. *Hieracium* 1. *latifolium Cluſii.* Ger. Emac. 301. Raii Hiſt. 1. 239. *Hieracium latifolium Pannonicum* 1. *Cluſii.* Raii Synop. 73. Park. 800. *Hieracium Pannonicum latifolium* 1. *Cluſio. Piloſellæ majori, ſive Pulmonariæ luteæ accedens.* J. B. 2. 1026. *Hieracium montanum, non ramoſum, caule aphyllo, flore pallidiore.* Raii Cat. 162. *Dens Leonis foliis integris, caule raris foliis veſtito, monanthes fere.* Raii Hiſt. 1. 244. HUNGARIAN HAWKWEED.

It grows on chalky Hills, and flowers in *June*; the Herb is in Uſe, which is highly extolled for its Efficacy in pulmonic Diſorders. *Buxb.* It is of ſingular Service in the Phthiſis. *Cam. Dale.*

The eighteenth Sort is thus diſtinguiſh'd:

Hieracium; dentis Leonis; obtuſo folio; majus. *C. B. P.* 127. *Tourn. Inſt.* 470. *Boerh. Ind. A.* 87. *Hieracium longius radicatum.* Ger. 234. Emac. 298. Park. 790. Raii Hiſt. 1. 230. Synop. 72. *Hieracium macrocaulon junceum, ſive minus, primum Dodonæo.* J. B. 2. 1031. LONG-ROOTED HAWKWEED.

The Root of this Hawkweed ſtrikes deep into the Earth, long, thick, and but little branched. The Leaves lie flat on the Ground, round about the Root, being ſomewhat rough and hairy, and round-pointed at the End, and cut in, in ſeveral Places, like Dandelion: The Stalks are tall, branched, and tough, having ſeveral Flowers, like thoſe of Dandelion, but leſs, of a yellow Colour, which turn into Down, having long ſlender Seed. It grows every-where in the Fields and Meadows; and flowers in *May* and *June*.

This is a Plant ſeldom uſed; but, from the Likeneſs of the Leaves and Flowers, it is eſteem'd to be of the Nature of Dandelion, or Sow-thiſtle, aperitive, cooling, and diuretic.

It grows in Paſtures, and flowers in *June*, *July*, and *Auguſt*. The Leaves are commonly uſed, which agree in Virtues with thoſe of the other Hawkweeds; the Herb drank is a Remedy for Pains in the Sides. *Dale.*

The twenty-ninth Sort is thus diſtinguiſhed:

Hieracium; murorum; folio piloſiſſimo. *C. B. P.* 129. *Raii Hiſt.* 1. 239. *Synop.* 74. *Tourn. Inſt.* 471. *Boerh. Ind. A.* 87. *Pulmonaria Gallica, & Pulmonaria aurea.* Offic. *Pulmonaria Gallica ſive aurea latifolia.* Ger. Emac. 304. *Piloſella major quibuſdam, aliis Pulmonaria flore luteo.* J. B. 2. 1033. FRENCH or GOLDEN LUNGWORT.

It grows in Woods, and on old Walls, and ſhady Banks; and flowers in *June* and *July*. The Herb is uſed, which agrees in Virtues with the *Pulmonaria maculoſa*. See PULMONARIA.

HIERACIUM is, alſo, a Name for ſeveral ſorts of *Sonchus* and *Dens Leonis*.

Hieracium, capitulum inclinans. A Name for the *Hedypnois*; *annua.*

Hieracium, minus. A Name for the *Hyoſeris*; *anguſtifolia.*

Hieracium, montanum. A Name for the *Chondrilla*; *Hieracii folio*; *annua.*

Hieracium, ſtellatum. A Name for the *Rhagadiolus*; *alter.*

HIERATICUM, ἱερατικὸν. The Name of a *Malagma*, in *Galen, de C. M. S. L. Lib.* 8. *Cap.* 5. aſcribed to *Aſclepiades*, and appropriated to Diſorders of the Stomach, Liver, and Pains of the Viſcera.

HIERAZUNE. A Name for the *Lotus*; *pentaphyllos*; *ſiliquâ cornutâ.*

HIEROGLYPHICA, ἱερογλυφικὰ, from ἱερὸς, ſacred, and γλύφω, to engrave. Characters in Medicine, invented, as pretended, by *Hermes Triſmegiſtus*. It ſometimes, alſo, means the Lines, and other Marks, in the Palm of the Hand, which are conſulted in Chiromancy.

HIEROS, ἱερὸς, ſacred, holy: An Epithet applied to a Variety of Things. See SACER.

HIGUERO, *Oviedi*, J. B. Park. *Arbor Indica Fructu Cucurbitæ Forma & Sapore.* THE CALEBASH-TREE.

It is a large Tree, of the Size of the black Mulberry-tree, and very common in all the Iſlands of *America*, and, alſo, on the Continent. The Flowers, in Shape, almoſt reſemble a Lily, and are of a Colour mixed of white and green, but of a nauſeous Smell: The Fruit is of various Sizes and Figures; ſometimes like an Oſtrich's Egg; ſometimes round, and of the Bigneſs of a Man's Head; and ſometimes oblong; green at firſt, but, when ripe, black and hard, and containing Seeds like a Gourd, and of the Size of Cucumber-ſeeds, with a yellowiſh Kernel. The unripe Fruit contains a white juicy Pulp, of a Smell almoſt like Naſturtium, but of a ſweetiſh Taſte.

The unripe Fruit is preſerv'd with Sugar, and uſed in Fevers; and the ripe ſerves for Cups, and other Drinking-veſſels. The ripe Pulp of the Fruit is not eatable, but is an excellent Remedy for the Head-ach; eſpecially when it proceeds from the Heat of the Sun, if a Cataplaſm be made thereof, and applied to the Forehead and Temples. *Ray's Hiſt. Plant.*

HILUM. The blackiſh Spot in Beans, commonly called, the Eye of the Bean.

HIMANTOPUS, *Plinii, Geſn.* an aquatic Bird, rarely found, and living upon Inſects: It has long Legs of a Blood-red Colour; whence it has its Name *Himantopus*, which is deriv'd from αἷμα, Blood, and πούς, a Foot.

Its Fat is reſolvent, and good for the Gout. *Lemery des Drogues.*

HIMAS, ἱμὰς, properly a Thong, or Strap of Leather, in Medicine, is a Laxneſs of the Uvula, when it becomes long and ſlender, in a pendulous Poſture: It differs from *Cionis*, in that, under this latter Diſorder, the Uvula is not extenuated, but, on the contrary, ſeems to acquire a greater Thickneſs.

HIMEROS, ἵμερος, ſignifies an amorous Longing, or Deſire; as appears from the following Verſe in *Homer*, quoted by *Erotian*, Ὡς σέο νῦν ἔρραμαι, καί με γλυκὺς ἵμερος αἱρεῖ, "As now "with Love I'm ſeiz'd, and ſoft Deſire." *Il. γ. Verſ.* 446. and *Il. ξ. Verſ.* 328. where ἵμερος expreſſes the amorous and conjugal Deſires of *Paris* and *Jupiter* to *Helena* and *Juno*. It comes from the Verb ἱμείρομαι, which, in *Hippocrates*, frequently imports a Venereal Congreſs.

HINNULUS, νεβρὸς, a Hind; the Young of the Deer or Goat Kind. The Rennet of a young Hind of a Deer, taken within nine Days after it is brought forth, is a Preſcription in *Scribonius Largus* for the Epilepſy. The Hind, he ſays, is known to be under nine Days old, by the Ears lying flat, whereas, after nine Days, they are erected. This Rennet he directs to be dried in a Place where neither Sun nor Moon can tranſmit their Rays; and then to be adminiſter'd to Children in a Pill, of the Size of a Vetch, in two Cyathi of warm Water; but, to Adults, of the Size of a good Bean, in three Cyathi of warm Water, for thirty Days together, drinking afterwards two or three Cyathi of pure Water. He who communicated this Remedy, ſays *Scribonius*, ſaid it would be more likely to ſucceed, if the Hind is killed with a Knife, which had before been employed in cutting the Throat of a Gladiator. *Pliny, Lib.* 28. *cap.* 9. ſay, that the Rennet of a Hind, cut out of the Dam's Uterus, is preferred before the greateſt Remedies, for its medicinal Virtues.

HIPPACE, ἱππάκη. What they call *Hippace*, is Cheeſe made of Mares-milk, which is indeed of a rank Smell, but very nouriſhing, and may be compar'd with Cheeſe made of the Milk of Cows. Some give the Name of *Hippace* to the Rennet of a Colt. *Dioſcorides, Lib.* 2. *cap.* 80.

HIPPION. A Name for the *Gentiana, Alpina, pumila, vera, major.*

HIPPOCAMPUS. Offic. Rondel. de Piſc. 2. 114. Belon. de Aquat. 446. Charlt. Exer. 63. Salv. de Aquat. 72. C. Jonſ. de Piſc. 77. Mouff. Inſect. fol. ult. Aldrov. de Inſect. 736. Raii Ichth. 157. Ejuſd. Synop. Piſc. 45. The SEA HORSE.

It is taken in the *Mediterranean* Sea. The Aſhes of the burnt Fiſh, mixed with Tar or Fat, or Amaracinum Unguentum, and the

the Part anointed, cures an Alopecia. *Dioſcorides*. It is a Remedy againſt the Bite of a mad Dog. *Ælian*. *Dale*.

HIPPOCASTANUM.

The Characters are;

The Leaves are digitated, and like thoſe of the common Cheſtnut; the Calyx is quinquefid, and, as it were, bilabiated. The Flower is roſaceous, pentapetalous, anomalous, and, in a manner, bilabiated, the Petals growing round the Baſe of the Ovary; whence, alſo, ariſe five, ſix, or ſeven Stamina. The Flowers are diſpoſed on a long Spike, making a ſpecious Appearance. The Ovary is ſeated in the Bottom of the Calyx, and produces a long, thick Tube, with an uniform or hooked Apex; and becomes a prickly, unicapſular Fruit, gaping on all Parts, and full of Seeds, like thoſe of the Cheſtnut.

Boerhaave mentions three Species of this Plant, which are;

1. Hippocaſtanum; vulgare. *Tourn. Inſt.* 611. *Boerh. Ind. A.* 2. 250. *Caſtanea equina*. Ger. 1253. Emac. 1442. Park. Theat. 1401. Raii Hiſt. 2. 1683. *Caſtanea equina folio multifido*. J. B. 1. 128. *Caſtanea folio multifido*. C. B. Pin. 419. HORSE CHESTNUT. It is cultivated in Gardens and Walks, and flowers in *May* and *June*. The Fruit is uſed, and eſteemed an Errhine. *Dale*. It is ſaid to be good for broken-winded Horſes.

2. Hippocaſtanum; vulgare; folio conſtanter variegato.

3. Hippocaſtanum; vulgare; flore maculis flavis picto.

Boerh. Ind. alt. Plant. Vol. 2. *p.* 230.

HIPPOCRAS. See CLARETUM.

HIPPOCRATES. Having already given a pretty full Account of the Method and Practice of Medicine, as eſtabliſhed by this great Phyſician in the Preface, it may be ſufficient, under this Article, to give a brief hiſtorical Account of his Life, his Family, and the various Editions of his Works. *Hippocrates* was deſcended from *Æſculapius*, in the eighteenth Degree of Succeſſion; and, by his Mother's Side, he was in the twentieth Degree of Deſcent from *Hercules*, according to the following Genealogy, which was drawn up by the Antients, from the Memoirs of *Eratoſthenes*, *Pherecydes*, *Apollodorus*, and *Arius Tarſenſis*. *Æſculapius*, who was educated by *Chiron*, married *Epione*, the Daughter of *Hercules*, and by her had ſeveral Daughters, and two Sons, *Podalirius* King of *Caria*, and *Machaon*, who reigned in *Meſſenia*: The Deſcendants of *Podalirius* were *Hippolochus*, *Soſtratus* I. *Dardanus*, *Cleomittades* I. *Chryſamis* I. *Theodorus* I. *Soſtratus* II. *Chryſamis* II. *Cleomittades* II. *Theodorus* II. *Soſtratus* III. *Nebrus*, *Cnoſidicus* of *Coos*, *Hippocrates* I. *Heraclides* of *Coos*. The great *Hippocrates*. This Branch of *Podalirius* reigned in *Caria* till *Theodorus* II. under whom they were diſpoſſeſſed by the *Heraclidæ*, and obliged to retire into the Iſle of *Coos*, which is over-againſt *Caria*; where they all practiſed Medicine with high Reputation, eſpecially *Nebrus*, *Cnoſidicus*, *Hippocrates* I. and *Heraclides*. But the Heir of all their Fame and Talents was our *Hippocrates* II. whom Nature had favour'd with ſo ſtrong a Conſtitution, that no Labour or Hardſhip could alter it; and with ſo prodigious a Penetration, and Capacity of Mind, that ſhe is fabled to have conducted him into her deepeſt Abyſſes, and there diſcover'd to him all her Myſteries. He was born at *Coos*, in the firſt Year of the eightieth Olympiad, four hundred and fifty-eight Years before the Birth of our Saviour, and in the fifth Year of the Reign of *Artaxerxes Longimanus*; and was cotemporary with *Socrates*, *Herodotus*, and *Thucydides*, and other great Men of theſe Times. His Father *Heraclides*, and Grandfather *Hippocrates*, both great Phyſicians, took care to teach him, not only Medicine, but Logic, Phyſics, or Natural Philoſophy, Geometry, and Aſtronomy: He ſtudied Eloquence under *Gorgias* the *Leontine*, the moſt celebrated Rhetorician of his Time.

The Iſle of *Coos*, the Place of his Birth, is very happily ſituated; and had, for a long time, been famous for a public School of Medicine, founded by his Anceſtors: He had therefore all the neceſſary Conveniencies for learning the Theory of Medicine, without going out of his own Country; but, as the greateſt Cities in thoſe Times were not very populous, ſo, in order to perfect himſelf in the Practice of his Art, he follow'd the Precept which he gives to others in his Νόμος, Law; where he ſays, that, "after acquiring the Science of Medicine, it is neceſſary to "travel, and viſit foreign Cities, in order to be ſomething more "than a Phyſician in Name; for Ignorance, which proceeds "from want of Experience, is but a bad Stock for thoſe who "poſſeſs it, and an unfortunate Incumbrance by Night and by "Day."

He travell'd in *Macedon*, *Thrace*, and *Theſſaly*; and, in making the Tour of theſe Countries, he made the greateſt Part of thoſe Obſervations which are contained in his Book of Epidemic Diſeaſes. He went indeed over all *Greece*, curing not only particular Perſons, but Cities, and whole Provinces. The *Illyrians* ſent Embaſſadors to intreat him to come and remove a cruel Peſtilence, which ravaged the whole Country: *Hippocrates* was very willing to go to the Aſſiſtance of theſe People; but firſt informing himſelf of the Winds, which were then predominant in *Illyria*, of the Heats of the Seaſon, and of every thing which preceded the Contagion, he was ſenſible, that there was no Remedy for the Diſtemper, and refuſed to go. But, foreſeeing that this Peſtilence would ſoon be carried into *Theſſaly* and *Greece* by the ſame Winds, he immediately ſent his two Sons, *Theſſalus* and *Draco*, with his Son-in-law *Polybus*, and ſeveral of his Pupils, to different Places, with neceſſary Inſtructions; and went himſelf to the Aſſiſtance of the *Theſſalians*, from whence he paſſed to the *Dorians*, and thence to *Phocis*, viſiting *Delphos*, where he offered up Prayers and Sacrifices; and, paſſing thro' all *Bœotia*, made his Appearance at *Athens*, behaving himſelf all the Way like another *Apollo*; or, to uſe the Words of *Callimachus*, doing the Office of that divine Panacea, "whoſe precious Drops expel Diſeaſes wherſoever "they fall."

On another ſtill more preſſing Occaſion, he delivered the City of *Athens* from the great Plague, which had made infinite Ravages, and is ſo well deſcribed by *Thucydides*, an Eye-witneſs, and after him by *Lucretius*. They ſay the general Remedies, which he made uſe of on that Occaſion, were great Fires, which he cauſed to be kindled in all the Streets; and directed all Sorts of aromatic Flowers and Drugs to be caſt therein, in order to purify the Air; a Method practiſed, a long time before *Hippocrates*, by the *Egyptians*, who, as we are inform'd by *Plutarch*, purified the Air in the Morning with Perfumes of Roſin, burnt Myrrh in the Middle of the Day, and in the Evening, at Night-fall, kindled up Torches, call'd CYPHI, the Preparation of which may be ſeen under that Article. Some, however, are of Opinion, that the Plague, deſcrib'd by *Thucydides*, was not the ſame which *Hippocrates* cured at *Athens*.

So great was his Reputation, that moſt Princes and Kings try'd to get him to their Courts. He was ſent for to the Court of *Perdiccas*, King of *Macedonia*, who was thought to be ill of a Conſumption; where, after conſidering the Diſtemper, he diſcovered that the Cauſe of it was nothing but a Love for his Father's Miſtreſs, named *Phyla*.

Artaxerxes offer'd him immenſe Sums of Money, and entire Cities, to oblige him to come and remove a Peſtilence, which made terrible Devaſtations in his Armies and Provinces; and order'd him a Preſent of a hundred Talents, by way of Advance. *Hippocrates* regarding thoſe Riches as Enemies to his Country, and an eternal Reproach to his Houſe, he refuſed them, and return'd the Governor of the *Helleſpont* this generous Anſwer: "Write to your Maſter, that I am rich enough; and that I "cannot, with Honour, accept his Offers, nor go and cure "*Barbarians*, who are Enemies to the *Greeks*." Somebody telling him on this Occaſion, that he did wrong to ſlight ſo great a Fortune, and that *Artaxerxes* was a very good Maſter, he anſwer'd, "I have no Buſineſs with a Maſter, how good "ſoever he may be."

He was ſent for by the Senate of *Abdera* to cure *Democritus*, who paſſed for a Madman in the Opinion of the Populace, who are always ready to miſtake a Man, who is wiſe above the common Rate, for a Fool, or a Madman. *Hippocrates* gave, on this Occaſion, a ſignal Proof of his Contempt of Riches, in refuſing ten Talents, which were offer'd him.

When the *Athenians* ſent *Alcibiades* into *Sicily*, *Hippocrates* gave them his Son *Theſſalus*, for a Phyſician to their Army, and defray'd the Expences of his Voyage. The ill Succeſs of that Expedition did not prevent the *Athenians* from honouring *Theſſalus* with a Crown of Gold at his Return, after three Years Service.

No Citizen ever gave greater Proofs of Patriotiſm, than *Hippocrates*. When the *Athenians* made Preparations to carry their Arms into the Iſle of *Coos*, *Hippocrates* immediately went to implore the Protection of the *Theſſalians*, and the neighbouring States; and ſent his Son *Theſſalus* to *Athens*, to endeavour to allay the Tempeſt which threaten'd his Country. Both Father and Son met with Succeſs; for *Macedonia*, *Theſſaly*, and *Peloponneſus*, were all up in Arms, and ready to march to the Aſſiſtance of *Coos*; and the *Athenians*, either out of Fear or Gratitude, hearken'd to the Remonſtrances of *Theſſalus*.

Pythagoras taught, that the Way for Mortals to render themſelves like the Deity, was to ſpeak the Truth, and to do Good to all the World. According to this Maxim, no Man ever more juſtly deſerved the Title of *divine* than *Hippocrates*. The Good, which he has done to all ſucceeding Ages, is very well known; and he was ſo great a Lover of Truth, that he was willing to adverti ſe Poſterity of a Miſtake, into which he had fallen, and which might have been buried in Oblivion, like thoſe of other Phyſicians, whoſe good Succeſs is publiſh'd to all the World, and their Errors induſtriouſly conceal'd. In the fifth Book of his *Epidemics*, he confeſſes, with an Ingenuity, of which none but great Minds are capable, that, being called to attend on *Autonomus*, who had received a Wound in his Head, he unfortunately miſtook the Wound for one of the Sutures, and neglected trepanning him: Some Days after, the Patient being ſeized with a great Pain in the Side, and Convulſions in both Arms, he was ſenſible of his Fault, and applied the Trepan, but in vain; for, it being the fifteenth Day, and the Summer Seaſon, the Patient died the next Day.

Hippocrates desir'd of the Gods, in Recompence of his Labours, neither Riches nor Pleasures, but a long Life in perfect Health, Success in his Art, and to render himself famous to Posterity. This Desire of his is declar'd in his *Oath*, and it was accomplish'd in its full Extent; for he lived one hundred and nine Years in Soundness of Mind and Body; he succeeded so well in his Art, that he has been regarded as the Founder of it; and he received, during his Life, such great Honours, as were never given to any Mortal. The *Argians* erected a Statue of Gold to his Honour; and the *Athenians* decreed him Crowns of the same Metal, pass'd an Act, that himself, and his Descendants, should be maintain'd in the *Prytaneum*, and initiated him into the great Mysteries; an Honour very rarely confer'd on Strangers, and never before on any but *Hercules*; and he has left behind him an immortal Reputation. *Plato* and *Aristotle*, the two greatest Geniuses which perhaps ever appear'd, follow'd him as their Master, and made it their Business to explain his Sentiments. In short, *Hippocrates* has been always regarded as the most faithful Interpreter of Nature; and, in all Appearance, he will preserve the Glory and Reputation, of which more than two thousand Years have not been able to deprive him, to the latest Ages.

He died in *Thessaly*, in the second Year of the one hundred and seventh Olympiad, three hundred and forty-nine Years before the Birth of Christ, and was buried between *Larissa* and *Gortona*.

Having thus given some of the most remarkable Passages of this great Man's Life, it will be easy from thence to form his Character; and therefore we shall do no more than give an Account of the various Editions of his Works, as we find them in *Fabricius's Bibliotheca Græca*.

The *Greek* Editions are,

1. That at *Venice*, An. 1526. by *Aldus*, in Folio.

2. At *Basil*, 1538. Folio, by *Frobenius*, corrected after three Manuscript Copies by *Janus Cornarius*.

Latin Editions.

The antient *Latin* Version of *Hippocrates* and *Galen* is lost, but there are *Latin* Editions of *Hippocrates*, since the Publication of some Treatises of his, which were most of them translated out of *Arabic* into *Latin*, and printed at *Venice* 1493. and 1497.

1. That, translated by several Hands, at *Basil*, printed by *A. Cratander*, 1526. Folio.

2. The Version of *M. Fabius Calvus*, of *Ravenna*, at the Command of Pope *Clement* VII. from *Greek* Manuscripts in the *Vatican*, and printed at *Rome* 1549. Folio.

3. The Version of *Janus Cornarius*, printed at *Venice* 1545. Octavo; and at *Paris* 1546. Octavo; and the same Year at *Basil*, in a more beautiful Letter, by *Frobenius*, in Folio; and again, at the same Place, in 1553. in Folio; and 1554. in Octavo, 2 Vols. Again, in the same Place, by *J. Culman* of *Geppingen*, 1558. Folio; at *Lyons*, 1562. Octavo, and 1564. Folio, with the Commentary of *Marinellus*, and the Arguments of *Culman*; at *Venice* 1575. and 1619. Folio; at *Vicenza* 1610. Folio, with a paraphrastic Translation of the Epistles, and some other Treatises of *Hippocrates*, done by *Cornarius*, and inserted before the Work; at *Cologn* 1542. Octavo.

4. The *Latin* Version of *Anutius Foesius*, printed at *Francfort*, *apud Wechelos*, 1596. Octavo.

The *Græco-latin* Editions are,

1. That of *Hieron. Mercurialis*, printed at *Venice*, 1588. Folio.

2. Of *Anutius Foesius*, printed at *Francfort*, *Typis Wechelianis*, 1595. Folio. Re-printed at the same Place, 1621. and 1645. and at *Geneva*, 1657. Folio.

3. Of *Joh. Antonid. Vander Linden*, with the Version of *Cornarius*, printed at *Leyden*, 1665. Octavo.

4. Of *Renatus Charterius*, who revised and compar'd, by Manuscripts, the Works of *Hippocrates* and *Galen*, corrected the Version in Multitudes of Places, adding the various Readings, and Corrections at the End of each Volume; printed at *Paris*, 1679. 13 Vol. Folio.

Besides the Editions mentioned, *Prosper Martianus*, on the Works of *Hippocrates*, and his posthumous Annotations, were published by *Petrus Castellanus*, at *Rome*, 1626. Folio. Twenty-two Treatises, with the Version of *Cornarius*, and an Analysis, or Tables, and Animadversions of *Theod. Zwinger* were printed at *Basil*, 1579. Fol. and are now very scarce. *Fabricii Bibliotheca Græca*.

HIPPOCRATICA *Facies*. See FACIES.

HIPPOCRATICUM *Scamnum*. See BATHRON.

HIPPOCRATICUM *Vinum*. See CLARETUM.

HIPPOGLOSSUM. See BISLINGUA.

HIPPOGLOSSUS. A kind of Fish, being a larger Species of Sole; whose Use in Food see under ALIMENTUM.

HIPPOLAPATHUM. See LAPATHUM; *Alpinum*; *folio subrotundo*.

HIPPOLITHUS, ἱππόλιθος, from ἵππος, a Horse, and λίθος, a Stone; a Stone found in the Stomach or Intestines of a Horse. See EQUUS, and BEZOAR.

HIPPOMANES, ἱππομανὲς, from ἵππος, a Horse, and μαίνομαι, to be mad, is a Name for the CYNOCRAMBE, or APOCYNUM, so called, because it makes Horses, which eat of it, mad, *Theocrit. Idyl.* 2. and for the expressed Juice of the *Tithymallus*, *Theophrast. Hist. Plant.* It also signifies a Juice distilling from the Genitals of a Mare in the time of her Covering. *Aristot. Hist. Anim.* Some, again, take it for the Secundines of a Mare; and, lastly, it signifies a fleshy Substance, adhering to the Forehead of a Colt newly foaled, which some imagine to have a Virtue of procuring Love, and promoting the Birth.

HIPPOMARATHRUM, ἱππομάραθρον, from ἵππος, an Horse, and μάραθρον, Fennel; Horse-fennel.

HIPPOMARATHRUM is Wild Fennel, large, and bearing a Seed like *Canchry*, or *Cachry*. The Root is sweet-scented, and, being drank, cures the Strangury, and, used in a Pessary, provokes the Menses. The Seed, or Root, taken internally, bind the Belly, cures the Bites of venomous Animals, breaks the Stone, and removes the Jaundice. The Decoction of the Leaves, drank, procures Plenty of Milk, and purges Women after Child-birth. There is another Plant called *Hippomarathrum*, which has narrow, slender, oblong Leaves, with round, Coriander-like, acrimonious, sweet-scented, and hot Seeds: Its Virtues are the same with those of the preceding, only less efficacious. *Dioscorides*, *Lib.* 3. *Cap.* 82.

Ray mentions a *Hippomarathrum Sphærocephalum*, or round-headed *Hippomarathrum*, propagated by Seeds sent from *Egypt* by *Prosper Alpinus*, which differs from the Cachryophorous, or Cachry-bearing *Hippomarathrum*, in that it is much larger, having longer and bigger Stalks, and bearing Umbels of a violet Colour, almost perfectly spherical, and producing Seeds like those of Fennel. *Raii Hist. Plant.*

HIPPONE. The Name of a Malagma, invented by *Philagrius*, and described by *Aetius*, *Tetrab.* 3. *Serm.* 3.

HIPPOPHAES, ἱπποφαὲς, according to *Dioscorides*, is a shrubby Plant, which is of Service to Fullers in scouring their Cloth: It is also called ἱπποφαὲς, (*Hippophaes*) and ἱπποφυὲς, (*Hippophyes*) and ἱππόφυον, (*Hippophyon*) by *Theophrastus*. In *Pliny*, *Lib.* 21. *Cap.* 15. we read *Hippophaes*, and *Lib.* 22. *Cap.* 12. we find it *Hippophyes*. *Gaza* renders the Word in *Theophrastus* by *Lappago*; and *Galen*, in his *Exegesis*, says, it is also called κνάφος, (*Cnaphos*) and σύβος, (*Stybos*) for which some read σίλβος (*Stilbos*).

Hippophaes, says *Dioscorides*, grows in maritime and sandy Places, is a Shrub of the spriggy Kind, [φρυγανώδης] which sends forth its Shoots thick and close on all Sides, has long Leaves, nearly resembling those of the Olive-tree, but narrower and softer, among which are interspersed dry, whitish, angulous Thorns, distant from one another. The Flowers resemble Clusters of Ivy-berries, being collected in Bunches, but smaller and soft, and of a whitish, and partly red Colour. The Root is thick, soft, bitter, and full of a milky Juice. From this Plant, as well as from the *Thapsia*, they extract a Juice, which is reposited either by itself, or work'd up with the Flower of the Ervum, and dry'd. The Weight of half a Scruple of the Liquor taken alone purges bilious, watry, and pituitous Humours; but the Dose of the Ervum, impregnated with the same, is two Scruples in Hydromel. The Plant, together with its Root, is dry'd, triturated, and exhibited in half a Pint of Hydromel. They prepare a Liquor from the Plant, and its Root, as is done from the *Thapsia*; the Dose of which is a Dram, for a Purge. *Dioscorides*, *Lib.* 4. *Cap.* 162.

The Author above-mention'd says, that "the *Hippophæstus*, "which some call *Hippophaes*, grows in the same Places with "the *Hippophaes*, and is a kind of *Fullers Thorn*; that it is a "low Ground-herb, and has only small prickly Leaves, with "gaping, empty Heads, and bears neither Stalk nor Flower; "the Root is thick and soft." By this Description it appears, that the *Hippophaes* and *Hippophæstus* are the same Plant; and that the latter is only the *Hippophaes*, in its recent State, before it produces a Stalk. But on what Plant to fix this Name, is a Point much controverted, and not easy to be determined. *Columna* calls the *Carduus Stellatus* the *Hippophaes*, and doubts whether the *Rhamnus Salicis Folio* of *C. B.* ought not to be so named. *C. Bauhine* separates the *Hippophaes* of *Anguillara*, from the *Hippophaes* of *Dioscorides*, referring the former to the *Rhamnus*, how justly, I will not determine; for I suppose none of them to be genuine, because none of their Roots afford a milky Juice. *Matthiolus* writes, that *Hieronymus Amatheus*, a Physician of *Oderzo*, in the State of *Venice*, shew'd him a Plant, which he had sent him from *Venice*, by *J. Baptist. Ropisso*, a Physician of *Pavia*, which not only answer'd all the Characters of the *Hippophæstus* of *Dioscorides*, but also the Virtues, as he assures us he found by an Experiment; and this put him in Hopes of discovering it. *Parkinson* thinks it a Species of *Tithymalus*, and I see no Reason to disagree with him; and therefore I have placed it under the Head of *Tithymalus*, and collected and compared the Synonyma. *Dale*.

Hippocrates often uses the Juice of the *Hippophaes*, as well as the *Coccus Cnidius*, as a Purge for the Head; he prescribes it also

to

to evacuate white Phlegm, and for the Anaſarca, to expel pituitous Humours in the Sciatica; in the *Typhus*, a ſort of burning Fever, he exhibits the Juice of *Hippophaes* with the *Coccus Cnidius*, as a Cathartic; and *Lib. de intern. Morb.* he adviſes purging downward by *Hippophaes*, and upwards by *white Hellebore*.

The Synonyma, according to *Dale*, are;

Hippophaes, Hippophæſtum, & Hippomanes. Offic. Park. Theat. 197. *Hippophaes Anguillare & Dodonæi, ſive Spina purgatrix.* J. B. 1. 410. *Hippophaes quibuſdam ἄκανθα καθαρτικὴ*, i. e. *Spina purgatrix.* C. B. P. 293. *Rhamnus Catharticus Oleæ folio.* Ejuſd. *Tithymalus maritimus.* Ejuſd. *Tithymalus ſpinoſus.* Wheeler. Itin. 307. *Tithymalus maritimus, Creticus ſpinoſus.* Park. PURGING-THORN.

It grows in the *Morea*; the Juice is uſed to purge off, by Stool, pituitoſe Humours.

Boerhaave gives the Name of *Hippophae* to the *Rhamnoides*; *fructifera*; *Salicis foliis*; *baccis leviter flaveſcentibus*: And alſo to the *Facea*; *ſtellata*; *folio papaveris erratici.*

HIPPOPHÆSTUM, *ἱπποφαιστον.*

Dioſcorides makes different Chapters of the *Hippophaes* and *Hippophæſtum*, and, giving the Virtues of the latter, ſays, that a Juice is extracted from the Leaves, Root, and Heads, which, dry'd, and exhibited to the Weight of a Scruple and half, purges Water, and Phlegm, and is particularly ſerviceable in the Orthopnœa, Epilepſy, and nervous Diſeaſes. *Dioſcorides, Lib.* 4. *Cap.* 163. See HIPPOPHAES.

HIPPOPOTAMUS. Offic. Aldrov. de Quad. Digit. 181. Geſn. de Quad. Digit. 493. Charlt. Exer. 14. Jonſ de Quad. 76. Raii Synop. A. 123. Mont. Exot. 5. Bellon. de Aquat. 25. THE SEA-HORSE, or rather RIVER-HORSE.

The Teeth and Teſticles of this Animal are uſed in Medicine; the Teſticles, dried and triturated, are drank againſt the Bites of Serpents. *Dioſcorides.* The Teeth, made into Rings, are ſuppoſed to be of great Virtue againſt the Cramp. *Charlt. Dale.*

Another Species of *Hippopotamus* is the

Equus marinus. Offic. *Equus marinus & Hippopotamus falſo dictus.* Raii Synop. A. 191. *Roſmarus.* Jonſ. de Piſc. Tab. 44. *Waleus alius Mors.* Charlt. de Piſc. 49. *Mors ſeu Morſz, vel Roſmarus.* Geſn. de Aquat. 211. THE SEA-HORSE.

The Parts of this Animal uſed in Medicine are, the Pizzle, which is a round, bony Subſtance, a Cubit, or more, in Length; thick, ponderous, and ſolid; and much thicker and rounder at the End, near the Glands; and the Teeth, which are great, long, thick, ponderous, hollow, and white.

The Pizzle, pulverized, is uſed to expel the Stone; the Teeth, for Service and Value, are compared to Ivory, and are made into various Forms, as into Rings for the Cramp, and for other Purpoſes. *Dale.*

HIPPOSELINUM. See SMYRNIUM.

HIPPOSIS, *ἵππωσις*, from *ἱππάω*, or *ἱππόω*, to preſs, after the manner of Fullers, a Preſſure, Compreſſion, or Depreſſion: Thus, *Lib. de Artic. τὰ μὲν γὰρ ἐξεστῶτα εἰς τὴν χώρην ἀναγκάζει ἡ ἵππωσις εἶναι*, "for things out of their Places are reduced into "their Situation by Compreſſion."

HIPPOSORCHIS, *ἱπποσορχις*, from *ἵππος*, a Horſe, and *ὄρχις*, a Teſticle, in the *Ausburgh* Diſpenſatory, means the Powder of the Teſticles of a Horſe; but *Hipporchis* had been a more elegant Word, and better turned according to the Rules of Compoſition.

HIPPURIS, *ἵππυρις*, from *ἵππος*, a Horſe, and *οὐρὰ*, a Tail, is a Name given to ſeveral ſorts of *Equiſetum*. *Hippuris minor* is a Name for the *Ephedra*; *maritima*; *minor.*

Ἵππυρις, Lib. 7. *Epidem.* is ſuppoſed to ſignify an inveterate and ſtubborn Defluxion on the Pudenda of thoſe who continue too long, or mount too often, on Horſe-back, or ſome Weakneſs, or other Inconvenience, of the ſame Parts, proceeding from the ſame Cauſe.

HIPPUS, *ἵππος*, is an Affection of the Eyes, under which they are continually trembling, and twinkling, as is uſual with thoſe who ride on Horſe-back. The Author of the *Definitiones Medicæ* ſays, *ἵππος ἐστὶ διάθεσις ἐκ γενετῆς, &c.* "The *Hippus* "is an Affection contracted from the Birth, in which the Eyes "are unſettled, and always in Motion, being under a perpetual "Concuſſion and Trembling. This Diſorder was called by "*Hippocrates*, *ἵππος*, and is an Affection of the Muſcle which "ſuſtains the Eye, and embraces the Baſe of the viſual Organ."

HIRA. There are great Diſputes about the Orthography and Signification of this Word. The antient Copies read *Chira*, ſome *Hilla*. Some reſtrain its Meaning to the *Inteſtinum jejunum*, others extend it to all the Inteſtines; and *Linden*, in a larger Senſe, to all the Contents of the Abdomen. *Caſtellus.*

HIRBELLUM, in *Paracelſus, Tr. de Surditate*, is ſomething unknown, which renders Perſons delirious. *Caſtellus.*

HIRCI BARBA. See TRAGOPOGON.

HIRCULUS. A Species of Plant ſo called, becauſe of its rank, goatiſh Smell.

HIRCUS. The ſame as CAPER, which ſee. *Hircus Bezoarticus*; ſee BEZOAR.

HIRQUUS. The great Angle of the Eye.

HIRUDO, *Sanguiſuga.* Offic. Charlt. Inſect. 62. Met. Pin. 207. *Hirudo ſive Sanguiſuga.* Mont. Exer. 323. *Hirudo maxime apud nos vulgaris.* Raii Hiſt. Inſect. 3. *Hirudo major, equina.* Schrod. 5. 342. THE LEECH.

Theſe are ſmall black Animals, deſtitute of Legs, variegated with Lines and Points, and living in watry Places. The ſmall Leeches are prefer'd to the large, as being leſs hurtful; and, among the ſmall ones, ſuch as are mark'd with Lines on the Back.

It is not impoſſible, but that the Antients might take the Hint of bleeding from theſe Inſects; for it is well known, that in the Spring, when Horſes are allur'd into Ponds and Rivers by the green Graſs, the large Leeches, called Horſe-leeches, ſeize their Legs, or Flanks, perforate a Vein, and excite a profuſe Hæmorrhage; and that, after this, the Horſes improve in Health, and Fleſh. See BDELLA.

Themiſon was, probably, the firſt Phyſician who uſed Leeches; he is, at leaſt, the firſt that takes notice of them: For *Hippocrates* never once mentions them; and *Cœlius Aurelianus* quotes nothing concerning them in the Extracts he gives us from the Writings of thoſe Phyſicians who liv'd betwixt the Times of *Hippocrates* and *Themiſon*. Thoſe of the Sect of *Themiſon* us'd Leeches upon many Occaſions; and ſometimes applied Cupping-glaſſes to the Part, after the Leeches dropt off, in order to draw off more Blood. *Galen* does not mention them, perhaps, becauſe they were peculiar to the Methodic Sect, which he deſpiſed. Indeed they are mention'd in an imperfect Treatiſe *de Cucurbitulis, de Scarificatione, de Sanguiſugis*, &c. aſcrib'd to *Galen*, but, probably, without Foundation; becauſe *Oribaſius, Lib.* 7. ſpeaks to the ſame Purpoſe with regard to Leeches; and declares he extracted it from *Antyllus* and *Menemachus*, who were Methodics, at leaſt the laſt of them. This Remedy was, probably, firſt diſcover'd by the Peaſants.

Leeches are a Species of aquatic Worms or Inſects, which, being applied to the Body, bite through the Skin, extract Blood out of the Veins, and are very conducive to Health; for which Reaſon they were us'd in very early Times, by the *Greek* and *Roman* Phyſicians. Since there are various kinds of them, it will be proper to give ſome Direction for the Choice. Thoſe, then, taken out of clear Brooks and Rivers are beſt; for the others from Lakes, Fiſh-ponds, and ſtagnating Waters, are impure and malignant, exciting ſometimes violent Pains, Inflammations, and Tumors. The moſt experienced Surgeons likewiſe prefer thoſe with ſlender-pointed Heads, and greeniſh or yellowiſh Streaks on their Backs, with their Bellies of a Reddiſh-yellow; for when their Heads are large, and from a blue they incline to a black Colour all over their Bodies, we look upon them to be the moſt malignant Sort. But one Obſervation more ſeems abſolutely neceſſary, never to apply Leeches lately caught in Rivers, or foul Waters; but let them be firſt put into a Glaſs full of clean Water, and often ſhifted, that they may purge themſelves of their Filth and Venom. After keeping them ſome Months in this manner, they may be us'd ſafely. See *Tab.* XXXIII. *Fig.* 5.

Before the Leech is applied, it ſhould be taken out of the Water, and put into an empty Cup, or Glaſs; that, being thirſty, it may more ſpeedily inſinuate itſelf into the Skin, and draw off a greater Quantity of Blood. And as for the Part, it may be put on the Temples, or behind the Ears, if there is any Diſorder in the Head or Eyes, from a Redundance of Blood, and eſpecially if the Patient is delirious in a Fever. They may ſometimes be conveniently apply'd to the Veins of the Rectum, in the blind and painful Piles; nor will this Application be of leſs Service, in Hæmorrhages of the Noſe; and in ſpitting or vomiting Blood; for their Efficacy in promoting a Revulſion, eſpecially when an Obſtruction of the Hæmorrhoids occaſions this Profuſion, is very extraordinary. But before the Leech is uſed, the Part ſhould be rub'd, till it is hot and red; then the Tail muſt be taken hold of with a dry Cloth, or it muſt be laid half over the Edge of a Glaſs, and thus directed to the proper Place, where, when it is once fixed, it ſucks very greedily. If ſeveral are neceſſary, apply each ſucceſſively in this manner. When they will not adhere, as it ſometimes happens, it is proper to moiſten the Skin with warm Water, or the Blood of a Pigeon, or Chicken: If that will not entice them, others muſt be ſubſtituted in their ſtead. The Application of Leeches to the Caruncle in the greater Canthus of the Eye, after Phlebotomy, has been found very ſerviceable, in all inflammatory Diſorders of that Organ. Cream and Sugar, rub'd upon the Part, will invite Leeches to bite, when other things fail.

As ſoon as the Leeches are diſtended with Blood, they generally fall off ſpontaneouſly; but, if a larger Quantity of Blood is requiſite, new ones muſt be apply'd, or the Tails of theſe already fixed muſt be cut off; for then, the Blood running thro' them, they will be induced to draw more. If, after a ſufficient Evacuation, they do not ſpontaneouſly ſeparate themſelves from the Skin, upon ſprinkling a little Salt or Aſhes, they immediately drop off; and this Method is beſt, becauſe pulling them away, often cauſes an Inflammation, or Tumor. The Leech, which is whole, may be put again into the clean Water, and kept for future Uſe; but

but that which is cut, certainly dies. The Wound may be washed with warm Water, and dressed with a vulnerary Plaister, though it usually heals without. Those who desire to know more of these Insects, may read *Aldrovandus*, *Gesner*, *Botallus*, *Petr. Paul. Magnus*, *Sebizius*, *Heurnius*, *Cransius*, *Schroder*, and *Stahl*, who have treated of them more at large.

When Leeches fall off, the Hæmorrhage generally continues for some time, as twelve Hours, and frequently longer. Upon this Occasion, as the Blood cannot be receiv'd in Vessels, but is absorb'd by Linen, it makes a great Appearance, and seems much more than it really is: This alarms the Patient, and puts the Attendants into an unnecessary Consternation, upon a Supposition, that the Hæmorrhage will be so profuse, as to occasion Faintings, and Death, neither of which is likely to ensue; for the Bleeding may, at any time, be stopt by Compression, or the Application of Styptics; as Brandy, with a little powder'd Colcothar. But it is more frequently necessary to bathe the Part wounded, with warm Water, in order to encourage a Discharge of Blood, when it does not flow in Quantities sufficient to answer the End propos'd.

HIRUNDINARIA. See ASCLEPIAS.

HIRUNDO. A kind of Bird commonly call'd the *Swallow*, of which *Dale* mentions four Species; which are,

1. *Hirundo*. Offic. Schrod. 5. 320. Ind. Med. 59. Bellon. des Oyse. 379. Mer. Pin. 177. *Hirundo domestica*. Aldrov. Ornith. 2. 662. Jonst. de Avib. 83. Gesn. de Avib. 492. Charlt. Exer. 95. Will. Ornith. 155. Raii Ornith. 212. Ejusd. Synop. A. 71. *Hirundo vulgaris*. Scalig. THE SWALLOW.

Of medicinal Use are the whole Bird, its Heart, Blood, Nest, and Dung. Swallows, with their Young, burnt to Ashes, are a Specific in the Epilepsy, and for Dulness of Sight, and Lippitude, if made into a Litus with Honey; it also cures the Quinsey, and Inflammations of the Uvula. The Heart also is said to be good against the Epilepsy, and to strengthen the Memory; some eat it against a Quartan. The Blood is thought to be of singular Benefit to the Eyes. The Nest helps the Quinsey, and cures Redness of the Eyes, and heals the Bite of a Viper, if apply'd to the Place. The Dung heats mightily, and discusses, being of an acrimonious Quality. It is of excellent Service against the Bite of a mad Dog, in the Colic, and nephritic Disorders, and excites the Belly to Excretion. *Celsus* tells us, *Lib.* 4. *Cap.* 4. that it was commonly said, "that whoever eats a young Swallow, shall be free from all "Danger of a Quinsey for a whole Year."

2. *Hirundo riparia*. Schrod. 5. 320. Mer. Pin. 178. Aldrov. Ornith. 2. 694. Gesn. de Avib. 507. Jonst. de Avib. 84. Charlt. Exer. 96. Raii Ornith. 213. Ejusd. Synop. A. 71. Will. Ornith. 156. THE SAND MARTIN.

The whole Bird, and its Blood, are used in Medicine, with the same Intentions as the preceding.

3. The third Sort of *Hirundo* is the APOS; which see.

4. *Hirundo Indica*. Offic. *Hirundo maritima*. Act. Philos. Lond. N° 285. p. 1396. *Hirundo Sinensis nido eduli Bontii*. Will. Ornith. 15. Raii Ornith. 215. Ejusd. Synop. A. 72. *Hirundo Chinensis*. Bont. 66. *An Hirundo exotica aquatica*. Jonst. Mantiss? THE INDIAN SWALLOW.

It is found in the maritime Places of *China*. What relates to Medicine, is its Nest, which is of a hemispherical Figure, of the Size of a Goose's Egg, pellucid, and in Substance resembling the *Ichthyocolla*. It stimulates to Venery: It is a Question, whether they are made of the Sperm of certain Fishes, or of the Gum of some Plants growing on the Rocks. In *China* these Nests are esteem'd delicious Food.

HISMAT. Spuma Argenti, or Litharge. *Rulandus*.

HISPANICUM *viride*, Verdegrise. *Rulandus*.

HISPIDITAS, Hairiness in general; but in a particular Sense it is used to signify either the Disease called PHALANGOSIS, or that other named DISTICHIASIS. See these Words.

HISPIDULA. A Name for the HELICHRYSUM; *montanum*; *flore rotundiore*.

HISTORIA, History, in Medicine, is usually restrain'd to signify the same as *Casus Medicus*, or *Observatio medica*, a medicinal Case, or Observation. See CASUS.

HISTOS, ἱστὸς, properly the Mast of a Ship; but in *Hippocrates*, *Lib. de Artic.* is an erect Piece of Wood, on the Top of which is placed another horizontally, whence depends a Pully, constituting together a chirurgical Machine for restoring a Gibbosity of the Spine.

HOAXACAN, *Hern.* The same as *Guaiacum*. *Raii Index*.

HOBUS, *Hovus Indica Pruni Facie*. J. B. Ovied.

A Species of Plum-tree growing in the *West Indies*, and bearing a Plum of the Shape of our Damascen-plums, and yellow when ripe. The Plum is of an agreeable Taste, being somewhat acrimonious, and is easy of Digestion, but difficult to chew, because it is full of Fibres; some take it for a Species of *Myrobalans*.

From the tender Tops of the Branches, and the Bark, the *Indians* prepare a sweet-scented Water, which is good to refresh tired Limbs; they also use it in their Baths in *New-Spain*. The Fruit of the Tree strengthens the Stomach, and somewhat loosens the Belly. If Incisions be made in the Root, there distils a Liquor which is good to drink. *Lemery des Drogues*.

HOCIAMSANUM, Agrimony. *Marcellus Empiricus*, *Cap.* 20.

HOEDUS. See CAPER.

HOITZ!LOXITL. See *Balsamum Peruanum*.

HOLCAS, ὁλκὰς, in *Hippocr. Lib. de Flat.* is a Ship of Burden. *Foesius*.

HOLCE, ὁλκὴ, the Name of a Weight, the same as *Drachma*. *Gorræus* from *Galen*. But properly, as in *Dioscorides*, it signifies the same as σταθμὸς (*Stathmos*), a Weight in general.

HOLCIMOS, ὁλκιμος, from ἕλκω, to draw, tractile, is an Epithet apply'd to what may be drawn out at Length, and still preserve its Continuity, which is the Property of viscid and glutinous Substances. *Galen*, *Com.* 2. *in Lib. de Artic.* on a Passage where the Word in *Hippocrates* is εὐόλκιμον (*euolcimon*), easily tractile. *Holcimos* is also spoken of the Liver affected with a Tumor. *Galen de Loc. affect.*

HOLCUS, *Plin.* A Name for the *Hordeum*; *spontaneum*; *spurium*.

HOLERA, an antiquated Word for *Cholera*; sometimes it was written for *Olera*, the Plural of *Olus*. *Castellus*.

HOLIPPÆ, very thin Cakes, prepar'd of fine Flour and Sugar, pour'd upon a hot Iron Plate figured, and then set to the Fire. The Name is now appropriated to Sweet-meats, tho' there are extant, in Dispensatories, Prescriptions for purging *Holippæ*. *Castellus*.

HOLLI, the *Indian* Name for what the *Spaniards* call *Ulli*; which is a very useful resinous Liquor, that distils from the Tree *Holquahuytl*, or *Chilli*: This is sometimes, tho' but rarely, mixed with Chocolate; and especially, in case of a Dysentery and Diarrhœa, when, with four Ounces of *Cacao*, they mix one Ounce of *Holli*. But, by way of Precaution, the Cacao, on account of its Pinguiousness, and the Gum *Holli*, because of its extraordinary Tenaciousness and Viscidity, must first be torrefy'd, to prevent their obstructing the Viscera, and producing a Cachexy. *Ray*, *Hist. Plant.*

HOLMISCOS, ὁλμισκος. See MORTARIOLUM.

HOLMOS, ὅλμος. See MORTARIUM. *Holmos* is also the Trunk of the Body, separate from the Limbs. *Castellus*.

HOLOPHLYCTIDES. The same as PHLYCTIDES, or PHLYCTÆNÆ; which see.

HOLOSCHOENOS. A Name for the *Juncus*; *aquaticus*; *maximus*.

HOLOSTEO AFFINIS. See MYOSUROS.

HOLOSTEON. The Name of a Fish which is found in the River *Nile*: It is of no Use in Medicine. *Lemery des Drogues*.

HOLOSTEUM MINIMUM. A Name for the *Alsine*; *vernа*; *glabra*; which see.

HOLOSTIUM. A Name for the *Plantago*; *angustifolia*; *albida*; *Hispanica*.

HOLOTHURION; whether a Plant, or Animal, or of the Class of Zoophytes, is not certain; but it deserves to be mention'd, on account of an Observation made by *Bontius*, *Obs. select. Med. Ind. annex.* that excessive Drinking of a Liquor, prepared of Rice and *Holothurium*, and called *Arac*, was the Cause of a deplorable, complicated, chronic Disease, in a certain Case that fell under his Cognisance; for which Reason he calls it, a cursed Liquor. *Castellus*.

HOLOTONICOS, ὁλοτονικὸς, from ὅλος, whole, and τείνω, to stretch, is spoken of an universal Convulsion, or Rigor of the whole Body; called also *Tetanus*. *Castellus*.

HOLSEBON, HELSATON, HELSEBON. Common Salt prepared. *Rulandus*.

HOMÆOMERES, ὁμοιομερὴς, from ὅμοιος, similar, and μέρος, a Part, is an Epithet of any thing which consists of similar Parts.

HOMERDA, human Dung. *Castellus*.

HOMILIA, ὁμιλία, in *Hippocrates*, according to *Erotian*, bears three Senses: First, It signifies Conversation and Discourse, as *Lib. de Medico*. Secondly, A Connexion and Cohesion of the Parts, and especially of the Bones, *Lib. de Artic.* where the Verb ὁμιλέω is used. And, lastly, It means Exercise; as in the Book just quoted. *Erotian apud Hippocratem*.

HOMO, Man, is not only the Subject of Medicine, but contributes with his Body to the *Materia medica*.

Officinal Simples, furnished from the Parts of the human Body, whilst alive, are the Hairs, Nails, Saliva, Ear-wax, Sweat, Milk, Menses, Secundines, Urine, Dung, Semen, Blood, the Stones of the Bladder, which are the *Bezoar Microcosmi*, and the Membrane which covers the Head of the Fœtus.

The *Hair* is commended for the Production of Hair, for the Jaundice, Luxations, and for stopping an Hæmorrhage. The *Nails* are said to provoke Vomiting, and to be an Hydragogue in Dropsies. The *Saliva* of a Man fasting is recommended against venomous Bites; as those of Serpents, a mad Dog, and the like. The *Ear-wax* is said to be a present Remedy in the Colic; outwardly used, it cures the Stings of Scorpions, conglutinates Wounds, and Fissures, and Cuts in the Skin. See CERUMEN.

RUMEN. The *Sweat* is ſaid to be effectual againſt the Scrophula, if it be mixed with the Herb and Root of Mullein, and wrapt up in the Leaf, and ſo applied to the Place. The *menſtrual Blood*, of the firſt Flux, dried, is commended, taken inwardly, for the Stone, and the Epilepſy: Externally uſed, it eaſes the Pains of the Gout; it is alſo ſaid to be of Service in the Peſtilence, Abſceſſes, and Carbuncles; it cures the Eryſipelas, and cleanſes the Face from Puſtules. The *Secundines* are extol'd for removing ſtrumous Tumors in the Throat, againſt the Epilepſy, and for invalidating the Effects of Philtra, or Love-potions; for exterminating a Mole and a Fœtus, and for deſtroying noxious Vermin, and Animals, even ſuch as are procured in the Body by unlawful Arts. The *Urine* heats, dries, reſolves, abſterges, diſcuſſes, cleanſes, reſiſts Putrefaction; and is, therefore, of principal Service in Obſtructions of the Liver, Spleen, Gall-bladder, in the Dropſy, Jaundice, and as a Preſervative againſt the Plague. A Draught of the Husband's Urine, which the old Women call *Water of Caſtor*, is ſaid to facilitate the Delivery of the Wife in hard Labour: Outwardly uſed, it dries the Habit, diſſolves Tumors, cleanſes Wounds, even though poiſon'd, prevents a Gangrene, looſens the Belly, abſterges Scurf from the Head, mitigates the Paroxyſms of Fevers, cures Exulcerations of the Ears, helps Redneſs of the Eyes, removes Tremblings of the Limbs, diſcuſſes Tumors of the Uvula, and eaſes Pains of the Spleen: There is prepar'd of it a *Sal Ammoniac*, which is an artificial ſtriated Salt, made into Cakes, of a white Colour, and of a bitteriſh pungent Taſte; the Method of Preparation is, by boiling together Urine, Soot, and common Salt; chooſe what is pure and white.

There ſeem to be ſome Foot-ſteps of a natural *Sal Armoniac* in *Dioſcorides*, *Pliny*, and other antient Authors, who deſcribe it as found under the Sands of *Libya*; but no ſuch thing is to be found in the Shops at preſent; nor is it known what it was. See the Virtues of artificial *Sal Ammoniac* under AMMONIACUM.

Human *Dung* is mollifying, maturating, and anodyne; whence it is very ſerviceable in mitigating Pains excited by Charms, for ripening peſtilential Carbuncles, and for a Phlegmon, particularly of the Throat, as in a Quinſey, and to prevent an Inflammation in Wounds: Some even preſcribe it inwardly for the Quinſey, to repreſs the Paroxyſms of Fevers, and for the Epilepſy. The *Semen*, or *Sperma*, is uſed by ſome for diſſolving the malific Influence of Spells cauſing Impotence; and of the ſame is prepar'd a magnetic Mummy, which ſerves for a Philtre. The *Blood*, drank recent and hot, is ſaid to be effectual againſt the Epilepſy, if the Patient, afterwards, uſes vehement Motion, or Running till he ſweats; it ſtops all ſorts of Hæmorrhages: Uſed outwardly, it, alſo, repreſſes all Eruptions of Blood, and, eſpecially, from the Noſe. The *Stone* in the human Bladder diſſolves the Stone, and all tartarous Matter in any Part, and expels the ſame; for which Reaſon, it frees from all Obſtructions. The *Membrane*, which ſometimes ſurrounds the Head of the Fœtus, is ſaid to be of extraordinary Efficacy againſt the Pain of the Colic.

Officinal Simples, taken from the human Carcaſe, are, the *Mummy*, which is a reſinous, harden'd, black, ſhining Surface, of a ſomewhat acrid and bitteriſh Taſte, and of a fragrant Smell. Under the Name of *Mummy* are comprehended, firſt, The Mummy of the *Arabians*, which is a Liquament, or concreted Liquor, obtain'd in Sepulchres, by Exudation from Carcaſes, embalm'd with Aloes, Myrrh, and Balſam. If this Mummy could be procured right and genuine, it would be preferable to the other Sorts. The ſecond kind of Mummy is the *Egyptian*, which is a Liquament of Carcaſes, ſeaſon'd with Piſſaſphaltus. A third Subſtance, which goes by the Name of *Mummy*, is a Carcaſe torrefied under the Sand, by the Heat of the Sun; but ſuch a one is ſeldom to be met with in our Country. The other Parts uſeful in Medicine are the Skin, Fat, Bones, Marrow, Cranium, and Heart.

Mummy reſolves coagulated Blood, and is ſaid to be effectual in purging the Head, againſt pungent Pains of the Spleen, a Cough, Inflation of the Body, Obſtruction of the Menſes, and other uterine Affections; outwardly, it is of Service for conſolidating Wounds. The *Skin* is recommended in difficult Labour, and hyſteric Affections, and for a Withering and Contraction of the Joints. The *Fat* ſtrengthens, diſcuſſes, eaſes Pains, cures Contractions, mollifies the Hardneſs of Cicatrices, and fills up the Pits left by the Meaſles. The *Bones*, dried, diſcuſs, aſtringe, ſtop all ſorts of Fluxes, and are, therefore, uſeful in a Catarrh, Flux of the Menſes, Dyſentery, and Lientery; and mitigate Pains of the Joints. The *Marrow* is highly commended for Contractions of the Limbs. The *Cranium* is found, by Experience, to be good for Diſeaſes of the Head, and particularly for the Epilepſy; for which Reaſon it is an Ingredient in ſeveral antiepileptic Compoſitions. The *Os triquetrum*, or triangular Bone of the Temple, is commended as a ſpecific Remedy for the Epilepſy: The *Heart* alſo cures the ſame Diſtemper. *Schrod. Dale.*

HOMOCHROEA, ὁμοχροια, from ὁμοῖος, ſimilar, and χρόα, the Skin, is an Equability of the Superficies, or a Smoothneſs of the exterior Habit of the Body; or of any Part thereof. *Hippocrates, de Cap. Vuln. & de Fract.*

HOMOGENES, ὁμογενὴς, from ὁμοῖος, ſimilar, and γένος, a Kind; homogeneous, or of the ſame Kind; is applied to every thing that always retains the ſame Nature, and keeps one conſtant Tenor: Thus a Fever is ſaid to be ὁμογενὴς, homogeneous, when it is continual and uniform. *Gorræus.*

HOMOLINON. Crude Flax. In medicinal Authors, it generally imports, according to *Salmaſius*, coarſe Cloth made of Flax not previouſly macerated and whiten'd, which the Antients uſed in their Baths by way of Towel.

HOMONOPAGIA. A Head-ach. *Arculanus.*

HOMONYMIA. Homonymy, or Equivocation; that is, the comprehending various Things under one Name: This has cauſed much Confuſion in the *Materia Medica.*

HOMAPLATÆ, or OMOPLATÆ. The Scapulæ, or Shoulder-blades.

HOMORUSIA. The Name of a Medicine deſcribed by *Avicenna*, and ſaid to be good for Diſorders of the Liver and Spleen, to provoke Urine, and break the Stone in the urinary Paſſages.

HOMOTONOS, ὁμότονος. Equal, equable, or proceeding in the ſame Tenor. It is an Epithet apply'd to Fevers, which proceed in the ſame Tenor from the Beginning to the End, without either Relaxation or Exaſperation.

HOMUNCULUS. See ADOLESCENS.

HOPLE, ὁπλή. The Hoof of graminivorous Animals.

HOPLITODROMOS, ὁπλιτοδρόμος, from ὅπλον, Armour, and δρόμος, to run. A Perſon who took his Exerciſes arm'd, in order to render them more violent.

HOPLOCHRISMA, ὁπλόχρισμα, from ὅπλον, Armour, and χρῖσμα, an Ointment. The Dreſſing a Weapon, or wounding Inſtrument, with a View of curing the Wound made therewith by this means.

HOPLOMOCHLION. The Name of an Inſtrument incloſing the whole Body, like Armour, of which *Fabricius ab Aquapendente* gives a Figure in his chirurgical Works.

HOPLON, ὅπλον. Beſides the common Signification of this Word, which is, a military Weapon, it imports a Cord, or Rope, in medicinal Authors.

HORA, ὥρα. Beſides the common Acceptation of this Word, it imports that Seaſon of the Year which begins about the Dog-days, when the Autumnal Fruits begin to be ripe. Hence

HORÆUS, ὡραῖος. An Epithet for Fruit; properly that which is ripe about Autumn. But it is us'd by modern Authors to expreſs any Fruits which are perfectly ripe. See ALIMENTA.

I will not be certain, if I have not inadvertently tranſlated *Fructus boræi*, *unripe Fruits*, which is an Error.

HORDEOLUM. A Diſorder of the Eye. See CHALAZA.

HORDEUM.

The Characters are;

It has a thick Spike; the Calyx, Husk, Awns, and Flower, are like thoſe of Wheat and Rye, but the Awns are rough. The Seed is ſwelling and ſharp-pointed at both Ends, and cloſely united to its Husk.

Boerhaave mentions ſeven Species of Hordeum; which are,

1. Hordeum; polyſtichum; hybernum. *C. B. P.* 22. *Theat.* 438.

2. Hordeum; polyſtichum; vernum. *C. B. P.* 22. *Theat.* 439.

3. Hordeum; diſtichon, quod Spica binos ordines habeat Plinio. *C. B. P.* 23. *Tourn. Inſt.* 513. *Boerh. Ind. A.* 2. 159. *Hordeum.* Offic. *Hordeum diſtichum.* Ger. 66. Emac. 70. J. B. 2. 429. Park. Theat. 1130. Raii Hiſt. 2. 1243. Synop. 3. 388. C. B. Theat. 440. BARLEY.

It is ſown in Fields in the Spring, and the Seeds, or Corns, are us'd. Barley is cooling and drying, abſterſive, aperitive, and digeſtive, emollient, diuretic, and nutritive. The Preparations of it is *Byne*, *ſive Malta*, *Malt*; of which is made *Ceruviſia*, *Wort*, which, boil'd with Hops, is call'd *Biera*, *Beer*; without Hops, *Ala*, *Ale*. See ALLA. See FARINA.

Barley, however prepar'd, never heats the Body, but moiſtens, or dries, according to its various Ways of Preparation. Thus, when it is boil'd, as in a Piſan, it moiſtens; when it is torrefied, as in Polenta, it dries. Barley differs from Wheat, as it generates a mild and detergent Juice; whereas that of Wheat is thick and viſcid, and has ſomewhat of an obſtruent Quality. In antient times, Bread was made of the Flour of Barley, and in Uſe among the Subjects of very rich and potent States, for Inſtance, the *Athenians*; and now, in this latter Age, Barley-loaves are ſtill prepar'd, but principally by the poorer Sort, and to ſupply a Dearth of Wheat. But, however, at preſent it is but of little Value among us, no more than it was among the *Romans* in *Pliny's* time, for making of Bread, or any thing of that Kind; but it is in general Uſe, and high Eſteem, for making of Beer; and is as neceſſary to the Northern People, on account of Drink, as Wheat is for Bread.

There

There are various Ways of preparing Barley, either as ſimple or medicinal Aliment. A Cataplaſm made of Barley-flour, and Butter, is an anodyne Remedy againſt all kinds of Pain. The Polenta of Barley, ſays *Sim. Paulli*, boil'd in Vinegar, and ſtrain'd through a Linen Cloth, frequently mitigates the intolerable Pain of the Teeth, being us'd as a Collution, or rather held for ſome time in the Mouth. A Kinſman of mine, ſays the ſame Author, labouring under moſt violent Pains of the Stone, with an intolerable Iſchury, after trying, in vain, the uſual Remedies, deſir'd my Aſſiſtance. I took as much Polenta as I thought fit, well bruis'd, and hot out of the Kettle, with an equal Quantity of Hops; and fry'd them together, with Plenty of Butter, [Oil might ſerve the turn] and made it into a Cataplaſm; which I folded in a Linen Cloth, and applied it, as hot as he could ſuffer it, to the Pecten and Perinæum. Within a Quarter of an Hour, the Patient receiv'd Relief, and was freed from his Torments, to the great Joy of his Family: And I have ſince us'd the ſame Cataplaſm on ſeveral Patients afflicted with the Stone and Dyſury, with the like happy Succeſs. *Raii Hiſt. Plant.*

Theo. Bartholine cur'd an epidemical Pleuriſy, only by a Decoction of Barley. *Ephemer. German. An.* 2. *Obſ.* 2. For Preparations of Barley, ſee PTISANA, POLENTA, MALTUM, and CEREVISIA.

4. Hordeum; diſtichum; ſpica breviore & latiore; granis confertis. *Raii Hiſt.* 1243. *Zeoccrithon*; *ſive Oryza Germanica.* C. B. P. 22. Theat. 421.

5. Hordeum; diſtichum ſpica nitida; Zea, ſeu Briza nuncupatum. See BRIZA.

6. Hordeum; ſpontaneum; ſpurium; Holcus Plinii Anguillare. *Lob. Ic.* 30.

7. Gramen Gras Montbelgardenſium. *J. B.* 1. 438. *Feſtuca, Graminea glumis hirſutis.* C. B. P. 9. Theat. 143. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 159.

Beſides the foregoing Species of Hordeum, *Dale* mentions the two following; which are,

1. *Hordeum, mundatum & perlatum.* Offic. FRENCH, and PEARL BARLEY.

What we call *French* Barley, becauſe it is uſually imported from *France*, is no other than Barley decorticated in a Mill, adapted to that Purpoſe. See Dr. *Plot*'s *Nat. Hiſt.* of *Oxfordſhire*. The beſt is what is round, white, and bright. What we call Pearl-barley, becauſe it reſembles *Scots* Pearls, is prepar'd after the ſame manner; only is twice or thrice ſubjected to the Mill, in order to be ground, and made leſs. Chuſe that which is ſmall, white, has Sprinklings of the Flour on all Sides, new, and not muſty. Some, you are to obſerve, will have Pearl-barley made of Millet, becauſe it is ſo ſmall; others, of Wheat. Both of them agree in Virtues with the common Barley, only are more nutritive.

2. *Hordeum cauſticum.* See CEVADILLA.

HORDEUM *nudum.* A Name for the *Triticum*; *ſpica Hordei Londinenſibus.*

HORIZON, in the ſpagiric Language, is the Mercury of Gold. *Rulandus.* The *Aurum horizontale*, otherwiſe called *Mercurius Corallinus*, is ſaid to be Mercury fix'd by the *Liquor Alcaheſt.* See AURUM.

HORMINUM.

The Characters are;

It reſembles the Sclarea, or Clary, in all reſpects; only the Galea is hollow, not falcated, or hooked, and ſhorter.

Boerhaave mentions fourteen Species of this Plant; which are,

1. Horminum; ſylveſtre; Lavandulæ flore. *C. B. P.* 239. *Park. Theat.* 57. *Raii Hiſt.* 545. *Synop.* 3. 237. *Tourn. Inſt.* 178. *Boerh. Ind. A.* 165. *Oculus Chriſti.* Offic. *Horminum ſylveſtre.* Ger. 628. Emac. 771. *Gallitrichis affine Maru, ſi non genus aliquod, Sclarea Hiſpanica.* J. B. 3. 313. WILD CLARY.

The Root of the wild Clary is thick and woody, not dying every Year, as the Sclarea does. The lower Leaves grow upon pretty long Foot-ſtalks, being about three Inches long, and about an Inch broad, cut into ſeveral Parts, and ſerrated about the Edges, and ſomewhat rugged and wrinkled. The Stalks are ſquare, and ſomewhat hairy; uſually leaning towards the Ground, not ſo tall as the Sclarea, having broader and ſhorter Leaves, ſet two oppoſite at a Joint, without Foot-ſtalks; ſerrated about the Edges. The Flowers grow in looſe Verticils, uſually ſix in a Whorle; they are much leſs than the Sclarea, having a ſmall Galea appearing but little above the Calyx, of a deep blue Colour. The Whorles ſtand at ſome Diſtance, having each two very ſmall Leaves ſet under it. The Calyx is pretty large, and cut into two Parts, the lower being ſlit in the Middle; and the upper divided into two Cavities, by a Partition in the Middle, and contains four pretty large oval, ſmooth, black Seeds. The Whole has a pretty ſtrong and not unpleaſant Smell. It grows frequently in gravelly Grounds, and flowers in *June* and *July*. The Seed is principally us'd.

This is ſuppoſed to have the ſame Virtues with the Sclarea, but in a lower Degree. But what this Plant is remarkable for, is the Seed, of which one, put into the Eye, will cleanſe it of any thing that is offenſive, and clear away Redneſs, Inflammations, or Specks.

It delights in a gravelly Soil, and flowers in *June*. See SCLAREA.

2. Horminum; pratenſe; flore minimo. *Schol. Bot. Pat.* 68.

3. Horminum; vernum; folio Betonicæ, flore cœruleo.

4. Horminum; foliis alatis, hirſutis; verticillis non foliofis; caule & cauliculis rubris.

5. Horminum; ſativum. *Offic. C. B. P.* 238. *Raii Hiſt.* 1. 542. *Boerh. Ind. A.* 166. *Horminum ſativum genuinum Dioſcoridis.* Park. Theat. 56. *Horminum ſylveſtre, foliis purpureis.* Ger. 628. Emac. 771. *Horminum coma purpuro-violacea.* J. B. 3. 178. Tourn. Inſt. 178. PURPLE SPIKED CLARY.

With us it is cultivated in the Gardens of the Curious, and flowers in *July*. The Seed is us'd; which, drank in Wine, is accounted a Provocative to Venery. Mix'd with Honey, it clears the Eye from white Specks, and Albugines; it extracts Splinters out of the Body. *Dioſcorides*. It ſtimulates the Nerves, and inebriates; and is of excellent Service in a Dropſy, being of a heating Quality. *Dale.*

6. Horminum; coma rubra. *J. B.* 3. 309.

7. Horminum; coma viridi. *T.* 178.

8. Horminum; Verbenæ laciniis. *Triumf.*

9. Horminum; folio querno. *Volk.*

10. Horminum; Ægyptuum; minimum; ramoſiſſimum. *Lipii.*

11. Horminum; ſativo ſimile; coma purpurea; flore vario. *H. Cath.*

12. Horminum; purpuro-violaceum; rigidius. *Suppl. alt.*

13. Horminum; minus; procumbens; folio Betonicæ.

14. Horminum; foliis alatis; flore violaceo. *Sher. Triumfett. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 165.

Beſides the foregoing Species of Horminum, *Dale* mentions the following:

Horminum ſylveſtre. Offic. *Horminum ſylveſtre latifolium.* Ger. Emac. 771. Raii Hiſt. 1. 546. *Horminum ſylveſtre latifolium verticillatum.* C. B. Pin. 238. Tourn. Inſt. 178. *Horminum Germanicum humile.* Park. Theat. 56. *Horminum Gallitricho affinis planta, Horminum ſylveſtre latifolium Cluſio.* J. B. 3. 314. WILD CLARY.

It grows in many Places of *Germany*, and flowers in *June*. The Seeds are in Uſe, which are of greater Efficacy than thoſe of the Garden-ſort.

Horminum is, alſo, a Name for ſeveral Species of SCLAREA; which ſee.

HORNUS, or HORNOTINUS. A Species of Wheat, the ſame as SETANIOS, which ſee.

HORRIDUS, or HORRIFICA. In Medicine it imports either rough, as when the Skin is rough, like that of a Gooſe; or ſhivering, or attended with Shiverings; and is an Epithet of Fevers, importing the ſame as PHRICODES.

HORROR.

We are taught by *Galen*, *Com.* 7. *in Aph.* that a *Horror* is an Affection proceeding from depraved Humours paſſing through the Skin. And, *de Sympt. Cauſ.* he tells us, "This Diſorder is an "unequal Motion, or univerſal Concuſſion, of the Skin, as is "alſo a *Rigor* of the whole Body; but theſe two Affections are "diſtinguiſhed in this, that a *Horror* is a ſlight Motion, but a "*Rigor* a great and violent one." Hence ſome juſtly make a *Horror* to be a ſmall Rigor. *Galen*, *Lib.* 2. *de Diff. Feb.* ſays, it is a Medium between a *Rigor* and a *Refrigeration.* Horrors are produced by all ſuch things as cauſe a Rigor; for, as *Galen*, *Com. in* 7 *Aph.* obſerves, *Horrors* are effected in Bathing as well by Heat as Cold, by a Concourſe of acrimonious Humours to the Skin; for, as the ſame Author tells us, *Com.* 3. *in* 6 *Epidem.* all Bodies full of bad Juices, when vehemently heated, as by a Fever, or a Phlegmon, are affected with a *Horror.* And the Author of the *Prorrhet. Lib.* 1. writes, that *Horrors* may be excited by an internal Phlegmon, eſpecially ſuch *Horrors* as are tranſient, and ſoon paſs into an Anxiety. *Galen*, *de Cauſis Sympt. Lib.* 2. *Cap.* 5. thus writes: "My Sentiments, he ſays, of this "Matter, are, that the ſame Perſon who, while at Reſt, was "only ſenſible of an Inequality, upon putting himſelf in Mo"tion, is ſeiz'd with a *Horror*; and, upon uſing Exerciſe, with a "ſhaking *Rigor*." And, a little after, he ſays, "We know ſome, "who, labouring under Crudities, were eaſy while they were "at Reſt; but, after they had enter'd the Bath, or ſtood in the "Sun, by heating, rarefying, and converting into Spirits, the "excrementitious Parts, which before remained quiet, have raiſ"ed a Commotion, in the ſame manner as Anger is excited "and kindled by the Paſſions." When thoſe excrementitious Parts, as being either bilious or pituitous, contract an Acrimony, as it uſually happens from an extraordinary Putrefaction, they are put in Motion, and, being tranſmitted to the Skin, are there the Cauſe of an *Horror.* Having thus given the Definition and Cauſes of a *Horror*, we are now to ſhew what may be predicted from them.

Firſt, then, *Horrors* are never good when they ſucceed continual Fevers, thoſe excepted, which are themſelves ſucceeded by an Intermiſſion of continual Fevers; for they are good: As, for Inſtance, when a *Coldneſs*, *Horror*, or *Rigor*, ſeizes the

Patient under a burning Fever, at the time when the Paroxyſm is expected; for they are Signs, that Nature is very ſtrong, and expels the vitious Humours from the Veins. Good critical *Horrors* are alſo very ſalutary, appearing when the Diſeaſe is, in ſome meaſure, concocted, and ſucceeded by ſome good Evacuation or Purgation. Of this Nature was that obſerv'd by *Hippocrates* of the Virgin of *Lariſſa*, 3 *Epid. Sect.* 3. *Ægr.* 12. of whom he ſays, "On the ſixth Day much Blood came from "her Noſe; ſhe was ſeiz'd with a *Horror*, and immediately "after with a copious and hot Sweat over all the Body, at-"tended with a Criſis, upon which the Fever left her." When Signs of Concoction, therefore, appear, together with other critical Signs, if a *Horror* ſeizes the Patient, it is a good Sign; for it uſually precedes critical Evacuations and Purgations. To this Purpoſe the Author of the *Coac. Prænot.* writes, that "Pa-"tients under a *Horror*, Anxiety, and Laſſitude, attended with "a Pain in the Loins, are ſubject to a Flux of the Belly." Such *Horrors*, in our Opinion, are no Signs of a Hæmorrhage in particular, but of a critical Perturbation in general, according to the Obſervation of the Author of the *Prorrhetica*, 149. "If "critical Sweats, he ſays, ſucceed an *Horror*, and this *Horror* "returns the next Day upon the Patient, with unaccountable "Want of Sleep, expect an Hæmorrhage from the Noſtrils." But this is an uncertain Prediction, as *Galen* affirms in his Commentary on the Place. A *Horror*, therefore, is good only when ſucceeded by ſome Intermiſſion of a continual Fever, or when it is a good critical Sign.

Bad Horrors are ſuch as ſucceed an Empyema, or Tabes, bad critical ones, and ſuch as happen in the Beginning of peſtilential Diſtempers; which laſt are owing to a very great Depravation of the Humours, and a Weakneſs of Nature, which makes Efforts to move the Humours, but finds itſelf too feeble; which more plainly appears to be the Caſe, when the Patient, after an Horror, recovers but little Heat. Such was the Caſe of thoſe, of whom *Hippocrates* ſpeaks, 3 *Epid. Sect.* 3. who laboured under peſtilential Fevers; "they were ſeiz'd, he ſays, "with a *Horror*, and were delirious a little before Death." The ſame was particularly obſerv'd of *Crito*, who died the third Day of a peſtilential Tumor. 1 *Epid. Sect.* 3. *Ægr.* 9. "He "took his Bed, ſays *Hippocrates*, the ſame Day, [he was ſeiz'd "with a violent Pain in his great Toe] being afflicted with "a Horror, Nauſea, and could get but little Heat." This was alſo the Caſe of *Ariſtocrates*, 7 *Epid. Text* 52. who was ſeiz'd with an *Horror*, and dy'd the third Day of a peſtilential Carbuncle.

Bad critical *Horrors* are, according to *Galen*, ſuch as are dubious and difficult to be determin'd, or deadly: Such is that, 7 *Aph.* 4. where a Horror, ſucceeding a Sweat, is pronounced not beneficial; and the Author of 1 *Prorrhet.* 83. tells us, that "a Pain in the Loins, tranſlated upon the Stomach, and accom-"panied with a Fever, Horror, and Vomiting of much thin "and aqueous Matter, a Delirium, and Loſs of Voice, ends, "at laſt, in black Vomitings and Death." Again, *Coac.* 8. "Frequent Horrors of the Back, which are ſoon tranſient, "ſhew the Strength of the Diſorder." Hence it appears, that *Horrors*, ſucceeding bad and deſtructive Vomitings, are of the bad critical Kind; which, as *Galen* obſerves, *Com. in* 7 *Aph.* 4. either import a difficult *Criſis*, that is, when not attended with mortal Symptoms; or fatal, when ſome mortal Sign attends them. In the *Coac. Præſag.* juſt quoted, it is ſaid, that thoſe *Horrors* are of a dubious Nature, which frequently recur, and ſoon paſs off; which, in 1 *Prorrhet.* 75. is thus expreſs'd: "Fre-"quent *Horrors* from the Back, which are ſoon tranſient, are "difficult to be ſupported, and indicate a painful Suppreſſion "of the Urine." The ſame is ſtill more explicitly and juſtly declared in the *Coac. Præſag.* above cited; where we read, "that "ſuch *Horrors* are difficult to be ſupported, as indicating a Sup-"preſſion of Urine, and the Strength of the Diſeaſe; but a "thin or cold Sweat ſupervening, is a very bad Sign." Of theſe fatal *Horrors Hippocrates* ſpeaks, 3 *Epid. Sect.* 3. "All "theſe [*Sorts of Fevers*] he there ſays, were attended with great "Perturbations: Many were diſturb'd in the Belly, had Horrors, "with Sweats not critical, and Urine more in Quantity than "what was drank, and not thick, or ſhewing any Signs of Con-"coction." Such were the *Horrors* obſerv'd in the Woman who lay ill at the cold Springs in *Thaſos*; and of this Kind are the bad critical Horrors, which, with mortal Signs, always portend Death.

In the laſt Place, there are bad *Horrors*, which are not removed by a Fever, but are accompanied with very bad Evacuations, of which we read, *Coac.* 36. where it is ſaid, that "they "who labour under a Laſſitude, with a *Horror*, and a Sweat, in "manner of a Criſis, and a ſudden Return of Heat, are in a "bad State; and the more, if, beſides theſe Symptoms, Blood "alſo diſtils from the Noſe." Frequent *Horrors* are Indications of a Tabes; for we find, they were common Attendants of that extraordinary and mortal Tabes, deſcrib'd by *Hippocrates*, 3 *Epid. Sect.* 3. where he ſays, "the Patients were ſeiz'd with a Horror "and Delirium juſt before their Death." However, frequent *Horrors* are not of themſelves ſufficient to indicate a Tabes, without the Concurrence of ſome other Signs; ſuch as a Difficulty of Breathing, and a conſtant Fever, which is exaſperated at Night, with Sweats, a Deſire of Coughing, a Pain, and other Signs, by which *Hippocrates*, *Lib. Prognoſt.* teaches us how to know thoſe who labour under an Empyema. But, in a continual Fever, attended with an inward Phlegmon, or a Putrefaction of Matter in the Lungs, many, frequent, and irregular Horrors, with a Pain, and Difficulty of Reſpiration, always indicate a Suppuration or Purulence; and this ſeems to be the Sentiment of the Author of *Coac.* 17. where he ſays, "that frequent *Horrors*, and Difficulty "of Breathing, under Pains, indicate a Tabes," as they are Signs of Pus, and a future Tabes from thence. For, if a malignant Hæmoptoe, or where the Humours in the Lungs, or an Inflammation, is converted into a Suppuration, there are always *Horrors*, and a Cough, which are excited from an Irritation of the Membranes of the Lungs or Thorax, by the Acrimony of the putrid Humour. *Proſper Alpinus de Præſag. Vit. & Mort.*

HORTULANUS, named alſo *Melharia* and *Cyncramus*, the Ortolan: It is a Bird little leſs than a Lark, very fat, and of different Colours; the Beak and Legs are inclined to red. It feeds upon ſeveral Sorts of Seeds, but prefers Millet, which fattens it moſt. It is found in warm Countries, ſuch as *Provence*, *Dauphiny*, *Languedoc*, and *Italy*. The Fleſh is tender, delicious, juicy, and of an exquiſite Taſte; and, as it has but few viſcous and groſs Humours, but abounds with oily and balſamic Juices, and volatile Salts, ſo it is reckon'd a Reſtorative, Strengthener, and Nouriſher; increaſes the ſeminal Fluid, is eaſy of Digeſtion, produces good Juice, and is ſuppoſed to promote the Menſes. Its Fat is of a lenifying, diſſolving, and ſoftening Quality.

HORTUS. The Female genital Organs are thus call'd.

HOTTONIA, *Water-violet*.

The Characters are;

It hath a Roſe-ſhaped Flower, conſiſting of one Leaf, which is divided into five Parts, almoſt to the Bottom; in the Centre of the Flower ariſes the Pointal, which afterwards becomes a cylindrical Fruit, in which are contained ſeveral ſpherical Seeds.

We have but one Sort of this Plant; which is,

Hottonia. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 206. WATER-VIOLET.

This Plant is very common in deep ſtanding Waters and Ditches, in ſeveral Parts of *England*. The Leaves of this Plant appear on the Surface of the Water the Beginning of *April*; and, in *May*, the Flowers appear on pretty long naked Stalks, growing in a Spike. Theſe Flowers are of a fine Roſe-colour, which, together with their fine-cut Leaves, make a beautiful Appearance on the Water. *Miller's Dictionary*, *Vol.* 2.

There are no medicinal Virtues attributed to this Plant, that I know of.

HOXOCOQUAMOCLIT. A Name for the *Sena, orientalis, fruticoſa, Sophera dicta*.

HUART. The Name of a beautiful aquatic Fowl, found in *Canada*. The Fat is ſaid to be reſolutive, emollient, and good to fortify the Nerves.

HUCHA. The Name of a Fiſh, called alſo *Trutta fluviatilis altera*.

HUCIPOCHOTL, *Huaxacenſis, ſeu Ricinus Novæ Hiſpaniæ*. Hernandez.

It is deſcribed by *Hernandez* as a Shrub, creeping like Vines, and bearing a Fruit nearly reſembling a Haſle-nut, but incloſing three Kernels, after the manner of the *Ricinus*.

The diſtilled Liquor reſtores the decay'd Strength in ſuch an effectual Manner, that they ſay it will raiſe the Patient, tho' almoſt at the Point of Death. The ſame is cooling and fattening, and the very Leaves of the Tree, eaten as Greens, work the ſame Effects, and cauſe a good Colour. The Tears, which diſtil from the broken young Shoots, are an admirable Remedy for an Inflammation of the Eyes. Five of the Kernels, or ſeven, if the Patient be robuſt, cleanſed from a certain Membrane, which covers them, are an excellent Evacuant of Phlegm and Bile, both upwards and downwards, and in ſo ſafe a Manner, that the Working of it, if convenient, may be reſtrained by the ſlighteſt Thing taken for that Purpoſe.

HUMECTANTIA. Moiſtening Remedies. And

HUMECTATIO. Humectation. Theſe are already explained under the Article FIBRA.

HUMERUS, in Anatomy, is the large Bone of the Arm, articulated at one End to the *Scapula*, and at the other to the *Ulna* and *Radius*. See BRACHIUM.

The principal Bandages, adapted to Diſorders of the *Humerus*, are ſpecified under the Article FASCIA.

HUMIDUM ſometimes implies the ſame as *Humor*.

HUMILIS *Muſculus*, is the ſame as Deprimens Oculum, or *Depreſſor Oculi*. See OCULUS.

HUMMATU. See NILA.

HUMOR. A general Name for any Fluid. The Antients ſeem to have call'd the nutritious Juices the *Radical Humor*; and to have conſtituted, as a Cauſe of Diſeaſes, a Diſproportion betwixt the *innate Heat*, and *Radical Moiſture*.

HUMORISTA, a Name of Ridicule, beſtow'd by *Helmont* on the Phyſicians of the *Galenic* Sect. *Caſtellus*.

HUNC, *Hucci*. Jupiter, or Tin. *Rulandus*.

HURA. *The Sand-box-tree*.

The Characters are;

It hath a Funnel-ſhaped Flower, conſiſting of one Leaf, which is ſpread open at the Brim, and ſlightly cut into twelve Parts: At the Bottom of the Tube is placed the Pointal, which, afterwards, becomes a globular compreſſed Fruit, which has twelve Cells, in each of which is contained one roundiſh flat Seed.

We know but one Sort of this Plant; which is

Hura Americana, Abutili Indici folio, *H. Amſt.* AMERICAN HURA, *with a* Leaf like the *Indian Abutilon*. This is ſometimes called *Jamaica Walnuts*, and the *Sand-box-tree*; and, by others, *Warnelia* and *Havelia*.

This Shrub is a Native of the *Spaniſh Weſt-Indies*, from whence the Seeds have been brought into ſeveral Iſlands in the *Weſt-Indies*, where the Inhabitants cultivate theſe Plants in their Gardens, by way of Curioſity. It ariſes to the Height of fourteen or ſixteen Feet, and divides towards the Top into ſeveral Branches, which are adorned with large Leaves, indented on their Edges, and terminating in a Point. Theſe Leaves, as alſo the younger Branches, are of a deep-green Colour, and are full of a milky Juice, which iſſues out on their being broken or bruiſed. The Fruit of this Plant, if ſuffer'd to remain on till they are fully ripe, burſt in the Heat of the Day with a violent Exploſion, making a Noiſe like the Firing off a Piſtol; and hereby the Seeds are thrown to a conſiderable Diſtance. Theſe Seeds, when green, vomit and purge, and are ſuppoſed to be ſomewhat akin to the *Nux Vomica*.

The Fruit of this Plant is, by the Inhabitants of the *Weſt-Indies*, cut open on the Side where the Foot-ſtalk grew, and the Seeds carefully taken out; and the Shells are uſed as a Standiſh, to contain Sand for Writing; which gave Riſe to the Name of Sand-box-tree. *Miller's Dictionary, Vol. 2.*

HUSSO. A large cetaceous Fiſh, the *Mario* of *Pliny*, and almoſt peculiar to the *Danube*, where it comes from the Sea, for the ſake of freſh Water. It is ſometimes found four-and-twenty Feet in Length, and four hundred Pounds in Weight. This Fiſh is wholly cartilaginous, and void of Bones, except in the Head, and has no Scales. It produces the *Ichthyocolla*. *Schroder*.

HYACINTHUS.

The Characters are;

The Root is bulbous; the Leaves are long and narrow; the Stalk is erect, naked, and bears its Flowers on a Spike, which reſembles that of the Caryophyllus aromaticus: The Flower is hermaphrodite, naked, monopetalous, tubulated, and divided into ſix Segments, which are reflected outwards; it is ſhaped like that of the Caryophyllus aromaticus, cloſely embraces the Ovary, and is furniſh'd with ſix Stamina: The Fruit is roundiſh, and almoſt triangular: The Seeds roundiſh, or flat. *Boerhaave, Index alter, Pars 2. p. 111.*

Boerhaave mentions fifty-eight Species of this Plant; none of which have any medicinal Virtues attributed to them, except the firſt; which is thus diſtinguiſh'd.

Hyacinthus; oblongo flore, cœruleus; major. *C. B. P.* 43. *Tourn. Inſt.* 344. *Boerh. Ind. A.* 2. 111. *Hyacinthus.* Offic. *Hyacinthus Anglicus.* Ger. 99. Emac. 111. Raii Hiſt. 2. 1159. Synop. 3. 373. *Hyacinthus Anglicus ſive Belgicus.* J. B. 2. 585. *Hyacinthus Anglicus, Belgicus, vel Hiſpanicus.* Park. Parad. 122. HAREBELLS.

This Hyacinth has a round white bulbous Root, about as big as an Olive; from which ſpring ſeveral long, narrow, and thickiſh green Leaves; among which ariſes a long, ſmooth, brittle, round Stalk, eight or nine Inches high, bearing a Spike of ſix or ſeven long, round, ſweet-ſmelling Flowers, of a deep-blue or purple Colour, ſomewhat hollow, and turning back their Brims; the whole Spike hanging down its Head. When the Flowers are paſt, there come roundiſh Seed-veſſels, containing black corner'd Seed. It grows every-where in Woods, Hedges, and Thickets; and flowers in *May*.

The Roots are the only Parts uſed, and that but very rarely; tho' ſome Authors affirm, that they are good to ſtop all kinds of Fluxes, and that they are diuretic. *Miller's Bot. Off.*

Galen recommends it for the Jaundice.

HYACINTHUS is alſo a Name given to ſeveral Sorts of MUSCARI; which ſee.

HYACINTHUS STELLATUS.

The Characters are;

The Flower is hexapetalous, expanded after the manner of the *Ornithogalus*, with narrow Stamina; the Fruit is roundiſh, like that of the *Ornithogalus*; the Root is bulbous; and the Plant has the Leaf and Appearance of the *Hyacinthus*. *Boerhaave, Index alter, Part 2. p. 116.*

Boerhaave mentions eleven Species of this Plant; none of which have any medicinal Virtue attributed to them, except that the Bulbs of all the Species are reckon'd poiſonous, and produce exceſſive Vomitings.

HYACINTHUS TUBEROSUS.

The Characters are;

The Root is tuberous; the Stalk erect, and ſurrounded, at Intervals, with foliaceous Vaginæ, or Sheaths; the Flowers are more like thoſe of the Lily, and much larger than thoſe of the bulbous Hyacinth.

Boerhaave mentions two Species of this Plant; which are,

1. Hyacinthus; Indicus; tuberoſus; flore Hyacinthi Orientalis. *C. B. P.* 47.

2. Hyacinthus; Indicus; tuberoſus; flore pleno. *Boerh. Ind. alt. Vol. 2. p.* 111.

Neither of theſe have any medicinal Virtues attributed to them at preſent, that I know of.

HYACINTHUS is alſo the Name of a Stone; which is thus diſtinguiſh'd by Authors.

Hyacinthus. Offic. Charlt. Foſſ. 38. Kentm. 30. Mont. Exot. 14. Schrod. 328. Aldrov. Muſ. Metall. 962. Schw. 381. Worm. 104. De Laet. 27. Boet. 159. Geoff. Prælect. 79. THE JACINTH.

The Hyacinth is ſo called from its Reſemblance to the Plant of that Name, in its yelloviſh-red Colour, of which there being ſeveral Degrees, the different Kinds of it are taken from thence: Some are of the Colour of red Lead, or bilious Blood; ſome of Saffron; ſome of yellow Amber, which are the leaſt eſteem'd. Hyacinths are diſtinguiſh'd into Oriental, which are brought from the *Eaſt-Indies*; and Occidental, which come from *Sileſia*, *Bohemia*, *Auvergne* in *France*, and other Places: Theſe Hyacinths ſeem to be different from that mention'd by the Antients, eſpecially by *Pliny*, which was of a ſhining Violet-colour, like the Amethyſt, tho' not ſo ſtrong. Many ſuperſtitious Virtues have been aſcribed to this Stone: They ſaid it was of a cold Nature; that it ſtrengthens the Heart, is gently aſtringent, and procures Sleep. *Schroder* reckons it a great Specific againſt Spaſms and Contractions: It is an Ingredient in the *Electuarium de Gemmis*, together with the other precious Fragments, as they are called; and it gives its Name to the famous *Confectio de Hyacintho*. *Geoffrey*.

This Gem is ſometimes imitated with Glaſs of Lead; but the true Stone is eaſily diſtinguiſh'd from the adulterated, by the Weight and Hardneſs.

CONFECTIO DE HYACINTHO.

Take of the Fragments of Hyacinth, red Coral, Bole Armoniac, and ſeal'd Earth, of each half an Ounce; Grains of Kermes, Tormentil-root, and Dittany, Seeds of Citrons, Sorrel, Purſlain, Saffron, Myrrh, red Roſes, all the Kinds of Saunders, the Bone of a Stag's Heart, Shavings of Hartſhorn and Ivory, of each four Scruples; Sapphire, Emerald, Topaz, Pearls, Leaves of Gold and Silver, of each two Scruples; Camphire, Musk, and Ambergriſe, of each five Grains; Syrup of Lemons, as much as is ſufficient to make it according to Art.

HYÆNA, ὕαινα, an Hyæna. It is not certain what was the Animal meant by the Antients, under this Name; ſome taking it for a Quadruped, and ſo make it a kind of Wolf, or Cat, or Civet-cat; and others will have it to be a Fiſh. Whatever it was, the antient Writers aſcribed great Virtues to it: Thus *Pliny, Lib.* 28. *Cap.* 8. ſays, that the Fleſh of the *Hyæna* eaten, but, eſpecially, the Liver, is of great Efficacy againſt the Bite of a mad Dog; that the Fat rubbed on the Wound, and the Skin ſpread under the Patient, are an effectual Relief in ſuch an Exigence. *Scribonius Largus*, Nº 171, 172. relates, that, being inform'd, that there was an old Barbarian in the Iſland of *Crete*, who had been caſt there by Shipwreck, and receiv'd a Salary from the Government; and that he cured all who were bitten by mad Dogs, tho' affected with an Hydrophobia, and tho' they barked, and were ſeized with Spaſms, only by tying ſomething to their Left Arm; he had the Curioſity to inquire concerning the Matter, of *Zopyrus*, a Phyſician of *Gordium*, who was ſent on a Deputation from the States of that Iſland, and was entertain'd at his Houſe. He frankly told me, ſays *Scribonius*, as the beſt Return he could make for the Civilities he had received, that this wonderful Secret was nothing but a Piece of an Hyæna's Skin, tied up in a Cloth. I never yet had the Opportunity to try it, he ſays, and wiſh I never may; tho' I took care to provide myſelf, immediately, with an Hyæna's Skin, againſt ſuch an Exigence. Agreeably to this Relation of *Scribonius*, we are adviſed by *Ætius, Tetrab.* 1. *Serm.* 2. *Cap.* 162. to keep an Hyæna's Skin by us, that, whenever a Perſon happens to be bit by a mad Dog, we may tie it about him; becauſe, ſays he, it has a Property of preventing an Hydrophobia, and even relieves thoſe who are affected with that deplorable Symptom.

Of all Animals, ſays *Pliny*, the Hyæna was moſt celebrated and admired among the Magicians, as being itſelf endu'd with a Power of exerciſing magic Arts, as they pretended, and alluring infatuated Perſons within its Reach. The Skin of the Head, bound on the Part, cures the Head-ach: The Gall, rub'd on the Forehead, cures Lippitude; and the Decoction thereof, with three Cyathi of *Attic* Honey, and an Ounce of Saffron, prevents the leaſt Diſorder of that Nature, and removes all

Dimneſs

Dimneſs and Cataracts, Albugo, Aſperities, Excreſcences, and Cicatrices of the Eyes. The Sanies of the recent Liver, which diſtils upon broiling, cures the Glaucoma, being rubbed on the Place with clarified Honey: The Teeth cure the Tooth-ach, with a Touch, or being orderly faſten'd to the Parts: The Shoulders eaſe Pains of the Arms and Shoulders: The Teeth, taken from the Left Side of the Mouth, and bound to the Face, in the Skin of a Sheep or Goat, cure the racking Pains of the Stomach: The Lungs, eaten, cure the Colic: The Aſhes, with Oil, are a Remedy for ſtomachic Diſorders; being anointed on the Part: The Marrow of the Back, with old Oil and Gall, cures Diſtempers of the Nerves: The Liver cures Quartan Agues, being eaten thrice before the Fit: The Aſhes of the Spine, with the Tongue and Right Foot of a Sea-calf, and Bull's Gall, all boiled together, and ſpread on the Skin of the *Hyæna*, remove the Gout; the Gall, with the *Aſian* Stone, has the ſame Effect: They who are affected with Trembling, Spaſms, Twitchings, and Palpitation of the Heart, are to eat a Piece of the Heart; ſo as that the reſt of it be burnt to Aſhes, and made into a Litus, with the Brain of the Animal: The ſame is a good *Pſilothrum*, uſed alone, or with the Gall; the Hairs being firſt pulled out, from where you deſign none ſhall grow; and it ſerves to exterminate ſuperfluous Hairs in the Eyelids: The Fleſh of the Loins eaten, and anointed upon the Part with Oil, eaſes Pains of the Loins: The Eye, eaten with Liquorice and Dill, helps Barrenneſs, and promiſes Conception in three Days: One of the great Teeth, tied up in Linen, is ſaid to be a Remedy againſt nocturnal Fears, and Terrors of Ghoſts and Apparitions; and Maniacs are order'd to be ſuffumigated with the ſame, and to have it tied to the Breaſt, together with the Fat of the Kidneys, or with the Liver, or the Skin: The firſt of the Vertebræ of the Spine, called *Atlantia*, is accounted a Remedy for the Epilepſy: The Fat kindled is ſaid to drive away Serpents; and Part of the Jaw bruiſed with Aniſe, and eaten in Food, is ſaid to remove a Horror; the ſame uſed in Suffumigation, they ſay, provokes the Menſes. Thus far *Pliny*; who ſpeaks of many more ſurpriſing Effects aſcrib'd to this Animal; but, as they principally depend on ſome ſuperſtitious Obſervances in the Preparation or Application, we chuſe to omit them.

It is moſt certain, that the Hyæna is not the Zibetta, or Civet-cat; but is more likely, from the Sound of the Name, to be what they call *Ginetta*, *Genetta*, which is an Animal common enough in *Spain*, and agrees with the *Hyæna* in its Spots, and many other things, and is a Species of Wolf. The Antients wrote *Hyæna*, whence, by a way of forming Diminutives uſual in modern Languages, came the Words *Hyænetta* and *Jenetta*, like *Hyacinthus* and *Jacinthus*; thus are form'd *Capſetta* and *Tabuletta*, and Multitudes of others. So that the *Hyæna* may be the *Genetta* by its Spots, and ſome other things; but whether they agree in all, let others inquire; for I determine nothing. *Salmaſius*, *Plin. Exercit.*

Bellonius is miſtaken in aſſerting the *Hyæna* of the Antients to be the *Zibetta*; for they are nothing alike. The Hyæna is a Species of Wolf, the Zibetta rather of the Cat-kind. The *Arabians* ſo call this latter, which *Nicetas* call ζαπήτης (*Zapetes*); and the Ointment prepar'd of it, ζαπήτιον (*Zapetion*). Some ſay, the *Arabians* call the Hyæna *Adib*; but it is certainly of the Wolf-kind. Others tell you, that the *Arabic* Word for the Hyæna is *Dahab*; and *Bellunenſis* writes, that the *Dahab*, or *Dabha*, is an Animal between a Dog and a Wolf, which devours Carcaſes, and is very common in *Syria*; this muſt be underſtood of the Hyæna. The ſame Author writes, that the *Adenant*, that is, the *Babus*, is an Animal like a Dog, which barks by Night, and feeds upon Carcaſes, and is frequently found in *Syria*, between *Damaſcus* and *Berytus*; and this too ſeems to be ſpoken of the *Hyæna*; for *Pliny* relates of the Hyæna, that it is the only Animal which digs up the Graves in Search of Carcaſes. Some ſay, that the *Arabians* call a Wolf by this Name. It is hardly credible, that the *Hyæna*, being ſo noted a Beaſt among the Antients, ſhould not, among other Properties, have been diſtinguiſhed by them, for its extraordinary Scent, if it were the *Zibetta*; and there is nothing weaker than to argue from the Silence of the Antients concerning the *Zibetta*, that therefore the *Hyæna* is the *Zibetta*; for neither have they ſaid any thing about the *Muſcus*, or Animal from whence Musk is taken: Does it therefore follow, that the Muſcus is the Hyæna? *Salmaſius*, *Plin. Exercit.*

HYALODES, ὑαλώδης, from ὕαλος, Glaſs, vitreous or glaſſy, in *Coac. T.* 150. is an Epithet applied to οὖρον, Urine, which depoſits much vitreous, cold, white, viſcid Phlegm, and indicates a favourable Criſis in Diſeaſes proceeding from crude Humours of this Kind, being reckon'd among the Cauſes, as well as Signs, of a Solution. The ſame Author ſeems afterwards to apply the Word γονωδὲς, (*Gonoeides*) to the ſame ſort of Urine, and to uſe it as *Hippocrates* does in ſeveral Places, to ſignify much vitreous and groſs Phlegm of the Colour and Conſiſtence of the *Semen genitale*. And *Galen*, *Com.* 2. *in* 6 *Epid.* explains γονωδὲς οὖρον, to be Urine depoſiting much vitreous Humour.

HYALOIDES, ὑαλοειδὴς, from ὕαλος, Glaſs, and εἶδος, a Reſemblance, is an Epithet of the vitreous Humour of the Eye.

HYANCHE, ὕαγχη, from ὗς, a Swine. A Quinſey, accompanied with an external Tumor on each Side of the Throat, is called by this Name, according to *Cœlius Aurelianus*, *L.* 3. *Acut. C.* 1.

HYARITH. Luna. *Rulandus*. I ſuppoſe he means Silver.

HYBOMA, ὕβωμα. Gibboſity.

HYBOUCOUHU *Americanus*, *itemque* CARAMENO *fructus iiſdem*. Theveti. J. B.

This is an *American* Fruit, of the Figure and Size of the Date, but is not eatable; they expreſs from it an Oil, which they keep in a Veſſel made of the Shell of a Fruit, called *Caramena*, in the *Indian* Language.

This Oil is principally uſed for a Diſtemper common in *America*, called *Tom*, which ſeems to be the ſame as the Chigres; a Collection of very ſmall Worms, in the fleſhy Parts, cauſing a Tumor about the Size of a Bean. This Oil is alſo uſed to fortify the Limbs when fatigued, and to heal Wounds and Ulcers. *Lemery des Drogues*.

HYDARTHROS. A ſort of clear Ichor, which flows from the Joints when wounded, or ulcerated. The Farriers call it Joint-water. It is derived from ὕδωρ, Water, and ἄρθρον, a Joint. See GANGRÆNA.

HYDATINON, ὑδάτινον. The Name of a *Collyrium*, made principally of Rain-water, mention'd by *Galen*, in his Commentary upon the ſixth Book of *Hippocrates*'s Epidemics.

HYDATIS, ὑδατὶς, is a little tranſparent Veſicle, or Bladder full of Water, which is ſometimes found ſolitary, and ſometimes in Cluſters, upon the Liver, and various other Parts, eſpecially in hydropical Conſtitutions.

But *Hydatis*, in a particular Senſe, is a Diſorder of the Eye-lid, called alſo *Aquula*, of which *Paulus Ægineta* gives the following Account: The *Hydatis*, he ſays, is a preternatural pinguious Subſtance, ſeated under the Skin of the Eye-lid. In ſome Subjects, and eſpecially in Children, as abounding with Moiſture, it increaſes ſo as to become the Cauſe of many Symptoms, oppreſſing the Eye, and by that means inducing Rheums. In this Diſorder the Eye-lids appear watry, under the very Eye-brows, and are incapable of a due Elevation; and, if compreſſed with the Fingers, ſeparate; the Space between them is inflated; the Patient is infeſted with Defluxions, principally in the Morning, and is not able to behold the Splendor of the Sun without Tears, and is alſo ſubject to a continual Lippitude.

The Patient, in this Caſe, being placed in a right Poſture, we compreſs the Eye-lid with two Fingers, the fore Finger, and the middle Finger, a little ſeparated, that there may be ſome Collection of Water between them; we then order an Attendant, who ſtands behind, and ſupports the Head, gently to extend the Eye-lid, near the Middle of the Eye-brow; then, with a Lancet, we make a tranſverſe Inciſion in the Middle, no larger than we uſe in opening a Vein, but deep enough to divide the whole Skin, and even to touch the *Hydatis*, proceeding with much Care and Caution; for many, by carrying the Inſtrument too deep, have divided the Cornea Tunica, or, at leaſt, have wounded the Muſcle of the Eye-lid. If the *Hydatis*, therefore, immediately offers itſelf to Sight, we are to extract it; if not, we are gently to divide farther. Having open'd the Hydatis, we take hold of it with our Fingers, in ſoft Linen; and after moving it this way, and that way, and ſometimes turning it round, extract it. After Extraction we apply a doubled Linen Cloth, dipt in *Poſca*, to the Wound, and bind it up. Some, with the Head of a Probe, introduce pounded Salt into the Section, in order to conſume what may poſſibly be left of the Hydatis. When the Dreſſing is taken off, if no Inflammation appears, the Place is to be healed with ſome Collyrium, that is commonly uſed to anoint the Eye, or with *Lycium*, or *Glaucium*, or Saffron. *P. Æginetæ*, *Lib.* 6. *Cap.* 14.

St. Yves informs us, that there ſometimes comes on the Edge of the Cartilages of the Eyelids, or on the Conjunctiva, an Elevation, like the Bladders which appear on the Skin after Burns. They are as big as a Pea, or a Lentil, are fill'd with a very clear Liquor, and have the Name of Hydatides, from the Lymph which they contain. Sometimes a Seroſity is extravaſated between the Conjunctiva, and the Membrane which covers it; it ſeparates theſe Membranes, and, in the Movement of the Eye, a Sort of Wrinkle appears; which ſhews, that a Seroſity ſtagnates between theſe Membranes, and produces this Swelling. This Diſeaſe is not at all dangerous; it is only a little troubleſome, when it ſeizes only Part of the Conjunctiva, or the Edge of the Eye-lid. The ſureſt Remedy is to prick it dexterouſly with the Point of a Lancet, and to lay it open, according to the longitudinal Direction of the Tumor; the little Purſe immediately diſcharges its Humour, and the Cure, without any other Remedy, ſucceeds.

When all the Circumference of the Globe is filled with Water, the Conjunctiva becomes red: In this Caſe, the Patient muſt be let Blood. When the Seroſity ſeems to diminiſh, let him be purged, and apply to his Eye a Collyrium, compoſed with a Dram of the Lapis Medicamentoſus Crollii, diſſolved in half a Pint of common Water; or elſe you may make uſe of Wine, in which red Roſes, Sage, Thyme, and Wormwood, have been boiled.

Lime-

Lime-water is likewiſe very good. By theſe means, this Collection of Seroſity is ſoon diſperſed. *St. Yves.*

HYDATISMUS, ὑδατισμός. The Noiſe, or Sound made by the Humours contain'd in external Abſceſſes or Vomicas, as it fluctuates.

HYDATOCHOLOS, ὑδατόχολος. An Epithet ſometimes apply'd to Stools, which are very liquid, and bilious.

HYDATODES, ὑδατώδης, or HYDATOIDES, ὑδατοειδής, from ὕδωρ, Water. Watery. It is an Epithet for Wine very much diluted; for limpid Urine; for the aqueous Humour of the Eye; and for a Perſon labouring under an *Anaſarca*.

HYDEROS, ὕδερος. A general Name for the Dropſy. But, by *Galen*, it is apply'd particularly to the *Anaſarca*. Ὑδερος πρὸς ἀμίδα is the ſame as *Hydrops ad Matulam*; that is, a *Diabetes*.

HYDNON, ὕδνον. *Dioſcorides, Lib.* 2. *Cap.* 175. ſays it is a round Root, without either Leaves or Stalks, and yellow: It is, he ſays, dug up in the Spring, and good to eat either raw, or boiled. The Interpreters tranſlate the Word by *Tuber*. It ſhould ſeem to be the Truffle.

HYDRA. The Name of a certain venomous Serpent, mentioned by *Aldrovandus*.

HYDRAGOGOS, ὑδραγωγὸς, from ὕδωρ, Water, and ἄγω, to bring away. Hydragogue. Remedies which evacuate a large Quantity of Water in Dropſies are thus called. In *Hippocrates, Epidem. Lib.* 7. it imports a Perſon grown hydropical, from drinking too large a Quantity of Water.

HYDRARGYROSIS. Mercurial Unction, with a View of exciting a Salivation.

HYDRARGYRUM. Quick-ſilver. See MERCURIUS.

HYDRARTHROS. See HYDARTHROS.

HYDRELÆUM, ὑδρέλαιον. A Mixture of Oil and Water. It is, by *Galen*, eſteem'd refrigerating.

HYDRENTEROCELE, or rather, HYDRO-ENTEROCELE, from ὕδωρ, Water, ἔντερον, an Inteſtine, and κήλη, a Tumor. A Dropſy of the Scrotum, complicated with a Deſcent of the Inteſtine. See HERNIA.

HYDROA. See HIDROA, and SUDAMINA.

HYDROCARDIA. A Word coin'd by *Hildanus*, to expreſs a ſerous, ſanious, or purulent Tumor of the Pericardium.

HYDROCELE, ὑδροκήλη, from ὕδωρ, Water, and κήλη, a Tumor. A Dropſy of the Scrotum. See HERNIA.

HYDROCEPHALUS, from ὕδωρ, Water, and κεφαλὴ, the Head.

An Hydrocephalus is a preternatural Tumor of the Head, ariſing from a certain preternatural Lymph. It is term'd internal, when the Water is collected within the Bones of the Cranium; external, when retain'd between the Skin and Cranium. The firſt Kind is rarely ſeen, but in new-born Infants; and is contracted either in the Womb, or during a difficult Birth. Among others, the Reader may conſult *Wedelius, de Morb. Infantum*, and *Ruyſch. in Theſaur. Anat.* 2. *Tab.* III. which laſt has given us a very ample Account of this Diſeaſe. Theſe Infants are generally in great Danger, and that increaſes in proportion to the Diſorder, which is often found incurable; for, upon an Inciſion, the Lymph is no ſooner diſcharged, than the Infant dies, as Experience has too often convinced us. If the Diſtemper is recent, it will be more adviſeable to try the Power of Medicines; ſuch as repeated gentle Purges, to draw the peccant Humour downwards, while a large Compreſs, dipt in Lime-water, Spirit of Lavender, or Hungary-water, is applied outwardly. The proper Bandage we have already deſcrib'd, under the Article FASCIA.

The principal Difference between the external and internal Hydrocephalus is, the former makes the outward Superficies of the Head ſoft; whilſt, in the latter, the Head is as hard as uſual: The Reaſon of this appears from the laſt Paragraph. Though the former is not without Danger, it is more eaſily cur'd than the latter; but, the Difficulty is increaſed by the Greatneſs and Duration of the Diſorder. The Cure is to be attempted by internal and external Remedies, ſuch as Cathartics, Diaphoretics, Diuretics, attenuating and corroborating Medicines, for internal Uſe; and externally, the Method recommended in an internal Hydrocephalus is the moſt adviſeable; for theſe may be apply'd with folded Linen Cloths, or with digeſtive aromatic Bags, made with Marjoram, Origanum, Mother of Thyme, Peny-royal, Chamomile, Sage, Roſemary, and Lavender. Theſe, impregnated with the above-mention'd Epithems, are to be applied warm to the Head, and then ſecure them by a proper Bandage. *Hildanus* ſays, he has cur'd an Hydrocephalus by the repeated Application of Lime-water alone, as a Fomentation, with a Sponge. Beſides theſe Remedies, we may apply an Errhine, or cephalic Snuff, made of Marjoram, Lilies of the Valley, true Marum, Cubebs, the Horſe-cheſtnut, and Tobacco.

Further, it is proper to chew Tobacco, which will diſcharge the Lymph from the Head. Laſtly, ſome foment with the Fumes of burning Spirit of Wine, highly rectified; but, if all theſe Remedies are ineffectual, we muſt then proceed to chirurgical Treatment; and, firſt, lay Bliſters, prepar'd of Canthárides, behind the Ears, and on the Neck. And, if this fails, the next Method is to cup the Parts. *Piſo* affirms, that he cured an Hydrocephalus by an Iſſue in the Neck; and, therefore, a Seton, which has the Effect of two Iſſues, may be ſerviceable. When all other Means have proved unſucceſsful, ſome of the Antients have recommended a deep tranſverſe Inciſion, for diſcharging the Water, at the Bottom of the Head; but, as this may wound or divide the Veins or Muſcles, I cannot approve of it, but think it much better to promote the Diſcharge by ſeveral longitudinal Wounds, or Scarifications. After this, the Wounds muſt be dreſs'd with Lint, ſpread with a digeſtive Ointment; and, that they may be kept open, a little red Precipitate muſt be ſometimes added. Having thus removed the Diſorder, the Wounds ſhould be heal'd with a vulnerary Balſam; and the Patient ſhould be kept to proper internal Medicines, and a regular Diet. We find Examples of this Diſtemper in *Paré, Zacut. Luſitanus, Kerkringius*, and others: Particularly *Veſalius* ſays, he found nine Pounds of Serum in the Ventricles of the Brain of a Perſon afflicted with this Diſeaſe.

HYDROCOTYLE.

The Characters are;

The Root is very creeping, the Leaves umbilicated and rounded. The Flower is pentapetalous, roſaceous, and ſeated in the Ovary: The Ovary conſiſts of two flat ſemiorbicular Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Hydrocotyle; vulgaris. *T.* 328.

2. Hydrocotyle; Zeylanica; Aſari folio. *T.* 328. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 70. 71.

I know of no medicinal Virtues aſcrib'd to this Plant; except only, that it is poſſeſs'd of an acrid Quality.

HYDROCRITHE, from ὕδωρ, Water, and κριθὴ, Barley. Barley-water. *Blancard.*

HYDRODES FEBRIS. A Fever, in which the Patient is affected with copious ſymptomatical Sweats, from the very Beginning of the Diſorder.

HYDRO-ENTEROCELE. See HYDRENTEROCELE, and HERNIA.

HYDROGARON. Garum, diluted with Water. *Aetius, Tetrab.* 1. *Serm.* 3. *Cap.* 84. deſcribes a purging Hydrogaron.

HYDROLÆUM. The ſame as HYDRELÆUM.

HYDROLAPATHUM. A Name for the *Lapathum*; *aquaticum*; *folio cubitali*. See BRITANNICA.

HYDROMELI, ὑδρόμελι. Hydromel, otherwiſe call'd *Mulſum, Aqua Mulſa*, or *Melicratum*. Water impregnated with Honey, either before or after Fermentation, is thus call'd. There are various Ways of preparing it, ſome of which are deſcrib'd by *Columella, Lib.* 12. *Cap.* 12. We have, under the Article ALCALI, ſpecified the medicinal Virtues of Hydromel, made without Fermentation, from *Hippocrates*. That made by Fermentation is call'd Vinous Hydromel, or Mead, and is eſteem'd good for the Gravel. See MEL.

HYDROMELON, ὑδρόμηλον. This is made of one Part of Honey impregnated with Quinces, and two Parts of boil'd Water, ſet in the Sun, during the Dog-days. *Dioſcorides, L.* 5. *Cap.* 30.

HYDROMPHALON, from ὕδωρ, Water, and ὄμφαλος, the A Navel. A Tumor of the Navel, containing Water. See HERNIA.

HYDRONOSOS, from ὕδωρ, Water, and νόσος, a Diſeaſe. A Name for the SUDOR ANGLICUS.

HYDROPEGE, from ὕδωρ, Water, and πηγὴ, a Fountain. Fountain-water.

HYDROPHOBIA, from ὕδωρ, Water, and φοβέω, to fear. A Dread of Water. This is a Symptom of that Species of Madneſs cauſed by the Bite of a mad Animal, whence the Diſtemper itſelf is named *Hydrophobia*. But the Symptom is not peculiar to the Diſtemper above-mention'd, tho' it is always an Attendant; for we meet with ſeveral Inſtances of Fevers accompany'd with a Dread of Water; and this led *Cœlius Aurelianus* into a Miſtake, when he quotes *Hippocrates*, as mentioning this Species of Madneſs. The Place he alludes to, is in the firſt Book of the *Prorrhetics*, Text 16. and runs thus, οἱ φρενιτικοὶ βραχυπόται, ἤδη καθαπτόμενοι, τρομώδεες. This is again repeated in the *Coacæ Prænotiones*, Text 96. Thus, Οἱ φρενιτικοὶ βραχυπόται, ἤδη καθαπτόμενοι, τρομώδεες ἢ σπασμώδεες. By βραχυπόται, he means only, as *Galen* explains it, thoſe who in Fevers drink very ſeldom, and then but in ſmall Quantities. And, by the whole Paſſage, he only ſeems to mean, that thoſe phrenitic Patients, who drink but ſeldom, and little at a time, and who are affected with any ſmall Noiſe, are ſubject to Tremors and Convulſions.

And I remember, that *Hippocrates*, ſomewhere in his Epidemics, uſes the Word λυσιτωματεῖν, which *Calvus* reads λυσσωματεῖν, and tranſlates it accordingly, as if it came from λύσσα, the Madneſs caus'd by the Bite of a mad Animal; whereas it only imports a great Diſſolution of the Body, from λύω, to diſſolve.

But we meet with Hiſtories of Caſes, where this Symptom of an Hydrophobia was very remarkable. Thus we are told, that a Perſon walk'd to *Harlem*, from *Leyden*, in a very hot Day; and, being much fatigued, fell into a violent Fever, attended with

with this extraordinary Circumſtance, that he could neither drink, nor ſwallow his Spittle.

In the *Edinburgh* Medical Eſſays, Vol. I. Dr. *Waugh*, of *Kirkleatham*, gives a Hiſtory of a Girl, that had ſtrange convulſive Fits, upon endeavouring to drink or eat any thing. Towards the End of the Fit, ſhe fell to the Ground as dead; but, in a Quarter of an Hour, began to ſpeak, complaining of an intolerable Pain in her Breaſt, and a Weight upon her Spirits, or Anxiety which ſhe could not expreſs; and, with her Finger, pointed to the Part affected, which was under the upper Part of the Sternum, where it is joined with the Clavicles. About two Months before, ſhe had a Quinſey, with a violent Fever; and, when it was expected every Minute that ſhe would be ſuffocated, the Swelling about her Throat ſuddenly diſappearing, ſhe was relieved in a great meaſure; but was ſenſible of a painful Weight remaining in her Breaſt, at the Place ſhe pointed at; and, from that time, Deglutition had met with ſome Obſtacle, which had daily grown worſe. About three Days after the Doctor had ſeen her, a Tumor broke, which almoſt ſuffocated the Girl with the Stench and Quantity of Matter, and ſhe recovered.

In the ſame Volume, Dr. *John Innes*, of *Edinburgh*, gives a remarkable Caſe of an *Hydrophobia*, which I don't find proceeded from the Bite of a Mad Dog. This was in a young Gentleman, who was ſeiz'd with a violent Pain at the upper Orifice of the Stomach; his Pulſe was much oppreſs'd, and very irregular, and often intermitting, and his Extremities chill'd. He was almoſt ſuffocated, fetching heavy Sighs, and, very often, looking ghaſtly, ſpouting out Saliva frequently. In his Intervals he would call for Drink; but, the Moment he ſaw it, fell into the moſt ſurpriſing Horrors, and, as it approach'd him, ſtarted, look'd frighted, had Convulſions, eſpecially about the Mouth, and peeviſhly put it away with his Hand; and then, with an Air that ſpoke at once both Fright and Reſentment, he would ſtare after the Drink, and, ſoon after, impatiently call for it; and repeated the ſame Scene frequently. He was cured by repeated Bleeding.

Great Diſputes have aroſe concerning the Antiquity of the Hydrophobia; and *Plutarch* is quoted by ſome, particularly *Le Clerc*, as alleging that it firſt appeared in the Days of *Aſclepiades*: But this is a Miſtake, for *Plutarch* only relates a Diſpute between *Philo* the Phyſician, and *Diogenianus*, whether Nature could produce new Diſtempers, or not. *Plutarch* quotes *Athenodorus*, who ſays, that the *Elephantiaſis* and *Hydrophobia* both firſt appeared in the Time of *Aſclepiades*. *Diogenianus* anſwers as to this Particular, that the *Hydrophobia* was known to *Homer*. *Plutarch* never denies this, but endeavours to prove, that new Diſeaſes may be produced.

Cœlius Aurelianus, in order to prove the Antiquity of this Diſtemper, quotes a Paſſage out of the Eighth *Iliad* of *Homer*, where *Teucer* calls *Hector* κυνὶ λυσσητῆρα; tho' he does not ſeem to depend much upon it. He has, however, omitted ſome other Paſſages in the ſame Author, which are, in my Opinion, more for his Purpoſe, and come fully up to the Point. Thus, in the Ninth *Iliad*, the artful *Ulyſſes* is introduced addreſſing *Achilles*, a Hero, who had made Phyſic a Part of his Studies, in theſe Words:

——Ἕκτωρ δὲ μέγα φρονεῖ βλεμεαίνων
Μαίνεται ἐκπάγλως πίσυνος Διΐ, οὐδέ τι τίεται
Ἀνέρας οὐδὲ θεούς· κεχαρηὼς δὲ ἑ λύσσα λέλυκεν.

In the thirteenth *Iliad*, *Hector* is again called Λυσσώδης by *Neptune*.

It muſt be obſerved, that λύσσα, λυσσητὴς, and λυσσώδης, properly imply this particular Species of Madneſs. The Word λύσσα or λύτ/α is uſed to ſignify the Madneſs of Dogs by *Ariſtotle*, *Galen*, and *Dioſcorides*. And λυσσόδηκτος is uſed by the laſt-mentioned Author to ſignify a Man bit by a mad Dog. Λυσσάω is uſed by *Aretæus* in this Senſe, and Λυττώσης by *Plutarch*, to ſignify the ſame thing.

The *Hydrophobia*, or Madneſs caus'd by the Bite of a mad Animal, is always, in Man, excited by the Bite of ſome Animal previouſly mad: Thus, Dogs, Cats, Wolves, Foxes, Horſes, Aſſes, Mules, Cows, Swine, Monkeys, Men, and even Cocks, affected with this Diſtemper, have been known to propagate it by their Bites to Men, and other Animals. But Dogs, Wolves, and Foxes, are moſt frequently affected, and that without any previous Bite from another Animal: In theſe the Diſtemper ſhould ſeem to be only a Symptom, accompanying all the Fevers they are ſubject to. And this is confirm'd by the Obſervation, that we may make almoſt any Dog run mad, by keeping him ſome time without Water, and, by that means, giving him a Fever, eſpecially if, at the ſame time, his Aliment is rancid, ſalt, putrid, and fetid. And this ſort of Food, together with want of Water, a very hot Climate, or one ſubjected alternately to exceſſive Heats, and immoderate Cold, an extremely hot and dry Seaſon long continued, and Worms generated in the Kidneys, Brain, Inteſtines, and Cavities of the Noſe, are, by *Boerhaave*, juſtly eſteem'd the preceding Cauſes of Madneſs in theſe Animals.

With reſpect to the Propagation of this Diſtemper from Brutes to Man, the Diſeaſe ſeems to be, as it were, inoculated by the Bite into the Animal, which receives it; for it is remarkable, that the Wound, whereby the Poiſon is received, grows ſore, and feſters ſome little before, or about, the Time the Diſtemper begins to appear. Something very like this happens in the Inoculation of the Small-pox; for the Inciſions, where the variolous Matter had been introduced, begin to grow ſore and painful about the fourth or fifth Day, that is, about the Time that the Diſtemper begins to ſhew itſelf. It is further remarkable, that, when the Inoculation does not take Effect, the Inciſions heal up in a few Days, like a common Cut; and I have ſome Reaſons to believe we may form a Judgment, with ſome Degree of Certainty, of the Danger a Patient is in from the Bite, by obſerving the Wound; for, while that remains with a Scab upon it, I look upon him to be in great Danger; but, when once it is cicatrized, I am in no great Pain for the Conſequences. However, I would not pretend to eſtabliſh this as a certain Maxim, but ſhould rather recommend it as worthy Obſervation, to Phyſicians, who ſhall hereafter be concerned in ſuch Caſes.

The Signs of an approaching Madneſs in Dogs are, according to *Boerhaave*, theſe: They become dull, ſolitary, and endeavour to get out of Sight, and hide themſelves; they are mute, as to their Bark; but make a kind of murmuring Noiſe, refuſing, at the ſame time, all kinds of Meat and Drink; they are enraged, and fly upon Strangers, but, in this Stage, remember and reſpect their Maſters; their Ears and Head hang down, and they walk nodding, as if overpower'd by Sleep. This is the firſt Stage of the Diſtemper, and a Bite received then is very dangerous, but not of the worſt Kind. Then they begin to pant, and hang out their Tongue, to emit a great deal of Froth from their Mouths, which they keep perpetually open; ſometimes they walk ſlowly, and as if half aſleep; and then ſuddenly run, but not always directly forward, as is pretended; at laſt they begin to forget their Maſters; mean time their Eyes look diſpirited and dull, full of Tears, and red; their Tongue is of a lead Colour; they are ſuddenly extenuated, and now rage exceſſively. They ſeldom ſurvive this ſecond Stage thirty Hours; and a Bite received at this time, (*Boerhaave* ſays) is incurable; but the more raging the Animal is, the longer he has been affected, and the nearer he is to Death, the more dangerous is the Bite, the more violent are the ſubſequent Symptoms, and the ſooner they come on; and *vice verſa*.

Boerhaave has omitted two Circumſtances, which are very material, as being the moſt certain Signs of approaching Madneſs: One is, that all other Dogs, upon ſmelling the Dog going mad, will avoid him, and run away with Horror, ſhaking their Heads with ſome Vehemence. *Lommius* ſays, other Dogs are even terrified at the Sight of mad Dogs, or at hearing them bark.

The other Circumſtance is, that the Tone of the Dog's Voice, when he barks, will be quite alter'd from what it was, and ſeem hollow and hoarſe; and this is one of the firſt perceivable Alterations. And tho', as our Author obſerves, the Dog may poſſibly be mute, in that Sort commonly called the dumb Madneſs; yet it is more frequently found, that a Dog, eſpecially if confined, ſhall bark for a Day or two, without ceaſing.

The Symptoms of this Species of Madneſs in Cattle, according to *Vegetius*, are a great Diſtention of all the Veins, Inflammation of the Eyes, Sweats, Tremors, Grinding of the Teeth, Beating themſelves againſt the Wall, and ſoon after direct Madneſs.

The Poiſon communicated by the Bite of a mad Animal is of a very extraordinary Nature: For a ſlight Scratch, and that thro' the Clothes, and even without drawing Blood; the Application of the Foam diſcharg'd by a mad Animal, whilſt recent, or even after it has been long dry'd, to the Lips or Tongue; a Kiſs given to a mad Animal; a Wound made with an Inſtrument, with which a mad Animal had been killed many Years before; eating the Milk or Fleſh of a mad Animal; or much touching and handling any thing infected with this Poiſon, may all excite the Diſtemper in another ſound Animal. Thus *Cœlius Aurelianus* informs us, that a certain Perſon had contracted this Diſtemper by a Wound received from an infected Dunghil Cock. The ſame Author relates, that a Woman, in mending a Garment, which had been torn by a mad Dog, licked the Seam with her Tongue, in order to make the Needle paſs thro' the more readily, and became mad within three Days. *Dioſcorides* tells us, that *Themiſon* the Phyſician contracted this Diſeaſe, by a too diligent Attention on a Friend, who was ill of it; and *Aretæus* ſays directly, that the Breath of a mad Dog will make a Man run mad without any Bite: Some other Moderns alſo, quoted by *Stalpart Vander Weil*, give Inſtances to the ſame Purpoſe; as *Palmarius*, who relates, that a Country Fellow, ill of this Diſtemper, begged earneſtly to kiſs his Children before he died; he accordingly did, but ſeven Days after they were all ſeiz'd with the ſame Illneſs, and died. *Cardan* gives an Account of a noble *Venetian*, who was infected by kiſſing a favourite Whelp, which, being mad, was ordered to be drowned. *Matthiolus* alſo tells us, he had ſeen two Perſons mad, who were infected only by touching the Foam of a Dog, without

the leaſt Bite. That a ſmall Scratch of a Tooth is capable of producing this Miſchief, is proved every Year, by melancholy Inſtances in our own Country. But, farther, that the Scratch of a Cat's Claw, or the Peck of a Cock, has ſometimes been fatal, we have the Teſtimonies of *Hildanus*, *Bartholine*, and *Baccius*, concurring with the Authority of *Cœlius Aurelianus*. *Baccius* gives an Inſtance of Madneſs in a Gardener, conſequent upon a ſmall Wound received from a Cock. *Hildanus* relates, that one *Daniel Perrin*, a young Man, was ſeized with a kind of Melancholy, attended with ſtrange Apprehenſions and Imaginations, ſome Months after he had been ſcratch'd, in the Thumb, by a Cat; the third Day he himſelf was called to him, and found him labouring under an Hydrophobia. The ſame Author gives a remarkable Caſe of a Woman, who, having mended her Gown, which had been torn by a mad Dog, inadvertently bit off the remaining Thread; and, in about three Months, ſhe was ſeiz'd with all the uſual Symptoms of an *Hydrophobia*, and died raving.

There is no Poiſon known which produces ſuch terrible Effects as that communicated by a mad Animal, nor which induces ſuch a Change in a Man who receives it; which rages with ſuch Violence, and ſo ſuddenly, when it one begins to act; and which may, notwithſtanding, lie concealed for ſo long a time, before it manifeſts itſelf by its Effects; for though, in ſome, the Diſtemper breaks out very ſoon after the Poiſon is receiv'd, yet, in others, it has been known to lie dormant for more than twenty Years; and, after that, to excite an *Hydrophobia*, with all the Train of terrible Symptoms attending it. This Diverſity ſhould ſeem to depend upon the Heat of the Seaſon, the Degree of the Diſtemper in the Animal which communicates the Poiſon, and the Conſtitution of the Patient who receives it; and the Diet, and Medicines, taken by way of Preſervative. Bilious Conſtitutions are more likely to be ſoon affected, than ſuch as are pituitoſe, and hydropical..

Cœlius Aurelianus only obſerves, that ſome fall ill ſooner after the Bite, others later; that ſome are a Year or more before they are ſenſible of its Effects, but moſt perceive it after forty Days. *Galen* is of much the ſame Opinion. *Dioſcorides* relates, not upon his own Knowledge, but Report, that People have gone mad ſeven Years after the Infection was received. *Paulus* and *Actuarius* agree with *Galen* and *Dioſcorides*, as to the Time. *Stalpart Vander Wiel* quotes Caſes from ſeveral Authors, where the Infection has broke out in an Hydrophobia, eighteen, thirty, even forty Years after the Bite. Of the three Caſes *Hildanus* gives us, the two firſt continued perfectly well for three Months; but the Man who received a Scratch upon the Thumb, continued well about ſeven. In Dr. *Liſter*'s Patient the Conſequences of the Poiſon appeared in five Weeks; and in Dr. *Howman*'s in ſix. See the *Philoſophical Tranſactions*.

There are ſome Caſes upon Record, which ſhew that the Diſorders, cauſed by the Bite of a mad Animal, are ſometimes periodical, and not always immediately fatal. Thus *Roſcius*, in a Letter to *Hildanus*, which the laſt-mentioned Author has given us, after the 86th Obſervation, *Cent.* 1. relates the following Caſe:

In the Month of *Auguſt* 1581. a Lady received a Wound in her Left Arm, by a mad Dog, which ſhe had the Misfortune to meet in the Street. A ſtrong Ligature was made upon her Arm above the Bite, and Topics applied. The Place was alſo cauterized, and had Inciſions made upon it. Alexipharmics were preſcribed by her Phyſicians. After this, ſhe continued well till the ſeventh Year, when ſhe was ſeized with violent Pains in the Arm formerly wounded, which ſeem'd to her as if a Dog was gnawing it. This was ſucceeded by a Raving, and Delirium, a Melancholy, and Dejectedneſs, pertinacious Watchings, inſatiable Thirſt, a Fever, and great Weakneſs: She had alſo a great Averſion to Food, but had no *Hydrophobia*, for ſhe drank freely. With proper Care, in a few Days, ſhe recover'd, the Symptoms gradually diſappearing. Seven Years after this ſhe was again ſeiz'd with violent Diſorders, which began in the ſame Arm. The Place particularly where the Bite formerly had been, was extremely painful, and ſomewhat convulſed. Beſides this, ſhe felt almoſt inſufferable Gripings, and, at the ſame time, her old Watchings and Thirſt returned. However, ſhe, at leaſt, ſeem'd to be cur'd a ſecond time; but, in ſix Years after, all the ſame Symptoms return'd. This was twenty Years after receiving the Wound. The next Year ſhe had another Fit of the ſame Illneſs; in the twenty-ſecond, two; and in the twenty-third, three; and in the Year 1604, when this Letter was wrote, ſhe had been tormented with two more. It is likewiſe remarkable, that ſhe felt convulſive Motions and Pains in the wounded Arm, upon any Alterations in the Weather.

Dr. *Liſter* tells us of a Tradeſman, in *London*, who had, for twenty-five Years, been troubled with Convulſions of his Head, which often obliged him to move it with great Velocity, ſideways, from Shoulder to Shoulder; and in thoſe Paroxyſms, which ſeiz'd him in the Night, he would make a ſtrange Noiſe, reſembling the Barking of a Dog. Upon Examination, the Doctor thought there was great Reaſon to believe, this odd Diſorder was originally cauſed by the Bite of a Dog, which he had received many Years before. And in this he was much confirmed, by ſome Accounts given him by the Man's Wife, which, he ſays, are not to be mentioned.

In the *Philoſophical Tranſactions* we are told, that in *Ireland*, about the laſt of *October* 1679. two Boys, about nine or ten Years old, handled and waſhed the Head of a Dog, which had been bitten by a mad one. The Dog never was diſorder'd, but, about *May* 1680. the Children were ſeized with a grinding Pain, towards the Bottoms of their Bellies, which aſcended gradually towards their Navels. About *July* 1. they were ſeized with a ſlow Flux, and fainting Fits, when the Pain aſſaulted them. Some time after, this Pain got above the Stomach, upon which they had very violent convulſive Motions, particularly about the Stomach and Belly, with foaming at the Mouth, in the Intervals of their Fits. Theſe Symptoms continued and increaſed till the latter End of *Auguſt*, that they were taken with a *Fear of Water*, inſomuch that, upon the Sight of any thing *liquid*, they would fall down as dead, and continue ſome little time as in a Swoon; then they would tumble and toſs with violent Motion, and Diſtortions of their Bodies, accompanied with heavy Groans; and ordinarily, the eldeſt eſpecially, ſnarl'd, and bark'd, and endeavoured to bite like a Dog. In about an Hour they would recover, and creep away, as if afraid of any body that was near them. They came entirely to themſelves when the Fits went off, which returned daily, till about the Middle of *September*; and then their Diſorder was more violent, and they more wild than ever, inſomuch that in the Intervals they could not endure any Company, not even that of each other. This continued about a Week, and then the eldeſt cry'd out to his Father, as one ſurpriſed, that he was well; which accordingly both he and his Brother were, and continued ſo for three or four Days; then they fell ill again, and recovered in ſeven Days, without any farther Relapſe. It is remarkable, that they both went into, and came out of, their Fits, at the ſame time. 'Tis, alſo, worthy of Obſervation, that, in *Auguſt*, they took Doſes of *Mercurius Vitæ*, and Antimony, with *Venice* Treacle, and the teſtaceous Powders.

I have been told, alſo, by a Gentleman of Veracity, of a Caſe where the Diſtemper appear'd periodically, in a Boy, who was Whipper-in to a Pack of Fox-hounds, in the North of *England*.

The Symptoms of this Species of Madneſs are thus deſcrib'd by *Cœlius Aurelianus*.

Thoſe who are juſt about to fall into an *Hydrophobia*, are ſeiz'd with a certain Anxiety, without any evident Reaſon, are prone to Anger, have their Bodies render'd uneaſy, and ſubjected to preternatural and unuſual Motions. Their Sleep is either reſtleſs and diſturb'd, or they are affected with perpetual Watchings. Their Aliments become corrupted, their Stomachs oppreſſed, and they are inclined to ſtretch out their Legs and Arms. They are afflicted with a continual Oſcitation, and a violent Nauſea, or Inclination to vomit. They make unaccountable Complaints with reſpect to the Weather, as thick and rainy, when, at the ſame time, the State of the Air is pure, ſerene, and clear. They are rendered uneaſy, fretful, and diſcontented, by Showers and Falls of Rain, and have an unuſual ſmall Appetite for Drink.

When the Diſorder comes on, they are afflicted with a violent and inſatiable Thirſt, but, at the ſame time, are ſtruck with an unaccountable Terror and Dread, not only at the Sight, but alſo at the Sound or Name, of Water. Then they become afraid of Fomentations of Oil uſed for their Relief, and their Pulſe is thick, ſmall, and irregular. Some are ſeiz'd with a ſlight Fever, convulſive Throws of the Stomach, a Torpor and Numbneſs of the Joints, a preternatural Elevation of the Præcordia to the ſuperior Parts, and a coſtive State of the Belly: Then they diſcharge their Urine frequently, and by little at a time, and are ſeized with a Trembling, and Convulſions. Their Voice becomes hollow, and reſembling the Barking of a Dog. The Poſture of their Bodies is like that of a Dog, when lying aſleep on the Ground. Their Reſpiration is difficult, and their whole Body is rendered highly reſtleſs, and uneaſy, upon the Entrance of any Perſon into the Room, for fear he ſhould bring Water with him. Their Eyes and Countenance become red, their Bodies ſlender, and the ſuperior Parts of it pale, and covered with Sweat. The Tongue hangs out of the Mouth, and, in Men, the Penis is ſeiz'd with a frequent Tenſion, accompanied with an involuntary Emiſſion of the ſeminal Fluid.

The laſt Stage of the Diſorder is accompanied with an Hiccup, and a Vomiting of Bile, which is generally of a blackiſh Colour. Some are ſtruck with an unaccountable Dread, and, upon ſtretching out their Hands to any Veſſel with Liquor in it, they forthwith retract them with Horror. Some, upon the Sight of Water, frankly acknowledge, that it is a natural Liquor, and that to which they have been accuſtom'd; but, when they ſee it put in Motion, recede from it with the utmoſt Averſion. Thus *Soranus* informs us, that he knew a Perſon labouring under this Diſorder, who made ſuch a Confeſſion; but tells us, at the ſame time, that he could not prevail upon him to take the Water. *Artorius*, alſo, gives us an Inſtance of a certain Soldier, who, labouring under this Diſorder, upbraided himſelf

himſelf with his inexpreſſible Dread of Water, the darling Liquor to which he had been ſo much accuſtom'd; ſince, in the hotteſt Battles, he had never felt the ſmalleſt Emotions of Cowardice in his own Mind. *Eudemus*, a Follower of *Themiſon*, makes mention of a certain Phyſician labouring under an Hydrophobia, who, conſcious of the Danger, earneſtly intreated thoſe, who entered the Room, to keep at a Diſtance from him; and, at laſt, a Torrent of Tears burſting from his Eyes, the Drops had ſuch a ſurpriſing Influence upon him, that he ſtarted up, and tore his Garment. *Soranus* informs us, that he ſaw an Infant, afflicted with this Diſorder, ſtruck with Terror at its Mother's Breaſts. The ſame Author, alſo, ſays, that a certain *Athenian* told him, that he had ſeen a Man labouring under an Hydrophobia, who, being baniſhed from the Houſe in which he lay, came to a Place, where he died, with his Body folded up like that of a ſleeping Dog; and that, before his Death, he was ſo furiouſly mad, that he haſtily ran to a Dog, who lay there, and bit him.

Boerhaave thus deſcribes the Symptoms of an Hydrophobia.

A Perſon, before in perfect Health, when affected with this Diſorder, begins ſometimes ſooner, and ſometimes later, to labour under the following Symptoms, almoſt in the ſame Order in which they are enumerated: Firſt, the Part into which the Contagion was immediately receiv'd, is affected with Pain; then wandering Pains are perceiv'd in other Parts, eſpecially thoſe adjacent to that primarily affected; a Wearineſs, Heavineſs, and Liſtleſſneſs, are induced on all the muſcular Parts of the Body. The Patient's Sleep is reſtleſs, diſturb'd, and accompanied with Frights, Convulſions, and Twitchings of the Tendons: He is, alſo, afflicted with continual Uneaſineſs, Sighing, Sadneſs, and a Love of Solitude. The firſt Stage of the Diſorder is, generally, both accompanied and ended with theſe Symptoms; and, during this State of the Patient, Blood taken from the Veins has all the apparent Signs of laudable Blood. Then all the already enumerated Symptoms are increas'd, together with an Addition of a violent Uneaſineſs about the Precordia, and a Difficulty of Breathing, accompanied with Sighs and Horror; then the Patient is ſeiz'd with Horripilation and Trembling, upon the Sight either of Water, Fluids of any kind, or any Object which is either pellucid, or capable of reflecting the Rays of Light, like a Mirror. The Appetite is entirely loſt, whilſt, at the ſame time, a Power of ſwallowing the moſt ſolid Subſtance remains. The Approach of any Liquor to the Body, eſpecially to the Tongue and Lips, produces an incredible Uneaſineſs, Trembling, Convulſions, and a State next to direct Rage and Madneſs. A yellow bilious Kind of viſcid Subſtance, or a porraceous Bile, is vomited up. The Patient becomes hot, feveriſh, ſubject to continual Watchings, and is afflicted with a Priapiſm, and a Train of incoherent, diſorderly, and unuſual Thoughts. The Diſorder proceeds in this manner, and its ſecond Stage generally ends here. Afterwards the above-enumerated Symptoms are increas'd, and the Tongue becomes rough, and hanging out; the Mouth gaping, and the Voice hoarſe. The Patient is, alſo, rack'd with an inſatiable Thirſt, but unfortunately ſeiz'd with an unaccountable kind of Madneſs upon every Attempt to drink, or upon the Sight, or Contact of any Fluid. The Froth is collected in his Mouth, and he is neceſſarily prompted by his Diſorder, to diſcharge it on others. He is poſſeſs'd of an ardent Deſire of biting every Object which comes in his Way; nor can this Deſire be check'd by the Influence of his Will. He froths at the Mouth, grins, and gnaſhes his Teeth; his Pulſe and Reſpiration become defective; he is ſeiz'd with a cold Sweat, and a violent Degree of Madneſs; whilſt, at the ſame time, his Senſes remain entire, inſomuch that he is himſelf fearful, leſt he ſhould do any Injury to others. A convulſive Death, accompanied with a violent Difficulty of Breathing, almoſt always puts an End to his Life, within four Days after the Approach of his Diſeaſe.

The Diagnoſtic of this Diſtemper is evident from the preceding Hiſtory thereof. With reſpect to the Prognoſtic, the Degree of the Infection may be eſtimated from that of the Violence of Madneſs in the Animal from which it was receiv'd; from the Seaſon and Climate; and from the Conſtitution of the Patient, in the manner above-mention'd. But, in general, *Boerhaave* affirms, that there is no certain Preſervative againſt it, yet known; and that there is no Example, that can be depended upon, of any one having been recover'd, who was once ſo far gone as to dread Water. This Author adds, that it is much to be lamented, that, after the common Methods have been put in practice perpetually without Succeſs, for ſo many Ages, others have not been tried, different from thoſe which ſo long Experience has convinced us were ineffectual.

By the Diſſection of Bodies, deſtroy'd by an Hydrophobia, we learn, that the Organs of Deglutition are in ſome Degree inflamed; that various Sorts of bilious Viſcidities are collected in the Stomach; that the Gall-bladder is full of black Bile; that the Pericardium is dry; that the Lungs are incredibly diſtended by Blood coacervated therein; that the Heart is full of almoſt dry Blood; that the Arteries are full, but the Veins almoſt empty; that the Blood is extremely fluid, ſo as ſcarcely to concrete when expoſed to the Air; mean time all the Muſcles, Viſcera, Cerebrum, Cerebellum, and ſpinal Marrow, appear more dry than uſual.

Thus upon diſſecting the Body of a Patient, who died in conſequence of the Bite of a mad Dog, there was no Moiſture found in the Pericardium; the Sinuſes of the Heart were found dry, and deſtitute of Blood; and a certain Portion of the Pericardium was almoſt burn'd, and reduced to Powder. *Capivaccius, Pract. Lib. 7. Cap. 12.*

Upon diſſecting the Body of a young Man, who died of the Bite of a mad Dog, the Brain was found entire and untouch'd; but all the Viſcera, deſtin'd for the Performance of the natural and vital Functions, were exceſſively dry: However, it was uncertain, whether this Phenomenon was produced by the Nature of the Poiſon, or the preceding Evacuations, to which the Patient had been ſubjected. *Boneti Specul. Anat.*

A certain young Man was ſuddenly ſeiz'd with an Hydrophobia, to ſuch a Degree, that he could not ſwallow a ſingle Drop of any Kind of Liquor, though he could, at the ſame time, ſwallow any ſolid Subſtance. Notwithſtanding all the Meaſures us'd for his Relief, he was, on the third Day, ſeiz'd with Madneſs; and the Saliva, flowing copiouſly from his Mouth, was thrown on all the By-ſtanders. Upon the fourth Day, ſitting in a Seat, out of Bed, he was ſuddenly ſuffocated, after a Struggle or two. Upon laying open the Body, it appear'd extenuated and conſum'd, as if he had died of a long-protracted Hectic; all the muſcular Part of the Fleſh, together with the Fat, was almoſt totally conſum'd. The Omentum was, alſo, entirely conſum'd, ſo that the Inteſtines appear'd naked, and diſtended with Flatulences. The Glands of the Meſentery, and the Pancreas, were extenuated. The convex Part of the Liver appear'd to be ſound; but the concave Part was inflam'd, and adher'd ſo ſtrongly to the Spleen, that it could hardly be ſeparated without breaking. The Left Lobe of the Lungs adher'd ſo firmly to the Spleen, that an Inciſion was neceſſary in order to ſeparate them. The Gall-bladder was full of a greeniſh Bile, and adher'd cloſely to the Ribs. The interior Coat of the Stomach was ſo corrupted, that it might be abraded by the Fingers. The ſuperior Orifice of the Stomach was very ſmall, and the whole Oeſophagus was narrow and conſtricted. The Lungs were dry; and, on both Sides, adher'd to the Ribs. There was not a ſingle Drop of Water found in the Pericardium. The Heart was flaccid and extenuated; but its Right Ventricle was full of grumous Blood, whereas in the Left Ventricle the Blood was ſufficiently fluid. The Kidneys were pretty large, and free from every apparent Defect. Upon interrogating the Patient, when he was in his Senſes, whether he had been bit by a mad Dog, he ſaid he remember'd no ſuch Circumſtance. But a Scar on his Left Leg made it pretty probable, that he had met with a Misfortune of this Kind. But there are Inſtances of Hydrophobias produced without the Bites of mad Animals. See *Pliny, Lib. 8. Cap. 40. Marcellus Donatus, Hiſt. Medic. Mirab. Lib. 6. Cap. 1. Salmuth. Cent. 2. Obſ. 52. Zacut. Luſitan. de Medic. princ. Hiſt. 20. Borell. Cent. 3. Obſ. 38. Joh. Henric. Brechtfeld, in Actis Danicis Bartholinianis, anno* 1682.

Mr. *Tauvry* having, for ſome Days, attended a young Man, who had the Misfortune to be bit by a mad Dog, and whoſe Death he had predicted as infallible, laid open his Body, though in great Haſte, thinking, by the Diſſection, to diſcover ſomething remarkable, which might account for the Dread of Water.

The internal Part of the *Oeſophagus* was inflam'd, as, alſo, the *Arteria Trachea*, tho' not in ſo high a Degree: In the Bottom of the Stomach there were about three Spoonfuls of a glaucous viſcid Subſtance, of a pretty-dark browniſh Colour, and reſembling that which the Patient often vomited, when alive: The Gall-bladder was full of a Bile which was almoſt entirely black: The *Pericardium* contain'd a very ſmall Quantity of Water: The Arteries were full of a very fluid Blood; but the Veins contain'd very little: No coagulated Blood was any-where to be found. The Patient's Blood, after his Death, did not coagulate, when expoſed to the cold Air; whereas the Blood, taken from him by Veneſection ſome Days before, eaſily coagulated: The Brain, and almoſt all its Parts, were a great deal drier than uſual, as well as the Beginning of the Spinal Marrow, and all the Muſcles. *Hiſt. de l' Acad. Royale des Sciences, Ann.* 1699.

A Farmer of *Moncheſtein*, in the Canton of *Baſil*, upwards of thirty-ſix Years of Age, very early in the Morning of the fourteenth Day of *January* 1687. heard his Dog bark and howl violently, in a Neighbour's Stable. Upon this he riſes, and goes to ſee the Reaſon of this unuſual Noiſe: When he came near the Place, he obſerved a ſtrange mad Dog making towards him, over the ſnowy Meadows; which Sight terrified him ſo much, being unarm'd, and in his Shirt, that he called a Servant to his Aſſiſtance: But, before he came, the Creature, which he had taken for a Wolf, attacked him furiouſly: They engaged for a conſiderable Time, till, at laſt, both lay proſtrate on the Ground: Before this, the poor Man had receiv'd ſeveral Wounds in his

Left-hand and Arm: At length, up comes the Servant, and frees him from his Adversary; he returns to Bed, and anoints his Wounds with some Oil of Lizards, which he happen'd to have by him; and bound it on with Linen, dipt in warm Wine. At Day-break he sent for an experienced Physician; who came with a Surgeon, and prescribed, internally, Alexipharmics and Theriacals, Scarifications and Cupping, to extract the deleterious Saliva of the Animal; and, indeed, omitted no one Remedy usual in these Cases. Every thing seem'd to have the desired Effect; there were no bad Symptoms, no Appearance of Poison, either in the Blood, Spirits, or Wounds; he was neither thirsty, nor did he lose his Appetite; the Inflammation of his Hand and Arm was dispersed by vulnerary Fomentations; and the Wounds, discharging a well-digested Matter, were healed in seven Weeks.

The Farmer, finding himself in perfect Health, follows his Employ, without any Inconvenience; but, as he had been long prohibited the Use of Wine, to make up for his lost Time, he would often intoxicate himself. The fourteenth of *March* following, he came for my Advice; and told me, that, as he lay in his Bed the Night before, he felt a shooting, pricking, and heavy Pain, in those Parts where he had been formerly wounded; but that it grew easier upon his getting out of Bed. I examined his Hand and Arm, saw the Wounds well consolidated; nor were the Pains more acute there, than in other Parts of the Arm; but, beginning at the Extremity of the Hand, continued to the Axilla, without any Tumor, or Alteration in the Colour of the Skin: I then view'd the rest of his Body, and found it fleshy, and in a good State: His Appetite was good, he was not thirsty, and complain'd only of a sort of Lassitude. Upon weighing these Things, I suspected his present Complaints to arise from the former Accident, and immediately order'd a Scarification and Cupping, upon the affected Arm and Back, together with the usual Antidotes.

He follow'd my Prescriptions for a Day and a Night; but, as his Distemper increased the next Day, and he was told his Disorder must necessarily arise from the Bite of the mad Dog, and would certainly be the Death of him, unless he applied to an Executioner, who was famous for curing this Disease, he directly hurries to him, tells his Case, gets an Ointment, and, perhaps, took somewhat internally; however, he would not own it. In the Evening, after having drank a free Glass, he returns home, makes use of the Ointment, swallows an Egg poached soft, and goes to Bed. In about half an Hour the poor Wretch begins to sigh, and complain frequently, to draw his Breath deeper, with great Pain, and with his Head erect; at the same time he dreaded Water, and all Liquids: This was follow'd by so excessive a Pain in his Breast, that he knew not how to turn himself. On the sixteenth I was called in, and, finding him in this Condition, but still sensible, offer'd him Spring-water, Broth, and a Cardiac Mixture: At the Sight of these he grew very uneasy, leaped out of Bed, shook his Hands and Legs, and ran from Place to Place: He could not draw his Breath, without Convulsions of the Neck and Breast; soon after he uttered Noises, mix'd with Howlings, which did not so much resemble the Barking of a Dog, as a Voice interrupted by frequent Concussions of the Jaws and Breast: The Shortness of his Breath permitted him to speak but half Words. All this while he discover'd not the least Inclination to bite the Company; but, being perfectly in his Senses, wished for Death. In the mean time, he felt an inextinguishable Thirst, either not being able, or not daring, to drink: If the Door or Windows were open'd, the Symptoms increased; for he dreaded the Air no less than Liquor: His Difficulty of Breathing, after a small Intermission, would return greater, bringing with it a plentiful cold Sweat, which accompanied him to the last: Tho' he abhor'd all Liquids, or, if he was prevailed on to taste them, was seized with a Tremor in all his Limbs, as if he dreaded instantaneous Suffocation, yet he shew'd no such Dislike to Solids; for, in Hopes of Relief, tho' with great Difficulty, he would swallow Bread, a comforting alexipharmic Electuary, or any thing of a thick Consistence: He had frequent Reachings, but never vomited; sometimes went to Stool, and discharged a small Quantity of lixivious Urine: His Pulse was unequal and weak, the Tendons of his Muscles almost always in a strong Vibration: His Abdomen never swelled; there was no Alteration, either in the Size or Colour of his Arm, at least as it appear'd to me twelve Hours before his Death: Towards his End he complain'd, that the Pains were remov'd from his Arm to his Breast and Heart, and that his Difficulty of Breathing increased every Moment. When he could take no more internal Medicines, and all Externals were found inefficacious, on the sixteenth of *March*, about Midnight, after he had been afflicted with the Hydrophobia above thirty Hours, he was suffocated.

Fifteen Hours after his Death, I open'd him, in the Presence of *Johannes Hoferus*, and others, and observ'd the following remarkable Circumstances: The Scars of his Wounds were neither red nor livid, but retained the natural Colour of the Skin; but there appear'd manifest Indications of a Gangrene and Sphacelus on the Shoulder and Scapula of the affected Side, and all over the Back; for these Parts were very livid; and the same Appearance reached to his Left Breast. Upon opening his Abdomen, we found the Intestines not inflated, but interspersed with several red Spots, the Signs of so many Inflammations: In the Stomach we met with a small Quantity of a Humour, which was crude, turbid, yellowish, and somewhat fetid; in this were contain'd some yellow Moleculæ, like the hard Yolk of an Egg.

In the Coats of the Stomach, especially about the Orifices, there appear'd some red Spots, larger than those of the Intestines: The other Viscera of the Abdomen were found entirely sound: But, when I laid open the Thorax, I was surprised to find it overspread with Blood, and of a redish and somewhat livid Colour.

The Lungs, every-where adhering to the Pleura, resembled a Mass of concreted Blood: Extravasated and coagulated Blood was found in their Vesicles, so that an unequal Tumor of the Lungs was observable.

The membranous Interstices between the cartilaginous Ringlets of the Aspera Arteria were intensely red: That Part of the Diaphragm which was adjacent to the Ribs, discover'd some Marks of a beginning Gangrene, by its preternaturally red and livid Colour. Upon making an Incision into the Ventricles of the Heart, the large Vessels about this Organ, or into the Lungs, all was found full of a concreted Blood, almost entirely destitute of Serum. *D. Theodorus Zwingerus, in Ephem. German. Dec. 3. A. 2.*

That I may not mislead any one, I must remark, that this Case manifestly contradicts what I have said above, relative to the Healing of the Wound.

The Prevention and the Cure of this Disorder, if we except a few Instances, are highly dubious and uncertain. The Reasons of this want of Success seem to be a boasting Pretence to many Specifics, and the Neglect of a due Method, founded upon the History of the Disorder.

So far, therefore, as we may conjecture from the History of this Disorder, from comparing it with other Diseases, and from the few Instances in which it has terminated happily, it seems to consist in a particular Affection of the Nerves, of the convulsive Kind, with which the Viscera, and their respective Vessels, are seiz'd. From these a peccant Condition of the Blood and Humours approaching, as it were, to a gangrenous Inflammation, takes its Rise. The principal and original Seat of the Disorder seems to be about the Stomach, and the Parts most contiguous to it.

With respect to the Methods of Cure, *Celsus* proposes the following:

When a Person is bit by a mad Dog, the Poison is to be extracted by means of Cupping-glasses; after which, if the Part is neither nervous nor muscular, the actual Cautery is to be apply'd to the Wound; but, if it cannot be cauteriz'd, it is expedient to take a due Quantity of Blood from the Patient. When the Wound is cauteriz'd, the same things are to be apply'd to it, which are proper for other cauteriz'd Parts. When the Application of the actual Cautery is contra-indicated by the Circumstances before-mention'd, the Wound is to be dress'd with strong Corrosives. After which, no other Treatment is requir'd, since the Wound is to be incarn'd and heal'd in the ordinary manner. Some, immediately after the Bite of a mad Dog, immerse the Patient in a warm Bath, where they permit him to sweat as long as his Strength will allow, with the Wound in the mean time open, that the Poison may be the more effectually discharg'd. Then they dress the Wound with a large Quantity of rich Wine, which is contrary to all Poisons; and, when these Measures have been persisted in for three Days, the Patient is thought to be secur'd against Danger.

But, when the Effects of Wounds of this kind are not duly guarded against, that Species of Disorder, which the *Greeks* call *Hydrophobia*, is generally produc'd, in which the Patient is tormented, at once, with a Dread of Water, and an insatiable Thirst. In this Case, few or no Hopes of Relief are to be conceiv'd. The only remaining Step to be taken, is to throw the Patient unexpectedly into a Pond, in which, if he cannot swim, he is to be suffer'd to sink, and be rais'd alternately, till he has drank enough; if, on the contrary, he is a skilful Swimmer, he is to be immers'd in the Water, till he has swallow'd a sufficient Quantity of it. By this means, both his Thirst, and his Dread of Water, will be remov'd; but, if his Body is weak and tender, it is to be dreaded, lest the Coldness of the Water should produce Convulsions, which may prove fatal to him. In order to prevent this Accident, he is to be immers'd in warm Oil, immediately after he is taken out of the Pond. *Celsus, Lib. 5. Cap. 27.*

Boerhaave's Directions are thus:

In order to prevent the Effects of a Bite inflicted by a mad Dog, it is necessary, first,

That as soon as the Poison is received into the Body, the whole Part immediately affected, and those adjacent to it, should have deep Scarifications made in them, so that they may discharge large Quantities of Blood. Then large Cupping-glasses, which attract strongly, are to be apply'd; or the Part is to be burn'd pretty deep with the actual Cautery, and afterwards kept in a continual

continual Suppuration, by the Application of ſuch Things, as by their perpetual Corroſion induce an exulcerated State of the Parts. During the Whole of this Time, from the very Beginning to the End, the Part is, without Interruption, to be fomented with a Brine or Pickle prepar'd of Sea-ſalt and Vinegar, and theſe Meaſures are obſtinately to be perſiſted in for ſix Months.

Secondly, The Cloths, or other Things, which have touch'd, or come near the Poiſon, are to be thrown away, and carefully avoided.

Thirdly, The Patient is, immediately after receiving the Misfortune, to be thrown headlong into the Sea, or ſome River, with a great deal of Apparatus, threatening Words, and other Circumſtances capable of ſtriking Terror into him; for which Purpoſe he is to be frequently immers'd in the Water, and again taken up. And this Method is to be often repeated with the ſame Train of Circumſtances; for the good Effects are only produc'd by the Dread and Conſternation into which the Mind is thrown, and not by the Salt-water; as we learn from the melancholy Caſe of a certain Man, who, after being bit by a mad Dog, was ſhipwreck'd, but was afterwards ſeiz'd with an Hydrophobia, tho' he had been oblig'd to ſwim for ſeveral Hours in the Sea, and been frequently immers'd in the Waves. The Patient is alſo to be frequently purg'd with Rhubarb, Agaric, and the Juice of Elder-bark.

Fourthly, Let the Patient have a gentle Sweat excited every Morning before Eating, by taking a Mixture of aromatic Vinegar, Sea-ſalt, and warm Water.

Fifthly, Let the Patient daily foment his Feet and Hands in a Bath of Water. Let him alſo waſh his Head, Mouth, and Fauces. 'Tis alſo expedient he ſhould ſwim, or bathe, as often as poſſible.

Laſtly, Let him frequently drink cold Water, till he throws it up by Vomit: He muſt often, likewiſe, uſe acidulated Liquors; and his Diet muſt be moiſt, light, and laxative; but he may frequently take them ſo liberally, as to vomit them again. He muſt, alſo, carefully abſtain from large Quantities of aromatic Subſtances, from Wine, from Things of a heating Quality, from violent Exerciſe of Body, and all Commotions of Mind.

The Cure of the Diſorder, when actually preſent, is principally to be attempted in the firſt Stage, or the Beginning of the ſecond; for the Conſequence of neglecting it longer is always fatal. It ſeems probable, ſays *Boerhaave*, that the following Method may be of ſome Efficacy, eſpecially as this is confirm'd by ſome few Experiments.

Immediately upon the Signs of approaching Madneſs, the Caſe is to be treated as extremely inflammatory; in purſuance of which, a large Quantity of Blood muſt be taken away, by a large Orifice, even till the Patient faints. Then directly inject nitrous Clyſters, mix'd with a little Vinegar. Thus:

Take Barley-water, ten Ounces; Nitre, two Drams; Elder-vinegar, and Honey of Roſes, each an Ounce.

Or,

Take Rue-water, ten Ounces; Sea-ſalt, two Drams; Vinegar impregnated with Marigold-flowers, ſix Drams; Honey, an Ounce: Make a Clyſter.

Let theſe be repeated boldly, and more frequently than is conſiſtent with Prudence in other Caſes. After this, his Eyes are to be blindfolded, and he is to be thrown into a cold Pond; or cold Water is to be thrown upon him, till he is not any longer afraid of Water. Then let him be immediately forc'd to drink a large Quantity of Water, and towards the Evening of the Day, in which he has been thus treated, let a Sleep be procur'd. Let his Diet be always highly ſlender, and moiſtening.

In the *Hiſtoire de l'Academie Royale des Sciences*, for the Year 1699, it is aſſerted, that Patients, labouring under an Hydrophobia, have been cured by throwing large Quantities of Water upon them; and an Inſtance is given of a Man ty'd to a Tree, and cured, by throwing two hundred Pails of Water upon him, without any other Means at all uſed.

But Mr. *Moriſot* furniſhes us with a well-atteſted Caſe of a Girl of twenty Years of Age, bit in the Hand by a young Boy, who was mad. Upon this, ſhe was ſeiz'd with all the Symptoms of Madneſs. And, at laſt, ſixteen Days after the Bite, thoſe who had the Charge of her, judg'd it expedient to bathe her in a large Tub full of River-water, rather cold than hot, and in which a Buſhel of Salt was previouſly diſſolved. In this ſhe was plung'd quite naked, and taken up at different times. After ſhe had been violently tormented in this manner, they left her ſitting in the Bath in a great Conſternation; and, when ſhe look'd at the Water in which ſhe was, ſhe was aſtoniſhed that ſhe could view it without any Emotion.

After this, her Diſorder was of the common Kind; ſhe was ſeiz'd with a Fever, which was treated in the ordinary manner. She had frequent Inclinations to vomit, and her Vomiting afforded her Relief, whilſt, in the mean time, Nature was aſſiſted by other proper Means; ſhe was ſeveral times afterwards put into the Bath, and at laſt perfectly cured in little more than a Month's time.

In Imitation of this, vaſt Quantities of Water were pour'd upon a Chandler, as I remember, of *Leiden*, till he no longer dreaded Water; and this was ſeveral times repeated; but at laſt he dy'd, notwithſtanding this Method.

Boerhaave farther ſays, that as this Method, which he recommends, is deduc'd from the Nature of the Diſeaſe, and the Rules of Art, ſo nothing can be more pernicious, than to murder the Patient, already parch'd with his Diſorder, by the Exhibition of acrid, heating, and drying Medicines, and ſuch as irritate the Nerves. Mean time, nothing can be more cruel and inhuman, than either utterly to neglect the Patient, without attempting his Relief; or to ſuffocate him, as is cuſtomary in *Holland*, after having obtain'd an Order from the Magiſtrates for that Purpoſe.

Hitherto, ſays *Boerhaave*, there is no Account, which can be depended upon, of any Remedy capable of curing this miſerable Diſtemper, tho' many are celebrated for this Purpoſe; all which owe their Reputation either to barren Speculation, or too great Confidence in the Reports of others; not excepting the Secret of *Æſchrion*, mention'd by *Galen* and *Oribaſius*, conſiſting of calcin'd River-crabs; nor the famous Opiate for the *Sicilian* Madneſs deſcrib'd by *Scribonius Largus*; nor the Skin of an *Hyæna* (ſee HYÆNA); nor the Medicine extol'd by *Aetius*, *Rufus*, and *Poſidonius*, conſiſting of the Aſhes of Crabs with Mithridate; nor the boaſted Remedy of *Palmarius*; nor the Remedy compos'd of Tin and Mithridate, too much extol'd by *Mayern*, *Grew*, and the Sportſmen; nor the Root of the Dog-roſe, tho' revealed by a Dream, as is pretended; nor the *Lichen Cinereus terreſtris*, however recommended; nor Pimpinel; nor the fry'd Liver of the mad Dog.

Thus far *Boerhaave*.

For an Account of the Efficacy of calcin'd Crabs, ſee CANCER.

The celebrated Remedy of *Palmarius* is this:

Take of the Leaves of Rue, Vervain, Sage, Plantain, Polypody, common Wormwood, Mint, Mugwort, Baſtard Baum, Betony, St. John's-wort, and leſſer Centaury, each equal Parts. All theſe muſt be gathered at the Time of Year when they are in the greateſt Perfection, and muſt be dry'd ſeparately, in a Place where they are expoſed neither to the Wind, nor the Sun. When theſe are powder'd and mix'd, a Dram, or a Dram and an half, muſt be given every Day; or, if the Bite has been long received, three Drams is the Doſe. Mean while, the Wound muſt be dry'd with a Sponge, and embrocated twice or three times a Day, with Wine, or Hydromel, in which half a Dram of this Powder is mix'd; and a common Plaiſter muſt be laid upon it.

In the *Philoſophical Tranſactions*, I find the following Medicines recommended, which are thoſe hinted at above by *Boerhaave*.

Take Leaves of Rue, pick'd from the Stalks, and bruiſed, ſix Ounces; *London* Treacle, (or, which is better, *Venice* Treacle) Garlick peel'd and bruiſed, and fine Filings of Tin, each four Ounces: Put them in four Pounds of Canary, or good White-wine; or, in caſe of a nice or hot Conſtitution, into the ſame Quantity of ſtrong and well-work'd Ale, in an earthen Veſſel, well ſtopt. Then let there be made a Digeſtion, or gentle Boiling of it, in a Bath-heat, for four Hours, ſhutting in the Steam; then preſs it, and ſtrain it. The Doſe is from two to three Ounces, (and in ſome Perſons more) to be taken every Morning, for nine Days. The Party bitten muſt faſt for three Hours after it, and the Dregs that remain after Expreſſion, muſt be bound upon the Wound received, renewing it every twenty-four Hours. *N. B.* The ninth Day, after the Bite, ſhould not be let ſlip before this Medicine be taken, leſt the Poiſon ſeize the Blood too ſtrongly. It muſt be given cold, or, at leaſt, only a little air'd. A double Quantity may be given to a Beaſt, ſoon after the Bite.

I never found this Remedy to fail. *Theo. de Vaux.*

Take dried Rue, and Scordium, each two Drams; *Virginia* Snake-root, one Dram and an half; Flower of St. John's-wort, three Drams; fine Filings of Tin, and Garlick, cut ſmall, each four Drams: Let them be all beaten, and exactly mix'd together, adding Syrup of Lemon-peel, enough to make it into an Electuary; divide this into nine equal Parts, one to be taken every Day, drinking after it a ſmall Draught of good ſtrong Ale. Let him walk upon it, and not dine till four Hours after. Uſe as little of the aforeſaid Syrup of Lemon-peel as may be; and if that be not at hand, a Syrup made of *Malaga* Wine, adding as much Sugar as it can diſſolve, may ſerve the Turn.

Mr. *Dampier*, who, as I apprehend, was Nephew to the celebrated Traveller of that Name, gives an Account, in the *Philoſophical*

losophical Tranſactions, of a Cure for the *Hydrophobia*: It is, he ſays, a ſort of Jews-ear; but Sir *Hans Sloane* ſays, it is the *Lichen Cinereus Terreſtris*, or Aſh-colour'd Liverwort, deſcrib'd by Mr. *Ray*, and grows commonly in barren Places all over *England*. This muſt be dried in an Oven, by the Fire, or in the Sun: Powder it, and paſs it through a fine Sieve; and then mix it with the like Quantity of Pepper, finely powder'd, of which Compoſition four Scruples make a Doſe. When given to a Dog, he muſt be kept from Meat a convenient Time; then blooded, and afterwards well waſhed all over; then give him the Medicine, mixed in a ſufficient Quantity of Milk, or Broth, warm. If it be for Cattle, they muſt alſo be blooded, and well-waſhed. The Doſe muſt be adminiſtered in a Drenching-horn, and proportioned to the Strength of the Animal. If to a Man or Woman, it muſt be given after Bleeding, and well waſhing the Face, Hands, and Place wounded, and all the Cloaths, which the Perſon had on when bitten, to waſh away the Saliva that may have fallen from the Mouth of the Dog, or other mad Creature; which is all the Reaſon for waſhing. A Man or Woman may take it faſting, in warm Milk, Beer, Ale, Broth, or how they beſt like it, two or three Mornings, to make ſure.

This has been taken into the College Diſpenſatory, under the Title of *Pulvis Antilyſſus*; and is the celebrated Remedy publiſhed by Dr. *Mead*, with ſome Variation in the Proportion of the Pepper to the other Ingredients. The Directions, as made public, are, firſt, to take away nine or ten Ounces of Blood, and then to uſe the following Medicine:

Take of powder'd Aſh-colour'd Liverwort, four Drams; and of the Powder of black Pepper, two Drams: Mix theſe together, and divide into four Doſes, one of which is to be taken faſting, for four Days ſucceſſively, in half a Pint of tepid Cows Milk. After taking theſe four Doſes, the Patient is to be put, faſting, every Morning, for a Month, either into a cold Bath, a cold Spring, or a River. Let him immerſe the whole Body, and remain in it, with his Head above Water, not longer than half a Minute, if the Water is exceſſively cold: Then let him bathe thrice a Week, for fifteen Days.

The Opiate of *Scribonius Largus* is thus directed:

Take of *Syrian* Spikenard, of Saffron, of Myrrh, of Coſtus, of Cinnamon, of Camel's Hay, of white Pepper, of long Pepper, of Caſtor, of Galbanum, of the Reſin of Turpentine, and of Opium, each three Drams; of white Henbane, two Drams; of Aniſe, one Dram; of the Seeds of Smallage, and Gum Tragacanth, each ſix Drams; of *Athenian* Honey, one Sextarius; and of *Falernian* Wine, one Ounce. In this latter the Tragacanth, and the Opium, are to be macerated: And, next Day, the other Ingredients, being bruiſed, are to be mixed with the Galbanum, the Honey, and the Roſin, which are to be melted over a Fire, in an earthen Veſſel: Then the dry Ingredients are to be ſprinkled in, and, if neceſſary, a little Honey may be added: and, that the whole Mixture may acquire the Thickneſs of a Cerate, it is to be again put on the Fire, and ſtir'd with an aſhen Spatula. This Medicine is to be boil'd, till it has aſſum'd a ſaffron Colour; then the Ingredients, which are macerated in the Wine, are to be added, and the Antidote kept for Uſe, in a glaſs Veſſel.

The Bulk of an *Egyptian* Bean, of this Medicine, is to be exhibited in Water. It removes Diſorders of the Stomach, eſpecially when accompanied with Fluxes; it alſo contributes to the Removal of that Species of Diſorder in the Eye, called *Epiphora*; and cures Gripes, Inflations of the Colon, Coughs, Pains of the Breaſt, and Liver. It is alſo good againſt Poiſons, and the Bites or Wounds of Serpents. The Part bit by a mad Dog, or wounded by a Serpent, is to be kept long exulcerated, and the Formation of a Cicatrix is to be prevented, that the Poiſon may be the more effectually diſcharg'd: For this Purpoſe ſuch things are to be externally applied, as exulcerate ſound Parts of the Body, ſuch as Garlick, Dittander, Celandine, *Bayrachium*, Muſtard, Squills, and Onions, with Vinegar. The Bark of the *Caprificus*, triturated, and applied by itſelf, is, alſo, excellent for this Purpoſe; and *Laſer*, by itſelf, does the ſame. *Scribon. Larg.* 172.

Pliny gives the following Account of the Diſcovery of the Virtues of the Root of the Dog Roſe-tree.

The only Remedy for the Bite of a mad Dog, and which was but lately diſcovered, by ſomething like an Oracle, is the Root of the Wild Roſe, which is called *Cynorrhodos*. *Pliny*, *Lib.* 8. *Cap.* 41.

It lately happen'd, that a Woman, who had a Son that was a Soldier in the *Prætorian* Guards, was admoniſhed, in a Dream, to ſend the Root of the Wild Roſe, which they call *Cynorrhodos*, and which ſhe had obſerved, but the Day before, as it were, courting her, with its pleaſing Aſpect, from among the Shrubs, to her Son, then making the Campaign among the *Lacetani*, in the hithermoſt Part of *Spain*: This Son had the Misfortune to be bit by a mad Dog, and the Hydrophobia was coming upon him. The Preſent came with an Epiſtle from the Mother, conjuring him, by all means, to comply with the divine Admonition. The Succeſs juſtified the Oracle, and the Man's Life was preſerved, though his Caſe was look'd upon to be deſperate; and the ſame Remedy has been always found ſucceſsful in the like Exigence. *Pliny*, *Lib.* 25. *Cap.* 2.

Boerhaave, in his Aphoriſms, treating of the canine Madneſs, adviſes us, not to deſpair of diſcovering a peculiar Antidote againſt this ſingular kind of Poiſon: And this, ſays he, we are encouraged to hope for, from the certain Inſtances we already have of Remedies effectual againſt particular Sorts of Poiſons.

This, I believe, is applicable to moſt, perhaps all, other Diſtempers, at preſent eſteem'd incurable, as well as to the Hydrophobia; for I am firmly perſuaded, that the ſame Providence which has thought proper to inflict Diſtempers upon Mankind, has, at the ſame time, taken care to furniſh us with Remedies adequate to their Cure; and that theſe might be diſcovered by a diligent Inveſtigation, provided our Reſearches were directed with Prudence, and our Induſtry equal to the Task.

Encouraged by this way of thinking, ſomewhat more than ten Years ago, I had a mind to try what Effect Mercury would have upon Animals under canine Madneſs. And as my Endeavours to diſcover a Cure for this hitherto terrible Diſtemper were crown'd with a greater Degree of Succeſs than I could reaſonably hope for, I delivered in a Memorial to the Royal Society, in 1735. containing an Account of ſome ſucceſsful Experiments; and I afterwards gave ſome more Caſes, in a Pamphlet, publiſhed upon the ſame Subject.

The firſt Experiment was made upon two large Fox-hounds, in *February* 1731-2. They were ſo far gone as to refuſe Food of all ſorts, particularly Fluids; they ſlavered much, and had all the ſtrongeſt Symptoms of an Hydrophobia. At Night twelve Grains of the *Turpeth Mineral* were given to each of the Dogs, which vomited and purged them gently. Twenty-four Grains were given to each, twenty Hours after, and forty eight-more after the ſame Interval. The Dogs ſalivated conſiderably, and ſoon after lapt warm Milk. At the End of twenty-four Hours more, twenty-four Grains were repeated to only one of the Dogs; and, after this Doſe, he lay upon the Ground, ſalivated extremely, was in great Agonies, and had all the Symptoms of a Salivation too precipitately raiſed, which he recovered, and lived many Years after. The other Dog relapſed, and died.

As the greateſt Part of the reſt of the Pack were ſuſpected to have been bit, ſeven Grains of the *Turpeth* were adminiſtered to each of them, for the firſt Doſe; and twelve more, after twenty-four Hours Diſtance, which was repeated every other Day, for ſome time, and likewiſe at the two or three ſucceeding new and full Moons. From this time the Pack continued ſound; and, though ſeveral were afterwards bit by ſtrange Dogs, the *Turpeth* always prevented any ill Conſequences.

The ſame Experiment has been made ſince, upon a Multitude of Dogs, and never once fail'd, though Dogs bit at the ſame time, and by the ſame Dogs, have run mad after moſt other Methods have been tried.

In 1733. A Girl, about fourteen Years old, had the Calf of her Leg ſo torn by a mad Dog, that the Surgeon was obliged to uſe means to prevent a Mortification from the Bite. She was vomited by the *Turpeth*. Three Days before the next Change of the Moon, the Vomit was repeated; and again the very Day of its changing. The ſame Method was purſued the next full Moon: And the Girl continued well.

In *November* 1734. a Boy, about ten Years of Age, had four Holes made in one of his Legs, by a mad Dog. The Turpeth was given as above, and the Wounds dreſt with Digeſtives; and he continued well. Theſe two liv'd near *Burton-upon-Trent*, and Mr. *Towndrow*, of that Place, was Apothecary.

A young Man of about Eighteen, near *Tamworth*, was bit in the Hand, and many Dogs were wounded at the ſame time in the Town where he liv'd, ſeveral of which ran mad, about ſix Days after the Miſchief was done. Upon this Circumſtance, he applied to Mr. *Wilſon*, Apothecary in *Tamworth*, to whom I had communicated the Succeſs of the Turpeth, in theſe Caſes. The young Man was, at this time, very melancholy and dejected, had Tremors, and ſlept very little for ſome Nights before, though he was not apprehenſive, that the Dog, which bit him, was mad. He had a dry Scab upon his Hand. On applying to Mr. *Wilſon*, he was vomited with emetic Wine.

The next Medicine he took was made according to the following Preſcription:

Take of Turpeth Mineral, twelve Grains; Lapis Contrayerva, one Dram; Venice Treacle, a ſufficient Quantity to make three Boluſes.

Let one be taken every Night, at Bed-time, with four Spoonfuls of the following Julap:

Take

Take of Rue-water, ſix Ounces; Treacle-water, two Ounces; Syrup of Peony, one Ounce and an half; Tincture of Caſtor, two Drams: Mix, and make a Julap.

Upon taking theſe, he ſweated very much, and had two looſe Stools every Day after them; his Tremors went off, and he ſlept better. After this, he went into the Cold Bath, and continued perfectly well.

But what is remarkable in this Caſe is, that the Wound ran a thick digeſted Matter, after this Method, and threw off the Scab like an Eſchar; after which it heal'd of itſelf.

A Boy, about Seventeen, and a Dog, were bit at the ſame Hour, by a mad Fox, which had ſome time before been bit by a mad Dog. The Boy, for ſome little time, took Turpeth Mineral and Camphire, as an Alterative, and remained well: The Dog died mad in ten Days.

A large Hound, that had been bit by a mad Dog, was quite raging on *Monday*; and fourteen Grains of the Turpeth, made up with Butter, were thruſt down his Throat, by means of a Hazle-ſtick. On *Tueſday* he had another Doſe of the Turpeth, and he eat very heartily; on *Wedneſday* the Turpeth was repeated; on *Thurſday* he was unchain'd; and on *Friday* he went a hunting.

A Neighbour's Dog, being mad, came into my Houſe, and wounded a middle-ſiz'd Spaniel Bitch, in ſeveral Parts. Immediately before, and after, he attack'd ſeveral other Dogs in the Neighbourhood. My Spaniel had her Wounds dreſs'd with a Mercurial Ointment, and took, every Day, for a Fortnight together, Turpeth Mineral, in ſmall Doſes, by way of Alterative. She was afterwards dipt, every Day, in cold Water, over Head, and is now alive and well.

As ſome of the other Dogs were much valued, the Tin Medicine was given to them, and ſome other things, commonly eſteem'd Specifics; but, in a Fortnight, moſt of them ran mad, and the reſt were deſtroy'd.

A Gentleman of *Warwickſhire* had an *Iriſh* Wolf-dog, of uncommon Size, which, running mad, met his Daughter, about five Years old, in a Paſſage, threw her upon her Face, and had certainly kill'd her, had not a Garland been fortunately faſten'd to his Collar. A Garland is made of two Hoops, croſſing each other, which, hanging before a Dog's fore Legs, prevents his running after Sheep, or being otherwiſe miſchievous. When I arrived, ſix or eight Hours after the Accident, I found the Dog raging; and was inform'd, that her Cap had been pull'd off, her Hair very much diſorder'd, and that the Dog had her whole Head ſeveral times in his Mouth. We were not, indeed, certain that ſhe was bit, though there were ſeveral Scratches on the back Part of her Head; but, poſſibly, they might be made by the Comb. I directed for her Turpeth Mineral, in ſmall Quantities, loaded with Camphire; which diſorder'd her ſo much, that I was oblig'd, inſtead of it, to give Pills made with crude Mercury, divided with Turpentine, and Pilulæ Ruffi. She afterwards us'd the Cold Bath for ſome time, and continued perfectly well.

A Boy, about Fourteen, was brought to me, whoſe Arm had been much torn by a mad Dog, about ten Days before: His Wounds look'd very livid. He took the Turpeth, in large Quantities; his Wounds heal'd, and he continued well. Another Boy, who had been bit by the ſame Dog in the Head, and had not taken this Precaution, died mad in a very few Days.

I have, ſince, had ſo many certain Examples of the Efficacy of Mercury in preventing and curing an Hydrophobia, that I cannot doubt of its being, at leaſt, as infallible in ſuch Caſes, as any one Medicine can be in any Diſtemper.

About ſix Years ago, the late Mr. *John Douglas* ſent me a Letter, and in it incloſ'd a printed Half-ſheet, containing Inſtructions for the Prevention and Cure of the Hydrophobia. In this Paper he quotes *Deſault*, an Author I, at that time, had neither ſeen nor heard of, which Mr. *Douglas*, at my Requeſt, ſent me a few Months after.

As the Method, which *Deſault* propoſes, and the Caſes which he gives, ſtrongly confirm the Efficacy of Mercury, it will not be ſuperfluous to inſert a Part of what he ſays upon this Subject, omitting his Theory, and whatever elſe ſeems of leſs Importance.

The Remedy, which I have tried, ſays he, with conſtant Succeſs in the Hydrophobia, is a Mercurial Ointment, made of one third Part of Mercury reviv'd from Cinnabar, one third Part of human Fat, and as much of Hog's Lard.

One or two Drams of this Ointment at a time ſhould be rubbed, by Intervals, or ſucceſſively, upon and about the Wound.

When a Perſon comes to me immediately after the Bite of a mad Creature, 1. I ſend him to bathe in the Sea; not that I have any Dependence upon its Efficacy, but, as it is authorized by public Opinion, it raiſes the Patient's Confidence, calms his Mind, and abates the great Fear which diſturbs him Night and Day.

2. Immediately after his Return, I order him one Dram of *Palmarius's* Powder in White-wine, to which I have added Coralline, an excellent Anthelmintic. Thoſe who cannot bear Wine, may take it in warm Water. This Doſe muſt be repeated every Morning, for thirty Days, by thoſe who have receiv'd a conſiderable Wound by the Bite; but only for twenty Days by thoſe who had no more than a few Holes made with the Teeth.

3. From the firſt Day of uſing the Powder, I order a Friction of Ointment, to be adminiſter'd as above directed. At firſt, the Friction muſt be repeated every other Day; after the third time, every third Day; and, after the ſixth, every fourth, till two or three Ounces of Ointment have been us'd; the Quantity of which ought to be proportioned to the Strength, Age, Temperament, Sex, and Bite.

But when the Patient comes ſeveral Days after the Bite; to prevent the Rabies, I order him to make the Frictions every Day, to four or five times, and increaſe the Doſe of the Powder. Then I interpoſe a Day or two, to avoid a Salivation; though I have often thought, a ſlight Ptyaliſm could not but produce a good Effect; for the Poiſon of the Rabies adheres to the Saliva; and, as Mercury naturally tends to the Mouth, doubtleſs the ſovereign Antidote of ſo many contagious Poiſons would likewiſe deſtroy that of the Hydrophobia.

4. I allow the Patient to wear Amulets about his Neck, and to apply any ſuch trifling Remedy, to which he is adviſed, provided they do not weaken the Virtue of my Powder and Ointment; becauſe they ſerve to pacify the Mind, which is a material Point.

5. I permit him to eat his uſual Meals, prohibiting all Exceſſes; and Wine I allow him, in Moderation, which inſpires him with Courage, and diſpels his tormenting Fears. I take care, that they be not left alone, and deſire their Relations to keep them Company, forbidding them to mention Madneſs, or mad Creatures. And I have found Muſic, while it laſted, ſuſpend their Horror and Sadneſs.

A mad Wolf attack'd, before Day, two Dogs, belonging to *Pey Dumeniu*, of the Pariſh of *Souſſans*, at *Mendoc*, the Farm belonging to M. *de Latour Demons*. The Engagement occaſioned a great Noiſe, which waked *Dumeniu*, who run out, in his Shirt, to help his Dogs; and the Wolf bit him in both his Hands, and his Arm. His Son, named *Couſiot*, runs out alſo, in his Shirt, to the Aſſiſtance of his Father, whom the Wolf leaves, and bites the Son ſeverely in the Arm. The Father, though wounded, came to the Relief of the Son; and the Wolf, running away, meets a Neighbour, one *Jean Guiraud*, whom he bites in the Arm, making four large, beſides ſeveral ſmall Openings. *Guiraud*, ſeizing the Animal by one of his hind Legs, made him quit his Hold. The Wolf purſues his Courſe, and afterwards bites one *Criq*, a Shepherd of M. *Brethonneau*. At laſt, the Animal was kill'd. The four wounded Men go to bathe in the Sea, and return with ſome Confidence of their Cure.

Some Days after, *Pey Dumeniu* feels a numb'd Pain about his Scars, which harden'd, and roſe like Embroidery; and, ſoon after, he and *Criq* were ſeiz'd with all the Symptoms of Madneſs, and in that Condition they both expir'd.

Couſiot, having ſeen the dreadful Death of his Father, expects the ſame unhappy Fate; and begins to perceive a Pain, and a hard Swelling in his Cicatrices. *Jean Guirard*, his Companion, is in the ſame Caſe. M. *Joutard*, Merchant, of *Caſtlenau*, immediately ſends them to me. I was ſurpris'd at the Largeneſs of the Wounds, and, from their Appearance, did not queſtion but Madneſs would ſoon enſue, if not prevented by an immediate Remedy.

I made them preſently anoint the Cicatrices, and the whole Arm, with a Dram and an half of Mercurial Ointment, which was repeated three Days ſucceſſively; then interpos'd a Day; and after the fifth Friction, two Days; and order'd, every Day, a Dram and an half of *Palmarius's* Powder.

After the third Friction, the Cicatrices grew flat and ſoft; the Pain went off; their Courage return'd; their Minds reſum'd their natural Tranquillity; and, at laſt, being perfectly cur'd, they return'd again to the Plough.

Can there be a ſtronger Inſtance, than this, of the Efficacy of Mercury in curing the Hydrophobia? Four Men are bit the ſame Day, and the ſame Hour, by the ſame Animal; two of them die of Madneſs, and the remaining two perceive the ſame Symptoms which foreboded Madneſs to the others; but Mercury ſecures them, aſſiſted by *Palmarius's* Powder.

REMARKS.

1. Old *Dumeniu* was bit in both his Hands, in the Arm and Thigh; the Number of his Wounds might accelerate his Madneſs; beſides, as he was in his Shirt, they were made in Parts uncloath'd.
2. In the Conſternation the two Patients, who came to me, were in, I omitted nothing to raiſe their Courage; and even gave them my Advice and Medicines *gratis*, to ſhew them, by not being mercenary, how confident I was of Succeſs.

3. As in the Venereal Diſeaſe Buboes, and Cicatrices, which grow hard and ſwell, are manifeſt Signs of the Pox; ſo the Swelling, Pain, and Hardneſs of their Cicatrices foretold, ſome Days before, that Madneſs was approaching. The Venereal Diſorder is contracted by the Intromiſſion of the Poiſon from one Body to another; ſo is the *Hydrophobia*. The Venereal *Virus* is ſome time before its Symptoms appear; the ſame Caſe happens in the Rabies. Authors obſerve, that the Venereal Diſtemper has concealed itſelf many Years before it appear'd; the ſame Obſervation has been made in the *Rabies*. Every one who expoſes himſelf to receive the Infection from Women, does not catch it; ſo all thoſe, who are bit by mad Dogs, do not contract the *Hydrophobia*. All theſe Strokes of Reſemblance, between the two Diſtempers, are ſo many inconteſtable Proofs of the Uſefulneſs and Efficacy of Mercury in the *Hydrophobia*.

As a farther Confirmation of the Efficacy of Mercury in the canine Madneſs, I muſt take notice of a Medicine which I hear has been ſucceſsfully uſed, both as a Preſervative from, and a Cure for, the *Hydrophobia*.

Mr. *Cobb*, of *Buſſelton*, near *Briſtol*, a Gentleman formerly in the Service of the *Eaſt-India* Company, brought from *Tonquin* a Sort of red Powder, which is much celebrated in that Country as efficacious in this Diſtemper. Upon Examination, this Powder proved to be native and factitious Cinnabar; and, according to the beſt Information I can get, Lady *Frederick* brought the ſame Remedy from the ſame Place. The Preſcription is as follows:

Take of native and factitious Cinnabar, each twenty-four Grains; Muſk, ſixteen Grains. Let them be powdered and mixed well together.

This Powder is to be taken all at once, in a Tea-cup full of Arrack; and is ſaid to ſecure the Patient for thirty Days: After which time, the Doſe is to be repeated in the ſame manner; but it ſhould be done as ſoon as poſſible after the Bite is received.

But, if the Patient has any Symptoms of the Diſeaſe upon him, the ſecond Doſe muſt be repeated three Hours after the firſt; and this is ſaid to be ſufficient for a Cure.

Mr. *Cobb* communicated this to Mr. *Roberts*, an Apothecary in *Pall-Mall*, who publiſhed the Receipt in ſome of the daily Papers; and, I hear, Sir *Benjamin Wrench*, of *Norwich*, has made ſome Experiments with it ſucceſsfully, as well as many others.

The original Receipt was given me by another Hand in this Form:

Take two Candarines of the beſt Muſk, five Candarines of native Cinnabar, and five Candarines of Vermilion; grind them fine, and mix them in a Cup of ſtrong Arrack or Brandy.

A Candarine of China is the ſeventy-ſecond Part of a *French* Crown or Dollar, and the eightieth Part of an *Engliſh* Crown; ſo that one phyſical Ounce is rather more than ſeventy-ſix Candarines.

Factitious Cinnabar is made of three Parts Mercury, to one of Sulphur; and one Pound of good native Cinnabar yields fourteen Ounces of Mercury; and therefore it ſeems, that the good Effects of this Medicine ought to be principally, if not entirely, aſcribed to the Mercury. As to the Muſk, it is an animal Subſtance, and conſequently of an alcaline Nature; and as Alcalis have, in all Ages, been recommended in this Caſe, it ſeems to be, at leaſt, not prejudicial, excepting in the Largeneſs of the Doſe, when taken in this Climate, by People much leſs uſed to Perfumes than the Orientals, who, probably, gave Muſk with the Cinnabar, in order to render the Medicine more agreeable.

That I may omit nothing which can contribute to ſet the Efficacy of Mercury againſt this ſort of Madneſs in its true Light, I muſt confeſs, I heard it was made uſe of once, without Succeſs; but I was ſoon after informed by the ſame Gentleman, who had firſt tried the Experiment upon his own Hounds, that a great Number of Hounds had run mad in the Gentleman's Kennel where the Remedy had failed, and, probably, had bit every Dog in it; that the Servants, being afraid to come near the Dogs, to give them the Medicine properly, threw a great Number of Balls, made with *Turpeth mineral* and Butter, into the Kennel; by which means ſome got more than their Share, and others none; ſo that thoſe which got none went mad, and bit the others again. He added, that he had not the worſe Opinion of the Medicine for this Trial, having never known it to fail, in a Multitude of Experiments made by himſelf.

HYDROPHTHALMIA, ὑδροφθαλμία, from ὕδωρ, Water, and ὀφθαλμὸς, an Eye, an Hydrophthalmy, is a Diſeaſe of the Eye, when it is diſtended by Water, or Serum, to an enormous Bulk, and ſwells out beyond its Orbit. See OCULUS.

HYDROPHTHALMION, from the ſame as the preceding, is the Part under the Eye, which uſually ſwells in cachectic and hydropic Caſes. *Blancard.*

HYDROPHYLLON, Water-leaf.

The Characters are;

It hath a bell-ſhaped Flower, conſiſting of one Leaf, and cut into ſeveral Segments; from the bottom Part of the Flower ariſes the Pointal, which afterward becomes a Fruit, opening in two Parts, incloſing Seeds of the ſame Shape as the Veſſel.

We have but one Kind of this Plant; which is,

Hydrophyllon; Morini. *Fonteq. Hort.* WATER-LEAF OF MORINUS.

There are no medicinal Virtues attributed to this Plant at preſent, that I know of.

HYDROPHYSOCELE, ὑδροφυσοκήλη, from ὕδωρ, Water, φύσα, a Flatus, and κήλη, a Hernia, is a Hernia proceeding from Water mix'd with Flatulences. *Caſtellus.*

HYDROPICA (*Medicamenta*) Medicines againſt a Dropſy. *Blancard.*

HYDROPIPER, a Name for the *Perſicaria urens.*

HYDROPNEUMOSARCA, ὑδροπνευμόσαρκα, from ὕδωρ, Water, πνεῦμα, Spirit or Wind, and σὰρξ, Fleſh, is a Humour, or Abſceſs, produced from a Mixture of aqueous, flatulent, and carnous Subſtances. *Caſtellus.*

HYDROPOIDES, ὑδροποιδὴς, from ὕδρωψ, a Dropſy, and εἶδος, a Reſemblance, is applied to aqueous Excretions, ſuch as are familiar to thoſe in Dropſies. The Word occurs in *Hippocrates, Lib. 4. de Morb.* and in ſome other Places.

HYDROPOTA, ὑδροπότης, from ὕδωρ, Water, and πότης, a Drinker. A Water-drinker. There is an Obſervation of *Helwigius* in *Bonet. Med. Septentr.* of one who contracted a Dropſy by drinking Water, and was cured by drinking Wine. *Caſtellus.*

HYDROPS.

That a Cachexy was a Diſorder next in Degree to a Dropſy, was unanimouſly maintain'd by the Antients; for which Reaſon, in their Works, they generally treated of the latter, immediately after conſidering the former; but by none of them has the Analogy between theſe two Diſorders been more judiciouſly ſhewn, than by the incomparable *Aretæus*, who, in the firſt Chapter of his ſecond Book of *Chronical Affections*, uſes the following Words: "A "Dropſy in any of the more noble and important Viſcera ren- "ders the whole Body of a bad Habit, ſo that no Part is free "from its Share of the Misfortune; for Water, fluctuating in "the lower Part of the Abdomen, is not properly what we call "a Dropſy, ſince the Fault is not lodged there: But, when the "Diſorder is ſucceeded by Tumor, Inflation, and Unſeemlineſs of "Colour, that Diſpoſition, in conſequence of which the Juices "are colliquated, and converted into Water, is a Dropſy, ſtrictly ſo "call'd; for tho', in a Dropſical Patient, there ſhould be a "ſpontaneous Diſcharge of the Waters, or tho' thoſe ſhould be "artificially evacuated, by making Inciſions in the Præcordia, "yet the Dropſy is not, by theſe means, removed, but keeps "its former Seat: The principal Cauſe, therefore, of this Diſ- "order, is a Cachexy, or bad Habit of Body." By this Paſſage the celebrated Author inſinuates, that the primary Diſorder is a Cachexy, or bad Habit of Body, which is attended with an aqueous Tumor or Swelling, as its Symptom and Effect; ſince, tho' this was removed, the Diſorder would ſtill remain. In the ſubſequent Part of the Chapter, he continues thus: "Thoſe la- "bouring under an Anaſarca are of a Colour reſembling that "which reſults from a Mixture of black and green, and their "Veins are of a dark or obſcure Colour." Now theſe Symptoms are very familiar to thoſe who labour under a Cachexy. Beſides, a Dropſy is produced by the ſame Cauſes, from which a Cachexy draws its Origin; as is ſufficiently obvious, not only from the Teſtimonies of Authors, but alſo from the more ſacred and inviolable Sanction of Experience. See CACHEXIA.

Since, then, a Cachexy is of ſo near Affinity to a Dropſy, that the former is juſtly accounted the Cauſe and Foundation of the latter; we may juſtly define a Dropſy a highly depraved Habit of Body, with reſpect to all its Parts and Functions, accompanied with a preternatural Stagnation and Collection of ſerous Humours, either in the whole Body, or in ſome particular Cavities of it.

That the vital, natural, and animal Functions, are, in a Dropſy, highly vitiated and injured, is ſufficiently obvious from its Symptoms, which are judiciouſly and accurately collected by *Aretæus* in the before cited Part, in the following Words: "All Patients "labouring under a Dropſy are pale, and afflicted with a Diffi- "culty of Breathing, and Cough. They are, at certain times, "ſlow, lazy, and have an Averſion to Aliments; and, if they eat "any thing, tho' in a ſmall Quantity, and free from a flatulent "Quality, they are, nevertheleſs, much inflated and diſtended: "Their Skins are entirely deſtitute of all Moiſture; neither can "a Sweat be raiſed on them by warm Baths. Beſides, they are "of a whitiſh Colour, and effeminate; their Sleeps are oppreſſive, "troubleſome, and ſhort; they are ſubject to Deliriums, anxious "and uneaſy about Trifles, and exceſſively fond of living."

A Dropſy, almoſt from the very Infancy of Medicine, has been divided into three Species, *Anaſarca*, *Aſcites*, and *Tympanites*:

panites: The firſt is, when the entire Body is tumid; the ſecond, when the Abdomen is turgid, and a Lymph, ſtagnating within its Cavity, overflows the Viſcera; and the third, when the Abdomen is not ſo ſoft as to yield to the Impreſſions of the Fingers, but appears highly inflated and hard. But *Aretæus* has added a fourth Species, and made a certain Difference between an Anaſarca, and a Leucophlegmatia, imagining, that tho', in both theſe Species of Dropſies, the Face and Arms are tumid; and that in a Leucophlegmatia, ariſing from a Redundance of Phlegm, as well as in an Anaſarca, the whole Body is filled, and that all the Parts ſuperior and inferior, the Breaſts not excepted, become tumid, which principally happens to thoſe who are young, robuſt, and in the Flower of their Age; yet, in an Anaſarca, the Fleſh is colliquated into a kind of ſanious Juice, reſembling that which is diſcharg'd from Members violently contus'd. Beſides, he maintain'd, that a Leucophlegmatia was a milder, and more eaſily cur'd, Species of Dropſy; becauſe there were various ways, by which it might be removed, ſuch as by Sweat, Urine, and, ſometimes, copious Stools; whereas, in the other Species of Dropſies, eſpecially thoſe of the complicated Kind, the Phyſician muſt change the whole Habit of the Body, before he can cure the Patient. By this peculiar Diſtinction, of ſingular Uſe in Practice, *Aretæus* ſeems to have inſinuated, that in a Leucophlegmatia, as well as in an Anaſarca, there was a large Quantity of Water, ſtagnating between the Skin and the Muſcles; but that, in an Anaſarca, the Blood, by which the Muſcles are nouriſhed, was, at the ſame time, highly corrupted, and conſequently the Diſorder proportionably more terrible. This beautiful Diſtinction is ſtill more conſpicuouſly made in the ſame Chapter, in the following Words: "Water between the Muſcles "and Skin is ſometimes form'd immediately after liberal Draughts "of cold Liquor; when, for Inſtance, any one under the In"fluence of exceſſive Thirſt drinks large Quantities of cold "Water, and the Liquor is afterwards conveyed to the Perito"næum, by which the Heat of the Stomach and Abdomen are "abated. Then the Drops of Water are diſcharged upon the "Ilia, which, being converted into Air, are carried off by Per"ſpiration. When this, therefore, happens, before any of the "Viſcera, or the whole Body, is affected, the Diſorder is pro"portionably the more eaſily cured."

To declare my Sentiments freely, Experience and Fact oblige me to maintain, with *Aretæus*, that a Leucophlegmatia is a gentler, and more eaſily cured, Species of Dropſy, than an Anaſarca. Theſe two are indeed generally confounded by modern Phyſicians; whereas by *Aretæus*, and *Cœlius Aurelianus*, the former of theſe is ſtyled *Intercus*, becauſe the Water collected ſtagnates in the Cellulæ of the Fat, and, by that means, acquires a paliſh Colour; whereas in an Anaſarca, or Hypoſarca, in conſequence of a greater Corruption of the Blood than in a Leucophlegmatia, the Colour of the Skin and Fleſh is more unſeemly, and appears of a blackiſh-green Hue; which is a manifeſt Sign, that the Viſcera ſubſervient to Sanguification, and the Depuration of the Humours, ſuch as the Lungs, Liver, and Kidneys, are either too much relaxed, or infarcted, and conſequently leſs fit for performing their natural Functions. When, therefore, a Leucophlegmatia is complicated with an Anaſarca, a more terrible Species of Dropſy is produced, ſince the former is only the Beginning, and the latter the perfect State or Height of the Diſorder.

But a ſtill more formidable, and almoſt incurable, Species of Dropſy, is that called Aſcites; the Symptoms of which are accurately enumerated by *Aretæus*, in the Part already quoted: "In Patients, ſays he, labouring under an Aſcites, the Ilia "are tumid, and the Feet inflated; whereas the Face, the "Arms, and all the other Parts of the Body, are extenuated. "The Teſticles become tumid, and the Prepuce, and whole "Penis, appear to be wreathed, as it were, by reaſon of the "Inequality of the Swelling. Upon reclining the Body to either "Side, the Water produces both a Tumor and Fluctuation in "the reclined Part, and the Noiſe of the fluctuating Liquor is "heard." From theſe Symptoms we may infer, that in conſequence of the large Number of ruptur'd lymphatic Veſſels, there is a copious Extravaſation of Lymph, and as it were an Inundation of the Viſcera, by which they are, in Proceſs of Time, totally corrupted.

As for that Species commonly called Tympanitis, and the dry Dropſy, in which the Abdomen, highly tenſe and inflated, ſounds like a Drum, upon being ſtruck with the Hand, we muſt obſerve, that it is rather a Symptom of an Anaſarca and Aſcites, than a diſtinct and ſeparate Species of Dropſy; but if it accompanies theſe Diſorders, as it generally does an Aſcites, it denotes a highly deplorable and incurable Caſe, which, ariſing either from Flatulencies pent up in the Inteſtines, or from the Vapours exhaled from the Waters extravaſated in the Abdomen, ſo deſtroys the Tone of the abdominal Muſcles, that they become entirely languid.

But, that we may the more accurately inveſtigate the Nature and Genius of a Dropſy, we ſhall deſcribe its Beginning, trace its Progreſs, and enumerate the various Symptoms with which it is attended: Firſt, then, a Swelling ſeizes the Feet, which, in Proceſs of Time, riſes to the Thighs, the Groin, the Ilia, the Abdomen, and the Pit of the Stomach. Sometimes the Abdomen, turgid with Water, is ſo exceſſively prominent, that the Patient cannot ſee his own Feet, but dreads a Rupture of his Abdomen. In Proceſs of Time a Quantity of Water falls down into the Scrotum, and frequently diſtends it ſo much as to render it as large as one's Head. Not only the Scrotum, but, alſo, the Prepuce, and Penis, are ſo ſwell'd, as to become intorted, and prevent the free Diſcharge of the Urine. In which Caſe 'tis perceived, that the Water, which diſtends the Penis, is convey'd from the adjacent Region of the Groin, and inſinuates itſelf between the Skin and Muſcles of the Penis; whereas the Water which diſtends the Scrotum, is generally convey'd from the Abdomen through the Proceſſes of the Peritonæum. Sometimes, alſo, eſpecially in Patients labouring under an Anaſarca, and Leucophlegmatia, it happens, that the aqueous Humour collected about the Groin, inſinuating itſelf under the common Integuments of the Teſticles, proves the Cauſe of a Swelling of the Scrotum, whilſt the Abdomen, in the mean time, is entirely free from Water. Nor, in all dropſical Patients, does the Scrotum become tumid, ſince I have known ſome Patients die of a Dropſy, without any Swelling in that Part. In Women, alſo, the Groins become tumid, and the Vagina is ſometimes ſo diſtended by the Waters, as to fall down. Beſides, a common Symptom of dropſical Patients is a Difficulty of breathing; which being increaſed by violent Motion, and eſpecially in the Night-time, by reaſon of the eaſy Aſcent of the Water in the Abdomen, in conſequence of the reclining Poſture of the Body, frequently induces a Danger of Suffocation. Hence, if the miſerable Patients have a mind to breathe freely, they are obliged to ſhift their Poſture, and rather ſit erect, than lie in Bed, as other Perſons do. They are, alſo, afflicted with a Cough, which is generally of the dry Kind, and without Expectoration; whilſt at the ſame time, an acrid, ſaline Lymph, which is peccant throughout the whole Body, in a particular manner, ſtimulates and irritates the ſlender Fibres of the Larynx, and Bronchia.

'Tis obſervable, that, in an Anaſarca, the Urine is diſcharg'd thin and white, whereas in an Aſcites it is evacuated in ſmall Quantities, but thick, and with a copious red and lateritious Sediment. In the Beginning of a Dropſy, the Quantity of Urine, for the moſt part correſponds to that of the Liquor drank; the Body, alſo, is ſoluble, and the Appetite good; but all theſe lucky Circumſtances gradually fail, in proportion as the Diſeaſe advances. Beſides, the Patient is rack'd with a violent and inſatiable Thirſt, ſo that the Poet might juſtly ſay,

Quo plus ſunt potæ; plus ſitiuntur Aquæ.

The Reaſons why a Dropſy is accompanied with this inſatiable Thirſt, are principally theſe: The Saliva, in conſequence of an Obſtruction of the ſalival Glands, can no longer lubricate and moiſten the parched Fauces; beſides, the ſmall Quantity of Saliva, which is diſcharged from theſe Glands, is not only viſcid and ſaline, but alſo immediately dried up by the febrile Heat; for the worſt State of the Diſorder is almoſt always accompanied with a ſlow and continual Fever, which may be ſufficiently known from the ſmall and frequent Pulſe, and which, gradually preying upon the Fleſh of the ſuperior Parts, and impairing the Strength, at laſt puts an End to the Patient's Life. In an Anaſarca, as well as in an Aſcites, there is often a conſiderable Itching perceiv'd in the membranous Parts of the Feet, which are alſo obſerv'd full of livid Spots, and Veſicules, which latter, when open'd, diſcharge a Serum, that, by its Acrimony, corrodes or inflames the adjacent Parts. Hence malignant Ulcers are frequently produced, which, according to *Hippocrates*, in the eighth Aphoriſm of his ſixth Section, are not to be cured and conſolidated without the greateſt Difficulty; for the Afflux of acrid Serum is too great to be mitigated by lenitive and drying Medicines. And this Species of Dropſy is generally accompanied with a Fever, which draws its Origin from an Inflammation of the Inteſtines, brought on, in a great meaſure, by draſtic Medicines; and a Horror and Rigor, ſucceeding, are Signs that the Viſcera are ſphacelated, and fatally corrupted.

We now proceed to take a View of the Phenomena obſervable in diſſecting thoſe who have died of Dropſies: And, firſt, as for the Liver; we know, from the *Miſcellan. Nat. Curioſ.* *Bonetus's Sepulchretum*, and the Works of other Anatomiſts, that this Organ, in dropſical Perſons, is, for the moſt part, found diſorder'd: Sometimes it is pale, and almoſt without Blood; at other times it is tumid, black, denſe, ſcirrhous, full of Hydatides, and, together with the Gall-bladder, contains either a Matter which is aqueous, and leſs bitter, or thick, and concreted, as it were, into ſmall Stones. *Horſtius*, in *Lib.* 3. *Obſ.* 9. and *Tulpius*, in *Lib.* 2. *Obſ.* 36. inform us, that, in young Perſons, they have obſerv'd the Liver contracted, as it were, into a Globe, and indurated to ſuch a Degree, that it made a Noiſe upon the Application of the Knife, when they endeavour'd to make an Inciſion in it; and, that, in a Tympanitis, they obſerv'd it dry and torrefied, like corrugated Leather. But *Ruyſch*, in his *Obſervations*, and *Bonetus*, in his *Sepulchretum Anatomicum*, furniſh us with Inſtances in which this Organ has been found ſound, and, apparently, free

from every Diſorder. Of this, alſo, *Riverius* ſeems to give us an Inſtance, in *Obſervat. Communicat.* 4. who, in a certain dropſical Patient, found the Liver in tolerable good Order, but the Spleen corrupted, and almoſt the Whole of its Subſtance reſembling black Bile. With reſpect to the other Viſcera, it is to be obſerv'd, that the Omentum, in diſſecting thoſe who have died of an Aſcites, is generally found either corrupted and ſphacelated, or extenuated and conſum'd: The Pancreas is generally found ſcirrhous, and the Meſentery diſtended to a large Bulk, in conſequence of the Veſicles filled with Water generally adhering to it, and its Glands ſwell'd to the Bulk of a Bean: Of this there is a memorable Inſtance, in the 35th Obſervation of the fourth Book of *Tulpius:* Nor do the Stomach and Inteſtines eſcape the Fury of this Diſorder; for I have obſerv'd them inflam'd, ſphacelated, and corroded. In a Tympanitis I have, alſo, obſerv'd the Stomach and Inteſtines turgid with Flatulences, as well as the Cavity of the Abdomen. Inſtances of this Kind are given by *Felix Platerus*, in *Lib.* 3. *Prax. Cap.* 3. *Obſ.* 50. and by *Hercules Saxonia*, in *Prælect. Part.* 2. *Cap.* 27. With reſpect to the Stomach, it is obſervable, that its interior Coat is full of gibbous Knots, as large as ſmall Nuts, which ſeem to be nothing but thoſe miliary and round Glands, which, in a natural State, are ſmall; and which, at other times, are obſerv'd ſcatter'd up and down the villous Coat, on that Side where it adheres to the nervous Coat.

Nor are the Viſcera of the Lower Belly only affected by this Diſorder; but it is, alſo, remarkable, that, in a Dropſy, whether of the Thorax or Abdomen, the Heart, and, eſpecially, its Right Ventricle, is often diſtended to a ſurpriſing Bulk; ſo that, in two Subjects, I found it as large as the Heart of an Ox: With reſpect to this, the *Miſcel. Nat. Curioſ. Dec.* 1. *An.* 5. *Obſ.* 64. and *Bartholin. Cent.* 2. *Hiſtor.* 66. may be conſulted. I can, from my own Experience, affirm, that in all the dropſical Subjects I have order'd to be diſſected, I have, beſides the Diſorders of the Viſcera, found polypous Concretions in the Heart, and its Veſſels; and this is confirm'd by the Obſervations of ſeveral Anatomiſts. A memorable Inſtance, of this Kind, is recorded in *Miſcel. Nat. Curioſ. Dec.* 2. *An.* 5. *Obſ.* 66. where, in a Perſon cut off by an Anaſarca, the Inteſtines, the Omentum, the Pancreas, the Liver, and Spleen, were found perfectly ſound; but, in the Right Ventricle of the Heart, there was a Polypus found, another in the Vena Cava, and another in the Pulmonary Artery; ſo that the Patient, during his Life, had juſt Reaſon to complain of a Rupture in the Right Side of his Heart. In the ſame Work, *Cent.* 9. *Obſ.* 50. we have an Account of the Diſſection of a dropſical Woman, in the Right Ventricle of whoſe Heart there was a Polypus, a Quarter of an Ell long, and running down into the Pulmonary Artery. More Examples of this Kind may be ſeen in the ſame Work, *Cent.* 3. *Obſ.* 117. *Cent.* 8. *Obſ.* 41. and *Decad.* 2. *An.* 6. *Obſ.* 73. Only we muſt obſerve, that where the Veſſels of the Heart are full of polypous Concretions, there is, generally, a large Quantity of Serum found in the Cavity of the Thorax.

As for the Serum collected in the Cavities of the Body, it generally varies, with reſpect to its Quantity, Colour, and Conſiſtence; for ſometimes it is like Water, but ſomewhat thicker, and, when put over the Fire, is concreted into a Jelly; at other times it is yellowiſh, and not unlike the Waſhings of Fleſh. As for the Quantity of the Serum, this alſo varies, in proportion to the Bulk of the Body, and the Length of the Diſeaſe; for ſometimes it has been found equal to thirty, ſometimes to ſixty, and, at other times, to an hundred Pints. But the greateſt Part of this Water, or Serum, is contain'd in the Cavity of the Abdomen, or between the Peritonæum and Muſcles of the Abdomen: But that this Water is ſometimes included in a Sack, form'd in the Duplicature of the Peritonæum, is ſufficiently obvious from anatomical Obſervations; and, of this, we have a memorable Inſtance, recorded by Mr. *Littre*, in the *Memoires de l'Academie des Sciences*, for the Year 1707.

Having thus enumerated the Phenomena obſervable in diſſecting Perſons who have died of Dropſies, we now come to inveſtigate the principal and immediate Cauſes, which generate or produce the Waters. The Antients, who were ignorant of the curious Laws of Hydraulics, ſo accurately obſerved in the human Body, and, eſpecially, of the Circulation of the Blood, aſſigned, as the Cauſe of this, a bad Sanguification, and a Converſion of the Blood to Water, in conſequence of ſome Diſorder in the Liver: But, in our Days, as the Structure of the human Body, and the Laws of the animal Oeconomy, are more accurately inveſtigated, we may, with far better Reaſon, aſſign the following Cauſes for this Effect. In my Opinion, then, a more ſatisfactory Reaſon can hardly be advanced for a dropſical Swelling, than the difficult, ſlow, and obſtructed Circulation of the Blood thro' the Veſſels. This Aſſertion is ſufficiently confirm'd by an Experiment firſt made, ſo far as I know, by the celebrated Anatomiſt *Lower*, who, with a Thread, tied up a large Vein in a live Animal, and ſuffer'd the Ligature to remain for an Hour; upon which he forthwith perceived an œdematous Tumor, in that Part to which the Ramifications of that Vein were diſtributed. Something analogous to this is obſerv'd, when, in order to ſtop violent Hæmorrhages, the Inſtrument, commonly called the Tournequet, is applied; for, if this Inſtrument remains applied for a long time, the Part is gradually raiſed into a Tumor. This is, alſo, illuſtrated by another Experiment; for, if the Subclavian Vein in the Right Arm, for Inſtance, of a dead Perſon, is ſtrongly compreſſed, and a ſomewhat thick red Liquor afterwards injected, by means of a Syringe, into an Aperture made in the Vein of the Hand, the Arm becomes tumid; and, upon laying it open, we find that a large Quantity of the red Liquor has penetrated into the Cellulæ of the Fat, lying under the Skin; for no other Reaſon, than that the injected Liquor, in conſequence of the Reſiſtance made by the Ligature, too much diſtends the Veins running through the Cellular Membrane, and is, at laſt, extravaſated through their Pores.

From theſe Experiments it is, if I miſtake not, ſufficiently obvious, that the true Cauſe of the Swelling of the Body in a Dropſy, of the Secretion of the Serum from the Blood, and of its Stagnation in the Cavities, is a too ſlow and languid Circulation of the Blood, eſpecially through the Veins. The Truth of this Aſſertion will be ſtill more evident, if we conſider, how eaſily the Circulation of the Blood, through the Veins, is ſtopt; and that, principally, for theſe Reaſons. The Motion of the Blood through the Veins, from the inferior to the ſuperior Parts, is, in conſequence of their perpendicular Situation, and the ſtated Laws of Hydraulics, much ſlower than in the Arteries; hence the Veins are not only more numerous, but have, alſo, larger Diameters, than the Arteries: The Coats of the Veins, alſo, are not furniſh'd with ſo ſtrong a ſyſtaltic, moving, and elaſtic Force, as is found in the Arteries: Beſides, the Coats of the Veins are highly ſlender, porous, and, conſequently, capable of allowing a thin Fluid to paſs eaſily through them. Now, if, by means of a Redundance of ſerous Humour, the Tone and Strength of the Veſſels, eſpecially of the Veins, ſhould, in conſequence of their too great Diſtention, be impair'd and weaken'd, the Circulation of the Blood through the whole Body, which regulates all its Functions, and preſerves them entire, muſt neceſſarily become languid, and be diminiſh'd; as is obvious from the Pulſe, which, in this Caſe, is rare, ſoft, and weak. From this languid Circulation of the Blood we deduce the genuine Cauſe and Reaſon, not only of the preternatural Swelling, but, alſo, of the other Symptoms which accompany a Dropſy; ſuch as Wearineſs, Heavineſs of the Body, Liſtleſneſs, and a Diminution of the ſalutary Excretions by Sweat, Urine, and Stool.

Beſides theſe, an inſupportable Difficulty of Breathing is almoſt a perpetual Symptom of every Dropſy, and, ſometimes, riſes to ſuch a Height, as to endanger a Suffocation: This formidable Symptom can hardly have any other Cauſe aſſigned for it, than a too weak ſyſtaltic Force of the Heart and Arteries; in conſequence of which, the Blood, abounding with a viſcid Serum, cannot paſs ſufficiently freely through the minute Ramifications of the Pulmonary Artery and Vein; hence it ſtagnates in theſe Ramifications, and, regurgitating to the Right Ventricle of the Heart, produces a ſtrange Uneaſineſs: And, ſince the principal Office of the Lungs conſiſts in this, that whilſt the Blood paſſes thro' the numerous and minute Veſſels of their veſicular Subſtance, the Lymph and Chyle may be intimately mix'd with its Parts, and impregnated with a kind of ſubtle and elaſtic Air, that thus the Blood may be render'd ſpirituous, fluid, and fit for adding Strength to the Body, hence we may juſtly infer, that a ſlow and languid Circulation of the Blood through the Lungs is the fatal Cauſe of the terrible Symptoms, with which the Dropſy is accompanied; for, by this means, the whole Work of Sanguification is injured, and, inſtead of a Blood ſufficiently florid and temperate, the Veſſels muſt neceſſarily be filled and infarcted with a redundant Serum. The State of the Patient is ſtill more deplorable, when polypous Concretions are already form'd in the larger Veſſels of the Heart and Lungs; ſince, by this means, the Circulation of the Blood through the Veſſels of the Heart and Lungs is not only retarded, and, ſtagnating there, produces various Misfortunes, but, alſo, begins to ſtop in the whole Vena Cava, and all the Parts to which it is diſtributed; hence an incredibly large Secretion of Serum is produced. The more difficult it is to remove this deep-rooted Obſtruction, the more rationally we may conclude, that the Dropſy ariſing from it is of the worſt kind, and not to be cured without the greateſt Difficulty.

Having thus traced the Generation of a Leucophlegmatia and Anaſarca, we now come to conſider that of an Aſcites: In this Species of Dropſy, therefore, I ſhall not heſitate to affirm, that the Liver is principally diſorder'd, ſince the Circulation of the Blood is not ſo ſlow in any of the other Viſcera as in this; and tho' the ſuccuſſory Commotion of the Liver, by means of the Diaphragm, in the Act of Reſpiration, and the Strength of the Coats, with which, from anatomical Obſervations, we know the Vena Portæ to be furniſh'd, ſeem greatly to promote the Circulation of the Blood; yet, when a viſcid Blood is convey'd to the Vena Portæ, this Vein, in conſequence of its wanting both a Pulſation and Valves, with Difficulty tranſmits the viſcid Blood through the numberleſs minute Ramifications of the Vena Cava: Hence a ſtrong Tendency of the Blood to Stagnation and Infarction

farction is brought on. If, therefore, in conſequence of uſing a ſmall Quantity of Drink, a ſedentary Life, a free Uſe of Acids, the Abuſe of ſpirituous Liquors, Hæmorrhages, or Fevers prepoſterouſly cured by Aſtringents, a Redundance or Lentor of the Blood and Lymph ſhould be brought on; or if, in conſequence of many violent Commotions of Mind, and the Shock of preceding Diſeaſes, the Tone of the Liver, and its Veſſels, ſhould be preternaturally weaken'd; theſe Veſſels muſt, of neceſſity, be infarcted, and the due Proportion of their Diameters to the Blood, which ought to move through them, being, by this means, deſtroy'd, it ſtagnates here-and-there, in their Cavities; and its aqueous Part, being ſecreted, fills the lymphatic Veſſels, great Numbers of which are found there: Beſides, the preternatural Spiſſitude of the viſcid Lymph renders its Circulation through the Liver proportionably more or leſs faint and languid. If a pretty thick Lymph, ſecreted from the Blood, ſhould remain in the Liver, and, in conſequence of the Diſſipation of its more fluid Parts, aſſume a proportionably greater Degree of Thickneſs, the Coats of this Organ will become thick, indurated, and, at laſt, degenerate into a Scirrhus; but the Induration will be principally obſervable in the more internal Parts; whereas the Scirrhus will be form'd in the external membranaceous Parts, and the Veſſels lying neareſt to the Surface. That the principal Seat, therefore, of an Aſcites is the Liver, is ſufficiently obvious from the Inſtances of Diſſections already given.

But, beſides the Liver, the other abdominal Viſcera are not entirely free from the Effects of the Diſorder; for *Riverius*, *Schenkius*, *Foreſtus*, and myſelf, have frequently ſeen the Spleen preternaturally large, diſtended with a black Blood, and cover'd with a ſcirrhous Membrane. According to *Rondeletius* and *Peyer* in *Obſervat. Anatom.* the Pancreas is, almoſt in all dropſical Patients, found hard, ſcirrhous, and ſometimes totally conſum'd: The Omentum is putrid and emaciated; the Glands of the Meſentery, Inteſtines, Duodenum, and Stomach, are preternaturally tumid and indurated. In my Opinion, theſe Viſcera receive the Taint from the preternatural State of the Liver, and the too languid Circulation of the Blood through its Veſſels, and that, principally, by reaſon of the ſtrict Union, and intimate Connection, between their reſpective Veſſels; for it is certain, from anatomical Obſervations, that all the Blood, which returns from the Stomach, the Inteſtines, the Meſentery, the Pancreas, the Omentum, and the Spleen, is convey'd into the Vena Portæ, and, by its means, through the vaſcular Structure of the Liver, to the Vena Cava, and the Heart. If, therefore, the progreſſive and circular Motion is ſtopt there, it is abſolutely neceſſary, that the Blood, regurgitating to the abdominal Viſcera, ſhould, in them, produce Stagnations, Infarctions, a ſcirrhous Diſpoſition, and Corruption.

As the Return of the Blood is highly ſlow through the Uterus, eſpecially through the ſpermatic Veſſels, which are contorted, folded up, and divided into various Curls, as it were, like the Tendrils of Vines, which makes its Journey to the Heart ſo much the longer; hence it happens, that in the Uterus, and its Appendages, ſuch as the Fallopian Tubes, and the Ovaria, copious Inundations, and aqueous Tumors, are ſometimes produc'd; for the fluid and aqueous Part never more readily and expeditiouſly ſecedes from the Blood, than when its Circulation through the Viſcera is ſlow and languid, as is obvious in the Liver. And, for this Reaſon, there is no-where a greater Number of lymphatic Veſſels, than in the Subſtance of the Uterus and Liver, and their adjacent Parts; which Veſſels, being diſtended by a copious Congeſtion and Afflux of Lymph, are raiſed into large Veſicles, by the *Greeks* called *Hydatides*, by the Breaking of which a Dropſy is ſometimes ſuddenly generated, and an incredible Quantity of Serum diſcharged into the Cavity of the Abdomen. Thus *Salmuthus*, *Cent.* 1. *Obſ.* 38. informs us, that in a certain Woman, who died of a difficult Labour, he found a large Number of Hydatides in the Confines of the Uterus: And *Pechlinus*, in his 19th Obſervation, tells us, that he ſaw the ſame, in diſſecting a Woman, who died during Geſtation. That in the *Cornua* and Tubes of the Uterus large Quantities of Water are, ſometimes, collected, is ſufficiently confirm'd by *Tulpius*, who, in the fourth Book of his Obſervations, *Obſervat.* 45. gives us an Inſtance of a Woman, who, in both *Cornua* of the Uterus, had about nine Pints of Water and Pus included in a large Number of ſmall Bladders. More Inſtances of this Nature may be found in *Schenkius*, *Lib.* 3. *Obſ.* 6. and 7. in *Rolfinkius de Organ. Genital. Cap.* 20. and in *Sydenham*, *de Hydrope*. This Truth is, alſo, confirm'd by an Obſervation of *Harder*, who tells us, that in a Country-woman not only the Left Ovary contain'd two Pints of a ſaline and fetid Water, but, that there was, alſo, a conſiderable Hydatis or Veſicle full of Water, in the Fallopian Tube, annexed to it. And I myſelf, twenty Years ago, obſerv'd, in a Woman of forty Years of Age, a Swelling, produced by a violent Fall, on the hypogaſtric Region, and accompanied with a tenſive Pain: This Swelling was ſucceeded by a large Diſcharge of limpid Water, which was, at firſt, evacuated with the menſtrual Blood, and continued to flow for half a Year after the menſtrual Evacuation ſtopt; ſo that, at leaſt, one Pint of this Water was daily diſcharged, till, at laſt, the Patient, having in vain tried a great many Remedies, and, being ſpent with a Conſumption, and ſlow Fever, exchanged her miſerable Life for another State.

There are, alſo, frequent Inſtances, ſome of which I myſelf have ſeen, in which a Dropſy has been concealed under the Diſguiſe of Pregnancy: Hence it is, that young Phyſicians are ſo often miſguided in their Eſtimates, with reſpect to this latter State. But I have ſeen pregnant Women, who, at the ſame time, laboured under a Dropſy, preſerved by a copious Diſcharge of Water after Labour; whereas thoſe who have not the Advantage of this Circumſtance, generally die; ſince the Humour is previouſly diſcharged into the Cavity of the Abdomen.

Platerus, in *Lib.* 3. of his Obſervations, gives us a memorable Inſtance of a Woman, who was ſeized with an Aſcites every time ſhe became pregnant: For this Reaſon I am of Opinion, that dropſical Swellings, in Women, ariſe rather from the Fault of the Uterus than that of the Liver, and Viſcera connected with it; and that they are more eaſily cured, than when the Liver is primarily affected; becauſe, in the former Caſe, a freer Diſcharge is afforded to the ſtagnant Serum through the Pores of the Uterus, than in the latter.

As for the procatarctic Cauſes of this Diſorder, we obſerve, that Perſons of a tall Stature are, in a peculiar manner, ſubject to Dropſies, both of the Abdomen and Thorax; for, as in theſe the Diſtance between the Feet and Heart is greater than in others, and the Situation of the Body at the ſame time perpendicular, ſo the Circulation of the Blood is, generally, ſlow and languid, and, conſequently, render'd difficult by the ſlighteſt accidental Cauſes: Hence it is, that polypous Concretions are generally found in tall Perſons, who have died of a Dropſy of the Thorax, or an Anaſarca. Thoſe, alſo, who are of a ſoft ſpongious Habit of Body, who have leſs firm Fibres, in which an aqueous Subſtance predominates, thoſe we call phlegmatic or ſanguineophlegmatic, are highly ſubject to Dropſies: Thoſe who are over-fat, thoſe who in their Infancy have been afflicted with catarrhous Defluxions, or who have been often ſubject to œdamatous Swellings, are, alſo, highly obnoxious to Diſorders of this Kind: Old Perſons, in whom, by reaſon of the impair'd Elaſticity of the Veſſels, the Excretions are not duly carried on, and the Lymph acquires a preternatural Lentor and Viſcidity, are, for this Reaſon, frequently ſubject to dropſical Swellings: Thoſe who lead ſedentary Lives, ſuch as Taylors, Shoemakers, and Weavers, are, all other Circumſtances being alike, more ſubject to this Misfortune than others: Thoſe, alſo, who breathe a moiſt Air, which impairs the Vigour of the Fibres, ſuch as Bathkeepers, Fiſhers, Fullers, and ſuch as waſh Clothes, are more ſubject to Misfortunes of this Kind than others: The Places and Countries in which we live, have, alſo, a very conſiderable Influence in producing this Diſorder: For which Reaſon more dropſical Patients are found in marſhy Places, and on the Sea-coaſt, than in Continents, and Places remote from the Sea: An Inſtance of this we have in *Holland*, both on Account of the Impurity of its Air, and its Contiguity to ſo large a Quantity of Water.

It may alſo happen by Accident, (a Change of the Inhabitants Method of Living, for Inſtance) that a Place, before not naturally ſubject to generate Dropſies, may afterwards become ſo. This, Dr. *Liſter*, in his Treatiſe *de Hydrope*, has very judiciouſly ſhewn to be true, with reſpect to *England*; for improper Aliments and Liquors contribute very conſiderably to the Generation of Dropſies. Among Aliments, thoſe which are thick, crude, viſcid, and ſweet, or Voracity alone, eſpecially in thoſe who uſe little Exerciſe, pave the Way, and, as it were, lay a Foundation, for this Diſorder. But Dropſies are more frequently produc'd by the Liquors drank, when peccant, either with reſpect to Quantity or Quality. Hence we obſerve, that thoſe who drink exceſſively large Quantities of Liquors, ſufficiently innocent when moderately us'd, generally become dropſical in a Tract of Years, unleſs an uncommon Strength of Nature, and Soundneſs of the Viſcera, prevent their Misfortune. This is ſufficiently confirm'd by the Fate of thoſe who ſwallow large Quantities of new and ill depurated Ale, eſpecially that which is prepar'd of Wheat. But we are certain, from daily Experience, that no Liquor is more prejudicial in this reſpect, than Brandy and Malt Spirits. Hence the Spirits diſtil'd from Malt, ſharpen'd with Aromatics, and commonly call'd Aqua-vitæ, may, with far better Reaſon, be call'd the Waters of Death, eſpecially when taken on an empty Stomach. Beſides, nothing more ſpeedily generates this Diſorder, than large Draughts of cold Liquors, immediately after exceſſive Heats; ſo that *Aretæus*, in the Paſſage before quoted, juſtly affirm'd, that "a Dropſy is ſometimes generated by drinking large Quantities of cold Liquors, in order to remove "an inſatiable Thirſt." Thus, *Sylvius*, in his Treatiſe *de Morbis Epidemicis*, tells us, that, by liberal Draughts of cold Liquor, during a febrile Heat and Thirſt, a Dropſy was brought on in two or three Days time. This Diſorder is ſtill more to be dreaded from the liberal Uſe of marſhy ſtagnant Waters, which *Hippocrates*, long ago, claſs'd among the Cauſes of a Dropſy. Hence alſo, the Reaſon is obvious, why, as we have already obſerv'd, Dropſies are moſt frequent in marſhy Places, and on the Sea-coaſt.

coaſt. Dropſies may, alſo, be produc'd by the unſeaſonable Uſe of mineral Waters, whether of the hot or cold Kind, without a proper Regimen; many tragical Inſtances of which have occur'd to myſelf in Practice.

But, among all the Cauſes which concur to the Production of other chronical Diſorders, and eſpecially the Dropſy, none is more conſiderable than the Paſſions of the Mind; eſpecially long-continued Grief and Sorrow, which have ſo ſurpriſing an Influence, that by deſtroying the Vigour, Tone, and Strength of the Viſcera, and moving Fibres, they render the Circulation of the Blood languid, and produce a Suppreſſion of the Excretions. Nor does violent Anger contribute leſs effectually to the Production of this Diſorder, eſpecially if large Quantities of cold Aliments or Liquors are uſed immediately after; for ſuch an Error is immediately ſucceeded by a violent Uneaſineſs and Conſtriction of the Præcordia, a cachectic Colour, a Loſs of Appetite, a Difficulty of Breathing; and, in Proceſs of Time, a Dropſy. Inſtances of this, I myſelf have more than once obſerv'd. The Reaſon of theſe Misfortunes ſeems to be this: That, by the violent Commotion of Mind, the Stomach and Duodenum, together with the adherent biliary Ducts, are violently and ſpaſmodically conſtricted. Hence the due Secretion of the Bile and pancreatic Juice, in order to promote a laudable Digeſtion, is not only prevented, but, alſo, in conſequence of the large Quantity of Aliments and Liquors, exceſſive Flatulences are generated, which check the due Diſcharges by Stool, and render the Circulation of the Blood unequal.

Beſides, nothing more directly contributes to the Production of Dropſies, than the Suppreſſion of uſual and critical Evacuations of Blood, ſuch as the Menſes and Lochia in Women, and the Hæmorrhoids in Men, as *Hippocrates* has juſtly obſerv'd in the twelfth Aphoriſm of his ſixth Section. Thus, *Dion Caſſius* informs us, that the Emperor *Trajan*, upon a Suppreſſion of the hæmorrhoidal Diſcharge, was ſeiz'd with an Aſcites, of which he was cured; but, happening to relapſe, fell a Sacrifice to the Diſorder. 'Tis, alſo, certain from Experience, that violent Hæmorrhages, whether from Wounds, the Noſe, the Uterus, or the Veins of the Anus, contribute very powerfully to the Generation of Dropſies; for the ſacred and ineſtimable Treaſure of Life is wrapt up in the Blood: So that, when too large a Quantity of this is evacuated, the minute Veſſels, ſubſervient to the Purpoſes of Secretion and Excretion, collapſe, and become too narrow. In conſequence of this, neither is a laudable Blood generated, nor the nervous Fluid duly ſecreted, a Circumſtance which produces a Weakneſs and Imbecillity of the Solids. Nor are the impure and recrementitious Juices eliminated, in conſequence of which, an inſupportable Load of Impurities is accumulated in the Body. I would not be thought to affirm, that every large Evacuation of Blood produces the Dropſy; but in Patients, where other Cauſes concur, I am of Opinion, that this Circumſtance very readily produces it. Thus I have known ſome Perſons, who, in conſequence of an Obſtruction of the Viſcera, labouring under Scurvy and Cachexy, and abounding with an acrid and impure Blood, have, after frequent and violent Hæmorrhages, fallen into a Dropſy; certainly not in conſequence of the Hæmorrhages alone, but alſo in conſequence of the bad Habit of Body, and Dyſcraſy of the Humours produc'd by the Obſtructions. Immoderate Dyſenteries, alſo, frequently lay a Foundation for Dropſies. Hence, *Hippocrates*, in the forty-third Aphoriſm of his ſixth Section, juſtly affirms, "that Perſons labouring under Diſ-"orders of the Spleen, when ſeiz'd with a Dyſentery, which "continues for a long time, die either of a Dropſy, or a Lien-"tery."

Prepoſterous Methods of curing Diſeaſes, uſed by unskilful Phyſicians, alſo, frequently prove the productive Cauſes of this Diſorder; when, for Inſtance, they all on a ſudden ſtop and ſuppreſs immoderate Diſcharges of Blood, or other Humours, by Aſtringents, Opiates, or Narcotics. Dropſies are alſo generated, when intermittent Fevers, eſpecially of the Quartan-kind, which generally have their Seat in the Liver, are, before the Obſtruction is remov'd, and the febrile Matter corrected, too ſoon ſtopt by Specifics, among the Number of which is the Peruvian Bark; for theſe Fevers very readily terminate in a Cachexy and Dropſy, as *Hippocrates* and *Galen* long ago obſerv'd. 'Tis certain from Experience, that this Misfortune frequently happens in Northern Countries; and I have often obſerv'd Dropſies ſucceeding epidemical Fevers, eſpecially in the poorer Claſs of People, whoſe Circumſtances could not afford proper Medicines. Dropſies, alſo, ſometimes ſeize thoſe who, in acute Fevers, in order to extinguiſh the Heat, or quench the Thirſt, uſe too large Quantities of Drink, without having ſufficient Evacuations by Urine or Perſpiration. It alſo, frequently happens, that ill-manag'd Mercurial Salivations colliquate the Blood to a kind of Serum, and by deſtroying the due Tone of the moving Parts, bring on Dropſies. The more draſtic Purgatives are alſo juſtly enumerated among the Cauſes of Dropſies, ſince by their means, the due Tone of the Viſcera is not only deſtroy'd, but alſo the Strength too much impair'd by an exceſſive Loſs of Serum, in conſequence of thirty, or perhaps more Stools a Day; by which means, inſtead of a pure and temperate Blood, crude Humours are generated in the Veins.

Both Dropſies of the Breaſt, and an Aſcites, are alſo frequently generated by the Receſs, or prepoſterous and injudicious Repulſion of the Itch, arthritic Diſorders, and the Gout; as alſo by the ſudden Conſolidation of old Ulcers and Fontanels. And, which is ſtill more ſurpriſing, I have obſerv'd a Repulſion of œdematous Swellings of the Feet, by whatever means, ſucceeded by a violent Oppreſſion and Uneaſineſs of the Breaſt, which were again followed by a Dropſy; for the thick and vapid Serum, which lay ſtagnant in the Feet, is by Swathing forc'd upwards; and, being abſorb'd by the ſanguiferous Veins, is convey'd to the Præcordia; and, being thence carry'd with the reſt of the Humours, from the Right Ventricle of the Heart, to the Pulmonary Artery, and its Ramifications, fills them with ſuch an exceſſive Load of Humours, as by compreſſing the pulmonary Veſicles, reſiſts the Ingreſs of the Air into them in a Degree ſufficient to propel the Blood thro' the Veins. The Blood, therefore, in this Caſe, regurgitates to the Right Ventricle of the Heart, and, by diſtending it, creates great Uneaſineſs, and a Difficulty of Breathing. Since, therefore, by this means the Circulation of the Blood thro' the Lungs is render'd highly ſlow and languid, the Serum is not only ſecreted through the Pores in the Cavity of the Breaſt, and extravaſated from the numerous lymphatic Veſſels of the Lungs; but the Circulation of the Blood in the whole Vena Cava is, alſo, in ſome meaſure, ſtopt and retarded, ſo that it is not ſurpriſing, that there ſhould, alſo, happen large Stagnations and Extravaſations of Serum in the inferior Parts.

Having thus taken a View of the Ætiology of this Diſorder, it now remains, that we accurately diſtinguiſh it from other aqueous Tumors, that by this means we may be able to take the more judicious Meaſures for its Cure. A Dropſy then ought not to be confounded with œdematous Swellings of the Feet, ſince the latter may happen without any Danger in ſound Perſons of a ſoft and ſpongious Habit, who are addicted to a ſedentary Life. Theſe kinds of œdematous Swellings are very frequent in pregnant Women, but, after Delivery, ceaſe ſpontaneouſly, without the Aſſiſtance of Medicine; for they are produc'd by the great Dilatation of the Uterus, which ſo compreſſes the Vena Cava, between that and the Vertebræ of the Loins, that the Blood cannot riſe to the ſuperior Parts with its uſual Freedom. It, alſo, frequently happens, that Tumors are produc'd in the inferior Parts, by a Compreſſion of the Iliac Veſſels, by means of Flatulences ſtrongly diſtending the Inteſtines. But when the Tone of the Inteſtines is reſtor'd, and the Flatulences expel'd, theſe Tumors are eaſily remov'd. Sometimes, alſo, we obſerve Swellings of the Legs produc'd by an Obſtruction of the free Circulation of the Blood, in conſequence of a violent and tenſory Compreſſion of the Thighs, in riding long Journeys.

We muſt be highly careful not to confound an Aſcites with Pregnancy, which is no hard Task to a judicious Obſerver; for, in pregnant Women, the Colour of the Countenance is freſh and lively, and the Tumor of the Abdomen unequal, and riſing, as it were, to the Præcordia; whereas, in dropſical Patients, the lower Part of the Abdomen is tumid, the Tumor is equal, and the Breaſts ſubſide. This latter Caſe is, alſo, accompanied with a Thirſt, which, in Geſtation, is far leſs. Beſides, in an Aſcites, there is always a Fluctuation perceived in the Abdomen, and the Water falls whichever Way the Patient reclines. The Motion of the Fœtus, alſo, in the Uterus, which generally happens about the twenty-ſeventh Week, removes every Poſſibility of a Miſtake. Nor is it to be denied, that, in pregnant Women, leucophlegmatic Swellings now-and-then appear at the ſame time; but this principally happens when they are with Child of Twins, or too plethoric, in conſequence of having neglected Veneſection.

'Tis, alſo, to be obſerved, that a Polypus of the Heart is ſometimes accompanied with a Swelling of the Thighs and Legs, without either an Anaſarca, or an Aſcites. This is known to be the Caſe, by the violent Straitneſs of the Breaſt, by the unequal intermittent, and frequently varying Pulſe; and, eſpecially, by a Dread of Suffocation, after the Sallies of Paſſion, or violent Exerciſe. 'Tis not, however, to be denied, that this State is, when other Cauſes concur, ſucceeded by a true and legitimate Dropſy.

There is, alſo, a conſiderable Difference between a ſpurious and legitimate Aſcites. The former is, when the Water is not contained in the Cavity of the Abdomen, but is pent up in Membranes, and included, as it were, in the Sack of the Peritonæum; for which Reaſon, ſome Authors call it *Hydrops Saccatus*. With reſpect to this Species of Dropſy, the Reader may conſult the *Miſcel. Nat. Curioſ. Decad.* 2. *An.* 8. *Obſ.* 23. as alſo Mr. *Littre*, in the Work before quoted. He may alſo conſult a Diſſertation delivered before *Albertus de Hydrope Saccato, per Lapſum in Abdomen curato*. In an Aſcites, on the Contrary, the extravaſated Water ſtagnates in the Cavities of the Thorax and Abdomen.

With reſpect to the Prognoſtics, and Event, of this Diſorder, *Aretæus*, in the Part already quoted, remarks, That

" All the Species of Dropſies are bad; the mildeſt is a Leuco-
" phlegmatia; a Tympanitis is dangerous; but an Anaſarca
" worſe." We may, in general, affirm, that an Aſcites is incurable when inveterate, and ariſing from other Diſorders, in which the Viſcera are already corrupted, or beginning to be ſo; when the Water is diſcharged from ruptured lymphatic Veſſels or Hydatides; when the Patient is racked with Thirſt, and the ſuperior Parts of his Body extenuated; and when the Urine is ſmall in Quantity, highly red, and depoſits a Sediment. On the contrary, we aſſert, with *Hippocrates*, that the Dropſy admits of a Cure, in which the Viſcera are obſtructed, but not ſcirrhous and corrupted; in which the Patient retains his Appetite, breathes with Eaſe, and diſcharges thin Urine, eſpecially if he has the Advantage of Youth on his Side. When a Dropſy, eſpecially a Leucophlegmatia, or an Anaſarca, ariſe from an Aſthma in plethoric Patients; from drinking too much in Fevers; from too keen an Appetite after the Cure of Fevers; or from violent Hæmorrhages; there are ſufficient Hopes of a Cure, provided the Relief of the Patient is ſeaſonably attempted by proper Remedies.

A Cough, happening in an Aſcites, is an unlucky Omen, as *Hippocrates*, in *Aph.* 35. of *Sect.* 6. and *Aph.* 47. of *Sect.* 7. juſtly obſerv'd: But we do not here mean that ſlight and gentle Cough, which generally ſeizes the Patient about the Beginning of the Diſorder. It is alſo a bad Symptom, when the Appetite and Strength are loſt; when the Thirſt is increaſed; when a large Quantity of Liquor is drank, and but little diſcharged by Urine: Febrile Horrors, accompanied with an internal Heat, happening in an Aſcites, are bad Symptoms, and generally prognoſticate the Death of the Patient. Hæmorrhages from the Lungs, and the Veins of the Anus, happening in an Aſcites, generally prove fatal Symptoms; as alſo an Eryſipelas of the Legs, accompanied with a Fever, as is obſerved by *Hippocrates* in the ſeventh Book of his *Epidemics*. The Perſon who, after the Cure of an Aſcites, relapſes, is not to be cured without the greateſt Difficulty; and, if he ſhould relapſe a ſecond time, he rarely ever eſcapes. The Reverſe of this holds true, with reſpect to an Anaſarca; which, when periodical, is not ſo dangerous as that which is fixed and permanent. 'Tis, beſides, to be obſerved, that Perſons do not readily die of Dropſies, except they have polypous Concretions in the Heart, and pulmonary Veſſels, a Scirrhus in the Liver, the Glands of the Meſentery tumefied; or, if Women, unleſs the Uterus is ſcirrhous and corrupted.

A Dropſy is ſometimes happily terminated by the powerful Efforts of Nature, without any Aſſiſtance from Art; whilſt the Water makes way for its own Diſcharge, either from the Feet, a Rupture of the Navel, or an Aperture of ſome other Part of the Abdomen. *Hippocrates*, in his *Coacæ Prænotiones*, obſerves, that a Diarrhœa, happening in the Beginning of a Dropſy, is ſalutary. Inſtances of this kind have occur'd to myſelf, in which, during the Courſe of a long-continued Diarrhœa, pure Water has been diſcharged by Stool, and the Dropſy, by that means, happily removed. On the contrary, if, in a conſummate and inveterate Dropſy, where the Viſcera are already corrupted, a Diarrhœa happens, the Hopes of Recovery are but faint and ill-grounded. *Fernelius*, in his *Pathologia*, *Lib.* 6. gives us a memorable Inſtance of a Woman, in whom, juſt on the Approach of her Menſes, a Humour congeſted in the lower Part of her Abdomen was ſpontaneouſly diſcharged thro' the Uterus, ſo that in two Days time the whole Swelling ſubſided; and, as it was again formed next Month, it was, at the ſtated time, again totally diſcharged in the ſame manner.

The Cure.

Before the Phyſician attempts the Cure of this Diſorder, he ought carefully to conſider, whether it will admit of a Cure, or is abſolutely incurable. If he ſhould perceive, that it is incurable, he ought rather to decline the Attempt, than hazard his Reputation; or, at leaſt, to ſecure the latter, by making a poſitive and abſolute Prognoſtic, with reſpect to the Fate of the Patient. The moſt genuine Method of Cure conſiſts in purſuing theſe two Intentions: Firſt, to evacuate the ſtagnating Waters, collected in the Cavities of the Body, and between the Skin and Muſcles; and, ſecondly, to remove the Cauſe, by means of which the Waters have been, and are ſtill, daily accumulated. The Evacuation of the Waters ſeems but to contribute very little to the Cure, unleſs the Cauſe, producing the Extravaſation of the Waters, is, at the ſame time, removed; for, when the Cauſe is not taken away, the Waters are ſoon generated afreſh. But, becauſe the Force and Energy of the Medicines, proper for removing the Cauſe of this Diſorder, are much impaired by the Load of Waters; and becauſe the Parts, in which they ſtagnate, are, in Proceſs of Time, injured and corrupted, the Phyſician's principal Care ought to be to free the Body, as much as poſſible, from all Impurities and recrementitious Juices.

For this Purpoſe, unleſs Nature does the Work, either by a copious Diarrhœa, or a Diſcharge of the Water from the Feet, we are carefully to deliberate, whether the End can be commodiouſly, and without Danger, obtained by the Paracenteſis. With reſpect to this, there is a memorable Paſſage, in the 21ſt Chapter of the third Book of *Celſus*, which runs thus: " *Eraſiſtratus* condemned the Method of Cure by the Paracenteſis, becauſe the Water is in vain evacuated; ſince, in conſequence of the Diſorder of the Liver, it is ſoon generated afreſh. But this Diſtemper does not ariſe ſolely from the Fault of the Liver; for the Spleen is affected, and the whole Habit of the Body bad. Beſides, if the preternatural Collection of Waters is not evacuated, it proves injurious, not only to the Liver, but alſo to the other Parts. 'Tis certainly expedient, that the Patient ſhould, if poſſible, be cured; tho' this Evacuation does not promote the Cure, but only make way for the Operation of Medicines, which was prevented and fruſtrated by the included Waters. 'Tis alſo certain, that all Perſons cannot be cured by this means, but only young and robuſt Patients, who are either entirely free from a Fever, or, at leaſt, have long and favourable Intermiſſions; for thoſe whoſe Stomachs are corrupted, thoſe in whom a Redundance of black Bile has produced this Diſorder, or who are of a bad Habit of Body, are by no means fit Patients for having this Method of Cure tried upon them."

My Opinion, with reſpect to the Paracenteſis, is, that, when in the Beginning of the Diſeaſe, whilſt the Viſcera are as yet ſound, and the Abdomen turgid with an intolerable Load of Water, which frequently happens in a Leucophlegmatia, both with and without an Anaſarca, and when the Waters cannot be ſafely evacuated by Purgatives, then the Operation may be performed, provided the Patient will ſubmit to it, and the Operator obſerve thoſe Cautions laid down by *Brunner*, in the *Miſcell. Nat. Curioſ. Decad.* 2. *An.* 8. for this celebrated Phyſician there directs a Tincture prepared of Myrrh, Aloes, and camphorated Spirit of Wine, to be injected, in order to prevent the Putrefaction of the Serum contained in the Abdomen, which eaſily happens by the Admiſſion of the Air after the Paracenteſis. " Nor, to uſe his own Words, have we any Reaſon to be afraid " of the Effects of this Preparation in the Abdomen; for it is " ſo far corrected by the Water lodg'd there, that the Tendons " and Nerves are not in the leaſt irritated by it; for in a Dog, " when the Inteſtines have been inflam'd, I have, with Succeſs, " uſed Spirit of Turpentine, which is ſtill hotter. Nor do I " doubt, but that if, by any Art or Expedient, this Fermentation " of the Lymph in the Abdomen, and the Inflammation, could " be prevented, the Paracenteſis might be had in greater Eſteem, " and ſuch Effects brought about by it, as have to others ap- " peared impoſſible; for, after the Evacuation of the Waters in " the Abdomen, the lymphatic Veſſels, whether corrupted or " corroded, would be ſooner healed than otherwiſe they are." This Operation is not only uſed without any Danger, but is in a manner abſolutely neceſſary in a Dropſy of the Peritonæum. In a deſperate Aſcites, I have known it uſed, not in order to produce a Cure, but with a View to prevent Suffocation, and preſerve the Patient a little longer alive. Beſides, in an Anaſarca, I have often ſeen a large Quantity of Water happily evacuated by Scarifications duly made in the Scrotum and Legs. But, in this Caſe, a Gangrene of the Parts is carefully to be guarded againſt.

But when, in an Anaſarca, or a Leucophlegmatia, a large Quantity of Waters may be eaſily evacuated by Medicines, this is to be attempted in the Beginning of the Diſeaſe, eſpecially by pretty ſtrong Purgatives, exhibited in ſufficient Doſes, and ſeconded by a proper Regimen. Let us, therefore, inquire what Medicines have been us'd by Phyſicians, for this Purpoſe. Firſt, then, Elaterium has been highly recommended, not only by the Antients, but, alſo, by the Moderns, as proper for evacuating the Waters. Thus *Dioſcorides*, in *Lib.* 4. *Cap.* 151. tells us, "That Elaterium is highly beneficial to dropſical Patients, " by evacuating the Waters without Danger, and without " proving offenſive to the Stomach." *Avicenna*, *Celſus*, *Alexander Maſſarias*, *Jacobus Bontius*, *Hercules Saxonia*, *Johannes Heurnius*, *Gabriel Fallopius de Medicinal. Aquis*, *Reiſner*, and *Henricus ab Heer*, beſtow very high Encomiums upon this Medicine. Among the *Engliſh* Authors, *Liſter* and *Sydenham*, in his *Tractat. de Hydrope*, prefer Elaterium, for this Purpoſe, to all other Purgatives. The latter of theſe Authors uſes the following Words: " Elaterium, exhibited in a ſmall Quantity, " powerfully contributes to diſcharge the Fæces, and eliminate " large Quantities of ſerous and aqueous Humours." After Elaterium, Gamboge, about a Century ago, began to be highly celebrated, as proper for evacuating the Waters; and, for this Purpoſe, half a Scruple, or twelve Grains, may be exhibited. Extract of Spurge is, for this End, warmly recommended by *Rulandus*; and the Juices of common Orris, and the middle Bark of Elder, are juſtly eſteem'd efficacious Hydragogues, not only by Phyſicians, but, alſo, by the Vulgar.

As for the Operation of theſe Medicines, it is to be obſerv'd, that by means of their acrid, volatile, and cauſtic Principle, they vellicate the nervous Parts of the Stomach, and, by that means, excite a Vomiting, even in ſound Perſons. But, in dropſical Patients, like Emetics prepar'd of Antimony, they operate

rather more by Stool, than Vomit; perhaps, becauſe the nervous Coats of the Stomach and Inteſtines are render'd too flaccid and relax'd by the ſtagnating Water. Hence, at the ſame time, it ſufficiently appears, that the more mild and gentle Purgatives are by no means ſufficient to eliminate, by Stool, the great Load of Waters treaſur'd up in the whole Body; but that ſuch Medicines are requir'd for this Purpoſe, as, by a certain ſubtile and penetrating Salt, ſtimulate the whole Syſtem of the nervous and muſcular Parts, eſpecially the Stomach and Inteſtines, and by that means eliminate large Quantities of Water. The Hydragogues and Emetics, already mention'd, are, of all others, the moſt efficacious, if their Doſes are duly proportion'd to the Vigour or Delicacy of the ſeveral Conſtitutions to whom they are exhibited; for there are numberleſs Inſtances of Perſons cur'd of Dropſies by a large Doſe of a proper Hydragogue, after thirty or more Stools.

Theſe draſtic Purgatives and Emetics may be made up into various Forms, which I have us'd with Succeſs in Practice. Thus,

Take of Elaterium, of the Extract of black Hellebore, of Wormwood, of the leſſer Centaury, and of Mercurius dulcis, each one Dram; of the Extract of Saffron, twelve Grains: Mix together, and, with *Peruvian* Balſam, form into a Maſs, from every half Dram of which prepare twenty Pills to be taken in the Morning.

Or a purgative Infuſion may be prepar'd thus:

Take of the middle Bark of Elder, of Bryony-root, of common Orris, of the fibrous Roots of black Hellebore, of *Alexandrian* Rhubarb, of red Gentian-root, of Swallow-wort, of Lovage, and of freſh Orange-peel, each one Ounce and an half; of the Tops of the leſſer Centaury, four Pugils; of Cloves, three Drams; and of the Tartarus tartariſatus, one Ounce: Infuſe in two Pints of Wine, a ſixth Part of which is to be taken for a Doſe, twice a Week.

Beſides the Purgatives taken by the Mouth, Clyſters are, alſo, of ſingular Efficacy in eliminating the Waters, eſpecially thoſe prepared of the Roots of Aſarum, the middle Bark of Elder, the Roots of common Orris, the Tops of the leſſer Centaury, Elder-flowers, and the Four carminative Seeds, together with Wine and Water, adding a ſufficient Quantity of the Oil of common Chamomile, and two Drams of *Epſom* Salt. Nor in all dropſical Patients is it at all times neceſſary to attempt the Elimination of the Waters by draſtic Medicines; for it is ſometimes more adviſeable to exhibit thoſe of a more mild and gentle Nature, in larger Doſes, which often produce the ſame Effect, with more Eaſe and Safety; for I have often ſeen more than ten Pints of Water diſcharg'd with Eaſe, by drinking, in half an Hour's time, three Ounces of the beſt Manna, two Drams of Sena-leaves, and the ſame Quantity of Cream of Tartar, diſſolv'd in Spring-water. Among the more ſafe Hydragogues we may, alſo, reckon a Dram or two of the Powder of white Mechoacan, either with or without Cream of Tartar. Rhubarb, whether in Subſtance, or reduced to an Eſſence, with Terra foliata Tartari, is, alſo, juſtly recommended for this Purpoſe. Thus *Adolphus Otto* has, from *Montanus*, given us a memorable Inſtance of a certain Man, who, when his Abdomen, Legs, and whole Body, were ſwell'd to ſuch a Degree, that his Life was deſpair'd of, had the Serum entirely eliminated, and a perfect State of Health reſtor'd, by the continual Uſe of Rhubarb, proceeding from Drams to Ounces of this Medicine.

After a ſufficient Evacuation by Stool, Diuretics of an attenuating Nature, and ſuch as reſolve viſcid Humours, are to be us'd. The moſt conſiderable and efficacious of this Kind are the Salts of medicinal Springs, ſuch as thoſe of *Egra*, the *Caroline*, and *Sedlitz* Waters in *Bohemia*, which, when drank pretty liberally, not only powerfully evacuate the Waters, but are, at the ſame time, poſſeſs'd of an aperient and diuretic Quality. For this Purpoſe, we muſt, alſo, recommend neutral Salts, ſuch as the Tartarus tartariſatus, the Terra foliata Tartari, Sal Polychreſtum, antimoniated Nitre, a Solution of Crabs-eyes prepar'd with Cream of Tartar, volatile Salt of Amber, reduced to a neutral Salt with Oil of Tartar *per Deliquum*, and, eſpecially, purified Nitre, or, which is ſtill more efficacious, Nitre regenerated from a Mixture of Spirit of Nitre and Oil of Tartar *per Deliquium*; all which Medicines are highly efficacious in reſolving Obſtructions of the Viſcera, and opening the urinary Ducts of the Kidneys. But it is to be obſerv'd, that all theſe are to be taken in a large Quantity of Liquor.

Beſides theſe, no leſs conſiderable an Advantage is promiſed from exciting a Diſcharge by Urine with the Salts of Herbs, obtain'd by Incineration, ſuch as the Salts of Wormwood, and Carduus Benedictus, the Salt of Tartar alone, duly calcin'd, the Liquor of fixed Nitre, and the *Liquor Silicum* of *Glauber*; which when exhibited in pretty large Doſes, I have often known to produce wonderful Effects, in removing œdematous Tumors. To this Claſs of Medicines, alſo, belong the ſweet Spirit of Nitre, the Anodyne mineral Liquor, the Clyſſus Antimonii; which liquid Medicines may, with great Succeſs, be exhibited either alone, or in Conjunction with the above-mentioned Salts, according as the State and Circumſtances of the Patient require.

The Vehicle in which theſe Medicines are taken, is, alſo, a Circumſtance of very conſiderable Importance; for the neutral Salts, above-mentioned, prove far more efficacious, if exhibited either in Whey, or the Water of Strawberries, or in *Moſelle* Wine, which is a powerful Diuretic, than in any other Liquor. I have, alſo, to the ſurpriſing Relief of Patients, order'd a Decoction of the Five aperient Roots, the Roots of Eryngo and Reſt-harrow, the Seeds of Carrot and Celery, Juniper-berries, and Winter-cherries; which Decoction may, alſo, be uſed for common Drink.

Sudorifics are by no means proper, when the whole Body abounds with impure and ſordid Juices, and when the ſubcutaneous Emunctories are block'd up and concreted; for dropſical Patients are not, without great Difficulty, diſpos'd to ſweat. And if, by being kept too warm, or by means of volatile Sudorifics, Sweats ſhould be forced, an Inflammation accompanied with a Fever, or a Tranſlation of the Serum to the Heart or Brain, or a Suffocation, or a Lethargy, or an Apoplexy, are juſtly to be dreaded. This Caution ought, alſo, to be carefully obſerv'd with reſpect to the Uſe of Laconic Baths, prepared with Spirit of Wine. But when the Body is freed from the preternatural Load of Humours, both by Purgatives and Diuretics, and when Nature herſelf tends to a freer Perſpiration, and an Evacuation by Sweat, then we are not to uſe the draſtic, but the more mild and gentle Diaphoretics, ſuch as the Mixtura ſimplex, the Mineral Liquor, mix'd with a ſmall Quantity of the Bezoardic Spirit of *Buſſius*, Tincture of Antimony, or Powders of the Ceruſs of Antimony, of Salt of Carduus Benedictus, and of purified Nitre, either alone, or mix'd with Rob of Elder, or dwarf Elder; all which Medicines are highly beneficial, eſpecially when frequently and prudently us'd, or when their Operation is aſſiſted by Fomentations of warm Wine, eſpecially *Hungarian* Wine, applied with Linen Cloths.

In order to render theſe internal Evacuants ſtill more efficacious, we are to ſecond them with external Applications, which are of ſingular Uſe and Advantage in Dropſies; for when a large Quantity of excrementitious Humours are collected in the external Parts under the Skin, and deſtroy the Tone and Strength of the ſolid Parts, common Senſe informs us, that ſuch external Applications, as by their corroborating, balſamic, and reſolvent Quality, not only attenuate the ſtagnant Humours, and render them fit for being received into the Pores of the Veſſels, but, alſo, reſiſt Putrefaction, and reſtore the Strength and Tone of the relaxed Parts, muſt neceſſarily contribute very much to the Elimination of theſe Humours through proper Emunctories; and I, myſelf, have often known more happy Effects produc'd, and in an eaſier manner, by theſe external Applications, than by internal Remedies. The Subſtances moſt proper for anſwering this Intention are, the Roots of Lovage, Orris, Squills, and Sow-bread; the Leaves of dwarf Elder, the Herbs Germander, Carduus Benedictus, and Wormwood; the Flowers of Roman and common Chamomile, together with thoſe of Elder, Bay, and Juniper-berries; together with the Seeds of Caraway and Cumin. Of theſe Sacks, or Epithems, may be prepar'd, and after being immers'd in Wine, Wine-vinegar, or boil'd in Lime-water, apply'd warm to the Abdomen, Legs, and Scrotum, and renewed when they become cold. Theſe Epithems are, in my Opinion, far more proper than external Applications in other Forms, ſuch as Plaiſters and Ointments.

Though theſe Remedies, both of the internal and external Kind, are of great Efficacy in removing a Dropſy, yet they do not abſolutely complete the Cure, ſince, for that Purpoſe, the Cauſes muſt be removed, and the future Generation of the Waters prevented. To theſe Evacuants we muſt, therefore, join Corroboratives, ſince the impair'd Tone, and weaken'd ſyſtaltic Force, both of the Viſcera and Veſſels, are the principal Cauſes of the ſlow and languid Circulation of the Blood and Lymph, and conſequently of the Stagnation. Corroboratives, therefore, are, of all other Medicines, the moſt efficacious, both for preventing this Diſorder, and Relapſes into it. For anſwering this Intention we recommend the Roots of Burner, Swallow-wort, Arum, and Zedoary; the Extracts of Wormwood, red Gentian, Carduus Benedictus, Germander, and the leſſer Centaury; as alſo Peruvian Bark, Caſcarilla, and Caper-bark, Myrrh, Amber, and Cinnamon. Of theſe an Eſſence, or Elixir, are to be prepar'd, with ſome thin Menſtruum, and *Hungarian* Wine, which may be exhibited according to the State of the Patient, with ſome chalybeated Liquor, ſuch as the Tinctura Mortis Zwelfferi, and continued for a due time, in proper Doſes: for this Medicine not only ſtrengthens the Stomach and Inteſtines, but alſo the Viſcera ſubſervient to Chylification and Sanguification, ſuch as the Liver, Lungs, and Spleen. It alſo ſucceſsfully promotes the ſalutary Excretions, if they ſhould happen to be either obſtructed or ſuppreſs'd.

It is a Queſtion of great Importance, whether Veneſection is proper in dropſical Caſes. Though this Evacuation may poſſibly ſeem improper, becauſe the Body is rather filled with Serum, than Blood; and the ſolid Parts are entirely deprived of their Vigour and Strength; and though Authors, eſpecially thoſe of a latter Date, ſcarcely mention Veneſection, as beneficial in the Cure of this Diſorder; there are, however, in the Works of the antient Phyſicians, many Paſſages where Veneſection is highly extol'd in the Cure of a Dropſy. Thus *Hippocrates*, in his Treatiſe *de Diæta in Acutis*, expreſſes himſelf in this manner: "If a dropſical Patient is afflicted with a Difficulty of Breathing, if this "ſhould happen in the Spring, and if the Perſon is young and "robuſt, a proper Quantity of Blood muſt be taken from his "Arm." And the learned *Jacobus Sponius*, in his *Aphoriſm. Nov. Sect.* 5. §. 87. ſubjoins a very memorable Obſervation in the following Words: "I have often ſeen, ſays he, a Dropſy "cured by Veneſection, which was rather increaſed, than re"mov'd and abated, by Hydragogues and Diuretics, of what"ever Kind." With reſpect to this important Affair, *Alexander Trallian* thus gives his Sentiments: "'Tis ſometimes neceſ"ſary to cure an Anaſarca by Veneſection. If not only the "Liver, but alſo the Stomach and Spleen, have contracted a "Swelling and Hardneſs, Evacuations of Blood, in ſmall Quan"tities, and at different Times, may be boldly uſed, eſpecially "if a ſufficient Degree of Strength does not contra-indicate it, "if a large Quantity of Blood is perceptible in the Veins, if "the Patient is in the Flower of his Youth, and the Seaſon "of the Year not very cold." *Paulus Ægineta*, in the forty-eighth Chapter of his third Book, confirms this Doctrine, but with certain Conditions, thus: "In the Cure of an "Anaſarca we begin with Veneſection, eſpecially if the Diſ"order has deriv'd its Origin from a Suppreſſion of the Hæ"morrhoids, or Menſes." My own Experience, in a great many Inſtances, has taught me, that in a Leucophlegmatia and Anaſarca, if the Patient is plethoric, and if the Diſorders have principally drawn their Origin from a ſanguineous Aſthma, Veneſection contributes not a little to the Cure: But, in an Aſcites and Tympanitis, I deny that Veneſection can be uſed without Danger; and *Trallian*, towards the End of the above-mention'd Paſſage, abſolutely excludes Phlebotomy in an Aſcites and Tympanitis.

As in a Leucophlegmatia and Anaſarca, in order to evacuate the ſerous Colluvies, a draſtic Purgative, exhibited in a pretty large Doſe, is ſometimes neceſſary; ſo, in an Aſcites, nothing is more dangerous than draſtic Medicines, ſince by their means I have often known a Sphacelus and fatal Inflammation of the Inteſtines ſuddenly brought on, as was obvious upon diſſecting the Perſons after Death: But, with reſpect to ſtrong Purgatives, I muſt obſerve, that they are beneficial in the Beginning of the Diſeaſe, ſo long as there is a ſufficient Degree of Strength; and that they ought not to be uſed too often, but at the Diſtance of ſix or ſeven Days from each other, whilſt the Patient's Strength is, in the mean time, to be ſupported by ſuch Medicines and Aliments, as afford a laudable Juice. But 'tis ſometimes more expedient to abſtain from theſe draſtic Medicines, ſuch as Gamboge, Elaterium, Coloquintida, and Hellebore, which are of a kind of colliquative and injurious Quality, which a naturally weak and delicate Stomach cannot bear; and, in their ſtead, rather to uſe Purgatives, mixed with Emetics, which either in the Form of Pills, or an Infuſion, produce the ſame happy Effect, in a far more ſafe and eaſy manner.

As Perſons labouring under a ſcorbutic Dyſcracy of the Humours are highly ſubject to Dropſies, they are to uſe ſuch antiſcorbutic Medicines as are thought to be poſſeſs'd of a ſpecific Virtue againſt the Dropſy, ſuch as the Roots of wild Horſe-radiſh, the Juices of Water-creſſes, and Garden-creſſes, as alſo of Scurvy-graſs, eſpecially if drank liberally and frequently, either with Whey, or a Decoction of red Beets; for I have often known poor People entirely cured of Dropſies by theſe ſimple Medicines, after having daily diſcharged, by their means, an incredible Quantity of Serum by the urinary Paſſages.

The Powder and Vinegar of Squills were, by the Antients, ſuch as *Galen*, *Cœlius Aurelianus*, *Celſus*, and others, highly eſteem'd for the Cure of this Diſorder, eſpecially when accompanied with an Aſthma, ſo violent as to threaten a Suffocation. And I can, from my own Experience, affirm, that I have known many receive unexpected, and almoſt incredible, Relief from theſe Medicines; for the penetrating and acrid Salt of this Root, inſinuating itſelf into the Coats of the Stomach, and other nervous Parts, ſtimulates them to a new Vigour, and briſker Motion, by which means the Circulation of the Blood is greatly aſſiſted. As for the Doſe, ſix or eight Grains may be mixed with the ſame Quantity of the Roots of Burnet, or Arum, and with the Addition of a few Grains of Nitre, exhibited in a warm Vehicle.

In a Tympanitis the Uſe of Clyſters, prepar'd of carminative Ingredients, is highly beneficial and efficacious. I have, alſo, obſerv'd, that in this Diſorder, purgative mixed with anodyne Pills, ſuch as the Pilulæ Starkii, the Pilulæ Wildeganſii, and thoſe prepar'd of the Extract of black Hellebore, Mercurius dulcis, Sagapenum, Opopanax, and Aſafœtida, have produced very ſalutary and happy Effects. Beſides theſe, ſome Relief is afforded by an external Anointing of the Abdomen, continued for ſome Days, with the Oleum Philoſophorum, or the Oil of Camphire prepar'd with Oil of ſweet Almonds.

In an Aſcites, when the Viſcera are much affected, and few Hopes of Recovery left, gentle Laxatives and Corroboratives are only to be uſed. This End is anſwered by the Pilulæ Polychreſtæ, prepared according to the Directions of *Becher*, interpoſing between each Doſe of them, a Doſe of the aperient Salts. By this Method, unleſs the Caſe is abſolutely deſperate, the miſerable Patients are either cured, or at leaſt preſerved longer alive: But theſe Medicines promiſe more happy Effects, and afford greater Relief, in an Anaſarca.

It ſometimes happens, that dropſical Patients loſe large Quantities of Blood, by Hæmorrhages either from the hæmorrhoidal Veins, or the Noſe, and Women by the menſtrual Diſcharge, not without a very conſiderable Danger, and Loſs of Strength; in which Caſe nothing is more abſurd and fooliſh, than the Uſe of Narcotics, in order to ſuppreſs theſe Hæmorrhages, ſuch as the Pilulæ de Cynogloſſo, or any other Medicines of a ſtyptic Quality; for by their means the Obſtructions of the Viſcera, which produce the Defluxions, are increaſed, and the Strength conſequently impaired.

Sometimes a Dropſy ſucceeds an ill-managed Salivation; in which Caſe the Diſorder is to be treated with Decoctions prepared of Guaiacum, Saſſafras, Root of the ſharp-pointed Dock, Oak-wood, Quick-ſilver, and Antimony, tied up in a Bag.

When the Scrotum, either in conſequence of an Hydrocele, or a Defluxion of Humours from the Abdomen, becomes ſo turgid as to render lying in Bed, and Motion of any Kind, highly uneaſy, many recommend the Operation of the Paracenteſis; which, however, is ſo little beneficial, that it often produces terrible Diſadvantages, and cannot be performed without endangering a ſucceeding Sphacelus. And as the Humour, contained within the Membranes of the Teſticles, is conſiderably viſcid, the Diſcharge is, of conſequence, generally ſmall. In ſuch a Caſe, 'tis, therefore, more expedient to attempt the Cure by diſcutient Cataplaſms, which often diſperſe the Humour, and afford great Relief to the Patient.

When Nature, the ſovereign and moſt skilful Phyſician, opens the Pores of the Skin, either in the Legs or Abdomen, thro' which large Quantities of Serum are continually diſcharged, and the Patient greatly relieved, we are carefully to endeavour to prevent Corruption; which End may be obtained by the Epithems above recommended frequently applied. Nature, in the mean time, is to be aſſiſted, the Corruption of the internal Parts prevented, and the Strength ſupported, by corroborative and balſamic Elixirs exhibited internally.

Hippocrates, in the fourth Book of his *Epidemics*, propoſes the following Method of curing a Dropſy: "A Perſon, ſays he, "labouring under a Dropſy, ought to fatigue himſelf by Exer"ciſe, to ſweat, to eat Bread, to drink little, and that of White"wine; to ſleep very moderately, and to uſe Purgatives; by "which means the Water and Phlegm are evacuated." This Method of Cure is principally proper in a Leucophlegmatia; to which thoſe are highly ſubject, who have previouſly been afflicted with chronical Diſorders, and violent Hæmorrhages; or who eat and drink exceſſively. For Patients of this kind *Hippocrates* recommends Exerciſe, in order to promote Perſpiration; as, alſo, Sweating, in order to carry off a Part of the redundant Serum; and the Eating of Bread, which does not generate a ſerous, but a ſufficiently laudable Chyle. 'Tis, alſo, proper to abſtain from large Quantities of Liquor, both becauſe the Dropſy naturally increaſes, and the Thirſt is not extinguiſhed, unleſs the Cauſe of the Diſorder is previouſly removed; and becauſe, in conſequence of the Heat augmented by Thirſt, the ſuperfluous Moiſture is diſſipated. There are, alſo, frequent Inſtances of Dropſies entirely cured by abſtaining from Drink for a whole Year. White-wine provokes Urine, and Sleep increaſes the Waters; but Hydragogues are, in this Diſorder, the moſt effectual Means of Relief, becauſe they carry off the ſuperfluous Moiſture.

As œdematous Tumors, which are, as it were, the Beginning of a Dropſy, are eaſily generated by Flatulences of the Primæ Viæ, eſpecially in hypochondriac Patients, 'tis, in this Caſe, expedient not to uſe Purgatives, but Clyſters prepared of carminative and coroborating Ingredients; ſuch as Bay and Juniper-berries, Rue, Marjoram, Leaves of dwarf Elder, Flowers of Roman and common Chamomile, and the Four carminative Seeds, boil'd either in Water or Milk, with an Addition of a ſufficient Quantity of the Oil of Dill and Chamomile. This Piece of Practice I have, alſo, uſed with great Succeſs, in Caſes where the goury Matter, being either repel'd or retain'd, has produced Spaſms and Flatulences of the Inteſtines, and threaten'd an approaching Dropſy.

Women are far more ſubject to Dropſies than Men, eſpecially if the menſtrual Diſcharge is either defective, or ſuppreſſed, or abſolutely ceaſes for ſome time. But this Misfortune principally happens to thoſe Women who lead a

ſedentary Life, indulge themſelves in Eaſe and Sleep, or have been long afflicted with exceſſive Care and Grief. In this Caſe, Veneſection, Exerciſe, Travelling, and Change of Air, contribute greatly both to the Prevention and Cure of the Diſorder. If theſe ſhould prove ineffectual, Mineral Waters are to be uſed, both internally and externally. Theſe are, alſo, highly efficacious in recalling the hæmorrhoidal Diſcharges when ſuppreſſed.

The Cure of œdematous Swellings of the Feet ought to be very cautiouſly manag'd; ſince there are many Inſtances of fatal Misfortunes produced by prepoſterous Meaſures taken for this Purpoſe. Thus, for Inſtance, if they are treated with Aſtringents and Caraplaſms, the Swellings indeed ſubſide, but the Serum is tranſlated to more noble Parts; and, when conveyed to the Lungs, produces a ſuffocative and fatal Catarrh. 'Tis, therefore, far more ſafe to cheriſh theſe Swellings with warm Cloths, or Bags full of hot Sand, or Bran, in order to keep up a continual Perſpiration. 'Tis, alſo, expedient to uſe broad Swaths, beginning at the inferior, and continuing them to the ſuperior Part of the Swelling. Some order Scarification, or, with *Celſus*, a deep Inciſion; for, ſays this Author, "An Inciſion is to be made in the "internal Part of the Leg, about four Fingers-breadth, above "the Ankle; that the Humour may be copiouſly diſcharged "for ſeveral Days: Inciſions muſt, alſo, be made in other Parts of "the Swelling." But this Method ought to be very cautiouſly uſed, and never attempted in an Aſcites, or in Caſes where there is a ſcorbutic Dyſcraſy of the Humours; for a Sphacelus is eaſily brought on by this means; and the Inciſions, in conſequence of the Laxity of the Fleſh, and the Afflux of the Humours, cannot be conſolidated without the greateſt Difficulty.

That we may the better aſcertain ourſelves, with reſpect to the Event of this Diſorder, we muſt have a due Regard to that beautiful Maxim of *Celſus*, compriſed in the following Words: "'Tis expedient to meaſure the Abdomen daily with a Thread, "which is to have the Circumference of the Body marked upon "it; and next Day we are to obſerve, whether the Body is "groſſer or ſmaller; for, when it becomes leſs, 'tis a Sign that "the Medicines operate duly. 'Tis, alſo, expedient to meaſure "the Drink and Urine of the Patient; for 'tis a hopeful Sign, of "Recovery, when more is diſcharged by Urine, than is drank." *Frederic Hoffman.*

The celebrated *Boerhaave* gives the following Account of Dropſies.

When an extravaſated aqueous Serum, received into the Cavities of the Body, or becoming ſtagnant any-where, preternaturally diſtends the Veſſels, the Diſorder is call'd a Dropſy.

This Diſeaſe may, therefore, happen, in whatever Part the Veſſels deſtin'd for the Conveyance of the Serum are found; that is, either in the whole Habit of the Body, or in any particular Part thereof.

Thus an *Hydrocephalus* may ariſe from a ſordid Collection of Water, either between the external Integuments of the Head; between theſe and the Cranium; between the Cranium and the Membranes of the Brain; between theſe Membranes and their Duplicatures; between theſe Duplicatures and the Brain; between the Foldings of the Brain; and, laſtly, in its Cavities, but yet without producing immediate Death.

This Diſorder is eaſily known, but the laſt-mentioned Species of it is incurable; whereas the others are either to be cured by gentle Cauterizing, Terebration, or Puncture, prudently and cautiouſly practis'd; exhibiting, at the ſame time, Hydragogues and Corroboratives, internally; or they are to be removed by the external Application of Diſcutients.

In a Dropſy of the Thorax, in which the Lymph may be collected from various Parts, the Symptoms are almoſt the ſame with thoſe of an *Empyema*. But a due Attention to the antecedent Cauſes of each Diſorder diſcovers the Differences between them. This is to be cured by the Operation for the Empyema, together with the due Uſe of ſuch Medicines as are oppoſite to its Cauſe.

In a Dropſy of the Thorax, ſometimes Hydatides, and ſometimes dropſical Abſceſſes, are found form'd in the Lungs, by an Accumulation of the Lymph diſcharg'd from the Veſſels, and received into the large Sinuſes. This Species of the Diſorder is equally difficult to be known and cured; unleſs, perhaps, the Meaſures taken to remove other preſent Symptoms, ſhould, at the ſame time, fortuitouſly produce a Cure of this Species of Dropſy.

When, by whatever Cauſe, Lymph is collected, and becomes ſtagnant, in the anterior, and moſt conſpicuous Part of the Aſpera Arteria, a Species of *Bronchocele* often appears. But Authors inform us, that, if this Diſorder is carefully adverted to, it is eaſily known, and moſt ſucceſsfully cured by Puncture, Diſcutients, and ſuch Things as derive the Humours from the Parts affected.

The Follicule of any Gland may be ſubjected to the like Misfortune, and the Diſorder removed by the like Means.

A remarkable Species of Dropſy ſometimes affects the *Ovaria* of Women, but moſt frequently of thoſe who are barren and ſuperannuated. This Diſorder is of ſo latent a Nature, that it is hardly to be known, till the Body of the Patient is laid open. It is never capable of being cured, but frequently changes into an Aſcites.

In the Cavity of the Uterus, when its internal Orifice is cloſed up, there is often ſo large a Quantity of Water collected, that the whole Abdomen appears as if the Patient labour'd under an *Aſcites*. This Species of Diſorder is, in like manner, not to be known, without the greateſt Difficulty, by reaſon of the fallacious Signs of Pregnancy, with which it is attended. It is to be cured by a Relaxation of the Orifice of the Uterus, by means of Fomentations, Vapours, and the due Uſe of uterine Medicines.

When, thro' the whole ſubcutaneous Fat, this Lymph either becomes ſtagnant, or is effuſed, that Species of Dropſy which is called Anaſarca, Hypoſarca, and Leucophlegmatia, is produced; which ſometimes affects the Parts about the Abdomen, and thoſe about the Scrotum.

When this Water is collected either in the Duplicature of the *Peritonæum*, in the Cavity of the *Abdomen*, between the *Peritonæum* and abdominal Viſcera, in the dilated Cavities of the Glands, or in the Veſſels contained in the Abdomen, the Diſorder is call'd *Aſcites*; as alſo *Tympanitis*, when the Abdomen is turgid with rarefied Vapours, ariſing either from Water, Pus, Ichor, or Air pent up there, and putrefied by the Heat.

A Dropſy of the Teſticles is, firſt, either that of the Scrotum, which is known by the Touch, the conſpicuous Pellucidity of the Parts, and the remaining of an Impreſſion made by the Finger; or, ſecondly, of the Bag, formed by the Production of the Peritonæum in a legitimate *Hernia*. This Species of the Diſorder happens in a violent *Aſcites*, and may be diſtinguiſh'd by the preceding Signs of an *Aſcites*, or a *Tympanitis*; by its Diſappearance, upon its being preſſed, upon the Patient's lying on his Back, with his Head and Body lower than the other Parts, and upon the Evacuation of the Water from the Abdomen; by the ſudden Increaſe and Decreaſe of the Diſorder, without any manifeſt Cauſes; and, laſtly, by the Tumor running out from the Scrotum to the Groin, in the Form of a Hog's-pudding. And, thirdly, a Dropſy of the *Tunica Vaginalis* of the Teſticles happens, when the Humours, there ſecreted, are not reabſorbed by their proper Veſſels, but, becoming ſtagnant, are accumulated and frequently diſtend the Coat in which they are contained, to an enormous Size; or, if in conſequence of a Rupture, or Obſtructions of the Veſſels, the Humours ſhould be there collected: An Inflammation, Suppuration, and Collection of Ichor, often produce a Diſorder, which has much the ſame Appearance with this Species of Dropſy; this ſort of Dropſy is to be known and diſtinguiſhed by the want of Elaſticity in the Tumor, its Reſiſtance, its Hardneſs, and the Slowneſs of its Production; as, alſo, by the Abſence of thoſe Symptoms which attend the firſt and ſecond Species of Dropſies of the Teſticles; by the round, or, at leaſt, the oval Figure of the Tumor; by the apparent Pellucidity, when, upon ſtraitening the Scrotum, the Bag of collected Matter, expoſed to a lighted Candle, appears clear and tranſparent. But if, beſides theſe, there ſhould be ſuch a Tumor between the nervous Coat and the Subſtance of the Teſticle, or even in the Subſtance of the Teſticle, the Diſorder can hardly be ſo accurately inſpected, as that it may be eaſily diſtinguiſhed from the preceding Species, nor perhaps is there any other Cure for it than Extirpation. The Diſorders of this Kind are called Hydroceles. See HERNIA.

All the Diſorders of this Kind are produced, firſt, by every Cauſe which is capable of ſo confining the Serum, that it cannot return into the Veins, but ſtagnates in the diſtended Veſſels: Or, ſecondly, by every Cauſe which ſo ruptures the Veſſels, that the Serum is diſcharged within the ſlender Membranes: Or, thirdly, by every Cauſe which ſo obſtructs the Veſſels which convey the Fluids from the Cavities, or ſo little moves the Humours contained in them, that they are neither exhaled nor reabſorbed.

The Cauſes of this Kind are principally obſerv'd to be an hereditary and natural Diſpoſition; the ſudden drinking of too large Quantities of cold Liquors, which are neither diſcharged by Vomit, Stool, Sweat, nor Urine, excited by Heat or Motion; acute Diſeaſes, either accompanied with an inſatiable Thirſt, and exceſſive Drinking, or without theſe Circumſtances; a lienteric Dyſentery long protracted; all obſtinate Obſtructions of the Viſcera, ſuch as Scirrhuſes of the Liver, Spleen, Pancreas, Meſentery, Kidneys, Uterus, and Inteſtines; the Jaundice, violent and long protracted quartan Fevers; Lienteries; Diarrhœas, Dyſenteries of long ſtanding; the Cœliac Paſſion; Empyemas; a Spitting of Blood; the Gout; exceſſive Evacuations of any Kind, and eſpecially of the arterial Blood; drinking of acrid and fermented Liquors; viſcid Aliments, and ſuch as are of difficult Digeſtion; a conſiderable Number of large Hydatides, hanging pendulous in the Cavity of the Abdomen; and many other Diſorders of a ſimilar Nature, ſuch as Melancholy, the Scurvy, and ſome others.

The Effects and Progreſs of this Diſeaſe are generally as follows: The Feet become tumid, eſpecially towards the Evening; and this Tumor is gradually increaſed and augmented; then a daily

daily increaſing Tumor appears in the Abdomen. In a *Tympanitis* the diſtended Abdomen ſounds, when ſtruck; in an Aſcites, when the Water flows freely in the Cavity of the Abdomen, the Noiſe of fluctuating Water is heard, upon moving the Body. But in that Species of *Aſcites*, where the Waters are included in their proper Veſicles, this Symptom does not always happen, and conſequently is not to be depended on. Add to theſe a Difficulty of breathing, Thirſt, a Senſation of Weight, Torpor, Coſtiveneſs; a ſmall Diſcharge of Urine, a ſlow Fever, no Evacuation by Sweat, a Degree of Leanneſs and Extenuation in the general Habit, proportion'd to the Largeneſs of the Tumor, in the particular Part affected: Then appears an *Anaſarca* of the Thighs, *Scrotum*, and abdominal Skin; Hydatides; an Acrimony of the Water become ſtagnant and putrefied, in conſequence of the Heat and Cloſeneſs of the Part in which it is confined; Ulcers, Gangrenes, Hæmorrhages from the Noſe, an Exomphalus, a Sphacelus of the Viſcera, and, at laſt, the Death of the Patient.

In the Cure of a Dropſy, the following Intentions are to be purſued:

Firſt, To procure a due Fluidity and Motion to the Lymph, whether it is Water or Serum, of the bilious, ichorous, or bloody Kind.

Secondly, To evacuate the Waters already diſcharged into the Cavities of the Body.

Thirdly, To remove the Weakneſs of the Viſcera, whether this Weakneſs is the Cauſe, or the Effect, of the Dropſy.

The Fluidity of the Lymph is procured, by removing thoſe Cauſes which prevent ſuch a Fluidity; which are, firſt, The too languid Force of the vital Powers ſubſervient to Circulation. Secondly, The Compreſſion, Rupture, or Obſtruction, of the Veſſels. And, thirdly, The exceſſive and preternatural Viſcidity of the Fluids.

With reſpect to the too languid Force of the vital Powers ſubſervient to Circulation; this is moſt commodiouſly remov'd by, what we call, Cardiacs, Corroboratives, and Medicines of a ſtimulating Quality; which, if the Patient is not afflicted with a violent Thirſt, are to conſiſt of aromatic, ſaline, oleous, and hot Subſtances; which may be eaſily prepar'd, in the various Forms of Electuaries, Mixtures, medicated Wines, medicated Ales, Pills, Decoctions, Syrups, or Lozenges. Thus, for Inſtance,

Take of the Roots of Maſterwort, both Species of Birthwort, Zedoary, and Mountain Hartwort, each one Ounce; of Ginger, ſix Drams; of the Flowers of the leſſer Centaury, two Ounces; of Roſemary-flowers, one Ounce; of Hedge-hyſſop, four Drams; of Elder and Juniper-berries, each half an Ounce; of Thyme, Mother of Thyme, and *Syrian* Marum, each one Ounce; of the Seeds of Wormwood, Tanſey, and Wormſeed, each one Ounce: Reduce all to a fine Powder; then take of this Powder, ſix Ounces; and of pure *French* Wine, four Pints: Make into a medicated Wine, of which let the Patient take two Ounces, four times a Day, upon an empty Stomach, uſing, at the ſame time, a proper Regimen.

Or,

Take of the above preſcribed Powder, two Ounces; Conſerve of Roſemary-flowers, one Ounce; and of *Fernelius*'s Syrup of Mugwort, a ſufficient Quantity for making a Conſerve, of which half a Dram is to be taken every fourth Hour.

Or,

Take of the preceding Powder, twelve Ounces; and of ſtrong Ale, a proper Quantity: Make into a medicated Ale, for common Uſe.

Or,

Take of the ſame Powder, four Drams; and of the beſt White-wine, eight Ounces: Make into an Infuſion, of which let the Patient drink one Ounce every two Hours.

This Intention is, alſo, anſwer'd by Elixir Proprietatis, volatile, oleous, and aromatic Salts; volatile, acrid, and oleous Spirits, of the aromatic, cephalic, and ſtomachic Kind; as, alſo, thoſe appropriated to Diſorders of the Uterus.

If the Thirſt is intenſe, the Cauſe of a hot Kind, and the Diſorder accompanied with a hot Fever, which frequently happens, the Thirſt is remov'd by refreſhing Cardiacs, grateful Acids, and Liquors gently aromatic. Thus, for Inſtance,

Take of the diſtilled Oils of Cinnamon, Citron and Orange-peel, each three Drops; of the Oils of Lavender-flowers, and of Juniper, each two Drops; and of Sugar, ſix Drams: Make an Elæoſaccharum, with which mix of the Robs of Elder and Juniper, each three Ounces; of the Spirit of Salt, one Dram; of the diſtil'd Waters of Cinnamon, Citron, and Orange-peel, each two Ounces; and of the diſtil'd Water of Mint, ten Ounces: Of this Preparation let the Patient take one Ounce every two Hours.

Or,

Take of the Juices expreſſed from the cut and recent Herbs of Fumitory, Succory, Dandelion, and Sorrel, each one Pint; and of Cream of Tartar, half a Pound. Over a gentle Fire, boil, to a Conſumption of Half; then, with every ten Ounces of this Decoction, when depurated, mix ten Ounces of Elder-rob: And, of this Preparation, let the Patient take half an Ounce every two Hours.

Or,

Take of dulcified Spirit of Nitre, four Drams; of the Spirit of Scurvy-graſs, ſix Drams; of the Syrup of Succory, with Rhubarb, and the Syrup of the Five aperient Roots, each one Ounce; and of *Rheniſh* Wine, one Pint: Mix all together, and of this Preparation let the Patient take an Ounce every two Hours.

In both Caſes, Frictions, Motion, and Heat, are proper.

When the Veſſels are compreſſed, ruptured, or obſtructed, the Cauſe producing ſuch Effects is to be inveſtigated, and, if poſſible, remov'd; or this Cauſe may be often corrected by Mineral Waters.

The exceſſive Viſcidity of the Fluids may be remov'd, either in a hot or cold Dropſy; firſt, By the Medicines already preſcribed: Secondly, By alcaline Subſtances, eſpecially Salts, both of the volatile, and, principally, of the fixed Kind; and, thirdly, By chymical Preparations of Mercury, Antimony, and Copper, duly prepar'd, and judiciouſly exhibited: Thus, for Inſtance,

Take of Turpeth Mineral, half a Grain; and of white Ginger, ten Grains: Make into a Powder, to be taken every other Morning, in the Pulp of a roaſted Apple.

Or,

Take of red precipitate Mercury, one Grain; and of Nutmeg, ſix Grains: To be made into a Powder, for the ſame Intentions with the former.

Or,

Take of Mercurius ſublimatus dulcis, ſeven Grains; and of Winter's Cinnamon, eight Grains: Reduce to a Powder, to be applied to the ſame Uſes with the former.

Or,

Take of emetic Tartar, half a Grain; and of an Elæoſaccarum of the Oil of Citrons, ſix Grains: Make into a Powder, to be taken every third Day.

Or,

Take of the mild Emetic, prepar'd by Detonation, from Antimony, two Parts, and Nitre, five Parts, four Grains: Reduce to a Powder, to be taken every Morning.

Or,

Take of the Filings of Copper, ten Grains; and of Sal volatile Oleoſum, ſix Drams: Make into a Tincture, of which let the Patient take twelve Drops, three times a Day, on an empty Stomach, with half an Ounce of the Syrup of the Five aperient Roots.

The Waters, collected in the Cavities of the Body, are to be evacuated, firſt, By the *Paracenteſis*: Secondly, By procuring new Outlets for it: Thirdly, By Urine: Fourthly, By Vomit: Fifthly, By Purging: And, ſixthly, By Diſſipation.

If the Cauſe of that Species of Dropſy, called *Aſcites*, is recent, and the Diſeaſe ſuddenly produc'd, by ſome external Cauſe; and if the Strength is entire, the Patient young, the Viſcera in good Order, and not injured by any other Diſeaſe, and the Water not putrid by its long Stagnation in thoſe Parts, the Operation of the *Paracenteſis* is forthwith to be perform'd.

This Operation is to be perform'd three Inches below the Navel, and as many from the Linea alba: But this Meaſure is to be eſtimated, as if the Body was ſound, and the Abdomen not diſtended. The Operation is to be perform'd in the Side oppoſite to the Source of the Dropſy, by making a Puncture, with a proper Inſtrument, lodged in a *Cannula*, and again drawn out of it: From this Cannula a ſmall Quantity of Water is to be evacuated, twice a Day, for, at leaſt, fifteen Days, uſing, at the ſame time, the Medicines already preſcrib'd: Or, according to a later Method, the Abdomen is, by means of Swaths, to be compreſſed, in proportion to the Quantity of Water evacuated, leſt the lax and pendulous Veſſels and Viſcera ſhould, after the Evacuations, fluctuate in the empty Abdomen.

If the Conditions, enumerated in the preceding Paragraph, are wanting, or if the State of the Patient is quite oppoſite, the *Paracenteſis* accelerates his Death.

Outlets made by the actual Cautery, Cauſtics, Veſicatories, Lancets, and Setons, in a fleſhy, but dependent Part, are highly beneficial; eſpecially if the Nature of the Diſeaſe admits of their being kept open.

Theſe Operations only take place when the Water is contain'd in the Cellular Membrane, without being effuſed into the Abdomen; and then, if the Viſcera are ſound, we may follow the Example of *Hippocrates*, and the *Egyptians*, and of the modern *Chineſe*, and apply an actual Cautery below the Knee, and then mollify the Eſchar with Butter, that it may fall off, and give Vent to the Water. *V. Proſper Alpinus de Med. Ægypt.*

As the Cellular Membrane, all over the Body, communicates, this Practice ſeems to be very rational. Care, however, muſt be taken to prevent a Mortification, by proper Bandages to the ſubſiding Parts; warm, aromatic, and lixivious Fomentations, and Dreſſings of warm Balſams applied to the Ulcer, or Emiſſary: And this muſt be done, when an artificial Emiſſary is made by any means whatever.

As there are many Inſtances of the Evacuation of the Waters by Urine, we are, when we diſcover ſuch a Tendency in Nature, to attempt this Method, by the Uſe of ſpecific, urinous, fixed, and compound Salts, animal Salts, vitriolated Salts, diſſolved Metals, and Specifics for Diſorders of the Kidneys.

Since, by Vomits, the viſcid Humours are reſolved, the obſtructing Matter ſhaken, and the ſtagnant Fluids expelled; they are, therefore, ſingularly beneficial in this Diſorder.

But the Vomits, for this Purpoſe, muſt be draſtic, frequently repeated, and exhibited at ſmall Intervals of Time: Thus, for Inſtance,

Take of the common emetic Wine, two Ounces and an half for a Doſe.

Of emetic Tartar, ſix Grains for a Doſe.

Of Turpeth Mineral, ſeven Grains for a Doſe.

Of the recent Juice expreſſed from the middle Bark of Elder, one Ounce; and of the Syrup of Violets, half an Ounce; for a Doſe.

Of the Leaves of the *Soldanella Marina*, one Ounce for a Doſe.

Of Elaterium, four Grains; and of the cathartic Syrup of Buckthorn-berries, one Ounce: To be made up for a Doſe.

Theſe Medicines are not only emetic, but, alſo, generally purge pretty briskly; and ſometimes promote a *Diureſis*.

The Evacuation of the Serum by Stool is obtain'd by the liberal and frequently repeated Uſe of draſtic Purgatives, exhibited in various, but, eſpecially, in liquid Forms: Thus, for Inſtance,

Take of the Reſins of Jalap and Scammony, each one Dram; of the Powder of Sena-leaves, and the bruiſed Seeds of baſtard Saffron, each four Drams; and of rectified Spirit of Wine, one Pint: Make a Tincture; with which mix four Ounces of the ſolutive Syrup of Roſes, with Sena: Of this let the Patient take one Ounce in the Morning.

Or,

Take of the cathartic Silver of *Boyle*, and of Crums of Bread, each four Grains: Mix up into a Maſs, of which make Pills, conſiſting of two Grains each: Of theſe let the Patient take one, every Half-hour, till the Purging begins.

The Waters are diſſipated by the Heat either of a Fire, a Stove, Sand, the Sun, Salt, or Dung; ſince, by means of theſe, a *Diaphoreſis*, or a Sweat, are excited.

But the Waters are, in a particular manner, diſſipated by a rigid Abſtinence from Drink, and eating Biſcuit with a little Salt, and a very ſmall Quantity of oleous Wine.

The Weakneſs of the Viſcera is to be remov'd by chalybeate Preparations, Steel in Subſtance, and Corroboratives of a gently aſtringent Quality, exhibited in due Doſes, and at proper Times; as, alſo, by dry Aliments, Exerciſe, and Wine which is ſtrong, old, and aſtringent: Thus, for Inſtance,

Take of the recent Filings of Steel, before they are ruſted, two Ounces; of *Peruvian* Bark, and *Winter*'s Bark, each two Ounces; of dried Rhubarb, half an Ounce; and of the beſt *Rheniſh* Wine, two Pints: Make into a medicated Wine, of which the Patient is to take two Ounces, thrice a Day, upon an empty Stomach.

A *Tympanitis* is to be cured by the ſame means, and in the ſame manner, if it draws its Origin from the rarefied Vapours, exhaling from the extravaſated and putrefied Humours; for, in this Caſe, the Cauſe of the Diſorder being remov'd, the Diſeaſe muſt of courſe be cured: But if it ariſes from the Air falling down into the Cavities, through the perforated Membranes of the putrefied Inteſtines, and not being able to return, but becoming rarefied by the Heat; in this Caſe, by the concurring Influence of the Air, all the Parts ſoon become putrefied; and the Diſorder, when proceeding from this Cauſe, is almoſt always incurable: Hence a dry Dropſy is accounted far more incurable than one of the moiſt Kind. Puncture frequently affords Relief, but rarely produces a perfect Cure.

The Species of Hydrocele, firſt mention'd, is cured, firſt, if the Anaſarca, whoſe Effect it is, is cured. Secondly, By the Heat, either of a Fire, a Stove, Sand, the Sun, Salt, or Dung.

Take of the beſt Roots of Bryony, and Jalap, of the Leaves of Rue, Wormſeed, and the Garden Artichoke, of the Leaves of Melilot, and the leſſer Centaury, and of the Bulbs of Onions and Garlick, each two Ounces: Boil to the Conſiſtence of a Cataplaſm, with a ſufficient Quantity of Water; adding, towards the End, of Galbanum, diſſolved with the Yolk of an Egg, two Ounces; of the Meal of Linſeed, one Ounce; of the Oil of Linſeed, four Drams; and of Sal Ammoniac, four Drams: Mix all together for a Cataplaſm to be applied to the Part affected.

Or,

Take of *Venice* Soap, four Drams; and of the *Spiritus Vini theriacalis*, twelve Ounces: Mix carefully for a Fomentation, to be applied with Woollen Cloths.

Or,

Take a ſufficient Quantity of decrepitated, highly dry, hot, and finely triturated Sea-ſalt: This, contained in a thin Linen Cloth, is to be applied, and renew'd when it becomes moiſt.

Or,

Take of Benzoin, Olibanum, Sarcocolla, and the Reſin of Guaiacum, each half an Ounce; of Camphire, half a Dram; of Maſtich, one Ounce; and of Sal Ammoniac, two Scruples: Reduce to a Powder, to the Steam of which, when kindled, the naked Scrotum is to be expoſed; after which Cloths, render'd hot with this Steam, are to be applied.

Thirdly, By ſtrong Diſcutients, in Conjunction with Corroboratives, apply'd to the Scrotum, and by external Heat continually excited, in order to induce a greater Motion, and Efficacy. The ſecond Species of Hydrocele mention'd, is moſt commodiouſly cured, firſt, by extirpating the Hernia; ſecondly, by removing the Matter of the Aſcites, and intercepting the Source, from which it flow'd; and, thirdly, by Machines adapted to compreſs the Part from which the Matter is diſcharg'd, as in Hernias. But this Species of Dropſy, when once form'd, is rarely perfectly cured. The laſt Species of Hydrocele is cur'd, firſt, by the often repeated Exhibition of draſtic Hydragogues, and the Uſe of drying Aliments; ſecondly, by the moſt efficacious Diſcutients and Corroboratives; thirdly, by the Paracenteſis of the Scrotum; and, fourthly, by Cauſtics and Suppuration. See HERNIA.

From what has been ſaid, it ſufficiently appears, that, in the Cure of a Dropſy, greater Difficulty ariſes from the Nature of the ſtagnant and putrefied Water, than from the original Cauſes of the Diſorder; for limpid Water may be abſorb'd by the bibulous Veins, and reconvey'd into the Circulation; which cannot happen, if the Humours effus'd, are viſcid, tenacious, and putrefy'd.

From what has been ſaid, it is, alſo, obvious, why, after an Evacuation of the Waters, a Gangrene of the Parts, which floated in them, is accelerated; for the Preſſure of the Water ſupports the Texture of the macerated and weaken'd Parts, which collapſe, and tend to Putrefaction, when this Preſſure is remov'd:

Why, upon a ſudden Evacuation of the Waters from the Thorax, or Abdomen, Death, or a violent Deliquium, enſue; for, the Preſſure of the Water being taken from the Arteries, they become larger, and the Blood ruſhes into them ſuddenly, deſerting, at the ſame time, the Brain:

Why dropſical Patients are afflicted with ſo inſatiable a Thirſt; what this Thirſt denotes; why Acids are often ſo beneficial in the Cure of a Dropſy; for this Thirſt is excited by a Fever, which is rais'd by an alcaline Putrefaction of the ſtagnating Juices: This is a very bad Symptom, and muſt be cur'd by Acids, which prevent Putrefaction:

Why, upon the Evacuation of a large Quantity of Water, at one time, by means of draſtic Evacuants, the Tumor of the Abdomen appears the ſame, or rather larger; and why, by the Exhibition of Opium, this Tumor ſubſides; for this Swelling proceeds from Flatulences excited by the violent Operation of the Evacuants; and, when the Agitation of the Humours is taken off by Opium, the Tumor ſubſides. And hence we learn, why Bandages are ſo beneficial in this Diſorder, and how far.

The Method of Tapping.

Experience aſſures us, that a Paracenteſis of the Abdomen is uſeleſs in the Tympanitis, though its Succeſs is fully confirmed in the Aſcites, by Inſtances of Perſons recovered from that Diſorder, by an accidental Perforation, through which the Water has diſcharged itſelf, upon which the Patients, beyond all Expectation, have been reſtored. The Encouragement, therefore, given to this Operation, is founded upon ſolid Reaſons: Though, to confeſs the Truth, it affords but a temporary Relief; for either Delay, or the infirm State of the Patient, or the Corruption of the Viſcera, generally bring on Death; but in young robuſt Perſons, lately attacked by the Diſtemper, it may be performed with Succeſs. For this Reaſon, if a proper Diet, and Courſe of Phyſic, do not, in ſome Weeks, alleviate the Diſeaſe, I adviſe an immediate Recourſe to Tapping, before the Patient's Strength is exhauſted, or his Viſcera corrupted by the morbid Humours. On the contrary, when it is attended with a Scirrhus, internal Abſceſs, or Conſumption, it ſeems altogether proper to refrain from the Operation. The ſame Rule ſhould be obſerved in thoſe Dropſies, which come on all at once; for there we may be ſure ſome large lymphatic Veſſel is burſt. As for the Wound itſelf, it is neither dangerous nor troubleſome, ſince it is but ſmall, and made in a fleſhy Part.

For the Diſcovery of Water in the Abdomen, the Surgeon muſt apply one Hand to each Side of the Patient's Belly, while he ſits or ſtands; and, by ſhaking it, he will perceive a Fluctuation of the Water, from Side to Side; if not, the Lymph is not extravaſated into the Cavity of the Abdomen, and conſequently a Paracenteſis is unneceſſary.

There are ſeveral different Methods of performing this Operation. The firſt, and moſt modern, is this: The Patient is laid on the Side of a Bed, and the triangular Needle, call'd the *Trocar*, (*Tab.* XLV. *Fig.* 1.) is thruſt into his Belly, about eight Fingers-breadth from the Navel, or in the Middle between the Angle of the Os Ilii and the Navel; then this Inſtrument (*Fig.* 2.) is extracted out of the Cannula (*Fig.* 3.), which is left in the Wound, till as much Water is drawn off, as the Strength will permit; which, if he does not grow faint, may be the whole Quantity. And, to prevent this Languor, an Aſſiſtant ſhould, with his Hands, preſs each Side of the Abdomen, or a Swathe of broad Linen, perforated in the Middle (*Tab.* XXVI. *Fig.* 8.), ſhould be carry'd round the Body, and gradually tightened, as in longitudinal Wounds of the Abdomen, till all the Water is evacuated; after which a Bandage muſt be apply'd, for this frequently enables the Patient to walk about immediately after the Operation; and without it, as *Hippocrates* obſerves, a plentiful Diſcharge of Water, at one Opening, is always attended with Faintneſs, and often with Death. Many, therefore, adviſe an Evacuation proportionable to the Strength of the Patient; after which, they extract the Tube, and, as the Wound is but ſmall, almoſt cloſing of itſelf, dreſs it with two ſquare Compreſſes, a Plaiſter and Bandage; next Day they repeat the Operation on the other Side, and, on the third, make another Aperture about two Fingers-breadth above the firſt; and ſo proceed, from Side to Side, alternately, till the Patient recovers or dies. They make freſh Wounds, to prevent an Inflammation, which is deſtructive to dropſical Subjects. In the mean time, the Patient ſhould be aſſiſted with a proper Regimen, and Courſe of Phyſic. As for the Poſture, he was formerly ſeated on a Chair or Bed; but the Moderns, after *Petit*, lay him on one Side of the Bed; for thus the Needle is more commodiouſly introduced into the lateral and lower Part of the Belly, the Water more perfectly diſcharged, and the Patient leſs ſubject to faint. Some, alſo, draw off the whole Quantity, at the firſt Tapping, and repeat it upon a Return of the Diſorder; but, where the Patient is infirm, I muſt preſer the other Method, as the ſafeſt. *Petit* approves of the Inſtrument, whoſe Cannula has a Slit in it (*Tab.* XLV. *Fig. a a*), as moſt convenient for diſcharging the Water; but, what Inſtrument ſoever the Operator chuſes, he ſhould lubricate the End with Oil, for the more free Admiſſion of it into the Abdomen.

The Antients, firſt perforating the Skin with a Cauſtic, thruſt a Knife, about a third Part of an Inch broad, into one Side of the Abdomen, about four Fingers-breadth below the Navel; and then introducing a Tube of Lead, Copper, or Silver, diſcharged as much Water, as the Patient's Strength would permit; this Inſtrument was about three or four Fingers-breadth long, (*Tab.* XXIII. *Fig.* Q S) either with the Edges bent outwards, or with a Rim, to prevent its ſlipping quite into the Abdomen.

After a ſufficient Evacuation, the Tube remaining there, the Orifice of the Tube was ſtopt with Lint, or a Cork. Over this they laid a ſticking Plaiſter, thick Compreſſes and Bandage, with the Napkin and Scapulary, as a Security againſt any involuntary Emiſſion. Next Day they repeated the Diſcharge, and continued this Method till the Patent recover'd, or died. But the modern Practice is certainly preferable; for the Introduction of the Cannula, after extracting the Knife, is a Task of no ſmall Difficulty; and leaving it in the Wound muſt unavoidably excite an Inflammation, and other bad Symptoms. Theſe Inconveniencies induced *Barbett* to contrive a hollow kind of Needle, of Silver, with a Foramen on each Side, as in *Tab.* XLV. *Fig.* 1. and 3. to perforate the Abdomen, and diſcharge the Water, at the ſame time; but as this ſharp-pointed Inſtrument, continuing in the Abdomen, might injure the Inteſtines, the Moderns have, more judiciouſly, ſubſtituted, in the room of it, the triangular Perforator, and Cannula, now call'd *Trocar*.

Though the Perforator is ſharp-pointed, there is no Danger of wounding the Inteſtines; becauſe the intervening Water keeps them at a conſiderable Diſtance from the Inſtrument; and, was it to touch them, their Lubricity would preſerve them from any great Injury. If the Tube ſhould be obſtructed, the Inſertion of a Probe will remove the Obſtacle. Sometimes the Navel is ſurpriſingly diſtended in hydropical Subjects. See *Hildanus*, *Obſ.* 47. *Cent.* 1. and *Purman's Chirurg. curioſ. p.* 330. In this Caſe, ſome adviſe a Perforation of the Part; and are encouraged to it by reading of a Patient, cur'd by a ſpontaneous Rupture there; though it is generally incommodious; for, beſides the Difficulty of diſcharging all the Humour, this Wound ſcarcely ever heals.

Sharp, in his Treatiſe on Chirurgical Obſervations, ſays, that, if the Navel protuberates, you may make a ſmall Puncture with a Lancet through the Skin, and the Waters will be readily voided by that Orifice, without any Danger of an Hernia ſucceeding, as is apprehended by many Writers.

Though a Paracenteſis of the Abdomen does not always cure a Dropſy, it, at leaſt, eaſes the Patient of the Oppreſſion, Difficulty of Breathing, and other Symptoms, which hinder his Sleeping, and oblige him to ſit up both Day and Night, ſo that the Operation is abſolutely neceſſary. Inſtances of its Succeſs may be ſeen in *Volteri Schola Obſtetricia*, *p.* 63. *Pechlini Obſ.* 62. *Nuchei Adenograph. p.* 122. *Brunner, in Ephem. Nat. cur. Dec.* 2. *An.* 8. *Sinibaldi Meth. parva. Saviardi Obſ.* 119. *Memoires de l'Academie Royale des Sciences, anno* 1703. *Dionis, Chirurg. Helvetii Lib. de Sanguinis Profluviis, p.* 79. *Act. Med. Berilinenſ. vol.* 9. & 10. *Heiſter. Inſtitut. Chirurg.*

Sharp ſays, that, during the Evacuation, the Aſſiſtants muſt keep preſſing on each Side of the Abdomen, with a Force equal to that of the Waters before contain'd there; for, by neglecting this Rule, the Patient will be ſubject to fall into Faintings, from the Weight on the great Veſſels of the Abdomen being taken off, and the ſinking of the Diaphragm ſucceeding; in conſequence of which, more Blood flowing into the inferior Veſſels than uſual, leaves the ſuperior ones of a ſudden too empty, and thus interrupts the regular Progreſs of the Circulation. To obviate this Inconvenience, the Compreſſion muſt not only be made with the Hands, during the Operation, but muſt be afterwards continued by ſwathing the Abdomen with a Roller of Flannel, about eight Yards long, and five Inches broad, beginning at the Bottom of the Belly, ſo that the Inteſtines may be bore up againſt the Diaphragm. You may change the Roller every Day, till the third or fourth Day, by which time the ſeveral Parts will have acquir'd their due Tone. For the Dreſſing, a Piece of dry Lint and Plaiſter ſuffice; but, between the Skin and Roller, it may be proper to lay a double Flannel, a Foot ſquare, dipt in Brandy, or Spirits of Wine. *Sharp.*

The Place where chirurgical Writers determine the Perforation to be made with the Trocar, in tapping the Belly, is four or five Inches below, and as much to the Side of, the Navel; or the Point where a Line, at that Diſtance from, and parallel to the Linea alba, would be interſected by another Line drawn perpendicular to the Linea alba at four or five Inches below the Navel. If this Point is ſuppoſed to be determin'd on a healthy Man, of middle Growth and Stature, it certainly is a very ſafe and convenient Place for making the Puncture; for it is ſufficiently dependent, eſpecially when the Perſon lies on the ſame Side. There are no thick fleſhy Bellies of Muſcles to pierce, nor are the Muſcles entirely tendinous, but are become tendineo-carnous; and at this Place there are no large Blood-veſſels or Nerves in hazard of being wounded: All which Advantages no other Part of the Abdomen has. But, then, this Rule of meaſuring four or five Inches is certainly not to be apply'd to hydropic People, as being very precarious, and, conſequently, very often dangerous; for, though the Diſtance is taken in full Meaſure, when the Abdomen is diſtended, yet, when the Belly ſubſides, the Perforation will be found nearer to the Navel, in proportion to the Degree of Diſtention; as, for Inſtance, Suppoſe that the anterior Part of the Abdomen is diſtended by Water, to double its natural Length and Wideneſs; that when the Water is drawn off, this Cavity is contracted to its natural Size; and that all the Parts have been equally ſtretched, and are again equally contracted; then, though four Inches were taken both Ways from the Navel, it is plain, that, after the Contraction, the Diſtance each Way will be but two Inches; ſo that the Perforation is not depending enough, the Rectus Muſcle is pierced, and, probably, ſome of the larger Branches of the epigaſtric Veſſels are wounded. What undoubtedly is meant, is to make a proportionable Allowance for the Quantity of Diſtention, and ſome Authors have ſaid as much; but none of them, except *Garengeot*, have laid down any other general Rule for chuſing the Place of Tapping: He, indeed, ſays, that the Puncture

ture ought to be made in the Middle, between the Navel and the Spine of the Os Ilium; but as this Spine is of a conſiderable Extent, his Rule is much too uncertain, eſpecially conſidering, that the preciſe Point to be pierced can be determin'd in all Subjects, and different Degrees of Diſtention, which the Belly ſuffers in Dropſies, by only remarking, that, in a ſound State, a Point, four Inches below, and to a Side of, the Navel, is the Middle betwixt the Navel and anterior ſpinal Proceſs of the Os Ilium; and that the muſcular Parts of the Abdomen are near equally ſtretch'd in the Hydrops Aſcites apertus; whence it follows, that this middle Point between the Navel and this ſpinal Proceſs is invariable, or nearly ſo; and, therefore, is the Part where the Perforation ought always to be made in Tapping.

Till of late, that Dr. *Mead*, by preſſing on the Abdomen, with an Aſſiſtant's Hands, while the Water of the Hydrops Aſcites was evacuated, diſcover'd the ſudden taking off the Preſſure from the deſcending Aorta, in ſuch Subjects as ſcarce have Blood enough to fill the Veſſels of the Body, to be the true Reaſon of the Syncope, Inflammation, and great Diſtention of the Veſſels of the abdominal Bowels, and, particularly, of the Inteſtines, Surgeons were very careful to draw off a ſmall Quantity of Water at once; and rather choſe to repeat the Operation more frequently, though they were ſenſible, at the ſame time, of ſeveral Diſadvantages attending their Method; for, beſides the Pain and Uneaſineſs to the Patient, and the Danger Orifices, made any-where in the Teguments of hydropic People, are in of mortifying, the Guts ſtill loſe more of their Tone by ſoaking longer in the Water, the Air being neceſſarily admitted by the Cannula into the Cavity of the Abdomen, is liable ſometimes to rarefy, diſtend the Belly, and form a Tympanitis; and never miſſes to haſten the Putrefaction of the Water, from which a Train of various bad Symptoms muſt follow.

All theſe evil Conſequences might, then, be prevented by drawing off all the Water at once, and preſerving the Preſſure ſtill on the Belly, which can be ſupplied by Art, but ought, for greater Safety, to be done gradually and equally, as the Water runs out; which neither the Preſſing with Hands, in time of the Operation, and applying a Bandage afterwards, which is the Practice of *England*, nor the Swathing with a Towel immediately afterwards, as I have ſeen done in the Hoſpitals at *Paris*, are rightly calculated for; and, therefore, theſe ſeveral Years, I have always us'd a Belt made of fine Flannel, cover'd with ſtrong Linen. The Body of the Belt is only ſo wide as to reach from the Spine of the one Os Ilium to that of the other; to one End of this Body ſtrong Tape, or Ribbands, are ſowed at a ſmall Diſtance from each other, and to the other End as many well-poliſh'd Buckles are put: Near the inferior Side of the Belt, and at a ſmall Diſtance from each End, a little Window is cut, which can be ſhut with two Buckles and Straps.

When the Operation of the Paracenteſis is to be perform'd, I mark, with Ink, the middle Point between the Navel and Extremity of the Spine of the Os Ilium of the Side which I deſign to pierce; then I apply the Belt, with the Flannel-ſide next the Skin, well-charg'd with Fumes of Benzoin, Maſtich, and ſuch other drying and corroborating Medicines, taking care that the Point of the Skin, formerly mark'd with Ink, ſhall be in the Middle of one of the Windows, or Openings of the Belt; after which a Linen Compreſs is put on the Back, to defend it from being hurt by the Buckles: And, laſtly, the Straps, or Tapes, are put through the Buckles, and drawn a little tight, by which the Water is preſs'd in greater Quantity to the Part of the Abdomen. where there is the leaſt Reſiſtance, which will be the Part uncover'd by the Belt, or the open Window; and, therefore, that Part becomes more prominent and tenſe, which facilitates the Perforation, and makes a greater Diſtance there between the containing Parts and Viſcera, and, conſequently, makes leſs Danger of the Guts being wounded by the Point of the Trocar.

Gradually as the Water is drawn off, the Straps are pull'd tighter; and, if the Patient will be ingenuous, the ſame Preſſure can be kept on the Abdomen, all the time of the Operation, and after the entire Evacuation, as was on it before one Drop of the Water was taken away; becauſe the Operator has a certain Gauge, the Breathing, to judge by; for the Difficulty of Breathing, which hydropic People labour under, being wholly the Effect of the Water preſſing the Diaphragm upwards, and thereby ſtraitening the Lungs, any Force equal to that of the Water, preſſing all the Parts of the Abdomen equally, will have the ſame Effect: For this Reaſon the Patient muſt, from time to time, acquaint the Surgeon, if he is ſenſible of his Breathing more freely, when the Straps are to be drawn tighter, till the Patient judges the Difficulty of Breathing to be the ſame as it was before. In this Way I have drawn off, more than once, from very feeble emaciated Patients, ſixteen *Scots* Pints, or ſixty-four Pounds of Water at once, without the leaſt Faintneſs or Uneaſineſs.

After all the Water is evacuated, which is greatly aſſiſted by the Preſſure, a Pledget and Plaiſter are to be put on the Orifice from which the *Cannula* was taken, in the common way; and a Compreſs being applied over theſe, the Window is to be ſhut upon this, and brought to the ſame Tightneſs with the reſt of the Band. At Pleaſure this Window can be opened and ſhut, and the Wound can be dreſſed; and the whole Belt may, as Occaſion requires, be ſlackened or ſtraitened.

The Belt juſt now deſcribed is what I have only made uſe of hitherto; but have ſometimes been ſenſible of Inconveniences, in applying it when the Belly is very greatly diſtended; for, in ſuch a Caſe, the Oſſa innominata keep the Belt from being right applied to the lower Part of the Belly, which is ſtretched down over the Patient's Thighs; the ſuperior Part of the Abdomen, being conſiderably ſmaller than the lower, is not ſufficiently ſtraitened; and, after the Operation is finiſhed, the Belt is liable to be gathered all in Wrinkles round the Loins, eſpecially if the Patient is reſtleſs and careleſs.

To prevent theſe Inconveniencies, I think a farther Improvement may be made to the Belt. Let a ſlanting Flap be added to its inferior Edge; from which let two Straps, with Buckles at their Extremities, go out to paſs between the Patient's Thighs, and to be faſtened to other Straps, which come out from the upper Edge of the circular Band, or to a ſcapular Bandage, brought over the Patient's Shoulders: It is evident, that the Flap will compreſs the hypogaſtric Region, which the Belt could not reach; and that the additional Straps, being tightly drawn, will keep the circular Band ſtretch'd at its full Breadth.

Monro, in *Medical Eſſays*, *vol.* 1. *p.* 214. where there is a Figure of this Belt.

HYDROPYRETOS, ὑδροπύρετος, from ὕδωρ, Water, and πυρετὸς, a Fever. A kind of malignant ſweating colliquative Fever. *Caſtellus*. According to *Blancard*, it is the ſame with the *Sudor Anglicus*.

HYDROROSATON, ὑδρορόσατον, from ὕδωρ, Water, and ῥόδον, a Roſe, is a Drink made of Water, Honey, and the Juice of Roſes, mix'd, according to *Ægineta*, *Lib.* 7. *Cap.* 15. in the Proportion of four Pounds of Roſes, freed from the Ungues or Bottoms, with five Pints of Water, and two Pints of Honey.

HYDRORRHODINON, ὑδρορρόδινον, from ὕδωρ, Water, and ῥόδον, a Roſe, is Water mix'd with Oil of Roſes; it is cooling, and provokes Vomiting, and was given, by *Galen*, to thoſe who had taken Poiſon.

HYDROSACCHARUM, ὑδροσάκχαρον, from ὕδωρ, Water, and σάκχαρον, Sugar, is a Mixture of Water and Sugar, anſwering to Hydromeli, by changing Honey for Sugar. *Caſtellus*.

HYDROSARCA, ὑδρόσαρκα, from ὕδωρ, Water, and σὰρξ, Fleſh. A Tumor, or Abſceſs, produced of Water and Fleſh. *M. A. Severinus*.

HYDROSARCOCELE, ὑδροσαρκοκήλη, from ὕδωρ, Water, σὰρξ, Fleſh, and κήλη, an Hernia. A Species of HERNIA; which ſee.

HYDROSELINUM, ὑδροσέλινον, from ὕδωρ, Water, and σέλινον, Parſley. Water-parſley. *Blancard*.

HYDROTICUS, ὑδρωτικὸς, from ὕδωρ, Water, is us'd by ſome Moderns in the ſame Senſe as HYDRAGOGUS; which ſee.

HYDRUS, HYDRA, ὕδρος, ὕδρα, from ὕδωρ, Water. A Water-ſerpent, call'd by the *Latins*, *Natrix*, and very venomous.

The Bite of this Serpent produces a large livid Ulcer, whence diſtils much black fetid Sanies, as from an Ulcer of the phagedenic Kind. The Cure requires a long Time, and is perform'd with much Difficulty.

To the Wound apply Origanum, bruis'd, and work'd in Water; or a Lixivium of Oak-aſhes, mix'd with Oil, or Barley-flour made up with Honey. Inward Remedies are, two Drams of Ariſtolochia, in diluted Wine; or two Cyathi of Poſca; after theſe may be taken the Juice of Horehound, or its Decoction in Wine, or wild Naſturtium, or the Seed or Flower of Haſta regia, or the Seed of Fennel in Wine. A recent Honeycomb, eaten with Vinegar, is, alſo, a good Medicine. *Paulus Ægineta*, *Lib.* 5. *Cap.* 16.

HYEMS, χειμών. The Winter.

The Diſeaſes particularly incident to this Seaſon of the Year, are Pleuriſies, Peripneumonies, Lethargies, Catarrhs, Hoarſeneſs, Coughs, Pains of the Breaſts, Sides, and Loins, Head-achs, Vertigo, and Apoplexy. *Hippocrates*, 3 *Aph.* 23.

In the Winter it is proper to eat more, and drink leſs, but what is ſtronger; to eat much Bread, Fleſh rather boiled, and moderately of Greens. Chuſe all things hot, or of a heating Quality. Venereal Indulgences are not ſo pernicious in this, as in ſome other Seaſons. *Celſus*, *Lib.* 1. *Cap.* 3.

The Winter requires much Labour and Exerciſe, and more plentiful Feeding, eſpecially if the Conſtitution of the Seaſon be Northerly, or dry and cold, as when the North Wind blows; but, when the contrary happens, the Labour ought to be the ſame, but the Diet more ſparing; and the Body is to be dried, in proportion to the Moiſtneſs of the Seaſon; and, by the ſame Rule, in Oppoſition to the Cold, it is adviſeable, to render our Bodies

hotter by Labour and Exercise, and the Use of hot Flesh-meats, and acrimonious Greens, and larger Allowances of Wine. *Oribas. Espor. Lib.* 1. *Cap.* 10.

HYGIDION, ὑγιδίον. The Name of a Collyrium ascrib'd to *Ammonius*, and described by *Ægineta*, *Lib.* 7. *Cap.* 16.

HYGIEIA, HYGEIA, ὑγιεία, ὑγεία, from ὑγιὴς, sound. Health, Soundness. Health is a right Disposition of the Body, and all its Parts, for performing their several Functions, consisting in a due Temperature, a right Conformation, and a just Connection. Health admits of Latitude, and is not one and the same in all Subjects, but is more perfect in one than another, who may yet be said to be in Health. The Word is, also, transfer'd to the Mind, and in that Sense means a just Disposition of the rational Powers, and the Passions, for their proper Actions; and this, in a great measure, depends on bodily Health.

Hygieia is, also, the Name of a Plaister, otherwise called *Panacea*, and *the Plaister of the three Brothers*, and described by *Aetius*, *Tetrab.* 4. *Serm.* 3. *Cap.* 13.

HYGIEINE, ὑγιεινὴ, from ὑγιὴς, sound, healthy, is the first Part of methodical Medicine, being that which prescribes Rules for the Preservation of Health. *Castellus.*

HYGRA, ὑγρὰ, liquid Plaisters, in Opposition to XERIA, ξήρια, dry Plaisters. *Castellus.*

HYGREMPLASTRA, ὑγρέμπλαστρα, from ὑγρὸς, humid, and ἔμπλαστρον, a Plaister; liquid Plasters. The Word occurs in *Pliny*, *Lib.* 34. *Cap.* 15.

HYGROBLEPHARICUS, ὑγροβλεφαρικὸς, from ὑγρὸς, humid, and βλέφαρον, an Eye-lid; an Epithet given to some Ducts, or Emunctories, discovered in the extreme Edge, or inner Part, of both Eye-lids. They are otherwise called *Hygrophthalmici*. *Castellus.*

HYGROCIRSOCELE, ὑγροκιρσοκήλη, from ὑγρὸς, humid, κίρσος, a Varix, and κήλη, an Hernia, is a Species of Hernia, compounded of an aqueous and varicous one, when varicous Obstructions arise in the Veins, which supply the Testes, and there is, at the same time, a copious Collection of Water in the Scrotum. *Galen in Def. Castellus.*

HYGROCOLLYRIUM, ὑγροκολλύριον, from ὑγρὸς, humid, or liquid, and κολλύριον, a Collyrium. A liquid Collyrium, consisting, for the most part, of liquid Ingredients. *Castellus.*

HYGROMETRUM, ὑγρόμετρον, from ὑγρὸς, humid, and μέτρον, a Measure, an Hygrometer. A Name which *Wedelius* has bestow'd, by way of Allusion to the Machine so called, on those infirm Parts, whose Contexture has been injured by a Fracture, though cured; and, by its Susceptibility of Impressions, shews the different State of the Air, with respect to Moisture, with greater Niceness and Certainty than the artificial Hygrometer. The same Author scruples not to call the Skin, a living *Thermometer* and *Hygrometer*. *Castellus.*

HYGROMYRON, ὑγρόμυρον, from ὑγρὸς, liquid, and μύρον, an Ointment. The Name of a liquid sweet-scented Ointment, described by *Aetius*, *Tetrab.* 4. *Serm.* 4. *Cap.* 114.

HYGROPHOBIA, ὑγροφοβία, from ὑγρὸς, liquid, and φόβος, Fear, imports the same Disorder as *Hydrophobia*, and with Propriety enough, because the Patients conceive a Dread, not only of Water, but of all Liquids. *Cœlius Aurelianus*, *Acut. Morb. Lib.* 3. *Cap.* 9. See HYDROPHOBIA.

HYGROPHTHALMICUS, ὑγροφθαλμικὸς, from ὑγρὸς, humid, and ὀφθαλμικὸς, belonging to the Eyes, is the same as HYGROBLEPHARICUS, which see.

HYGROS, ὑγρὸς, humid; ὑγρὸν, the Feminine, is used simply for liquid. Rosin, in Opposition to φρυκτὴ, (*phrycte*) torrefy'd. *Galen*, *Lib.* 6. *M. M. Hygra* is, also, spoken of ophthalmic Medicines, and means the same as HYGROCOLLYRIUM.

HYLARCHICUS, ὑλαρχικὸς, from ὕλη, Matter, and ἄρχων, a Prince, or Chief, is an Epithet given, by Dr. *Henry More*, in his *Enchirid. Metaphys.* to the universal Spirit of the World, which orders and governs the First Matter. *Castellus.*

HYLE, ὕλη, Matter, in Medicine, comprehends whatever comes under the Consideration of the medicinal Art, called, by *Galen*, *Com.* 4. *in* 6 *Epid.* ὕλαι τῆς τέχνης. *Hyle*, in *Paracelsus*, seems, also, to signify *Matter*. *Lib.* 2. *de Morb. Fossor. Theat. Chymic. Vol.* 2. *p.* 145. It is, also, a Term, in chymical Authors, for the Philosophers Stone. *Theat. Chymic. Vol.* 1. *p.* 16. And hence that Mixture, in the spagiric Operation about the Philosophers Stone, or the fermentable Mass of *Terra alta foliata*, usually called *Chaos*, takes, also, the Name of *Hyle*. *Libavius Synt. Arc. Chym.*

HYMEN, ὑμὴν, signifies a Membrane in general, but commonly means that circular membranous Fold, with which the exterior or anterior Extremity of the great Canal, in Virgins, and especially before the first Eruption of the Menses, is commonly border'd. This Fold is of different Breadths, more or less smooth, and sometimes semilunar, and in some Subjects leaves but a very small Opening, in others a larger Opening, and, in all, renders the external Orifice narrower than the rest of the Cavity. The Hymen is formed by the Union of the Internal Membrane of the great Canal, with that on the Inside of the *Ala*; and represents a membranous Circle, of different Breadths, and sometimes uneven: It is commonly ruptur'd after the Consummation of Marriage; is quite lost in Delivery, and afterwards only some irregular Portions of it remain, which, from their supposed Resemblance to Myrtle-leaves, have been termed *Caruncule Myrtiformes*. This Circle may, also, suffer some Disorder by too great a Flux of the Menses, by Imprudence, Levity, and other particular Accidents. *Winslow.*

With respect to the Hymen, upon which the *Jewish* Test of Virginity depends, it must be remark'd, that this Membrane is frequently not to be found in Girls a Month old, and very seldom in those of a more advanced Age. This I thought myself obliged to take notice of, because I have, sometimes, known Families render'd unhappy by a Disappointment, as to some unreasonable and ill-grounded Expectations, which, however it may happen in *Judea*, and the warmer Climates, ought to raise no Suspicions of Incontinence in ours.

HYMENODES, ὑμενώδης, from the preceding; membranous, or full of Membranes, or Pellicles. Thus ὑμενώδεις οὐρήσεις, and ὑμενώδης οὖρον, is Urine with Membranes or Pellicles; and ὑμενώδια ἐπιμήνια, *Lib.* 1. περὶ γυναικ. are membranous or fibrous Menses, abounding with viscid Phlegm; and αἷμα ὑμένων ἀνάπλεων, *Lib. eodem*, is Blood full of Fibres and Pellicles.

HYOIDES, ὑοειδὴς. An Epithet of a forked Bone, at the Root of the Tongue, called the *Os Hyoides*. See LINGUA.

HYOPHARYNGÆUS *Musculus*. See PHARYNX.

HYOPHTHALMOS, ὑοφθάλμου, from ὗς, a Swine, and ὀφθαλμὸς, an Eye, Hog's-eye, is a Name for the *Aster Atticus*, and, also, for a Species of ACHATES. *Gerræus.*

HYOSCYAMUS.

The Characters are;

The Leaves are alternate, soft, and flat; the Calyx is Bell-shap'd, short and wide-mouth'd, and divided into five acute Segments. The Flower is monopetalous, tubulous below, and expanded above, into five obtuse Segments, and furnished with five Stamina. The Fruit, inclosed within the Calyx, resembles a Pot with a Lid on it, and is divided into two Cells.

Boerhaave mentions eight Species of this Plant; which are,

1. Hyoscyamus; vulgaris; vel niger. *C. B. P.* 169. *Tourn. Inst.* 118. *Boerh. Ind. A.* 229. *Hyoscyamus.* Offic. *Hyoscyamus niger.* Ger. 283. Emac. 353. *Hyoscyamus vulgaris.* J. B 3. 627. Raii Hist. 1. 711. Synop. 3. 274. Park. Theat. 362. *Hyoscyamus niger vulgaris*, *Apollinaris*, *Altercum.* Merc. Bot. 1. 43. HENBANE.

Common Henbane grows to be two or three Feet high, having large, thick, round, hairy Stalks, set thick with soft, hairy, clammy Leaves, cut into several sharp Laciniæ, and sharp-pointed at the Ends; of a rank, strong, offensive Smell. The Flowers grow on the Tops of the Branches, several together, which flowering, by degrees, before they are all blown, the Stalk is extended to a pretty great Length, the Seed-vessels standing in a long Series, one under another; These Flowers are of a pale-yellow Colour, full of purple Veins, with several purple Chives in the middle, being monopetalous and Bell-fashioned, cut into five Segments, growing not much above the Calyx. The Seed is small, and somewhat flat, growing in a tumid Vessel, hid in the Calyx, which stands above it, appearing with five Corners, being stiff and hard. The Root is pretty long and thick, whitish both within and without, and not so offensive to the Smell as the Leaves; it grows frequently near Highways, and Ditch-banks; and flowers in *May* and *June*. The Leaves, Root, and Seed, are used.

The Leaves of Henbane are emollient, cooling, and anodyne, good for Inflammations, and to stop Defluxions of hot Rheum; and are often put into cooling, repelling Ointments. The Roots are accounted narcotic, and are but rarely used inwardly; they are frequently hung about Childrens Necks, being cut to pieces, and strung like Beads, to prevent Fits, and cause an easy Breeding of the Teeth. The Seed is commended by Mr. *Boyle* against spitting of Blood, as well as any other Hæmorrhage, made into an Electuary, with Conserve of Roses, and white Poppy-seeds. *Miller's Bot. Off.*

Its Leaves are insipid, and have an ill Scent; they give a pretty deep red Tincture to the blue Paper. The Root gives it a little fainter Red; it is sweetish, and has the Taste of an Artichoke. It is likely, that the Sal Ammoniac, which is in this Plant, is involved in a great deal of Sulphur and Earth; for,

By the chymical Analysis, its Leaves yield some volatile concreted Salt, and a great deal of Oil. Henbane is very soporific, resolving, and lenifying; it is seldom taken inwardly. *Helidæus* set a great Value upon its Seed, and mixed it with the Conserve of Roses, for spitting of Blood. *Tragus* affirms, that the Juice of Henbane, or the Oil made by Infusion of its Seeds, cures Pain in the Ears, if one syringes them with it. Henbane is used in anodyne Cataplasms, to resolve Tumors: For Example; they boil, in a certain Quantity of Milk, two Handfuls of Henbane-leaves; as much of those of Mandrake and Nightshade; and one Ounce of the Seeds of Henbane, and Poppy: Strain it all through a Sieve, and add the Yolk of an Egg, and a little Saffron. Some boil only the Leaves of Henbane in Milk, and apply them to the Part that is afflicted with the Gout. Some soften the Leaves of the same Plant, under

the Coals; and lay them upon the Breasts, to free the Passage of the Milk, or dissipate the Clods. *Tabernæmontanus* says, that the Seeds of it must be bruised with Wine, and applied as a Cataplasm upon the Breasts of Women newly brought to Bed. The Oil pressed out of this Seed has the same Virtues. For Chilblains on the Hands, hold them over the Smoke of Henbane Seeds burning upon Coals; and squeeze the Fingers, till the extravasated and condensed Lymph comes out: This Lymph, as it passes thro' the Pores of the Skin, takes the Shape of little Worms. *Martyn's Tournefort.*

An Oil is prepared of the Seed, which is of mighty Efficacy in procuring Sleep, the Temples being anointed with it: It is also of Service in the Gonorrhœa, or an immoderate Flux of the Menses, being applied to the Region of the Loins, and to the Perinæum. *Dale from Boxb.*

2. Hyoscyamus; rubello flore. *C. B. P.* 169. *M. H.* 2. 495.

3. Hyoscyamus; albus; major; vel tertius Dioscoridis; & quartus Plinii. *C. B. P.* 169. *Tourn. Inst.* 118. *Hist. Oxon.* 2. 494. *Boerh. Ind. A.* 229. *Hyoscyamus albus.* Offic. J. B. 3. 627. Ger. 283. Emac. 353. Park. Theat. 262. Raii Hist. 1. 712.

WHITE HENBANE.

White Henbane differs from the black, in being a lesser Plant, and not so woolly; the Leaves are broader, shorter, and less jagged, standing on long Foot-stalks, and are less offensive to the Smell; the Flowers are fewer, being of a pale-yellowish Colour, and not so big as the black; the Tops of the Calyces are larger, and the Seed whiter. It grows wild in the warmer Regions, but, with us, only in Gardens, flowering in *July*.

This Species of Henbane is accounted to be of a milder and less noxious Nature than the black Henbane, and therefore safer to be given inwardly, without Fear of any dangerous Consequences attending. *Miller's Bot. Off.*

It is to be met with, tho' but seldom, in the Gardens of Botanists. The Part in Use is the Seeds, which are small, round, flat, of an Ash-colour inclining to brown, of a fat and somewhat viscid Taste, and of a narcotic and ungrateful Smell: It is prescribed in an Hæmoptoe, or Spitting of Blood. *Dale.*

The antient Physicians frequently used either the Juice of the white Hyoscyamus, expressed from the green Stalks, Flowers, and Seeds; or the dry'd Seed, macerated in warm Water, and then bruised, for mitigating acute Pains, especially of the Eyes; for which Purpose, Collyria were prepared of the same. The same Medicine was in Use for acute Pains of the Ears; tho', indeed, the Use of these Kinds of Medicines, which take away the Sense of Pain, and are called by the Greeks ναρκωτικά, Narcotics, has been much suspected by the best Physicians; for it cannot but be pernicious, as it diminishes the sensitive Faculty in Bodies. *P. Alpinus de Plant. Exot.*

4. Hyoscyamus; major; albo similis; umbilico flore atropurpureo. *T. C.* 5.

5. Hyoscyamus; albus; Ægyptius. *Alp. Exot.*

The white Seeds of this Plant are very much inquir'd after in *Europe*. But our Apothecaries, instead of them, very erroneously substitute the Seeds of the yellow *Hyoscyamus*, which are yellow; and the Plant is erroneously taken by the vulgar Sort for the white *Hyoscyamus*.

The Juice of the white Hyoscyamus is very useful in a Cough proceeding from a Distillation of acrimonious and salt Humours from the Head, and the Forerunner of a Phthisis. To prevent so troublesome a Disorder, the *Egyptians*, when they go to sleep, take a Spoonful of the Seeds, very finely triturated, with an equal Quantity of Sugar pulverized; and find great Relief by it, in blunting and sweetening the Acrimony and Saltness of the Humour, and inducing Sleep. The Women also pound the Seeds, and take them in Sugar, for an immoderate Flux of the Menses. *Prosper Alpinus de Plant. Exot.*

6. Hyoscyamus; Creticus; luteus major. *C. B. P.* 169. *Prodr.* 192. *M. H.* 2. 494.

7. Hyoscyamus; aureus. *Alpin. Exot.* 99.

This Plant grows in the Island of *Crete*, or *Candy*; and bears small Flowers of a Gold Colour, whence it takes its Name: The Seeds are very small and yellow. Besides this Species, called the *Golden Hyoscyamos*, there grows in the same Island another kind of Hyoscyamus, which bears yellow Flowers, and produces yellowish Seeds; which are taken by our Apothecaries for those of the white Hyoscyamus.

Galen, Lib. 8. *Simpl.* says very justly of all the Hyoscyami, "The Hyoscyamus, which bears black Seed, causes Madness and "Lethargy; and that with the yellow Seeds nearly resembles it "in Qualities: But the third is very useful in Medicine, being "reckon'd in the third Order of Refrigerants." *P. Alpinus de Plant. Exot.*

8. Hyoscyamus; folio in tenuissimas & acutiores lacinias scisso. *Boerh. Ind. alt. Plant. Vol.* 1.

The *Hyoscyamus*, taken in a small Quantity, inebriates; in a greater, it induces a Sopor; in a Dose still larger, it brings on Convulsions; and, if the Quantity be still increased, its Effects are most certain Death. However, it has an anodyne Virtue; for, if the Leaves be bruised with Vinegar, they remove Pain, where it is proper to be removed; they act, or exert their Virtue, by way of Suffocation. The Leaves, boiled in sweet Milk, are an admirable Anodyne in Pains of the Gout, being applied to the affected Parts, especially with an Addition of Oil of *Hyoscyamus*, mixed with Oil of Olives. The Seeds are reckon'd among Narcotics, but are to be used with Caution; for they induce Sleep, while they remove Pain. In *D. Lodovici Pharmacia moderno Sæculo applicata*, there is describ'd a Cataplasm, prepared of the Leaves of Hyoscyamus, boiled in Oil, and reduced, with Wax, into the Form of a Cataplasm, which has admirable Virtues. The Oil, injected into the Ears, has a good Effect in Pains, or Hardness, proceeding from heterogeneous Matter therein. The Leaves, mollified at the Fire, are very good to dissipate Milk. In the Tooth-ach, the Smoke of the Seed is received thro' a Funnel; the same is a very good Remedy in Chilblains of the Hands and Feet. This Plant is an Ingredient in the *Populeum*; but these Suffumigations of the Teeth and Ears are to be used with Moderation, for fear of inducing a Stupor and Delirium.

The Name Hyoscyamos, ὑοσκύαμος, is derived from ὗς, a Swine, and κύαμος, a Bean, that is to say, *Hogbean*, because its Fruit resembles a Bean; and, as *Ælian* tells us, when the wild Swine have eaten of Hyoscyamus, they immediately fall into such violent Convulsions, that they would immediately die, if they did not throw themselves into Water, where, by plentiful eating of Crabs, they are perfectly recovered. *Hist. Plant. ascript. Boerhaave.*

Hyoscyamus is also used for several Sorts of Nicotiana; which see.

HYOSERIS.

The Characters are;

The Leaves about the Stalk are sessile, or without Pedicles. The Calyx bends forward, is contracted into a conic Form, and the Stalk wreathed; the Seeds are disposed in a flat Disk.

Boerhaave mentions but one Species of this Plant; which is,

Hyoseris; angustifolia. *Tab. Ic.* 180. *Hieracium, minus, folio dentis Leonis oblongo, glabro.* C. B. P. 127. T. 470. *Boerh. Ind. alt. Plant. Vol.* 1.

It agrees in Virtues with the *Cichoreum* or *Succory*, according to the *Historia Plantarum* attributed to *Boerhaave*.

HYOTHYROIDES, a Name given to two Muscles, which serve to dilate the Chink of the Larynx. See Larynx.

HYPACTICOS, ὑπακτικὸς, from ὑπάγω, to subdue, or bring down, or under, is a Word appropriated to express the Virtue of cathartic Medicines.

HYPÆTHROS, ὑπαίθρος, from ὑπὸ, under, and αἴθρος, the Cool of the Morning. A Place in the open Air, where Walking, and other Exercises, in Use among the Antients, were usually performed. The Word occurs in *Hippocrates, de R. V. I. A.*

HYPALEIPTRON, ὑπάλειπτρον. A sort of Spatula, for spreading Plaisters or Ointments, from ἀλείφω, to anoint.

HYPALEIPTON, ὑπάλειπτον. A Liniment.

HYPECOUM.

The Characters are;

The Leaves are finely jagged, like those of the *Fumaria tenuifolia*. The Calyx consists of four Leaves, (one Pair of them small and herbaceous, the other Pair larger and floral) withers, and falls off. The Flowers are dipetalous, the Petals bifid, in such a manner, as to make the Flowers appear tetrapetalous. From each Division of the Petals arises another sort of Petal, closely covering the Ovary, and four Stamina, on both Sides. The Ovary is furnished with a corniculated Tube, and becomes a flat, jointed Pod, containing, in each Joint, a single Seed.

Boerhaave mentions but one Sort of this Plant; which is,

Hypecoum; latiore folio. *Tourn. Inst.* 230. *Boerh. Ind. A.* 307. *Hypecoon.* Offic. C. B. P. 172. *Hypecoon siliquosum.* J. B. 2. 899. *Hypecoon legitimum Clusii.* Park. Theat. 371. Raii Hist. 2. 1328. *Cyminum cornulatum, sive Hypecoon Clusii.* Ger. 909. Emac. 1067.

HORNED WILD CUMIN.

It grows in *Provence* and *Languedoc*, and flowers in *May*. *Dioscorides* says, it is possess'd of the same Virtues with Poppy; and the modern Accounts thereof agree with his.

Hypecoumalterum. See Cuminum siliquosum.

HYPELÆON, ὑπέλαιον, from ὑπὸ, under, and ἔλαιον, Oil. The Dregs or Sordes of Oil.

HYPELATOS, ὑπήλατος, from ὑπὸ, under, and ἐλαύνω, to agitate. An Epithet of cathartic Medicines.

HYPENE, ὑπήνη, usually signifies a Beard; but, according to an Interpreter of *Homer*, it is the upper Lip, where the first downy Hairs appear. *Cœlius Aurelianus* writes, that the first downy Appearance of a Beard, about both the Lips, is so called. *Gaza* renders the Word from *Aristotle* by *Mystax*, the Hair of the upper Lip, or Mustaches. *Gorræus.* Τπήνη, in *Ruffus Ephesius*, is the Hair under the Chin. *Pappos*, πάππος, the Hairs upon the Chin; and the first Appearance of the Hairs on the upper Lip, he calls προπωγώνιον (*Propogonion*); which, when come to Maturity, take the Name of μύσακες (*Mustaces*). *Ruffus Ephesius, Lib.* 1. *Cap.* 7.

HYPENEMIUS, ὑπηνέμιος, from ὑπὸ, under, and ἄνεμος, the Wind, is an Epithet of barren Eggs, or such as are not impregnated by the Tread of the Cock. These Eggs are otherwise called *Ova Zephyria*, because *Zephyrus*, or the West Wind, was thought to contribute towards their Generation. *Castellus.*

HYPERBOLICUS,

HYPERBOLICUS, ὑπερβολικὸς, from ὑπερβάλλω, to exceed, or go beyond Meaſure, hyperbolical, or exceſſive, is a Term applied by *Galen*, *Com.* 1. *In Prognoſt.* No. 13. to the Poſition of the Body in Decubiture, when the Arms and Legs, and Spine, the Vertebræ of the Neck included, are extended or retracted beyond their due and ordinary Meaſure.

HYPERCATHARSIS, ὑπερκάθαρσις, from ὑπὲρ, a Prepoſition importing Exceſs, and κάθαρσις, Purgation, is an immoderate or exceſſive Purgation, the uſual Effect of a colliquating, corroſive, and ſtimulating Medicine. *Hippocrates*, 5 *Aph.* 4. and *Coac.* 565. ſays, that Convulſions, or the Hiccough, ſucceeding an *Hypercatharſis*, are bad Symptoms; and, in ſuch a Caſe, adviſes, as quoted by *Aetius*, to put the Patient immediately into a warm Bath, and let him drink a generous yellow White-wine, before and after Bathing.

An *Hypercatharſis* happens, when, by a continual Irritation of ſome corroſive and ſtimulating Cathartic, the Tone of the Veſſels belonging to the Belly is relaxed, and their Orifices opened. In the Beginning of this Diſorder, a very thin Matter, and ſuch as Nature does not want, is evacuated; but, afterwards, when the Relaxation and Aperture of the Veſſels are increaſed, the neceſſary Humours are diſcharged; and, firſt, there is an Excretion of yellow Bile, then of Phlegm, after that of black Bile, and laſt of all of Blood, a Fluid the moſt neceſſary to Nature of all the Humours: But, before this happens, the thineſt of the Humour is firſt diſcharged, and the thickeſt laſt of all. If you adminiſter, therefore, too ſtrong a Phlegmagogue, after Phlegm is evacuated, there comes an Excretion firſt of yellow, next of black Bile, then of Blood. If you give a violent Cholagogue, the Diſcharge of the Bile is ſucceeded by an Evacuation firſt of Phlegm, next of black Bile, and laſtly of Blood. Too violent a Melanagogue, after evacuating the black Bile, expels the yellow, then Phlegm; and, laſt of all, cauſes an Excretion of Blood, as if it were from Veſſels quite depriv'd of their natural Tone and Firmneſs. For, when the Veſſels, through Imbecillity, can no longer retain the other Juices, and their Orifices are opened, and the Medicine never ceases to irritate, when it can no longer attract the Humour to which it is appropriated, it is neceſſary, that the reſt ſhould follow in the Order above-related. *Oribaſ. Med. Coll. Lib* 14. *Cap.* 42.

They who labour under an *Hypercatharſis*, muſt be treated with Frictions of the Skin, and a warm Bath, drinking, before they bathe, thin, red, or yellow Wine, for ſuch is eaſieſt of Diſtribution, with Sops of Bread, and Pomegranates. If the Evacuation proceeds, let the Limbs be bound in ſuch a manner, that the Bandage may be carry'd from the upper to the lower Parts; and, by its Aſtriction, may cauſe an Interception of the Blood and Spirits, and ſo prevent an exceſſive Effuſion and Diſſipation. Exhibit, alſo, a ſmall Quantity of Theriaca, to be taken with the Fleſh of Vipers; for this Medicine paſſes to the Skin, and, in a ſhort time, makes a Revulſion, and diverts the Courſe of the Humours from the Belly, and blunts what is poiſonous and operative in Cathartics. If this be wanting, you may take, inſtead thereof, Troches of Theriaca, or Troches of Seeds, (ſee *Paſtillus de Seminibus*) and of the Antidote called *Philonium*. Cupping-glaſſes may, alſo, be apply'd to the Stomach, and Cataplaſms of Polenta and Mulſum; after which you muſt uſe aſtringent Epithems; but the greateſt Relief is obtained from Frictions of the whole Body, and potable Remedies. The Patient muſt keep himſelf from the cold Air, and what is very warm; for the firſt repels the Humours from the external Parts inwards, and ſo increaſes the Flux; and the other diſſipates and diſſolves the natural Strength and Spirits. If the Evacuation, thro' the corroding Force of the Cathartic, be increaſed, the aforeſaid Cataplaſms muſt be apply'd, and Obtundents be injected in Clyſters, ſuch as the Fat of a Gooſe, ſweet Wine, Oil of Spike, and others of the like Nature. *P. Ægineta*, *Lib.* 7. *Cap.* 7.

In an *Hypercatharſis*, Drinking is to be ſparingly indulg'd, and Sleep procured. Auſtere Wine, diluted with Spring-water, is to be exhibited in ſmall Quantities. Thick Polenta, roaſted and ſprinkled in the Drink, or a ſmall Quantity of the Heads of Poppy, or of Galls, is of Service in this Caſe. The Flower of decorticated or huſked Lentils, boiled with Vinegar and the black Beet, with an Addition of Sumach, and a ſmall Quantity of Poppy-heads, are very effectual. Dry'd Pears, expreſſed with the Juice of Quinces, are, alſo, good. If the Purging continues with Violence, we muſt uſe more effectual Remedies, and ſuch as are preſcrib'd in cœliac Diſorders. To thoſe who are eaſy to vomit, plenty of warm Water is to be given to drink, and Vomiting is to be promoted, either with the Finger, or intruding a Feather; and this muſt be attempted two or three times together. Then warm ſome Oleum Melinum (ſee *Melinum Oleum*) and Wine, and apply a Linen Cloth dipped in it to the Belly; and, after ſome moderate Diſtance of Time, exhibit the Quantity of a Bean of Theriaca, to be taken in Wine. *Aetius*, *Tetrab.* 1. *Serm.* 3. *Cap.* 118.

HYPERCORYPHOSIS, ὑπερκορύφωσις, from ὑπὲρ, above, and κορυφὴ, the Vertex, an Eminence, or Protuberance. *Hippocrates* calls the Lobes of the Liver, and of the Lungs, *Hypercoryphoſes*, ὑπερκορυφώσεις.

HYPERCRISIS, ὑπέρκρισις, from ὑπὲρ, above, and κρίσις, a Criſis, an Hypercriſis, is an exceſſive and violent Criſis of a Diſeaſe, when Nature, oppreſſed with the Abundance of the morbific Matter, makes extraordinary Efforts to free itſelf by immoderate Evacuations, attended with the greater Danger to the Patient, *Galen*, *Com.* 3. *in Prognoſt. T.* 1. It is alſo called *Hypercriſis*, ὑπερέκκρισις, a Superexcretion. *Galen*, *de C. M. S. L. Lib.* 3.

HYPEREPHIDROSIS, ὑπερεφίδρωσις, from ὑπὲρ, ſignifying Exceſs, and ἵδρως, Sweat. An exceſſive, or immoderate Sweating. *Blancard.*

HYPERESIA, ὑπηρεσία, Miniſtry, Office, in *Moſchion de Morb. Mul.* is uſed to ſignify the organical Function of the ſeveral Parts of the Body.

HYPERETRIA, ὑπερίτρια, a Female Aſſiſtant, or Midwife, at the Time of Labour; on which Occaſion, *Moſchion*, *de Morb. Mul.* requires there ſhould be three, at leaſt, preſent.

HYPERICUM.

The Characters are;

The Root is fibrous; the Leaves are conjugated, or grow by Pairs, at the Joints of the Stalks. The Calyx conſiſts of one Leaf, is quinquefid, not caducous, expanded. The Flowers are roſaceous, pentapetalous, adorned with many Stamina, embrace a conic Ovary, which is furniſhed with three long bended Tubes, and becomes a ſmall oblong Fruit, conſiſting of three Capſules cloſely joined, and filled with numerous minute Seeds.

Boerhaave mentions thirteen Species of this Plant; which are,

1. Hypericum; vulgare. *C. B. P.* 279. *Park. Theat.* 572. *Tourn. Inſt.* 274. *Boerh. Ind. A.* 1. 241. *Hypericum*, Offic. Ger. 432. Emac. 539. Raii Hiſt. 2. 1018. Synop. 3. 342. *Hypericum vulgare ſive perforata caule rotundo, foliis glabris.* J. B. 3. 381.

ST. JOHN'S-WORT.

St. John's-wort grows to be about two Feet high, very much ſpread out into Branches, which are ſmooth and round, having at each Joint two ſmall oblong Leaves, growing without Foot-ſtalks, with three pretty large Veins, running on the back Side of each, and, upon being held up againſt the Light, appearing full of ſmall Holes; whence it is called *Perforata*. The Flowers are numerous on the Tops of the Branches, conſiſting of five yellow Leaves, with a great Number of Apices and Stamina, when bruis'd between the Fingers, emitting a bloody Juice. The Seed-veſſel is longiſh and angular, ſomewhat like a Corn of Barley, divided into three Partitions, full of a very broad ſmall Seed; it has ſomewhat of a reſinous Smell. The Root is hard and woody, ſpreading much, and abiding many Years. It grows in Hedges, and among Buſhes, and flowers in *June* and *July*. The Leaves and Flowers are uſed.

St. John's-wort is aperitive, deterſive, and diuretic, helpful againſt tertian and quartan Agues, is alexipharmic, and deſtroys Worms, and is an excellent vulnerary Plant. A Tincture of the Flowers, in Spirit of Wine, is commended againſt Melancholy and Madneſs. Outwardly, it is of great Service in Bruiſes, Contuſions, and Wounds, eſpecially, in the nervous Parts. *Gerard*, in his Herbal, gives a very good Receipt of a compound Oil, of great Service in the foregoing Accidents. *Miller's Bot. Off.*

Its Leaves are ſtyptic, and a little ſaltiſh; they have a Salt reſembling Sal Ammoniac, but it is united with a great deal of Earth, and diſſolv'd in a Liquor not unlike Spirit of Turpentine; for the tranſparent Points upon the Leaves of this Plant, which ſeem to be ſo many Holes, the black Points upon the Borders of its Flowers, and the little Knobs upon its Fruits, ought to be regarded as ſo many Bottles fill'd with this Liquor. It is no wonder then, that St. John's-wort ſhould be vulnerary, deterſive, diuretic, febrifugous, and good for the Vapours. They diſtil this Plant, and make an Oil and an Extract of it; the Oil is ſimple or compound. The Simple is made thus: Infuſe the Tops of St. John's-wort between Flower and Seed, in a ſufficient Quantity of Olive-oil; ſet it for ſome Days in the Sun; ſtrain it out, and reiterate the Infuſion, till it be of a deep Red. For the Compound Oil, infuſe one Pound of the Tops of the ſame Plant in two Pounds of Oil, and one Pound of Red-wine; after it has been macerated three Days, boil it *in Balneo Mariæ*, till the Wine be conſumed: Make three Infuſions after the ſame manner, and in the laſt dilute a Pound of *Venice* Turpentine, and four Scruples of Saffron. Theſe Oils are excellent for all ſorts of Wounds; they give half an Ounce or an Ounce of it to drink, for Spitting of Blood, and the Dyſentery; for the Sciatica, Rheumatiſm, and ſuch-like Diſeaſes, they rub the Part with two Ounces of Oil of St. John's-wort, and one Ounce of good Spirit of Wine. This Mixture is very reſolving. To make the Extract of this Plant;

Take the Flowers in the Bud, put them to digeſt for two Days in good Spirit of Wine, ſqueeze out the Infuſion, and let it evaporate to the Conſiſtence of an Extract: They give from a Scruple to a Dram of it.

Angelus Sala preſcribes the Uſe of it for Madneſs, Melancholy, and raving Fits, which come without a Fever, or any manifeſt Cauſe. They have given the Name of *Fuga Dæmonum* to

to St. John's-wort, becauſe they believ'd it to be good to cure thoſe whom they fancy'd to be poſſeſs'd; but it is worth our Obſervation, that theſe People are commonly Cheats, or really hypochondriac; and, generally ſpeaking, all the Herbs which are thought good for pretended Poſſeſſions, are excellent for Vapours, Madneſs, and Melancholy: The Decoction of St John's-wort, the diſtil'd Water of this Plant, and the Infuſion of its Seed, kill Worms, and provoke Urine. It is uſed in the antinephritic Syrup of *M. Charas*, aperitive and cachectic Syrup of the ſame Author; Syrup of Mugwort, Powder which *Paulmier* (*Palmarius*) has preſcribed for Madneſs, *Venice* Treacle, reform'd Treacle of *M. Charas*, Mithridate, compound Oil of Scorpions, the *Unguentum Martiatum*, and in the *Mundificativum ex Apio*. *Martyn's Tournefort.*

2. Hypericum; Aſcyron dictum; caule quadrangulo. *J. B.* 3. 382. See ASCYRUM.

3. Hypericum; villoſum; erectum; caule rotundo. *T.*

8. Hypericum; perfoliatum; & perforatum. *T.* 255.

9. Hypericum; folio breviori. *C. B. P.* 279. M. H. 2. 469.

10. Hypericum; fruteſcens; Canarienſe; multiflorum. *H. A.* 2. 135.

11. Hypericum; fœtidum; fruteſcens. *T.* 255.

12. Hypericum; Orientale; flore magno, *T. Cor.* 19.

13. Hypericum; criſpum; triquetro, & cuſpidato, folio. *Bocc. Muſ. p.* 2. *T.* 12. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 242.

Miller enumerates thirty Species of this Plant.

Hypericum, fruteſcens. A Name for the *Spiræa*; *Hyperici folio, non crenato.*

Hypericum maximum. See ANDROSÆMUM.

Hypericum ſaxatile. See CARIS.

HYPERINESIS, ὑπέρινησις, from ὑπὲρ, importing Exceſs, and ἴνησις, an Evacuation. An immoderate Evacuation. The Word occurs in *Hippocrates*, *de Loc. in Hom.* and means the ſame as HYPERCATHARSIS before.

HYPERINOS, ὑπέρινος, from ὑπὲρ, denoting Exceſs, and ἰνέω, to evacuate, ſignifies one who is immoderately evacuated or purged, and, alſo, one who is extenuated. *Galen*, *Com. in 6 Epid.* explains the Word by κεκενωμένος (*cecenomenos*) "evacuated;" but, in his *Exegeſis*, he ſays, ὑπέρινος ὁ ὑπερκεκαθαρμένος ἄνθρωπος, καὶ αὐτὴ ὑπερίνησις, &c. "*Hyperinos* ſignifies "both the Perſon who is over-purged, and the Super-purgation "itſelf; and ſome have expounded it by ſaying, ὑπέρινος "ἰσχναίνει, *Hyperinos* is one who is extenuated: But the Word "ſeems to me to have a double Meaning, after the manner of "μακρόπνους (*macropnus*) and βραχύπνους (*brachypnus*)." His Meaning is, that as theſe Words, μακρόπνους, and βραχύπνους, ſignify not only long and ſhort Reſpiration, but, alſo, the Subjects affected by them; ſo *Hyperinos* is uſed, indifferently, for an immoderate Evacuation, and the Perſon who is exhauſted by ſuch a Diſcharge. *Varinus* explains ὑπέρινος by ὁ σφόδρα λεπτὸς, "One who is much extenuated;" and *Pollux*, ἐξινωμένος, "immoderately evacuated, or exhauſted."

HYPEROA, ὑπέρωα, from ὑπὲρ, and ὠὸν, an upper Place, the upper Part of the Mouth, called alſo *Palatum*, and *Baſis Cerebri. Caſtellus.*

HYPEROS, ὕπερος, is a Peſtle, which *Hippocrates*, *Lib. de Fract.* uſes inſtead of a Staff, for the Extenſion of broken Bones. *Foeſius.*

HYPERPHYES, ὑπερφυὴς, from ὑπὲρ, above or beyond, and φύω, importing to be generated in the natural Way, is an Epithet which imports ſomething beyond, or contrary to the ordinary Courſe of Nature; and is applied by *Hippocrates*, *Lib. de vet. Med.* to Diſorders which are extremely bad and dangerous.

HYPERSARCOSIS, ὑπερσάρκωσις, from ὑπὲρ, importing Exceſs, or Superfluities, and σὰρξ, Fleſh, is an Excreſcence of Fleſh.

HYPEXODOS, ὑπέξοδος, from ὑπὸ, under or beneath, and ἔξοδος, a Paſſing-forth or out, ſignifies Excretions, or a Flux, of the Belly.

HYPEZOCOS, ὑπεζωκὼς, from ὑπεζώννυμι, to undergird, is ſpoken of thoſe Membranes which are ſpread under other Parts; thus the *Pleura* is extended under the Ribs. *Cœlius Aurelianus*, *Lib.* 2. *acut. Morb. Cap.* 16. aſcribes a Cough to the Conſent of the Parts which are near and contiguous ὑπεζωκότι *Membranæ*, "To the ſurrounding Membrane."

HYPHEAR. See VISCUS.

HYPHEGESIS, ὑφήγησις, from ἡγέομαι, to lead; a going before, a leading or ſhewing the Way: Thus, *Lib. de Natura Pueri*, καὶ ὑφήγησιν ἐγένετο τούτῳ ὥσπερ ὕδατι ἐπὶ τραπέζης, "And a Way "was mark'd out for it, like Water poured on a Table." For in the Birth the Way was made for the Paſſage of the Fœtus, by the previous Flowing of the thin Ichor, or Water, as Water, poured on a Table, is derived and drawn along by the Finger, till it finds a Way to flow off. And, in *Jurejurando*, οὐδὲ ὑφηγήσομαι ξυμβουλίην τοιήνδε, "Nor will I be the Author, or Ad"viſer of any Counſel of that Nature," that is, of giving deadly Medicines to any Perſon whatſoever.

HYPNOBATES, ὑπνοβάτης, from ὕπνος, Sleep, and βαίνω, to go; one who walks in his Sleep.

HYPNOLOGICA, ὑπνολογικὰ, from ὕπνος, Sleep, and λόγος, a Diſcourſe, is a Part of Medicine, teaching a due Regulation of Sleep and Waking.

HYPNOPOEOS, ὑπνοποιὸς, from ὕπνος, Sleep, and ποιέω, to make or cauſe, is an Epithet of ſuch Medicines as procure Sleep.

HYPNOS, ὕπνος, Sleep. See SOMNUS.

HYPNOTERION, ὑπνωτήριον, the Name of an hepatic Epithem in *Aetius*, *Tetrab.* 3. *Serm.* 2. *Cap.* 11. where he treats of the Cure of a ſcirrhous Spleen.

HYPNOTICUS, ὑπνωτικὸς, from ὕπνος, Sleep; the ſame with HYPNOPOIOS, before.

HYPNUM, a kind of fertile Moſs, furniſhed with a Multitude of little calyptrated Heads, whoſe Calyptræ, for the moſt part, ſit obliquely on them; the Heads fall off tranſverſly, with their Margin ſometimes indented, ſometimes entire; and ſtand upon pretty long Pedicles, produced from the Wings of the Leaves, along the Stalks and Branches; and have their lower Part ſurrounded with ſquamous Involucra, or Covers, different from the Leaves: To this it may be added, that the Stalks are, for the moſt part, more diſperſed, and more fertile of Branches, than in the *Bryon*. *Ray's Synopſis Strip. Brit.* The general Diviſions of *Hypnums*, ſee under the Article BOTANY.

HYPO, ὑπὸ, a Prepoſition ſignifying *under*; but, in Compoſition, imports, not only an Inferiority with reſpect to Situation, but a Remiſſion or Diminution; as will be obvious from Examples in ſome of the ſubſequent Words.

HYPOBRYCHIOS, ὑποβρύχιος, from ὑπὸ, and βρύχιος, demerged, ſunk, in *Hippocrates* and *Aretæus*, ſignifies latent, or deeply ſeated; and is applied to the ſlow Beginning of a Fever, and to the Veins, and other deeply ſituated Parts. *Caſtellus. Foeſius.* See BRYCHIOS.

HYPOCAPNISMA, ὑποκάπνισμα, from ὑπὸ, and καπνίζω, to fumigate. Suffumigation. *Moſchion de Morb. Mul.*

HYPOCARODES, ὑποκαρώδης, from ὑπὸ, importing a Diminution, or lower Degree, of any Quality, and κάρος, a Carus, is one who labours under a Sopor, or lower Degree of a Carus. *Hippocr.* 1. *Prorrhet. & Coac.* In *Lib.* 3. *Epid.* we read ὑποκαρωθεὶς (*Hypocarothis*) in the ſame Senſe.

HYPOCATHARSIS, ὑποκάθαρσις, from ὑπὸ, importing Diminution, and κάθαρσις, Purgation, is a ſlight Purgation downwards, and ſo oppoſed to HYPERCATHARSIS. The Word, however, is ſometimes taken, ſimply, for any Degree of Purgation by the Belly, as in *Hippocrates*, *Lib. de Ulcer.* and *Galen*, *M. M. Lib.* 4. *Cap.* 6.

HYPOCAUSTUM, ὑπόκαυστον, from ὑπὸ, under, and καίω, to burn, is properly an Apartment for Bathing or Sweating, which is heated by a Fire under its Floor; but is generally uſed to ſignify a Stove.

HYPOCEPHALÆON, ὑποκεφάλαιον, from ὑπὸ, under, and κεφαλὴ, the Head, is a Pillow, or any Support for the Head. *Hippocrates*, 1. *de Morb. Mul.*

HYPOCERCHALEON, ὑποκερχαλέον, from ὑπὸ, and κέρχνος, an Aſperity of the Fauces, in 7. *Epid.* is a ſtridulous kind of Aſperity of the Fauces and Aſpera Arteria.

HYPOCHOERIS, a Species of *Sonchus*, not ſo prickly as the others: It comes from ὑπὸ, importing Diminution, and χοῖρος, a Swine. *Blancard.*

HYPOCHEOMENOS, ὑποχεόμενος, is one labouring under a Suffuſion, or Cataract. *Galen*, *de Sanit. tuend. Lib.* 6. *Cap.* 9.

HYPOCHLOROMELAS, ὑποχλωρόμελας, from ὑπὸ, importing Diminution, χλωρὸς, of a kind of pale Colour, and μέλας, black. Of a paliſh Colour inclining to black. *Hippocrates*, *Lib.* 6. *Epid.*

HYPOCHONDRIA, ὑποχόνδρια, from ὑπὸ, under, and χόνδρος, a Cartilage. The Hypochondria, or that Part of the Body, on both Sides, which lies under the ſpurious Ribs, and is extended to the Ilia, comprehending not only the Muſcles, but the internal Viſcera; becauſe, as *Pollux* ſays, πρὸ χόνδρου ὑπόκειται, "It is ſubjacent to a Cartilage." *Celſus*, from ſeveral Places of *Hippocrates*, renders the Word by *Præcordia*; and *Cœlius Aurelianus* often puts *Præcordia inflammata*, for an Inflammation of the Hypochondria.

Affections of the *Hypochondria*, in *Hippocrates*, are;

Hypochondrion aneſpaſmenon, ὑποχόνδριον ἀνεσπασμένον, a Revulſion and Retraction of the *Hypochondrium* inwards, without any proper Diſorder of the Part, which is a Prognoſtic of an Hæmorrhage, and a Phrenſy. *Coac.* 119.

Hypochondria diaborborizonta, ὑποχόνδρια διαβορβορίζοντα, a Rumbling of the Hypochondria, 5 *Aph.* 64.

Hypochondrii Entaſis, &c. ὑποχονδρίου ἔντασις λάπαρος, & ὑπόλαπαρος, a ſoft or ſoftiſh Tenſion of the Hypochondria, without a Tumor or Inflammation, *Lib.* 3. *Epid. Ægr.* 2. & 16.

& Ægr. 16. *poſt Stat. peſt.* There is alſo ὑποχονδείου ἔντασις ὀπίσθιος, an oblong Tenſion of the Hypochondrium, proceeding from an Inflammation of the two ſtrait Muſcles of the Epigaſtrium, which are extended from the Thorax, in a ſtrait Line, to the Oſſa Pubis. 1. *Prorrhet.* 144.

Hypochondria Catexeraſmena, &c. ὑποχόνδεια κατεξηραμμένα σφόδρως, ἢ ἰσχυρῶς αὐχμώδη, Hypochondria very ſqualid and dried up, καὶ περιεσπασμένα, and contracted and depreſſed by an exceſſive Dryneſs, not ἀνεσπασμένα, drawn inwards by an internal Inflammation. *Galen, Com.* 1. *in Lib. de R. V. I. A.*

Hypochondria meteora, ὑποχόνδεια μετέωρα, elevated or tumid Hypochondria, 1. *Epid. Ægr.* 8. 4 *Aph.* 72. The ſame are expreſſed, *Lib. de R. V. I. A.* by ἐπηρμένα (*epermena*) raiſed or liſted up, meaning by Flatulences, as *Galen* explains it.

Hypochondrii Xyntaſis, ὑποχονδείου ξύντασις, ſuch a Diſtention of the Hypochondria, as proceeds from an Inflammation, 1. *Epid. Ægr.* 2. 3. 8. 10. and elſewhere.

Hypochondrii Scoliotes, ὑποχονδείου σκολιότης, an Obliquity of the Hypochondrium, that is, an Inequality of that Part: Thus, in the following Paſſage, *Lib. de R. V. I. A.* ὑποχόνδειον μὲν γὰρ εἰ ὀπὸν πόνον ἔχει, ἢ ἐπηρμένον, ἢ ἔχει τινὰ σκολιότητα, "If, there-"fore, the Hypochondrium be pained, or tumefy'd, or con-"tract an Obliquity." Σκολιότης is explain'd, in *Galen*, by ἀνωμαλία, Inequality.

Hypochondrium chronium, ὑποχόνδειον χρόνιον, an Hypochondrium affected with an inveterate Diſorder, *Coac.* 292. So, alſo, 1. *Prorrhet.* we read τὰ ὑποχόνδεια μαλθακὰ χρονιότερα, Hypochondria which have been tumefied for a conſiderable Time.

HYPOCHONDRIACUS MORBUS.

The hypochondriac Diſorder is none of the leaſt conſiderable among thoſe of the ſpaſmodic Kind, incident to the nervous Syſtem: Becauſe it, principally, exerts its Tyranny under the Enſiform Cartilage, and the ſpurious Ribs, in the Region of the *Hypochondria*, it is, for this Reaſon, called the hypochondriac Affection. If we thoroughly conſider its Nature, it will be found to be a ſpaſmodico-flatulent Diſorder of the *Primæ Viæ*, that is, of the Stomach and Inteſtines, ariſing from an Inverſion or Perverſion of their periſtaltic Motion, and, by the mutual Conſent of the Parts, throwing the whole nervous Syſtem into irregular Motions, and diſturbing the whole Oeconomy of the Functions.

But, before we enter upon the Hiſtory of this Diſorder, we think it expedient to premiſe, that no Part or Function of the Body eſcapes the Influence of this tedious and long protracted Diſeaſe, whoſe Symptoms are ſo violent and numerous, that it is no eaſy Task either to enumerate or account for them; for, as, among acute Diſeaſes, a Fever, in a particular manner, deſerves the Name of Univerſal; ſo, among thoſe of a chronical Kind, the ſame may be juſtly ſaid of the hypochondriac Diſorder. But, that we may proceed regularly, and trace the Beginning and Progreſs of this Proteus-like Diſorder, we ſhall begin from the Cavity of the lower Belly, which is firſt of all ſubjected to the Tyranny of this Diſtemper. In the Beginning, therefore, of the Diſorder, violent Tenſions, and flatulent Inflations, of the Stomach and Inteſtines are perceiv'd, eſpecially under the ſpurious Ribs, and that moſt generally in the Left Region of the Hypochondria, on which a pretty hard Tumor ſometimes appears. As for the particular Diſorders of the Stomach and Oeſophagus, the Patient is afflicted with Nauſeas, loathing of Food, and a varying Appetite, ſometimes craving nothing, and at others ſomewhat more keen; the Aliments are ill-digeſted, and by that means acid and viſcid Crudities are generated: The Stomach is affected with an oppreſſive and heavy Pain, eſpecially after Meals: The *Oeſophagus* is ſpaſmodically conſtricted, and a limpid Mucus is frequently diſcharged out of the Mouth: Deglutition is difficult, and the Patient labours under a violent Cardialgia, a Heat of the Stomach, acid Eructations, Attempts to vomit, and Vomitings, the Matter of which is of ſo acrid a Quality, that Authors inform us, that the Teeth are not only benumbed, but, alſo, Linen Cloths corroded by it. In hypochondriac Patients I have, alſo, obſerved purely ſebaceous Vomitings; with reſpect to which, the Reader may conſult the *Miſcell. Nat. Curioſ. Decad.* 1. *An.* 3. *Obſ.* 253. Beſides, in the Inteſtines, particularly the ſmall ones, there are perceiv'd, about the Navel, violent and racking Pains, Contorſions, lancinating Twitches, Rumblings, and Murmurings: Violent Gripes are, alſo, produced in the large Inteſtines. Sometimes the Patient is ſeiz'd with a Flux, and, at other times, with an obſtinate Coſtiveneſs, accompanied with a Retention of the Flatulences, which, when diſcharged either from the Mouth or Anus, in ſome meaſure, relieve the other Symptoms, but are, ſoon after, copiouſly generated. The Patient often labours under frequent Deſires of going to Stool; and, generally, Tubercles, or blind Hæmorrhoids, appear about the Anus, and a ſymptomatic Diſcharge of Blood ſometimes ſucceeds: In ſome, the Diſcharge of the Urine is difficult and painful, and the Urine itſelf is thin, diluted, and white, ſometimes with a copious ſandy Sediment. Beſides, this Diſorder, when attended with a Pain in the Region of the Kidneys, often reſembles the Stone.

Nor does this Diſorder affect the Abdomen alone, but, alſo, draws other Parts into Conſent. Thus in the Breaſt there is great Uneaſineſs, Conſtrictions, a violent Difficulty of Breathing, ſometimes joined with an Oppletion of the Breaſt, Tremors, and Palpitations of the Heart. As the Diſeaſe increaſes, the Head is, alſo, affected; in the exterior Parts of which, Cephalalgias, Hemicranias, various conſtrictive Pains, accompanied with Rigidity and Immobility, and that particular Species of Pain called *Clavus*, are perceiv'd. In the internal Parts a Vertigo, a Ringing of the Ears, and a Difficulty of Hearing, are perceiv'd; the Eyes are dull, and the Sight dim: Some, alſo, ſee Objects double: The Eyes are painful and dry; the Tongue, eſpecially in a particular Part, is frequently ſeiz'd with a burning and uneaſy Pain; and the Saliva is copiouſly diſcharg'd: At laſt the animal Functions are impair'd, the Mind is, without any Reaſon, or by the ſlighteſt Cauſe, provok'd and thrown into violent Commotions. Hence Reſtleſſneſs, Anxiety, Terror, Sadneſs, Anger, Fear, Diffidence, idle Whims, and irregular Workings of the Fancy; the Memory is impair'd, the Reaſon weaken'd, the Sleep turbulent, uneaſy, and full of Terror. Some Symptoms of this Diſorder affect the whole Body, which is frequently overſpread with intenſe Heats, or profuſe Sweats; the Strength is loſt, and the whole Body, becoming languid, and averſe to Labour, gradually waſtes away. The Limbs are frequently affected with a pricking and lancinating Pain. At laſt, all the Secretions and Excretions, eſpecially thoſe of the ſanguineous Kind, are perverted and diſorder'd. But 'tis hardly poſſible to enumerate all the various Symptoms of this Diſorder, which are different in almoſt every Individual they torment.

The Accounts of this Diſeaſe, receiv'd from the moſt antient Phyſicians, correſpond with thoſe we have already given. Thus *Galen*, in his Firſt Book *de Locis affectis*, furniſhes us with a Paſſage of *Diocles*, in which hypochondriac Diſorders of the flatulent and melancholic Kind, ariſing from the Stomach, are mentioned; and which, for the ſake of its Brevity and Perſpicuity, deſerves to be tranſcribed: "The Patient, ſays he, after "eating, eſpecially ſuch Aliments as are of difficult Digeſtion, "or capable of exciting Heats, ſpits large Quantities of Moi-"ſture; is afflicted with acid Eructations and Inflations; he "perceives an Exæſtuation in his Præcordia, and a Fluctuation "when he checks the Eructations. Sometimes, alſo, violent "Pains of the Abdomen are perceiv'd, which, in ſome, reach "above the Diaphragm, but are allay'd, when the Aliments are "concocted. But, as ſoon as the Patient eats again, he is af-"flicted in the ſame manner. Theſe Pains ſometimes, alſo, rack "the Patient, when faſting, and after Supper. If at any time "the Patient vomits, the Matter thrown up conſiſts of crude "Aliments, and a Phlegm, which is bitter, hot, and acid to "ſuch a Degree, that the Teeth are benumb'd by it." This Author is of Opinion, that becauſe cold Subſtances afford Relief, the Diſeaſe ariſes from the Heat of the internal Parts.

Before we quit the Hiſtory of this Diſeaſe, we ſhall lay down ſome Cautions very neceſſary to be known: As, then, this Diſorder has ſeveral Degrees or Stages, which direct us in forming our Prognoſtics; ſo it has, alſo, Exacerbations, which amount to pretty violent Paroxyſms; for, tho' hypochondriac Patients are never perfectly well, yet their Symptoms are far more violent in the Winter, Autumn, and cold Weather of any kind; whereas the hotter the Atmoſphere is, the better State of Health they enjoy. Women ſubject to this Diſorder are obſerv'd to be moſt afflicted by it at the time their *Menſes*, which are generally deficient, ought to flow. It is, farther, worth our Obſervation, that hypochondriac Patients are rarely afflicted with continual, epidemical, and contagious Fevers, or the Plague, but remain free from theſe and many other raging Diſtempers. The Reaſon of this ſurpriſing Phenomenon ſeems to be this, that theſe Patients have, generally, in their *Primæ Viæ*, a large Quantity of acid and viſcid Crudities, which reſiſt the Efficacy of the Contagion, which operates by the Fineneſs of the ſulphureous Parts, that are in a manner fixed by theſe Crudities. Hence it, alſo, happens, that old and melancholic Patients are rarely affected by acute Diſeaſes, or even thoſe of a contagious Nature.

We find from Experience, that this Diſorder is moſt incident to young Perſons, and thoſe arriv'd at their full Growth, that is, from about the twentieth to the fiftieth Year of their Age; after which this Diſorder generally changes itſelf into arthritic Pains, the Gout, a Pain of the Loins, ſciatic Pains, the Stone, a Cachexy, a Scurvy, the *Morbus Niger*, Obſtructions of the Viſcera, an Hectic, and other formidable Diſorders. Thoſe, alſo, who are of a ſpongious, ſoft, lax Habit, and have ſmall Veſſels, are more ſubject to this Diſorder, than thoſe who are of a more firm and robuſt Conſtitution. Thoſe, alſo, are more ſubject to it than others, who are naturally languid, or who have received from their Parents an hereditary Diſpoſition to it; as, alſo, thoſe who by an imprudent Method of Living, or previous Diſeaſes, have their natural Strength and Vigour greatly impair'd. Thoſe are, farther, in a peculiar manner, ſubject to this Diſorder, who lead a ſedentary Life, and indulge themſelves too much in Study, continual Meditations, and Lucubrations. Hence the Diſorder is very common among the *Literati*. For the ſame Reaſon the Female Sex are obſerv'd to be afflicted with this Diſorder, though not ſo frequently as Men. But the

hypochondriac Diſorders of Women are falſely confounded with thoſe of the hyſteric Kind, and paſs under the ſame Name. See HYSTERICA.

Both Antients and Moderns have err'd in aſſigning the Seat of this Diſorder: The former, as they frequently obſerv'd a tenſive inflated Tumor under the ſpurious Ribs on the Left Side, where the Spleen is ſituated, imagin'd that the Seat of the Diſorder was in this Organ. This Opinion is eſpouſed by *Rhodius* and *Heurnius*. But beſides that the Spleen, in conſequence of its Structure, is not ſuſceptible of that acute and lancinating Pain perceived by hypochondriac Patients, we are taught by Experience, and the Diſſection of Carcaſes, that in hypochondriac Patients the Spleen is often found without any Diſorder. *Sylvius*, in his *Diſſert. de Uſu Lienis*, *Hoefferus*, *de Hercule Medica*, *Lib.* 3. *Cap.* 3. and *Hochſtederus*, *Dec.* 5. are of my Opinion. We are not, however, to deny, that there may, in this Diſorder, be an Infarction of the Spleen, though this Infarction is neither the Cauſe of the acute Pain, nor the Spleen the Seat of the Diſorder.

Some of the Moderns place the Seat of this Diſorder in the *Vena Portæ*, and its Ramifications, and think that the Blood ſtagnating there is the ſole and genuine Cauſe of all the Symptoms, which, in Men, have a Relation to the hæmorrhoidal, and in Women to the menſtrual Diſcharge; and that when theſe Diſcharges are promoted, the Symptoms ceaſe. But though 'tis not to be denied, as we ſhall afterwards obſerve, that Irregularities of theſe Evacuations, and the conſequent Stagnation of the Blood, eſpecially in thoſe Ramifications which are diſtributed through the nervous Coats of the Inteſtines, may often prove the ſecondary Cauſe of this Diſorder; yet we muſt obſerve, that this is not always the ſole and only Cauſe; for which Reaſon neither the Seat of the Diſorder, nor the Nature of the Symptoms, are to be ſought for here; for frequently there is no Diſpoſition to an hæmorrhoidal Diſcharge in hypochondriac Patients. And frequently Blood is copiouſly diſcharg'd from the Veins of the Anus, without any ſubſequent Relief of the Diſorder, as we are inform'd by *Rhodius Centur.* 2. *Obſ.* 93. *Claudinus*, *Conſil.* 89. and *Montanus*, *Conſil.* 246.

But I am of Opinion, that the true and genuine Seat of this Diſorder is lodged in the alimentary, membranous, and highly nervous Canal, which conſtitutes the Stomach and Inteſtines. This Canal conſiſts principally of four Coats: The innermoſt, known by the Name of villous, is furniſhed with erect and pervious Villi, like Papillæ. The Coat next to the villous is the nervous Coat. The third is the muſcular Coat, ſomewhat ſtronger, conſiſting partly of a few longitudinal, and partly of annular Fibres, and containing a large Number of Blood-veſſels. The outermoſt is the membranous Coat. There are three cellular Contextures between theſe Coats, one betwixt the villous and nervous Coat, another betwixt the latter of theſe and the muſcular Coat, and a third between that and the membranous Coat, commonly called the *Tunica Celluloſa* of *Ruyſch*. By the Strength of the muſcular Coat, and its annular fleſhy Fibres, theſe Parts are furniſhed with a kind of vermicular or periſtaltic Motion, which conſiſts in a gentle Conſtriction and Relaxation from the ſuperior to the inferior Parts. The natural Strength and Soundneſs of this Motion contribute not a little to the Preſervation of Health; for, by its means, the Digeſtion of the Aliments is duly carried on; the Secretion of the Bile, and pancreatic Juice, aſſiſted; the Preparation of a laudable Chyle, and its Propulſion into the lacteal Veſſels, promoted; by which means the other Juices of the human Body are render'd, at once, balſamic and ſpirituous. Beſides, by this periſtaltic Motion of the Inteſtines, the Crudities, Sordes, flatulent and aerial Vapours, left by thoſe digeſted Aliments, which are depriv'd of a laudable Juice, are propel'd through the alimentary Duct, and eliminated by the Anus. The Tone of theſe Parts, when ſound, and in its natural Degree, greatly facilitates and aſſiſts the free and equable Circulation of the Blood, and thus proves the principal Means by which the Functions, by Nature aſſign'd to the Inteſtines, may be duly perform'd.

After premiſing theſe things, we ſhall find it more eaſy to aſſign the immediate Cauſe, and account for the various Symptoms with which this Diſeaſe is attended. The Cauſe, then, of this Diſtemper conſiſts in a preternatural State of this periſtaltic Motion; when, for Inſtance, it is partly in one Place impair'd and deſtroy'd, partly in another too intenſe, and ſtrong, and every-where inverted, that is, perform'd from the inferior to the ſuperior Parts; for ſuch a Relaxation, and ſpaſmodic Diſtention, exiſting at one and the ſame time, in the Inteſtines, but ſucceeding each other in different Parts, conſtitute the true and genuine Nature of the hypochondriac Diſorder, and lay an excellent Foundation for accounting for all its Symptoms. This Opinion is confirm'd not only by Experience, but, alſo, by the Authorities of the moſt learned and celebrated Phyſicians, ſuch as *Ortlobius*, *Ettmuller*, *Needham*, *Wedelius*, and *Conringius*, in his *Diſſert. de Morbo Hypochondriac. Sect.* 11. Let us, therefore, try, whether, from this Cauſe, we can aſſign rational and ſatisfactory Reaſons for the numerous and direful Train of Symptoms with which this Diſorder is accompanied.

The immediate Conſequences, therefore, of a weakened periſtaltic Motion, are, a diſturb'd Digeſtion, an impair'd Chylification, and an obſtructed Excretion of the recrementitious Sordes. Hence theſe remain in the Inteſtines, and their acid and viſcid Crudities are, in a particular manner, inſinuated into the Flexures and Foldings of them, and a large Quantity of Flatulences is generated. Hence it happens, that theſe Sordes, by their long Stay in the Inteſtines, recede from their natural Qualities, and contract a certain Acrimony, by which they vellicate the nervous Coat of the Inteſtines, and excite ſpaſmodic Strictures. This Canal of the Inteſtines is, therefore, ſo violently conſtricted in ſome Places, that it cannot tranſmit the Flatulences. Theſe Flatulences fluctuate in that Part of the Canal, which is free from the Spaſms, and ſurpriſingly diſtend it; and this Circumſtance accounts for the Rumblings, Murmurings, and uneaſy Inflations. Beſides, the Flatulences, not finding a Paſſage downwards, by reaſon of the Spaſms, are forced farther upwards; and, in this Caſe, they principally poſſeſs the Colon, and are pent up in its Flexures, which are very numerous. For we muſt obſerve, that the Colon, eſpecially where it forms Flexures, under the ſpurious Ribs in both the Hypochondria, and coheres with the *Saccus Adipoſus* of the Kidneys, is far narrower than in its Middle. But here, eſpecially on the Left Side, it is frequently and violently diſtended with Flatulences, and elevated into a painful Tumor, which is falſely aſcribed to a Fault of the Spleen. When theſe Spaſms are continued, the periſtaltic Motion inverted, and the Diſorder increaſed, theſe Vapours penetrate into the Cavity of the Stomach, which they ſurpriſingly diſtend, and induce an uneaſy Inflation perceptible by the Senſes. The Stomach, being thus preternaturally diſtended, hinders the free Motion and Deſcent of the Diaphragm: Hence the Difficulty of Breathing ariſes. And, which is worſt of all, the Left or both Orifices of the Stomach are frequently conſtricted; by which means the Vapours are pent up in its Cavity, and produce terrible Uneaſineſſes of the Præcordia, and Cardialgias; which are conſiderably abated and mitigated when the Conſtrictions ceaſe, and the Vapours are diſcharged in Eructations.

Theſe are the Effects produced by the Flatulences, which, in conſequence of the deſtroyed periſtaltic Motion of the Stomach and Inteſtines, are, at once, copiouſly generated, and hindered from a due Diſcharge. The Diſorders of this kind were, by the *Greeks*, call'd τὰ παθήματα φυσώδεα. Let us now inquire, what Symptoms are produced by the Crudities left in the Stomach, the Duodenum, and the Foldings of the Colon, by the Aliments taken and diſſolved in the Stomach, in conſequence of an undue periſtaltic Motion. Theſe Crudities, by reaſon of their long Continuance, eſpecially in the Duodenum, where they meet with a large Quantity of the Bile and pancreatic Juice, are ſoon corrupted, become aceſcent, and aſſume an high Degree of Acrimony. Hence, by vellicating the Parts, they prove the Cauſe of Spaſms, tenſive Griping, lancinating and corroding Pains, which violently afflict the Region of the Stomach, and the reſt of the Abdomen, eſpecially about the Navel; by which means they lay a Foundation for a perpetual and uninterrupted Generation of freſh Flatulences. From theſe Sordes, alſo, ariſe the Keenneſs of the Appetite, Nauſeas, Cardialgias, Inclinations to vomit, Eructations, and acid Vomitings; and ſince in every Digeſtion they are put into a more violent fermentative Motion, hence the Reaſon is obvious, why hypochondriac Patients are worſt after feaſting ſumptuouſly: And ſince, in conſequence of ſo continual a Stimulus of the Inteſtines, their alternate Spaſms, and flatulent Diſtentions, are produc'd, hence the Reaſon is obvious, why hypochondriac Patients are coſtive, and that, ſometimes, to ſuch a Degree, that the fine Exhalations cannot be diſcharged, much leſs the Fæces.

It ſtill remains, that we enumerate the Diſadvantages accruing to the Circulation of the Blood, from the diſorder'd periſtaltic Motion: For, as, when this latter is in its due and natural State, a free and equable Circulation of the Humours is performed thro' the Inteſtines; ſo, when the periſtaltic Motion is either impair'd or deſtroy'd, the Circulation of the Blood thro' them is, of courſe, render'd proportionably ſlower, and more unequal; for in one Part of the Inteſtines there is a Spaſm, which, at once, conſtricts and compreſſes the Blood-veſſels; in another Part, Flatulences diſtend and expand the Sides of their Coats, and, by that means, violently compreſs the adjacent ſmall Veſſels. By this means, the Return of the Blood thro' the hæmorrhoidal Vein is more retarded, ſince the Situation of that Vein is perpendicular. Hence there every-where ariſe Stagnations of Humours in the Coats of the Inteſtines, which, as they may, for the Reaſon already given, be Symptoms attending the Flatulences, ſo they generally prove the Cauſes of them, as we ſhall afterwards ſhew. Firſt, it frequently happens, that the Blood is accumulated about the Extremity of the Rectum, and elevated into a Tubercle, called the blind Hæmorrhoids; and, alſo, frequently burſting forth with Force, terminates in an hæmorrhoidal Diſcharge; which, in this Caſe, is ſymptomatic. From this Stagnation ariſe, alſo, the Suppreſſions both of the *Menſes* and *Hæmorrhoids*, which always happen as the Diſorder increaſes. And from this Stagnation we may, alſo, account for the bloody

and black Diſcharges by Urine, Vomit, and Stool, which Authors, of great Veracity, affirm to have been made by Perſons labouring under violent Degrees of this Diſorder. With reſpect to ſuch an Evacuation by Vomit, the Reader may conſult *Riolanus Anthropol. Lib.* 2. *Cap.* 2. An Inſtance of one by Stool may be ſeen in *Adrianus Spigelius's Anatom. Lib.* 6. *Cap.* 5. and in *Solenander, Conſil.* 7. *Sect.* 2. And I myſelf, ſays *Hoffman*, ſaw the Urine of an hypochondriac Patient tinged with an intenſely red Colour.

Theſe Things happen in the inteſtinal Canal, but, after this, the Diſorder growing worſe, the moſt terrible Symptoms ariſe thro' all the Body, and diſturb all its Functions. This happens in conſequence of the Conſent between all the Nerves and nervous Parts, by means of which the Spaſms of the Inteſtines are propagated to other, and even the moſt remote Regions. Where there is a ſpaſmodic Stricture of the Nerves, there the Circulation of the Blood is unequal. Hence the Reaſon is obvious, why in inveterate hypochondriac Diſotders there are ſpaſmodic Strictures, and a ſlow Circulation through the whole Body. Thus the Parts of the Abdomen, adjacent to the Inteſtines, are firſt conſtricted; and, in conſequence of the Diſorder of the Bladder, and its Sphincter Muſcle, and of the Kidneys, the Urine is diſcharged thin, diluted, and aqueous. By means of the violent Convulſions of the nervous Membranes ſurrounding the Kidneys, Pains reſembling thoſe of the Stone are produc'd. The Spaſms convey'd to the Breaſt induce its Conſtrictions, together with Tremors and Palpitations of the Heart. When theſe Spaſms are conveyed to the Head, Pains of various Kinds are brought on; and, when they are propagated to the external Parts, they produce Coldneſs of the Extremities, and frequent Horripilations.

Since, therefore, in the hypochondriac Diſorder, a thick and impure Chyle is generated, Spaſms produced in the whole Body, the Circulation of the Blood render'd unequal, and the ſalutary Excretions by Sweat, Urine, and Stool, obſtructed, a ſcorbutic Dyſcraſy muſt of courſe be gradually increaſed, and thus the hypochondriaco-ſcorbutic Diſorder is formed. If, in Women, the Menſes are ſuppreſs'd, and by this means the Blood, or ſeminal Humours, become ſtagnant about the Uterus, and Parts ſubſervient to Generation, eſpecially when a ſalacious Temperament concurs, then hyſteric Fits are readily complicated with hypochondriac Diſorders; and the hypochondriaco-hyſteric Affection is produced. When thick and viſcid Humours are, by the Spaſms of the Lower Belly, copiouſly convey'd to the ſuperior Parts and Head, where they circulate ſlowly in the Veſſels of the Brain; the animal Functions are deſtroyed; the Senſes languiſh; the Force of the Memory, and Brightneſs of the Genius, are impair'd; the Patient is prone to Sadneſs, Diffidence, and Tears; fooliſh Fancies, and vain Ideas, ariſe in the Mind; and thus, by ſlow Degrees, an hypochondriac Melancholy is produced.

We now come to conſider the direct and immediate Cauſes of this Diſorder: Of theſe the moſt conſiderable, and frequent, is a Stagnation of the vital Juices between the nervous and muſcular Coats of the Inteſtines, which is, moſt frequently, owing to their ſlow Circulation through the Liver: Now the Liver is a vaſcular Organ, furniſh'd with more Veins than Arteries; the two moſt conſiderable of the former are the Vena Cava, and the Vena Portæ: Now it is certain, that the latter of theſe, from which the whole Inteſtines, Stomach, Meſentery, Spleen, Pancreas, and Uterus, receive, if not all, yet, at leaſt, moſt, of their Ramifications, by a peculiar Mechaniſm, receives the Blood returning from all the Viſcera of the lower Abdomen, and, diſcharging the Office of an Artery, but without a Pulſation, conveys it into the Liver: Hence the Reaſon is obvious, why, in a ſound State, the Circulation of the Blood is ſlower through the Liver, than through any of the other Viſcera of the Body: Hence it is no hard Task to conceive, why, in a preternatural and diſorder'd State, the Circulation of the Blood through this Organ ſhould be firſt of all retarded and obſtructed: Now, when the Circulation is retarded here, the Blood, according to the Laws of Hydraulics, muſt, neceſſarily, regurgitate to thoſe Viſcera, from which it was before convey'd to the Liver: For this Reaſon it greatly diſtends the Veſſels of theſe Parts, eſpecially the Veſſels of the Meſentery and Inteſtines, whoſe ſoft Coats are not capable of making great Reſiſtance. Thus, from this ſlow Circulation of the Blood through the Liver, ariſes its Stagnation in the Inteſtines, which deſtroys the due Æquilibrium between the Solids and Fluids, and is, as it were, the immediate Cauſe which deſtroys the Tone and Strength of the periſtaltic Motion, a Circumſtance which produces the hypochondriac Diſorder.

This is the Reaſon, why, in the Carcaſes of thoſe who have died of the hypochondriac Diſorder, degenerated into ſome other Diſeaſe, ſuch Phenomena appear, as proceed partly from a faulty Circulation of the Blood through the Abdomen, and partly from Cauſes which tend to render this Circulation ſtill more faulty. Thus *Guarinonius, in Conſil.* 484. informs us, that, on diſſecting the Body of an hypochondriac Patient, he found the Veins of the Meſentery obſtructed, and ſo dilated, that they, in a manner, reſembled Inteſtines. *Ludovicus Mercatus, Tom.* 3. *L.* 1. *C.* 7. tells us, that he found the meſeraic Veſſels of an hypochondriac Patient highly varicoſe. *Brunner. in Conſil.* 7. informs us, that he found a great Quantity of viſcid Blood in the meſeraic Veins. *Rhodius, in Cent.* 2. *Obſ.* 76. tells us, that he found the Colon ſcirrhous. *Welſchius*, in his *Diſp. de Malo hypochondriaco*, tells us, that he found the whole Colon diſtended with Flatulences; but ſo contracted at its Inſertion into the Inteſtinum Rectum, that it ſeem'd to be, as it were, grown together. *Blaſius*, in his *Comment. in Veſlingium*, informs us, that in ſome hypochondriac Patients the Liver has, after Death, been found incredibly large. And I myſelf ſaw the Pancreas obſtructed in a Perſon who died of the hypochondriac Diſorder. *Highmore*, in his *Diſquiſ. Anatom.* and *Harder. in Obſ.* 59. inform us, that they found the Pancreas ſcirrhous and ulcerated in hypochondriac Patients.

Among the remote Cauſes which greatly contribute to the ſlow Circulation of the Blood through the Liver, and its conſequent Stagnation in the Viſcera of the lower Belly, and, principally, the Inteſtines, the moſt conſiderable are Diminutions and Suppreſſions of the Menſes in Women, and of the Hæmorrhoids in Men.

Thus, it is certain, from Obſervation, that thoſe Perſons, who, when young, have been much ſubject to large Hæmorrhages from the Noſe, readily fall into this Diſorder, if, at a more advanced Age, they are ſeiz'd with the Hæmorrhoids, which generally ſuppoſe an hereditary Diſpoſition, and greatly facilitate the Circulation of the Blood through the Abdomen and Liver, and theſe Hæmorrhoids are, by any means, ſuppreſs'd; for the redundant Blood, being, in conſequence of this Suppreſſion, retain'd, is accumulated in the Abdomen, and, conſequently, for the Reaſon already advanced, circulates more ſlowly thro' the Liver, and, regurgitating to the Inteſtines, undergoes a deplorable and injurious Stagnation. The ſame holds true with the menſtrual Diſcharge, which, when diminiſh'd, or ſuppreſs'd, produces an Accumulation of Blood in the meſeraic Artery, where it attempts its Diſcharge by the hæmorrhoidal Veins; and, this being denied, regurgitates to the Inteſtines, and renders the Circulation of the Humours proportionably more difficult. Thus, in the Female Sex, hypochondriac Diſorders are frequently generated, which may be eaſily complicated with thoſe of the hyſteric kind, if, at the ſame time, a Stagnation of the Blood ſhould happen about the Uterus. In Caſes of this Nature, a ſpeedy and ſeaſonable Reſtitution of theſe Evacuations proves the moſt certain and natural Cure of hypochondriac Diſorders.

But there are ſtill a great many other Cauſes, which may diſorder the periſtaltic Motion of the Inteſtines, and, by that means, generate the hypochondriaco-flatulent Diſorder. Among theſe, the moſt conſiderable is what we call *Hereditary Diſpoſition*, which conſiſts in a weak Conſtitution of the nervous Parts, eſpecially of the Inteſtines, convey'd from Parents to Children, by means of which the Inteſtines are highly ſuſceptible of irregular Motions. To this we muſt, alſo, aſcribe the Smalneſs of the Veins, and the lax and ſpongious Habit generally obſerv'd in hypochondriac Patients. As this hereditary Diſpoſition is the Foundation of many Diſeaſes, ſo it, in a particular manner, contributes to the Production of the hypochondriac Diſorder, and the Hæmorroids. Thus, hypochondriac Patients propagate Children ſubject to the ſame Misfortune; and thoſe Mothers, who, during Geſtation, have been affected with hyſteric Fits, or indulged themſelves in Sallies of Paſſion, bring into the World Children, who, when advanced in Years, are, upon the ſlighteſt Occaſion, ſubject to hypochondriac and flatulent Diſorders.

Some of the Non-naturals, alſo, contribute not a little to the Generation of this Diſorder. Thus, a cold Air is of conſiderable Efficacy in the Production of this Misfortune; ſince, by conſtricting the external Surface of the Body, it forces a larger Quantity of the Humours inwards, which, the more they are accumulated, the more readily they become ſtagnant. A moiſt State of the Atmoſphere relaxes the Tenſion of the moving Fibres; a Circumſtance by which all the Diſeaſes, ariſing from a Want of due Tone in the Parts, are both generated and increaſed. Cold is, in a particular manner, prejudicial to the Inteſtines, when too freely admitted to the Abdomen, or Feet, the near Connection of which laſt with the Inteſtines is ſufficiently obvious from this, that delicate Perſons are forthwith ſeiz'd with Gripes, and Flatulences of the Inteſtines, if they walk barefoot upon cold Floors; as *Foreſtus, Lib.* 10. *Obſ.* 10. obſerves of his Brother. Hence the Reaſon is obvious, why hypochondriac Patients enjoy better Health in Summer, than in Winter; as, alſo, why, in Northerly Climates, this Diſorder is far more frequent, than in thoſe Countries which are bleſs'd with a more ſerene and temperate Air.

Beſides the Air, coarſe and thick Aliments, alſo, prove the antecedent Cauſe of the hypochondriac Diſorder. Crude, acid, flatulent Aliments, Pulſes, Summer-fruits, Preparations of Milk, Sallads, Cakes, eſpecially when recent and hot, generate a thick and impure Chyle, leave many Sordes in the Primæ Viæ, and remarkably diſorder the periſtaltic Motion of the Inteſtines, eſpecially in Perſons who do not uſe ſufficient Exerciſe. Ali-

ments

ments either not ſufficiently maſticated, or greedily eaten, by Perſons whoſe Stomachs are weaken'd by previous Diſeaſes, are highly prejudicial, and contribute much to the Production of this Diſorder. For this Reaſon *Blancard, in Prax. Cap.* 61. affirms, that this Diſorder is highly incident to the Inhabitants of *Friſeland*, in conſequence of their Abuſe of Peas, Preparations of Milk, and Sallads. And *Simon Paulli*, in his *Quadripartit. Botan.* gives us an Inſtance of a Woman, who became hypochondriac, by eating Bread immediately taken from the Oven. Drink may, upon a double Account, produce this flatulent Diſorder; either when it is taken too liberally, or taken cold when the Body is hot. In the latter Caſe, the Misfortune is almoſt inſtantaneouſly produced: In the former Caſe, the Diſorder is contracted by reiterated Acts, and proves a ſufficient Puniſhment for the paſt Indulgence in Gluttony. The Drink may, alſo, contribute to the Production of this Misfortune, if its Quantity is too ſmall, or too large; or if it is aqueous, too thick, or feculent.

This Diſorder frequently ariſes from an idle and ſedentary Life, which is often the only Cauſe of the Diſeaſe: For, as due Exerciſe not only increaſes the Strength and Motion of the ſolid Parts and Muſcles, but, alſo, renders the Humours more fluid; ſo, upon an Intermiſſion of this Exerciſe, the Strength becomes languid, the Elaſticity of the Fibres is impair'd, and the Humours, in conſequence of their undue Circulation, become thick. This ſedentary Life contributes ſo much the more effectually to the Production of this Diſorder, if immoderate Lucubrations, Meditations, and protracted Studies, are join'd with it. Any of theſe Cauſes contributes conſiderably to impair the Elaſticity of the ſolid Parts, eſpecially when they, who indulge themſelves in theſe things, hang their Bodies in a ſleeping Poſture over their Books; and are ſo ſedulous, that they are intent on their Studies amidſt the moſt delicious Banquets. Hence it is, that thoſe Women who indulge themſelves in Idleneſs, and drink little, as, alſo, ſtudious Men, are highly ſubject to hypochondriac Diſorders.

The Paſſions of the Mind, alſo, contribute conſiderably to the Production of this Misfortune; but the moſt conſiderable and powerful of theſe are long Grief, Care, and an anxious and uneaſy State of Mind. The Efficacy of theſe, in deſtroying the Strength of the ſolid Parts, and impairing the Digeſtion, is ſufficiently obvious from Experience. Thus *Horſtius*, in *L.* 4. gives us an Inſtance of a Man, who, for the Death of his Son, griev'd ſo long, that he became hypochondriac, and, at laſt, melancholy. And *Pechlinus, in Obſ.* 31. informs us of a certain Taylor, who was ſo griev'd for his Misfortunes, that he became ſubject to violent Flatulences, and hypochondriac Diſorders. A ſalacious wanton Turn of Mind, and its natural Conſequence, immoderate and too early Venery, are of ſo great Efficacy in weakening the Strength of the Stomach and Inteſtines, that I have frequently known hypochondriac Diſorders produced by this means.

It, alſo, frequently happens, that thoſe who are weakened by previous Diſeaſes, eſpecially when prepoſterouſly cured by aſtringent Medicines, Opiates, and Narcotics, as, alſo, Women debilitated by hard Labours, are afflicted with this Diſeaſe; for in theſe the Tone of the Stomach and Inteſtines, being highly languid, is eaſily deſtroy'd by the ſmalleſt Error in Regimen, or by giving way to the Tranſports of Paſſion. In like manner, I have often obſerv'd Perſons ſeiz'd with Colics, Gripes, Diarrhœas, and Dyſenteries, who, having the Misfortune to have their Diſorders treated with Aſtringents, have gradually fallen into violent Flatulences, and hypochondriac Affections. I have, alſo, more than once obſerv'd the ſame Misfortune produced by ſtopping a Gonorrhœa, or Fluor albus, too ſoon, by means of Magiſtery, and Sugar of Lead. A Caſe of this kind may be ſeen in *Hoffman, Conſult. ac Reſponſ. Medic. Tom.* 2. § 3. *Caſ.* 99. And nothing is more common, than the Production of hypochondriac Diſorders by the prepoſterous Suppreſſion of intermittent Fevers, or the unskilful Uſe of the *Peruvian* Bark under them; eſpecially if the Patient abounds with thick Humours, is addicted to a ſedentary Life, or ſubject to Spaſms of the Primæ Viæ. *Horſtius, in Lib.* 10. *Obſ.* 28. furniſhes us with an Inſtance of this kind. And I myſelf have often ſeen hypochondriac Affections brought on by the Suppreſſion of tertian Fevers. Women, alſo, frequently become hypochondriac after difficult, or ill-managed Labours. And, in general, whatever Diſeaſes, whatever Cures, or whatever Cauſes, are capable of injuring or deſtroying the periſtaltic Motion of the Stomach and Inteſtines, are juſtly claſs'd among the productive Cauſes of hypochondriac Diſorders. Among theſe we muſt, alſo, claſs Purgatives, and draſtic Emetics, frequently exhibited, eſpecially Preparations of Aloes, and the unskilful or exceſſive Uſe of Pills which contain Aloes; by which the Humours are invited to the Anus, and, being denied a Diſcharge, become ſtagnant there.

It now remains, that we diſtinguiſh this Diſorder from ſome others, in order to prevent their being confounded with each other, and then ſubjoin ſomething with reſpect to the Prognoſtics. The Difference, then, between this Diſorder and hyſteric Fits is ſpecified under the Article HYSTERICA AFFECTIO.

We have already obſerv'd, that in this Diſorder the periſtaltic Motion of the Inteſtines is inverted; but ſince this Inverſion is, alſo, the Cauſe of ſome other Diſorders, we muſt inquire, what Difference there is betwixt theſe, and that of which we now treat. Thus, in Vomiting, and the Iliac Paſſion, the periſtaltic Motion is inverted; but, in Vomiting, this Inverſion begins from the Pylorus, or, perhaps, the Duodenum, and is continued thro' the Stomach and Gullet to the Fauces; whereas, in the Iliac Paſſion, the Motion of the whole inteſtinal Canal, from the Sphincter of the Anus to the Orifice of the Oeſophagus, is inverted by violent Spaſms and Convulſions, which are accordingly ſucceeded by a Vomiting of the Fæces. But it is quite otherwiſe in the hypochondriac Diſorder; for in it the Inverſion of the periſtaltic Motion is only in ſome Parts of the Inteſtines; and thoſe which are free from it, afford a Seat for the flatulent Vapours. Hence we are enabled to account for the Rumblings and Noiſes which are ſometimes pretty loud in the Abdomen; as, alſo, for the Flatulences carried up and down through all the Parts of the Abdomen, and to the Sides, eſpecially in the Morning, or after intenſe Application of Mind, without any ſubſequent Diſcharge of Wind, or of the Fæces, by the Anus; for theſe Vapours, being pent up in particular Parts of the Inteſtines, are ſoon after driven, by the Spaſms, with a conſiderable Impetus, to other Parts; which Circumſtance ſufficiently accounts for the Noiſe and Rumbling.

The hypochondriac Diſorder is, alſo, different from the Colic, which frequently ſucceeds it; for, as the former is a long-protracted Diſorder, which ſometimes ſeizes, notwithſtanding the Obſervation of the moſt accurate Regimen; ſo a Colic is ſhorter, more tranſitory, generally ariſes from ſome Fault of the Aliments, and is accompany'd with Gripes of the Inteſtines, and an obſtinate Conſtipation, upon the Removal of which, it directly ceaſes; whereas the hypochondriac Diſorder is accompany'd with far more numerous and violent Symptoms. Hypochondriac Affections ought, alſo, to be carefully diſtinguiſh'd from the Stone in the Kidneys; for, tho' the former is frequently attended with Pains reſembling thoſe of the latter, yet no Excretion of ſmall Stones enſues; and if, perhaps, in the Urine, any Sand ſhould be obſerv'd, it after ſome time adheres to the Bottom of the Pot, like that Matter which is diſcharged in conſequence of a ſcorbutic Dyſcraſy of the Fluids; whereas, in genuine nephritic Pains, the Urine is, immediately after its Diſcharge, obſerv'd to contain Sand, and the Caſe is known by the Evacuation of ſmall Stones. Nor is a ſimple Flatulence, which is ſuddenly produc'd by Aliments of hard Digeſtion, and may be eaſily remov'd by the Exhibition of Carminatives, to be forthwith taken for the hypochondriac Diſorder, tho' the former may indicate the Beginning of the latter.

As for the Prognoſtics of this Diſorder, recent, and if it is left to itſelf, it is rather troubleſome, than ſpeedily fatal: But, when inveterate, it is not to be cured without great Difficulty; and when the Cure is prepoſterouſly attempted, or a bad Regimen obſerv'd, it generally is accompany'd with a violent and formidable Train of Symptoms, ſuch as Obſtructions and Scirrhuſes of the Viſcera, Cachexies, Dropſies, Hectics; and, by a Tranſlation, convulſive Aſthmas, Madneſs, incurable Melancholy, and Polypuſes, which prove mortal: A memorable Inſtance of which laſt, we are furniſh'd with by *Zachias*, in *Lib.* 3. *Cap.* 15. If the hypochondriac Diſorder is ſupported by Suppreſſions of the Menſes, or Hæmorrhoids, the Misfortune is often totally remov'd by a ſeaſonable Reſtitution of theſe Diſorders, either by Nature or Art. But great Care is to be taken, leſt, when the Diſeaſe is long protracted, we ſhould take a ſymptomatic hæmorrhoidal Diſcharge, for one of the critical and ſalutary Kind; for, by the former, the Diſeaſe is far from being reliev'd, whereas the latter is generally highly beneficial and advantageous.

THE CURE.

The Cure of a recent hypochondriac Diſorder is eaſily and ſoon perform'd; but when the Diſeaſe is ſo deep-rooted, that the Circulation of the Humours thro' the whole Body is diſordered and irregular, and the Tone of the ſolid Parts almoſt totally deſtroy'd, theſe Cauſes of themſelves not only require laborious, continued, and long-protracted Meaſures for their Removal, but, alſo, the incredible Perverſeneſs of the Patients, renders the Cure more difficult; for, in conſequence of the ſlow Circulation of the thick Blood thro' the Brain, they are inclined to continual Dread and Diffidence; for which Reaſon, they are always afraid not only of the greateſt Danger, but alſo of Death itſelf. Beſides, being fickle, giddy, and unconſtant, they apply to many Phyſicians, and make Trial of various Medicines; by which means their State is render'd ſtill worſe. The Phyſician, therefore, who attempts a Cure of this Diſeaſe, ſhould firſt order the Perſon, labouring under it, to be conſtant and patient; and then to purſue the following Intentions of Cure:

Firſt, To evacuate the flatulent Matter, and to correct, and gradually, eliminate, the acrid, viſcid, and bilious Sordes of the Primæ Viæ, which ſupply the Diſorder with perpetual Nouriſhment.

Secondly,

Secondly, After allaying the Spaſms to reduce the inverted periſtaltic Motion of the Inteſtines to its natural State, and, if too languid, to corroborate it, that the Concoction of the Aliments may be duly carry'd on, and a rich and laudable Chyle, and other Humours generated.

Thirdly, To diſcuſs the ſtagnant Juices, render the Circulation of the Blood thro' the Abdomen, and all the other Parts of the Body, equal; and to purge the Humours from Acrimony, by facilitating the cutaneous and urinary Excretions. And,

Laſtly, To corroborate the whole nervous Syſtem.

The firſt of theſe Intentions is principally to be anſwered, during the hypochondriac Paroxyſms, or when the Symptoms are preternaturally exaſperated, which generally happens after violent Commotions of Mind, Errors in Regimen, or in the Winter or Autumn. In order, therefore, to derive the inverted Motion of the Inteſtines downwards, allay the Spaſms, expel the Flatulences, and eliminate the Sordes, no Remedy is more infallible and efficacious than Clyſters which may be prepar'd of emollient Herbs, a Decoction of Oats, of Chamomile-flowers, of the Tops of Yarrow, the Oils of ſweet Almonds, Dill, Chamomile and Linſeed; with an Addition of the carminative and diſcutient Species, the Seeds of Dill, Caraway, and eſpecially Cumin. The Cure is to be begun with an Injection of theſe Clyſters, and, as the Spaſms of the Inteſtines frequently prevent their due Effects, they are to be often repeated, eſpecially if the Fæces are indurated; in which Caſe 'tis alſo expedient to exhibit large Quantities of the Oil of ſweet Almonds, internally, or to order the Patient to drink liberally of Water-gruel. Nor is the internal Exhibition of demulcent and gently laxative Medicines to be neglected; the moſt efficacious of which are, Infuſions prepar'd of Manna, Rhubarb, and Cream of Tartar; with an Addition of Oil of Juniper. Thus *Rhodius*, in *Cent.* 2. *Obſ.* 2. informs us, that he knew the hypochondriac Diſorder ſucceſsfully remov'd by the frequent Exhibition of Rhubarb.

A ſpeedy and ſingular Relief is, alſo, afforded by the frequent Exhibition of a Dram, or more, of the neutral Salts obtained from the *Epſom*, *Sedlitz*, and *Caroline* Waters, if exhibited with ſome proper Abſorbent, Rhubarb, Orange-peel, and Nitre, and drank in a large Quantity of pure Water. Very happy Effects are, alſo, produc'd by Raiſins impregnated with Rhubarb, laxative Apples boil'd, or, if the Stomach can bear them, raw; and laxative Prunes, which have frequently render'd the Body ſoluble, when all other Purgatives have been tried in vain, as we are inform'd by *Thonerus*, in his *Obſervat.* Great Benefit is alſo obtain'd from mild balſamic Pills; ſuch as the Pilulæ Solænandri, the Pilulæ Cratonis, the Pilulæ Aloephanginæ, the Pilulæ Marocoſtinæ, the Pilulæ Tartareæ Schrœderi, or the Pilulæ Becherianæ, the Pilulæ Stahlianæ, or the balſamic Pills, interpoſing an aperitive Powder between each Doſe. Or, if there is a Load of acid Fæces in the Inteſtines, Crabs-eyes, or the Magneſia Alba, alone, generally render the Body ſoluble. In the Intervals between the Paroxyſms, the Body is, alſo, to be kept ſoluble, and the Generation of Sordes prevented, by an alternate Exhibition of theſe Medicines, every eighth or fourteenth Day, as the State of the Patient ſhall require.

After the Body is render'd ſoluble, the next Intention of Cure is, to correct and qualify the acid and bilious Sordes lodg'd in the Primæ Viæ, and eſpecially in the Duodenum. This Intention is moſt effectually anſwered by abſorbent, precipitating, antiſpaſmodic, and gently carminative Powders, which not only mitigate the Spaſms, but by corroborating the Inteſtines, powerfully expel the Flatulences. The Powders of this kind may be prepar'd of Crabs-eyes, Mother of Pearl, the Pulvis Marchionis, purified Nitre, prepar'd Amber, Cinnabar, vitriolated Tartar, the Arcanum Duplicatum, and a little Caſtor, and exhibited in antiſpaſmodic Waters, eſpecially that diſtil'd from Chamomile-flowers, and Ale prepar'd of Wheat. But theſe Powders will be far more efficacious, if about twenty Drops of the Anodyne mineral Liquor are exhibited with them. This Intention is, alſo, promoted by ſuch Infuſions, as by a Diaphoreſis carry off the Sordes lodg'd in the Maſs of Blood, when ſupt in Bed in the Morning. The moſt uſual Ingredients for compoſing theſe, are the Herbs Baum, Paul's Betony, Betony, Agrimony, Scordium, Carduus Benedictus, the Tops of Yarrow, the Flowers of Daiſy, and common Chamomile, Fennel-ſeed, and ſtellate Aniſe.

In order to corroborate the Stomach, and reſtore its digeſtive Power, we may call in to our Aſſiſtance balſamic, and gently carminative Eſſences. But we muſt take care that they are not too ſpirituous, and by that means capable of throwing the Humours into more violent Commotions; which Misfortune infallibly attends the Exhibition of Aqua-vitæ, and the ſtomachic Eſſences generally us'd for this Purpoſe. But we may more ſafely uſe the Eſſence of Orange-peel duly prepar'd, the Tincture of Tartar, the Spiritus Nitri Dulcis, or Elixirs prepar'd of balſamic Herbs or Roots, with ſome lixivial Menſtruum; ſuch as the Elixir Viſcerale Stomachicum, which I have from long Experience found to be highly beneficial in flatulent and hypochondriac Diſorders; but the Uſe of theſe muſt be perſiſted in for a conſiderable time. In hypochondriac Paroxyſms, no ſmall Advantage is reap'd from waſhing the Feet in Baths moderately warm, which invites the Humours to the external Parts, and relaxes the Spaſms of the lower Belly. Baths for this Purpoſe may be prepar'd of River-water alone, with Bran, and Chamomile-flowers. But theſe ought not to be too hot, but moderately warm; and the Feet are to be immers'd pretty deep in them.

By the due Uſe of theſe Meaſures, the Violence of the Paroxyſms will be either totally remov'd, or conſiderably abated. But, ſince they are very ſubject to return, we muſt, to prevent this Misfortune, purſue the third Intention of Cure, which is to remove the Cauſes, diſcuſs the Stagnations of the Humours, open the Obſtructions of the Viſcera, and render the Circulation of the Humours equable thro' all the Parts of the Body. This Intention is excellently anſwer'd by Veneſections in proper Parts. But theſe are rarely to be us'd in the ſuperior Parts of the Body, leſt by this means we ſhould more effectually invite the Humours to them, which are already too copiouſly forced upwards by the ſpaſmodic Strictures of the lower Belly. Veneſections, in the Feet, are therefore moſt proper and beneficial, and, more or leſs, is to be taken away, according to the Quantity of Humours contain'd in the Patient's Body. The moſt commodious Seaſons for Veneſection are the Spring and Autumn, about the Equinoxes, or, if there is a Neceſſity for it, about the Solſtices, at which times, Commotions of the Blood are more frequent than at others. Veneſection will prove the more effectual, if the Body is previouſly render'd ſoluble, and the Humours deriv'd to the inferior Parts, by bathing the Feet. Beſides, if there is a Diſpoſition to the hæmorrhoidal Diſcharge, and if a Suppreſſion of this Evacuation excites the Diſeaſe, every Month a few Leeches are to be cautiouſly apply'd to the Anus. In this Caſe, it is alſo expedient, ſucceſſively for ſome Days, to exhibit mild balſamic Pills, with a nitrous antiſpaſmodic Powder.

But, in order to remove the Obſtructions of the Viſcera, correct the acid and impure Humours, promote the Excretions by Stool, Urine, and Sweat, provoke the ſuppreſs'd Diſcharges, and render the Circulation of the Blood equal, thro' all the Parts of the Body, I know of no Medicine, whether of the dietetic or pharmaceutic Kind, which is more ſafe and effectual than the prudent Uſe of Mineral Waters, with which Nature has ſo bountifully ſupplied us. But theſe Waters muſt neither be drank too liberally, nor muſt the Uſe of them too long be perſiſted in; for, by this means, they rather weaken and deſtroy the Tone of the Stomach and Inteſtines. The Body is alſo to be prepared for them, by removing the Sordes of the Primæ Viæ, and diminiſhing the Quantity of the Humours. Mild Laxatives, and due Exerciſe, are alſo to be uſed along with them. But there is a Choice to be made, with reſpect to theſe Waters; ſince, for Women, thoſe of a highly lax, and ſpongious Habit, and ſuch as are violently afflicted with Spaſms, hot Waters, and eſpecially the *Caroline* Springs, are moſt proper; or, if they ſhould rather chuſe cold mineral Waters, theſe ought to be uſed warm; whereas, for ſuch as are ſanguine, phlegmatic, and of robuſt Conſtitutions, the cold Mineral Waters of *Schwalbat*, *Ægra*, and *Pyrmont*, are moſt beneficial. Thoſe, on the contrary, who are of a firmer Habit, more agile, and of choleric Conſtitutions, receive moſt Benefit from the *Selteran* Springs, thoſe of the *Spaw*, *Toenſtad*, and *Wildungen*.

Great Relief is, alſo, to be expected from a due Regimen, which, if neglected, will render all Methods of Cure fruitleſs and ineffectual. A pure and temperate Air is, therefore, to be choſen, and the Patient is carefully to avoid a cold, moiſt, and cloudy Atmoſphere; and, in a particular manner, to refrain from ſleeping in ſuch an Air. Nor ought an exceſſive Dread of the Injuries of the Weather to reſtrain the Patient entirely from the free Uſe of the Air; leſt, by this over-done Care, his Conſtitution ſhould become too ſenſible and delicate; and, by that means, ſubject to be injured upon the ſlighteſt and moſt inconſiderable Change of Weather. But, above all, every Degree of Cold, eſpecially that ariſing from Northern Blaſts, is to be carefully kept from the Stomach, Loins, and Feet; ſince, when this is freely admitted to theſe Parts, the Inflation of the Stomach, the Pain of the Back about the lumbar Region, and the Gripes of the Inteſtines, forthwith return. Proper Aliments are, alſo, to be moderately uſed; ſince, when the Primæ Viæ are full of acrid and bilious Sordes, the moſt nutritive Subſtances are moſt prejudicial, according to *Hippocrates*, in *Aph.* 10. *Sect.* 2. where he tells us, "that the more we nouriſh Perſons, whoſe Juices are impure, "the more Injury we do them." The Patient is, alſo, carefully to abſtain from all Acids, ſalted Aliments, flatulent Subſtances, Pot-herbs, ſweet Cakes, Apples, Preparations of Flour, hot and aromatic Subſtances; nor is he to indulge his Appetite too much, eſpecially at Supper; for Abſtinence is the moſt ſovereign Remedy for all chronical Diſeaſes, as the Antients juſtly obſerv'd, and as *Carolus Piſo*, in his Treatiſe *de Morbis a ſeroſa Colluvie*, beautifully ſhews.

A right Choice of Liquors is, alſo, of great Efficacy and Importance in the Cure of this Diſorder. All Kinds of Malt Liquors load the Stomach, and are offenſive to it; but hot and ſpirituous Liquors are found ſtill more prejudicial. However,

old and generous *Rhenish*, or *Burgundy* Wine, diluted with Water, and drank ſparingly, may be allow'd at Meals, in order to ſtrengthen the Stomach. At other times, ordinary Drink, or the *Selteran* Waters, mixed with Wine, are to be uſed alternately. For this Purpoſe Decoctions to be drank cold, prepared of the Roots of Vipers-graſs, Succory, Sarſaparilla, and China-root, the Shavings of Hartſhorn or Ivory, the Roots of Liquorice and Carduus Benedictus, to which may be added Lemon or Orange-peel, are very proper. In ſanguine and choleric Patients, pure Water alone, if the Stomach is capable of bearing it, is highly beneficial, ſince it excellently allays the Commotions of the Blood.

In alleviating hypochondriac Diſorders, nothing is ſo powerful and efficacious as due Exerciſe, which ought never to be ſeparated from the other Means of Cure; for, by this, the Circulation of the Blood and Humours, together with a ſalutary Tranſpiration, a due Secretion and Excretion, are promoted, the Humours render'd more fluid, their Paſſage thro' the Lungs remarkably facilitated, the Motion of the Stomach and Inteſtines, and, conſequently, the Digeſtion, excellently aſſiſted. But, tho' Exerciſe is of ſo great Importance, yet the various Kinds of it, whether Riding, Walking, or riding in a Coach, are only to be moderately uſed; and are moſt proper, when the Digeſtion is at an End, and the Stomach not loaded with Aliments. Beſides, the Tranſports of Paſſion, and an immoderate Load of Medicines, are carefully to be avoided, as Things of the moſt pernicious and deſtructive Tendency. This Regimen, if, at the ſame time, the Body is kept ſufficiently ſoluble, and Veneſection is duly repeated, is not only the moſt efficacious Method of curing, but, alſo, of preventing, hypochondriac Diſorders.

When the Symptoms of the hypochondriac Diſorder are thus mitigated, the Cauſes removed, and all the Excretions rendered free and uninterrupted, a Relapſe is to be prevented by corroborating the Primæ Viæ, and the whole nervous Syſtem. This Intention is excellently anſwered, not only by a long-continued Uſe of the balſamic viſceral Elixir, and the Regimen already recommended, but, alſo, by Chalybeates; which, by their gentle Aſtringency, reſtore a due Strength and Tone to the weakened Fibres. Theſe are moſt commodiouſly exhibited in a liquid Form, as in Tinctures; or the Filings or Crocus of Mars may be commodiouſly exhibited in Powders, prepared of the Fæcula of Arum-root, Crabs-eyes, Amber, Cinnabar, the Arcanum duplicatum, and the aperitive Crocus of Mars, with the Addition of a few Drops of the Oil of Saſſafras-wood. The Barks of Caſcarilla and China-root, mixed with theſe Powders, are no leſs conſiderably efficacious. Another Powder may be, alſo, prepared of the Roots of Burnet and Arum, the Bark of Caſcarilla and Orange-peel, Amber, Mace, Cumin-ſeed, and Salt of Wormwood; which, by their mild and balſamic Quality, ſtrengthen the Stomach and Inteſtines, aſſiſt the Digeſtion, and prevent the Generation of Crudities. Nor is ſmall Advantage to be expected from the external Uſe of Chalybeate Baths; ſuch as thoſe of *Lanchſtad*, *Freyenwald*, and *Toeplitz*, to be uſed after drinking the *Carroline* Waters; ſince theſe, in Conjunction, greatly ſtrengthen the Body.

Nor are external Remedies to be omitted; ſince they are of ſingular Efficacy in violent Inflations of the Inteſtines. Among theſe, I am, from long Experience, convinced of the ſingular Virtue of the Emplaſtrum Camphoratum Soporatum of *Barbette*, or the Emplaſtrum Antiſpleniticum of *Fabricius ab Aquapendente*, applied to the Hypochondria. No leſs happy Effects will be produced by the Balſamum Vitæ, mixed with two Parts of Hungary Water, and applied by way of Ointment, Morning and Evening, to the Hypochondria.

Practical Cautions.

No Diſeaſe is more troubleſome, either to the Patient or Phyſician, than hypochondriac Diſorders; and it often happens, that, thro' the Fault of both, the Cure is either unneceſſarily protracted, or totally fruſtrated; for the Patients are ſo delighted, not only with a Variety of Medicines, but alſo of Phyſicians, that 'tis frequently requiſite to remind them of the following Maxim of *Montanus*: "Neither conſult Phyſicians, nor uſe "Medicines, and you'll ſoon recover." On the contrary, few Phyſicians are ſufficiently acquainted with the true Genius and Nature of this perplexing Diſorder; for which Reaſon they boldly preſcribe almoſt every thing contained in the Shops, not without an irreparable Injury to the Patient. Few pharmaceutical Preparations are of any Service for the Alleviation of this Diſtemper; and ſtrong generous Medicines, or thoſe called Cordials, are abſolutely next to Poiſon.

Among the Number of theſe, are, firſt, Vomits, which the Patients take ſometimes of their own accord, and, perhaps, oftener by the Advice of their Phyſician; eſpecially if they are afflicted with a violent Uneaſineſs of the Præcordia, Inflations of the Stomach, Naufeas, Efforts to vomit, Eructations, and ſuch an Obſtruction and Conſtriction of the Hypochondria, that they ſeem to be compreſs'd, as it were, with a Rope, or preſſed with a Weight. Nor is it to be denied, that, in ſuch a Situation, the Symptoms are, in ſome meaſure, relieved by a gentle Emetic. But I would have them abſolutely abſtain from the more draſtic ſtimulating Subſtances, for the Relief they afford is not only ſhort in itſelf, but brings after it a Train of highly terrible Symptoms. We are not, however, entirely to diſcharge gentle Vomits of Ipecacuanha mixed with Crabs-eyes. Nor are we to dread thoſe Vomits, which, by ſpaſmodical Conſtrictions of the Stomach, frequently happen to hypochondriac Patients, when they firſt begin to drink the *Caroline* Waters; for, when the Drinking is perſiſted in for ſome time, and the Mucus evacuated from the Bottom of the Duodenum, they will ceaſe ſpontaneouſly, and the Operation of the Water ſucceed the better.

Beſides, as the Phyſician's principal Care ought to be to preſerve the Body ſoluble, ſo he muſt beware of increaſing the Diſorder, by the Uſe of draſtic Purgatives, Preparations of Scammony and Jalap; for theſe ſtimulate the Inteſtines to violent Spaſms, throw the Humours into preternatural Commotions, deſtroy the Tone of the Parts ſtill more, and leave behind them a more obſtinate Conſtipation. Nor are Patients of delicate and tender Conſtitutions capable of bearing large Doſes of neutral Salts; but reap far greater Advantage from lubricating Aliments, Clyſters, Preparations of Manna and Rhubarb. Nor are the Pilulæ Polychreſtæ Balſamicæ, which contain Aloes, proper to be uſed by every Patient, or too frequently by any; eſpecially where there is no natural Diſpoſition to the hæmorrhoidal Diſcharge; and where the Redundance of Humours is not previouſly leſſen'd; for they ſtimulate the Inteſtinum Rectum, excite fruitleſs Efforts, and render the Stagnation and Dryneſs greater than they were before. On the contrary, when the Diſeaſe is encourag'd by a Suppreſſion of the Menſes, or hæmorrhoidal Diſcharge, theſe Pills are of ſingular Advantage, if exhibited every Month for ſome Days ſucceſſively. Nor is it improper, if they ſhould excite a Commotion of the Humours, to mix a due Quantity of the precipitating nitrous Powder with them. In ſome Patients, whoſe Primæ Viæ are loaded with acid Crudities, the Body is frequently rendered ſufficiently ſoluble by Crabs-eyes, or prepar'd Shells alone, ſince, by uniting with the Acid of the Stomach, they form a neutral bitteriſh Salt, which, by its gentle Stimulus, excites the Inteſtines to a Diſcharge of the Fæces; at leaſt they produce far better Effects than even the *Magneſia*, which, when there is no Acidity to encounter, vellicates the Stomach and Inteſtines.

Some hypochondriac Patients have their Bodies rendered ſoluble, and their Flatulences increaſed, or even Efforts to vomit, a Naufea, and actual Vomitings, produced by Preparations of Manna. In this Caſe, they ought to be entirely abſtained from, and the Relief of the Patient is to be attempted by Preparations of Rhubarb and Clyſters. Nor are there a few Patients, eſpecially of the Female Sex, to whom Clyſters are highly troubleſome and uneaſy; in which Caſe, they are to be prepared with a large Quantity of Oil, and frequently repeated, exhibiting internally, at the ſame time, ſuch Medicines as ſeem beſt adapted to the particular Conſtitution of each Patient.

As in the Cure of hypochondriac Diſorders nothing is of greater Uſe than Veneſection, ſo nothing is more hurtful and pernicious, when adminiſtred unſeaſonably, or in an improper Place; for it is abſurd and ridiculous to uſe it too often, on account of the ſuppoſed Thickneſs of the Blood; ſince, by this means, thoſe, who are already too weak, by an exceſſive Loſs of Blood, are rendered ſtill weaker: On the contrary, when the Veſſels are turgid with Blood, or the uſual Evacuations of Blood totally ſuppreſſed, liberal Veneſection is not only expedient, but highly advantageous: Nor ought this Evacuation to be made from the Arm, except in certain Caſes. At the Time of Veneſection the Patient ought to be particularly careful to preſerve an eaſy State of Mind, to guard againſt Cold, and abſtain from groſs Aliments, leſt, by the cold Air, a ſalutary Perſpiration ſhould be check'd, or, by the groſs Aliments, Crudities generated in the Primæ Viæ.

Great Caution is alſo requiſite in the Application of Leeches; for where there is no Propenſity to the hæmorrhoidal Diſcharge, or where that Evacuation is of the ſymptomatic Kind, we ought to be ſo far from promoting it by Leeches, that we ought rather to make a Revulſion and Derivation of the Blood from theſe Parts: But when the hæmorrhoidal Diſcharge has been ſtopt, and again ſeeks for a Vent; when there are violent Pains in the Os Sacrum, and Inteſtinum Rectum; or when a griping hæmorrhoidal Colic afflicts the Patient, nothing is more ſalutary and beneficial than Leeches: But 'tis frequently neceſſary to premiſe an univerſal Evacuation of the Humours by Veneſection: It is alſo expedient to cheriſh the Parts about the Anus with Fomentations, and apply the beſt Leeches, at the very Time when Nature makes an Effort to promote the Eruption.

That Exerciſe may produce the more ſalutary and happy Effects, it is to be performed in a ſerene and mild Air, leſt the Injury the Patient ſuſtains from the external Cold, ſhould not be compenſated by the Advantages accruing from the Exerciſe. Nor is it to be violent, but moderate, and continued gradually, till a gentle Heat is raiſed on the Body. We muſt, alſo, be highly careful, that the Maſs of Humours be diminiſhed, and the Body ſufficiently ſoluble, leſt the Exerciſe ſhould throw the Blood

into too violent Commotions. No Species of Exercise, especially Riding, either on Horseback, or in a Coach, ought to be used immediately after eating, since, by the Succussions, the Flatulences are rendered more troublesome. The most commodious Time for Exercise is, in the Morning, after drinking a few Cups of some warm Infusion; or in the Afternoon, when the Digestion is finished.

With respect to Drink, nothing can be absolutely determined; but every one ought to be at due Pains to discover what Liquor best agrees with himself: Some are very well with drinking light and weak Ale; for which Reason, the Use of that Liquor is not to be denied them. Others reap a very considerable Advantage, either from cold Water alone, or from a Decoction of Water with Cinnamon, which may be safely allowed them. When the hypochondriac Disorder is complicated with a scorbutic Disposition of the Humours, after purging the Primæ Viæ, not only Whey, if the Stomach is capable of bearing it, is of considerable Service; but also Milk, mixed with the *Selteran* Mineral Waters, may be advantageously exhibited. With respect to cold Mineral Waters, we must observe, that those, who are afflicted with excessive Spasms, or labour under a violent Cardialgia, ought not to drink them cold, because Cold is highly prejudicial to the Nerves: 'Tis therefore more expedient for such Patients either to use hot Mineral Waters, or such as are cold, made warm. All acid Wines, such as *Rhenish* and *Moselle* Wine, increase the Acidity of the Stomach when recent; whereas a moderate Use of old *Rhenish* or good *Burgundian* Wines, diluted with Water, may be safely permitted.

As irregular and disorderly Workings of the Fancy almost always accompany this terrible Disorder, the Patient ought carefully to avoid every Opportunity of having his Mind ruffled and discomposed, because, unless the Passions are kept in due Subjection, the Attempts of the Physician, tho' otherwise proper, will prove entirely fruitless and ineffectual: Facetious Company is, also, to be kept, and the Mind diverted by all the innocent Amusements of Life. For this Reason Journeys to Baths are beneficial to hypochondriac Patients, in several respects; since, by this means, they have Exercise, Change of Air, agreeable Company, and the Advantages to be reaped from the Waters themselves. On the contrary, Lucubrations, and close Study, especially during, or soon after Meals, are to be forbid; because 'tis certain from Experience, that nothing has a more direct Tendency to destroy the Digestion of the Aliments, than long-continued Application and Fatigue of Mind. In order to prevent the Generations of Flatulences in those Literati, who, in consequence of their Functions, cannot absolutely abstain from Study, besides Exercise, I know of no more valuable and efficacious Medicine than the Elixir Balsamicum.

When the hypochondriac Disorder is complicated with such a Degree of Melancholy, as to threaten the Appearance of direct Rage and Fury, which frequently happens, nothing affords a more speedy or infallible Relief than moderately warm Baths of sweet Water: For, as the Foundation of these melancholic Disorders, bordering upon Madness, consists in the spasmodic Constriction of the exterior and inferior Parts of the Body; and more especially in a violent and impetuous Conveyance of the Humours to the Head; so nothing is of more Efficacy in relaxing the Spasms, and restoring the equal Circulation of the Blood than these Baths; with which may be joined the internal Use of cold Mineral Waters, together with Venesection in the Feet, and sometimes an Evacuation of Blood from the Nostrils.

Chalybeate Medicines are highly celebrated in the Cure of hypochondriac Disorders: But as these are highly beneficial, when properly exhibited, so nothing is more certainly prejudicial and destructive than the Use of them without any regard to Time, or other Circumstances of Importance. If the Spasms are violent, the Viscera obstructed, the Patient costive, the Humours redundant, and the Primæ Viæ loaded with Crudities, we are to abstain from an immoderate Use of them; because, in this Case, the Disorder easily degenerates into a Cachexy. But when the Spasms are remitted, and the Mass of Blood diminished, they are of singular Service, by rendering the Excretions more free; only they are to be prescribed with a sufficient Quantity of diluting Liquors, and a due Degree of Exercise. Those who have not an Opportunity of using Mineral Waters, may, in their stead, substitute Broths prepared of the aperient Roots, together with the Tinctura Martis Zwoelfferi, and impregnated, either with Juice of Apples, or Quinces. These Broths are frequently to be used in proper Doses. *F. Hoffman.* See MELANCHOLIA and MAGNESIA.

HYPOCHOREMA, HYPOCHORESIS, *ὑποχώρημα, ὑποχώρησις*, from *ὑποχωρέω*, to retire or recede, is properly spoken of Matters which pass off by Stool. *Galen, Com. in Aph.* By *Hypochorema*, *ὑποχώρημα*, however, 7 *Aph.* 68. 69. 82. are to be understood Things voided by Urine.

HYPOCHYMA, *Hypochysis, ὑπόχυμα, ὑπόχυσις*, from *ὑπὸ* and *χύω*, to pour, the same as CATARACTA. See AMAUROSIS.

HYPOCHYTOS, *ὑπόχυτος*. See DIACHYTOS.

HYPOCISTIS. Offic. C. B. I. B. Park. *Purpurea flore candicante & flore luteo.* T. Coral. *Orobanche quæ Hypocistis dicitur.* R. H. *Minor à Cisto nascens.* H. Ox. RAPE of CISTUS.

This is a Kind of *Orobanche* or *Rape of Cistus*, growing usually as *Clusius* says, under the *Cistus Hypocistidem ferens*: It is a low dry Plant, thick-set with small round Leaves. The Flowers grow on the Top of the Stalks, in Shape somewhat like the Flowers of Pomegranates of a pale Colour. The Seed-vessels are large, resembling those of Henbane, in which lie a great deal of small dusty Seed. The whole Plant, especially, when it first springs out of the Ground, is of a red, or greenish-red Colour.

Of this Plant is made the *Succus Hypocistidos*, which is of a hard, tough Consistence, and a black shining Colour on the Inside, not much unlike the *Spanish* Juice, or Liquorice, of a rough, styptic, and a little sourish Taste. It is very drying and binding, being useful for a Diarrhœa and Dysentery, the Hepatic Flux, the Excess of the Catamenia and Fluor Albus; and likewise against Vomiting and Spitting of Blood.

HYPOCLEPTICUM *Vitrum*, a Glass Funnel, contrived for separating Oil from Water. The Word is formed of *ὑπὸ*, under, and *κλέπτω*, to steal, because it steals, as it were, and conveys away the Water from the Oil. *Blancard.*

HYPOCOELON, *ὑπόκοιλον*, from *ὑπὸ*, under, and *κοῖλον*, (Cœlon) the Cavity above the upper Eye-lid, is the Cavity under the lower Eye-lid, answering to the *Cœlon* before-mentioned. *Ruffus Ephesius, Lib.* 1. *Cap.* 4.

HYPOCRANIUM, a kind of Abscess, or Suppuration, so called because seated under the Cranium, between that and the Dura Mater. *Castellus.*

HYPODERIS, *ὑποδορὶς*, in *Ruffus Ephesius*, is the Extremity of the fore Part of the Neck.

HYPODERMIS, the same as EPIDERIS, or the CLITORIS. *Ruffus Ephes.*

HYPODESIS, *ὑπόδεσις*, from *ὑπὸ*, under, and *δέω*, to bind, *Hippocrates, de Offic. Medici*, is the Juncture of the two Fillets, which he calls *Hypodesmides*, *ὑποδεσμίδες*, and directs to be applied in Fractures, before the Application of the Compresses. *Galen, Com.* 2. *in Lib. de Off. Med. Tit.* 2.

HYPODESMIS, *ὑποδεσμὶς*. See the preceding Word, and the Article EPIDESMOS.

HYPOGASTRICA *Sectio*, from *ὑπὸ*, under, and *γαστὴρ*, the Belly, in Lithotomy, is what they call The high Operation.

HYPOGASTRION, *ὑποδάσεων*. See ABDOMEN.

HYPOGLOSSIS, HYPOGLOSSIUM, *ὑποδλωσὶς, ὑποδλώσιον, ὑποδλωσσὶς*, from *ὑπὸ*, under, and *γλῶσσα*, the Tongue, in a physiological Sense, is the inferior Part of the Tongue, adhering to the Jaw, and the Seat of the Disease called *Rana*; whence that Disorder is called by *Aetius, Tetrab.* 2. *Serm.* 4. *Cap.* 39. *ὑποδλωσίου βάτραχος*, the *Rana*, or Frog under the Tongue. *Hypoglossis, ὑποδλωσὶς*, in a pathological Sense, is a Tubercle under the Tongue, *Hippocrates, Lib.* 2. *de Morb. Hypoglottides, ὑποδλωττίδες*, are a kind of *Bechic*, or medicinal Preparations, for Disorders of the Aspera Arteria, to be held under the Tongue, till they are insensibly dissolved. Several Sorts of these are described by *Galen, de C. M. S. L. Lib.* 7.

HYPOGLOSSUM. See BISLINGUA.

HYPOGLOTTIDES *Pilulæ*. Pills for a Cough, to be held under the Tongue. See HYPOGLOSSIS.

HYPOGLUTIS, *ὑποδλουτὶς*, from *ὑπὸ*, under, and *γλουτὸς*, the Nates, is the fleshy Part under the Nates, towards the Thigh. *Gorræus.* It is otherwise expounded, the Flexure of the *Coxa*, under the Nates.

HYPOMIA, *ὑπωμία*, from *ὑπὸ*, under, and *ὦμος*, the Shoulder, in *Galen's Exegesis*, is expounded *τὸ ὑποκείμενον ἢ τοῦ τῇ ὑπωμίδι, ἢ αὐτῷ τῷ ὤμῳ*, "The Part subjacent to the upper "Part of the Shoulder, or to the Shoulder itself."

HYPONOMOS, *ὑπονόμος*, from *ὑπὸ*, under, and *νομὴ*, a phagedenic Ulcer, is a deep and sinuous phagedenic Ulcer.

HYPONOS, HYPONISCOS, *ὕπονος, ὑπόνισκος*, from *ὑπὸ*, under, and *ὄνος*, *Onos*, (a Name, in the antient Surgery, for the versatile Axes of a Machine contrived for the Reduction of Fractures and Luxations, *Galen, Com. in Lib. de Artic.*) seems to be an Instrument for managing the *Onos*, or turning it a different Way from what was done by the *Mochlos*, or Lever. *Hippocrates, Mochlicus*; where *ὑπόσονος* (*Hyposonos*) is corruptly read for *ὕπονος*. *Foesius.*

HYPOPEDIUM. A Cataplasm for the Sole of the Foot.

HYPOPHASIA, from *ὑποφαίνομαι*, to appear a little.

A sort of Winking, when the Eye-lids are drawn pretty close together, so that but very little of the Eye appears, that but a small Number of the Rays of Light may be admitted at once.

HYPOPHASIS. Of the same Derivation as *Hypophasia*.

This imports a Symptom very common in Diseases, and is of very bad Presage. It is, when the Eyes are almost closed, during Sleep; but, in such a manner, that part of the White of the Eyes appears; and a slight Motion of the Eye is perceiv'd. *Hippocrates.*

HYPOPHORA, *ὑποφορὰ*, from *ὑποφέρομαι*, to be carried or convey'd underneath.

A deep fistulous Ulcer.

HYPO-

HYPOPHTHALMION, ὑποφθάλμιον, from ὑπὸ, under, and ὀφθαλμὸς, the Eye.

The Part immediately under the Eye, which is ſubject to ſwell in a Cachexy or Dropſy. It ſometimes imports the ſame as HYPOPION.

HYPOPHYLLOCARPODENDRON.

The Name of a Plant in *Boerhaave*, of which he mentions two Species; which are,

1. Hypophyllocarpodendron; foliis lanuginoſis; in apice trifido, rubro, quaſi floreſcens.

2. Hypophyllocarpodendron; foliis inferioribus apice trifido, rubro, ſuperioribus penitus rubris, glabris.

There are no medicinal Virtues attributed to either of theſe Plants at preſent, that I know of.

HYPOPHYLLOSPERMOUS, of ὑπὸ, under, φύλλον, a Leaf, and σπέρμα, Seed, are ſuch Plants as bear their Seeds on the Backſides of their Leaves. *Mil. Dict. Vol.* 1.

HYPOPIA, ὑπώπια, imports Sugillations in the Parts immediately under the Eyes.

HYPOPLEURIOS, ὑποπλεύριον. A Name for the PLEURA.

HYPOPSATHYROS, ὑποψαθυρὸς, from ὑπὸ, importing Diminution, and ψαθυρὸς, friable. Somewhat friable. It is applied to the Excrements of the Belly, in *Hippocrates's Prorrhetics*.

HYPOPYON, ὑπόπυον, from ὑπὸ, under, and πύον, Pus, or Matter.

We frequently meet with a Collection of purulent Matter, immediately under the Cornea, near the aqueous Humour. This Diſorder is term'd *Hypopyon*, or *Pyoſis*: It proceeds from an Extravaſation of Blood, or Tranſlation of Pus, after a violent Inflammation, the Small Pox, couching a Cataract; or from any external Injuries of the Eye, as a Blow, Fall, Contuſion, or Burn. It is attended, in the Beginning, with acute Pains, both of the Head and Eye; and, according to the Degree of the Injury, is follow'd by a Diminution of Sight, Blindneſs, or Death itſelf.

St. Yves ſays, that Abſceſſes which affect the tranſparent Part of the Cornea, begin, ſometimes, with a little white Spot, which appears on the firſt Pellicle of that Membrane; this Symptom is ſucceeded by an external Elevation of the Part: They are eaſily cured, by ſlightly pricking them with a Lancet, without piercing the other Pellicles. But if the Abſceſs lies deeper, and in the Middle of the Cornea, and overſpreads almoſt the whole internal Part of that Membrane, it then becomes what is called an *Hypopyon*; but, if this Abſceſs be not ſo large, and it breaks, ſpontaneouſly, on the Inſide of the Eye, ſo that the Pus falls into the anterior Chamber, between the Iris and the tranſparent Part of the Cornea, and is there collected in a Speck, ſhaped like an Half-moon, reſembling that which appears at the Bottom of our Nails, it is then called *Onyx*.

Sometimes the tranſparent Part of the Cornea is free, and the Abſceſs lying between the *Conjunctiva* and *Sclerotica*, or in the Subſtance of the latter, the Pus breaks into the anterior Chamber, between the *Iris* and the tranſparent Part of the Cornea: In the firſt Caſe, the Preſſure of the Eye-lids may cauſe it; in the ſecond, it may proceed from the Preſſure of the *Aponeuroſes* of the Muſcles of the Globe.

The principal Methods of Cure are three: The firſt, and mildeſt, is the Uſe of reſolvent Medicines; ſuch as a frequent Application of a Decoction of Sage, Eyebright, Hyſſop, and Fennel-ſeeds, in Wine; or of little Bags, filled with thoſe Ingredients, and boiled in Wine: To theſe may be added, Bleeding and Purging; for, by theſe, unleſs the Blood or Pus is in a very great Quantity, the Eye may be reſtored to its former Vigour, as I am aſſured from long Experience. When theſe Remedies, therefore, appear to have any Effect, they ſhould be continued, till the Blood or Matter is diſperſed; but when the Pains, and other Symptoms, are increaſed by them, an Operation is abſolutely neceſſary; for, otherwiſe, in all Probability, the contain'd Matter will deſtroy the internal Parts of the Eye, or corrode the Cornea, and, after the moſt excruciating Pains, bring on an incurable Blindneſs.

But, before we enter upon the Operation, it will not be amiſs to deſcribe the Method of *Juſtus*, a celebrated Oculiſt in *Galen's* Time: He placed the Patient on a Seat oppoſite to himſelf, and, taking hold of his Head, with both Hands, ſhook it very aſſiduouſly about, till the Matter diſappeared. During this Agitation, it is very remarkable, what *Galen* teſtifies, that the Spectators could diſcern the Pus gradually ſubſiding to the Bottom of the Eye. Some, indeed, reject this as uſeleſs and ridiculous; but I muſt diſſent from them; and am confirm'd in my Opinion, not only by the Authority of *Galen*, but my own Experience: I had a Patient under my Care for an *Hypopyon*, who was obliged to take a Journey in a Chariot; upon his Return, the next Day, I found the purulent Matter diſperſed by the Concuſſion, and it was undoubtedly thrown down behind the Uvea. I ſhould, therefore, adviſe a Trial of this Practice, before any Inſtrument is uſed: But, before the Concuſſion, the Head, or whole Body, ſhould be diſpoſed in a ſupine Poſture, and the Eye preſſed gently with the Fingers, to looſen the Matter: When the Greatneſs and Obſtinacy of the Diſorder, or the Quantity of Pus, renders this Agitation ineffectual, recourſe muſt be had to the Operation, which *Galen*, *Aetius*, and other Antients, have deſcribed and recommended, tho' the Moderns have ſo far neglected it, that we ſhould ſcarce have heard of it at preſent, had not *Riverius*, *Meekren*, *Nuck*, and *Bidlow*, revived it, in the laſt Century.

As for the Operation, the Patient muſt be ſeated in a very light Room, directly againſt the Light, as in the Couching of a Cataract, his Hands and Head being held tight by Aſſiſtants. The Surgeon himſelf depreſſes the lower Eye-lid, while an Aſſiſtant elevates the upper; the Operator then takes a Lancet, and makes an Inciſion through the Cornea, below the Pupil, and about the Space of a Line from the White of the Eye, large enough to diſcharge the Matter, and aqueous Humour; all this with the utmoſt Caution, leſt he ſhould wound the *Uvea* beyond the Pus. If the Humour does not diſcharge itſelf ſufficiently, the Eye muſt be gently preſſed by the Fingers. Having thus diſcharged the corrupted Humour, a Compreſs, moiſten'd with a Collyrium of Roſe or Plantain-water, mixed with the White of an Egg, or with the Mucilage of Quince-ſeeds, either with or without Camphire, is to be applied, every third or fourth Hour, to the Eye. For this will both heal the Wound in the Cornea, and reſtore the aqueous Humour, with the Sight, if there is no very conſiderable internal Injury: For tho' there does remain a ſmall *Cicatrix* in the *Cornea*, yet, as it is below the Pupil, it will be little or no Detriment to the Sight. In the mean time, that the Operation may be perform'd with Safety, the Lancet ſhould be rolled in Lint, or a Piece of Plaiſter, ſo that not above a Straw's-breadth of its Point may be left uncover'd, that it may not penetrate too deep into the Eye. *Meekren*, for this Reaſon, invented a peculiar Inſtrument, publiſh'd in the tenth Chapter of his chirurgical Operations, and repreſented in our *Tab.* XXXIX. *Fig.* 10.

Sometimes the Matter is too thick to be diſcharg'd through this ſmall Aperture of the Cornea; then it will be proper to uſe the Needle, (*Tab.* XXXIX. *Fig.* 12.) which is, alſo, employ'd for making Setons: For, beſides that the *Uvea* is not ſo eaſily wounded by this curve-pointed Inſtrument, the triangular Figure will make a larger Inciſion, and, of conſequence, the inſpiſſated Matter will be more readily diſcharged; but this muſt be involved in the ſame manner as we directed the Lancet ſhould. *Platnerus* has delineated a peculiar Inſtrument for this Uſe, (ſee *Tab.* XXXIX. *Fig.* 13.) with almoſt the ſame triangular Point; and aſcribes the Invention of it to *Woolhouſe*. If the inherent Matter is too tenacious, *St. Yves* adviſes to introduce a ſmall Probe, or inject ſome cold Water with a Syringe, and to continue this; or, if the Diſorder returns in two or three Days, to repeat it, till the whole Pus is diſſipated; after which, the Wound may be healed. If there is an Inflammation, the Patient ſhould loſe ſome Blood, be bliſter'd, ſcarified, and diſcutient Fomentations, with other proper Medicines, ſhould be applied to the Part affected, as the Circumſtances require. *Heiſt. Chirurg.*

HYPORINION, ὑποῤῥίνιον. A Name for the Parts of the upper Lip, immediately below the Noſtrils.

HYPORISMA. The ſame as EMBORISMA.

HYPOSARCA, and HYPOSARCIDIOS, import an *Anaſarca*.

HYPOSPADIÆUS. One whoſe Urethra is terminated underneath the Glans.

It implies, ſtrictly, being almoſt an Eunuch.

HYPOSPATHISMUS, ὑποσπαθισμὸς.

This Operation, in Surgery, takes its Name from the Inſtrument with which it is perform'd. The *Hypoſpathiſmus* is of Uſe in copious Defluxions of pituitous Humours upon the Eyes, attended with a Redneſs of the Face, and a Senſation, as it were, of Worms or Ants crawling about the Forehead. In this Caſe, we firſt ſhave the Head, near the Forehead; then, ordering the Patient to move his lower Jaw, we avoid the temporal Muſcles, and make three ſtrait and ſimilar Inciſions in the Forehead, each two Digits in Length, as deep as the Bone, and three Digits diſtant from one another: After the Inciſions are made, we are, with the Inſtrument Spatula, to begin at the Inciſion next to the Left Temple, and raiſe all the Parts, together with the Pericranium, lying between it and the middle Inciſion; then paſſing the Inſtrument forward, in the ſame manner, from the middle Inciſion to that on the Right Temple, we are to paſs a ſharp Knife, whoſe Back is directed to the Bone, and its Edge to the Skin, from the firſt to the middle Inciſion, and thence to that of the Right Temple, cutting, as we paſs along, all the Veſſels which are diſtributed from the Head to the Eyes, taking care, at the ſame time, not to paſs the Knife entirely through the Skin. Then, after a moderate Evacuation of Blood is made, and the grumous Part expreſſed, a Pledget is to be put in each Inciſion, and a Dreſſing of Lint, ſoak'd in Water, applied, and ſecured by proper Bandage. Next Day, by reaſon of the Inflammation, we are to moiſten the Wounds, and temporal Muſcles, with a Mixture of Wine and Oil: And, on the third Day, removing the Dreſſings, we are liberally to anoint the affected Parts with the ſame, and continue to perform the reſt of the Cure, by the Uſe of Pledgets dipt in a Solution of Baſilicon, with Oil of Roſes. *Paul Æginet. Lib.* 6. *Cap.* 6.

HYPOSPHAGMA, ὑπόσφαγμα. The ſame as APOSPHAGMA. It, alſo, imports Sugillation, or Inflammation of the Tunica adnata of the Eye.

HYPOSTASIS, ὑπόστασις, from ὑφίστημι, to ſubſide. The Sediment in Urine. See URINA.

HYPOSTATHME, ὑποστάθμη, from ὑπὸ, under, and στάθμὸς, a Station. The thick Sediment which ſubſides in any Liquors, as the Amurca in Oil, or the Fæces in Wine. It is, ſometimes, us'd in the ſame Senſe as HYPOSTASIS.

HYPOSTEMA, ὑπόστημα. The ſame as HYPOSTASIS.

HYPOSTROPHE, ὑποστροφὴ, imports either a Patient's Turning himſelf, or a Relapſe. It is deriv'd from ὑποστρέφω, to deflect, turn aſide, or to return.

HYPOTHENAR. A Name for the *Abductor minimi Digiti Manus*. See ABDUCTOR. It, alſo, imports that Part of the Hand which is oppoſite to the Palm.

HYPOTHETON, ὑπόθετον, from ὑποτίθημι, to put under. A Suppoſitory.

HYPOTRIMMA, ὑπότριμμα. A ſort of Aliment mention'd by *Hippocrates*, in his ſecond Book *de Diæta*. According to *Heſychius*, it is made of Dates, Honey, Cumin, and other Ingredients, bruis'd together.

HYPOTROPE, ὑπόστροφὴ, from ὑπόστρέφω, the ſame as ὑποστρέφω, to return. A Relapſe.

HYPOXYLON. A Name for a Species of Agaric, which *Boerhaave* calls *Agaricus; digitatus; niger*.

HYPOZOMA, ὑπόζωμα, from ὑποζώννυμι, to ſurround. A Name for the Diaphragm.

HYPSILOGLOSSUS. The Name of a Muſcle of the Tongue. The ſame as CERETOGLOSSUS.

HYPSILOIDES. A Name for the Os Hyoides; ſo call'd from its Reſemblance to the *Greek Yſilon*.

HYPTIASMOS, ὑπτιασμὸς, from ὑπτιάζω, of ὕπτιος, ſupine. It imports Reſupination, or a ſupine Decubiture; or a Nauſea and Sickneſs at the Stomach, with frequent Inclinations to vomit.

HYPULUS, from ὑπὸ, *ſub*, under, and ὐλὴ, a Cicatrix. An Ulcer which lies conceal'd under the Cicatrix.

HYSMA, ὕσμα. Rain. *Hippocrates*.

HYSSOPIFOLIA MAJOR. A Name for the *Salicaria*; *Hyſſopi folio, latiore*.

HYSSOPIFOLIA MINOR. A Name for the *Salicaria*; *Hyſſopi folio, anguſtiore*.

HYSSOPITES. An Epithet for Wine impregnated with Hyſſop. *Dioſcorides*, *Lib.* 5. *Cap.* 50. recommends it againſt Diſorders of the Breaſt, Pleura, and Lungs, old Coughs, and Aſthmas. He adds, that it is diuretic, and good againſt Gripes, and periodical Rigors; and that it provokes the Menſes.

HYSSOPUS.

The Characters are;

The Leaves are oblong and narrow; the Galea is erect, roundiſh, and bifid; the Beard trifid, the Middle Segment being hollow, like a Spoon, bicuſpidated, or double-pointed, and, as it were, winged. The Flowers are cloſely ſet in Whorles, which, at firſt, are placed at a good Diſtance from one another, but are afterwards collected into a Spike, and take up only one Part of the Stalk.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Hyſſopus; Officinarum; cœrulea, ſeu ſpicata. *C. B. P.* 217. *Tourn. Inſt.* 200. *Boerh. Ind. A.* 160. *Hyſſopus vulgaris.* Park. Theat. 1. *Hyſſopus vulgaris ſpicatus anguſtifolius.* J. B. 3. 274. Raii Hiſt. 1. 579. *Hyſſopus Arabum.* Ger. 464. Emac. 576. HYSSOP.

Our common Hyſſop grows to be almoſt a Foot high, or more, with many Stalks, which are ſquare at firſt, but grow to be round, as they come to flower. The Leaves are long, narrow, and ſharp-pointed, ſet two at a Joint. The Flowers grow in long Spikes, made of thin Whorles, of pretty large thin Flowers, diſpoſed all on one Side the Stalk. They have a Galea cut in two, and the Labella divided into four Segments. The Seed is ſmall, and black, growing four together in the Calyx. The Root is thick, woody, and much divided. The whole Plant is of a pretty ſtrong aromatic Smell; it is ſown in Gardens, and flowers in *July*. The whole Plant is us'd.

Hyſſop is healing, opening, and attenuating; good to cleanſe the Lungs of tartarous Humours, and helpful againſt Coughs, Aſthmas, Difficulty of Breathing, and cold Diſtempers of the Lungs; it is alſo reckon'd a Cephalic, and good for Diſeaſes of the Head and Nerves. The bruis'd Herb, applied outwardly, is famous for taking away black and blue Marks out of the Skin.

The only Officinal Preparation of Hyſſop is the Simple Water.

Of how great Efficacy Hyſſop is, in Sugillations of the Eyes, we learn by an Inſtance from *Riolanus* the elder: I found by Experience, ſays that Phyſician, the Truth of what *Archigenes* affirms, in *Galen*, which is, that if the Tops of Hyſſop be tied up in a Cloth, and boil'd in Water, and the Cloth afterwards applied warm to the livid Eye, the Blood will be attracted by the Hyſſop to ſo manifeſt a Degree, as to ſtain the Linen. Upon this Authority I have, ſeveral times, preſcrib'd a Decoction of Hyſſop againſt Sugillations, even of the Eyes; only, inſtead of Water, I ſometimes order'd the Bag to be boil'd in Wine; and, directing the Application of it, ſomewhat warm, to the Eyelids, when the Patient went to bed, his Eyes being ſhut, the Lividneſs was remov'd as well as I could wiſh. *Simon Paulli.*

Mr. *Boyle* tells us, that a noted Gentleman of his Acquaintance, who had his Thigh terribly bruis'd by a Kick from an Horſe, was, by the ſole Application of a ſort of Cataplaſm prepar'd of the Leaves of Hyſſop cut very ſmall, and mix'd with freſh or unſalted Butter, in a few Hours freed from his Pain, and the very Skin clear'd from all livid or other Marks of the Blow. *Raii Hiſt. Plant.*

Hyſſop has a very pleaſant Smell, and a penetrating Taſte, leaving the grateful Reliſh of its aromatic Humour in the Mouth. Its heating, diſſolvent, ſtimulating, and deterſive Virtues appear from its aromatic and balſamic Smell. On theſe Accounts it muſt be very proper for freeing the Lungs from groſs, viſcid, purulent Phlegm; and an Infuſion of the Leaves in Water, ſweeten'd afterwards with Honey, is accounted one of the beſt Pectorals; but, if there be a conſiderable Inflammation, this Remedy is improper. Hyſſop, in Surgery, has its Uſe in heating and ripening, and in Caſes where an Expulſion by Sweat and Urine is required, as in the Gout, Leucophlegmatia, Scurvy, Aſthma, Dropſy, Pleuriſy, Cough, and Diſeaſes owing to Viſcidity. Preparations of it are an Infuſion, Decoction, the recent Juice, the diſtil'd Water, and the Conſerve. A Cataplaſm of the recent Leaves cleanſes foul Ulcers. The Vapour, receiv'd into the Ears, takes off their Ringing. Some prefer it to Wormwood, for corroborating the Stomach.

The Word *Hyſſop* comes from the *Hebrew Ezeb*, ſignifying an holy Herb, or an Herb appointed for cleanſing holy Places; whence the Pſalmiſt prays, *Purge me with Hyſſop*. But the Hyſſop of the Antients is unknown: Many take it to be Wall-rue; we are certain, at leaſt, that it was a Wall-plant; for *Solomon*, the Prince of Botaniſts, treated of Plants from the Cedar even to Hyſſop, a ſmall Plant growing on the Wall. Now, in Wall-rue there is a detergent Quality, as well as in Hyſſop, whence it is accounted ſerviceable in cutaneous Diſeaſes, eſpecially the Itch: But, whether this, or any other Herb, be the Hyſſop of the Antients, the Name is at preſent appropriated to the Plant above deſcrib'd. *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave*.

2. Hyſſopus; latifolia. *C. B. Prodr.* 107.

3. Hyſſopus; vulgaris; alba. *C. B. P.* 218. *M. H.* 3. 361.

4. Hyſſopus; rubro flore. *C. B. P.* 217. *M. H.* 3. 361.

5. Hyſſopum; montanum; Macedonicum; Valerandi Dourez. *J. B.* 3. 276.

6. Hyſſopus; anguſtifolia; montana; aſpera. *C. B. P.* 218.

7. Hyſſopus; humilior; Myrtifolia. *H. R. Par. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 160.

Miller enumerates thirteen Species of this Plant.

HYSSOPUS AUSTRIACA. A Name for the *Ruyſchiana*; *flore cæruleo, magno*.

HYSSOPUS CAPITATA. A Name for the *Thymus*; *capitatus*; *qui Dioſcoridis*.

HYSTERA, ὑστέρα. The UTERUS; which ſee.

HYSTERIALGES, ὑστεραλγὴς. An Epithet for any thing which excites Pains of the Uterus. It is, by *Hippocrates*, applied particularly to Vinegar: From ὑστέρα, the Uterus, and ἄλγος, Pain.

HYSTERA-PETRA. The Name of a Stone, otherwiſe called *Hyſterolithos*, found frequently in *Italy* and *Germany*. It is of the Shape of the Uterus; and hence ſome ſuperſtitious Virtues are attributed to it; as, that it cures Vapours, and provokes the Menſes, if tied about the Thigh.

HYSTERICA, ὑστερικὰ (τὰ), from ὑστέρα, the Uterus, or Womb, are Affections or Diſeaſes of the Uterus, 5 *Aph.* 35. where *Galen* explains the Word ὑστερικὴν by ὑστερικὴν πνίγα ἢ ἄπνοιαν, "hyſteric Strangulation, or Suffocation." Τὰ ὑστερικὰ ἐν κοιλίῃσι σκληρώματα, are Hardneſſes of the Uterus in the Belly, perceivable by the Touch, and a Senſe of Weight on the Part. *Coac.* Τὰ ὑστερικὰ (*Hyſtericæ*) are Women labouring under hyſteric Diſorders: Thus, 1 *Prorrhet.* 119. αἱ ἐν ὑστερικαῖς ἀπύροις ἄκαιρον ἀφροδίσια, "Women eaſily ſeiz'd with hyſteric Diſorders, "without a Fever, are ſubject to Convulſions." And this is repeated *Coac.* 349. and 554.

That Diſtemper, or rather Series of Diſtempers, which the Antients termed hyſteric Affections, may be very properly referred to the ſpaſmodico-convulſive Paſſions of the nervous Kind, as it frequently brings the whole nervous Syſtem into Diſorder, there being ſcarcely a Fibre, in the human Machine, exempt from its Influence. We define it, therefore, a ſpaſmodico-convulſive Affection of the nervous Kind, proceeding from a Retention or Corruption of Lymph, or Blood, in the uterine Veſſels, which, by means of the Nerves of the Os Sacrum, thoſe of the Loins, and the ſpinal Marrow, influences all the nervous Parts of the Body.

The Generality of Moderns make no Diſtinction between this and the hypochondriac Diſorder, but in the Subject, calling it in Women the hyſterical Affection, and in Men the hypochondriacal;

chondriacal; but as there certainly is a much wider Difference, it cannot be amiſs to give an exact Account of the Diſtemper. For this Purpoſe, if we conſult *Hippocrates*, *Aretæus*, *Fernelius*, *Duretus*, *Montanus*, *Ballonius*, *Hollerius*, *Mercurialis*, and *Johannes Heurnius*, we ſhall find them unanimouſly agreed, that the true, eſſential Symptoms are, a Strangulation about the Fauces, a ſuffocating Interception of Reſpiration, Fainting, a Privation of Speech, and Drowſineſs; and that, before the Paroxyſm, the Patient perceives an Aſcent of a kind of Globe; whence many Women idly imagine, that the Womb aſcends towards the Throat.

Theſe are the principal Symptoms of hyſterical Affections; but before the Paroxyſm, and afterwards, many others are obſervable, which ſpare no Part of the Body: For, at the Approach of the Fit, the Patient is ſeized with a violent Pain in the Forehead, Temples, and Eyes, together with an Effuſion of Tears, Dimneſs of Sight, an oppreſſive Pain, Terror of the Mind and Senſes, Anxiety, and Uneaſineſs. Thoſe who are ſeiz'd with the Diſorder, are generally coſtive, and have frequent Inclinations to diſcharge their Urine, which is limpid as Water; mean time they are tormented with Reſtleſſneſs, Anxiety, an almoſt ſuppreſs'd Reſpiration, and univerſal Languor. To theſe ſucceed a conſiderable Pain in the Loins, Cold, and Shivering: The Belly is indurated and inflated, the Navel ſhrinks very deep inwards, and then is perceived the Aſcent of a ſort of Globe from the Abdomen to the Hypochondria, and Diaphragm. Immediately after this begins a Palpitation of the Heart, with a Tremor; the Pulſe is unequal and hard, and ſometimes intermits; the Extremities grow cold, the Fauces ſeem contracted, and have a Senſation, as if they were compreſſed with a Cord; the Face is pale, Reſpiration is difficult, the Speech fails, and the Pulſation of the Arteries is ſcarcely perceptible. The Stricture of the Belly is ſo great, that no Wind can be diſcharged, nor a Clyſter be adminiſtered, on account of the Reſiſtance it meets with; and the convulſive Agitations of the Head and Limbs are, in ſome, ſo exceſſive, as to be eaſily perceivable, ſometimes accompanied with Clenchings of the Hands, and ſometimes without. Others lie buried without Senſe or Motion, in a profound Sleep. The Faces and Necks of ſome are very red, and inflamed, and their Pulſe ſtrong; others break out into immoderate Laughter, and upon the Recovery of their Speech talk incoherently.

The Paroxyſm, at certain Periods, will often remit; and then the Pulſe, which was before weak, languid, and ſunk, becomes higher, ſofter, and ſtronger, the Extremities recover their uſual Heat, the Patient breaks Wind upwards, the Inteſtines rumble, and the Patient awaking, as it were, from a profound Sleep, recovers her Speech, Senſe and Motion, but ſtill complains of a heavy Pain in the Head, and a Languor and Heavineſs of the Thighs, Legs, and whole Body. It is very ſurpriſing, that, from ſo inſtantaneous a Change, the Perſon, who was juſt before at Death's Door, ſhould now appear to enjoy a moſt perfect State of Health. Some, from the long Continuance of this Diſorder, have been miſtaken for dead, and buried alive, which Accident might be avoided, if we would remember, that they ſeldom die without an Attack of an Epilepſy or Apoplexy,

Frederic Hoffman, we ſee, thinks the hyſteric and hypochondriac Diſeaſes different from each other, but our great Countryman, *Sydenham*, believes them the ſame. As the laſt quoted Author's Deſcription of hyſteric Complaints are extremely accurate and exact, it muſt not be omitted.

Of all the chronical Diſeaſes, ſays he, this ſeems to occur moſt frequently; and as Fevers, with their Attendants, upon being compared with the whole Number of chronical Diſtempers, appear to conſtitute two thirds of the Diſeaſes of Mankind; ſo hyſteric Diſorders, or ſuch at leaſt as bear that Name, amount to half the remaining third Part, that is, to one half of chronical Diſtempers: For very few of the Female Sex are entirely free from every Species of this Diſorder, if thoſe are excepted, who are inured to Labour; and not a ſmall Number of the Men, who are accuſtomed to a ſtudious and ſedentary Life, are ſubject to the ſame Diſtemper. And though the Antients imputed the Symptoms, produced by hyſteric Diſeaſes, to ſome Diſorder of the Womb, yet, if we compare hypochondriac Complaints, which, we think, proceed from certain Obſtructions of the Spleen, or other Viſcera, with the Symptoms which appear in hyſteric Women, they will be found very nearly to reſemble one another. But it muſt be allowed, that Women are much more ſubject to this Diſeaſe than Men; not that the Womb is more indiſpoſed than any other Part of the Body, but for other Cauſes.

But the Frequency of this Diſeaſe is not more remarkable than the Variety of Forms, by which it diſcovers itſelf, as it aſſumes the Appearance of almoſt every Diſtemper with which miſerable Mortals are afflicted. For it always produces Symptoms peculiar to whatever Part of the Body it ſeizes; and, unleſs the Phyſician be a Perſon of Judgment and Penetration, he will be deceived, and imagine ſuch Symptoms to belong to ſome Diſeaſe eſſential to the Part affected, and not to the Hyſteric Paſſion.

Sometimes, for Example, it attacks the Head, and cauſes an Apoplexy, which, alſo, terminates in an Hemiplegia, exactly reſembling that kind of Apoplexy, which proves fatal to ſome aged and corpulent Perſons, and ariſes from an Obſtruction or Compreſſion of the Nerves, occaſioned by a copious Phlegm, contained in the cortical Part of the Brain. But the Apoplexy, in hyſteric Women, ſeems to be produced by a very different Cauſe; for it ſeizes them frequently after a difficult Delivery, attended with great Loſs of Blood, or proceeds from ſome violent Commotion of the Mind.

Sometimes it produces dreadful Convulſions, reſembling an Epilepſy, attended with a Riſing of the Belly and Præcordia towards the Throat, and with ſuch ſtrong convulſive Motions, that, though the Patient be otherwiſe but of a moderate Strength, ſhe can ſcarcely be held by the Attendants, uttering, at the ſame time, Sounds wild and inarticulate, and beating her Breaſt. Women of a very ſanguine and robuſt Conſtitution are moſt liable to this Species of the Diſeaſe, which is commonly named the *Strangulation of the Womb*, or *Fits of the Mother*.

Sometimes it ſeizes the external Part of the Head, between the Pericranium and the Cranium, and is accompanied with an almoſt intolerable Pain, fixed in one Place, not exceeding the Breadth of the Thumb, and likewiſe with enormous Vomiting. This Species I call the *Clavus Hyſtericus*, and thoſe are moſt ſubject to it who are troubled with the Green-ſickneſs.

Sometimes it falls upon the vital Parts, and produces ſuch a violent Palpitation of the Heart, that the Patient is convinced thoſe about her muſt hear the Heart ſtrike againſt the Ribs. Slender and weakly Women, who ſeem conſumptive, and Girls who have the Green-ſickneſs, are principally afflicted with this Species.

Sometimes it affects the Lungs, cauſing an almoſt perpetual dry Cough; and, though it does not ſhake the Breaſt ſo violently, yet the Fits are more frequent, and the Patient's Senſes are, alſo, diſordered. This Species of the hyſteric Cough rarely occurs, and principally happens to Women of a phlegmatic Conſtitution.

Sometimes, attacking the *Colon*, and the Parts below the *Scrobiculum Cordis*, it occaſions a moſt violent Pain, not unlike the Iliac Paſſion, and the Patient is likewiſe ſeized with an exceſſive Vomiting of a certain green Matter, reſembling porraceous Bile, and ſometimes of an unuſual Colour. After the Pain and Vomiting have continued ſeveral Days, and almoſt worn out the Patient, the Fit is terminated by an univerſal Jaundice. Beſides, the Patient is ſeized with ſuch Apprehenſion and Terror, as to reject all Hopes of recovering; and this Dejection and Deſpair, I have always obſerved to accompany this Species of the Hyſteric Paſſion, which principally afflicts Women of a crude and lax Texture of the Body, and thoſe who have greatly ſuffered by being delivered of large Children.

Sometimes this Diſeaſe affects one of the Kidneys, and, by the Violence of the Pain, it entirely reſembles a Fit of the Stone, not only in the Nature of the Pain, and the Situation, but likewiſe in the exceſſive Vomiting, with which it is attended, and the Pain extending through the whole Duct of the Ureter. So that it is difficult to diſtinguiſh whether the Symptoms proceed from the Stone, or from an hyſteric Cauſe; unleſs, perhaps, ſome Accident has a little before depreſſed the Woman's Spirits, or the Diſcharge of the green Matter by Vomit ſhould inform us, that the Symptoms ought rather to be aſcribed to an hyſteric Diſorder, than to the Stone. Nor does the Bladder always eſcape unaffected with this deluſory Symptom, where a Pain and a Suppreſſion of Urine are occaſion'd, as if the Paſſages were obſtructed by a Stone. This laſt Species in the Bladder rarely happens, but the former, in the Kidneys, more frequently; both uſually attack ſuch Women whoſe Health and Strength have been exhauſted by frequent hyſteric Fits.

Sometimes, affecting the Stomach, it occaſions continual Vomiting; and, ſometimes, fixing in the Inteſtines, it produces a Purging. But, though the green Matter often appears in both theſe Symptoms, neither of them are attended with Pain. Thoſe who have been greatly debilitated by frequent hyſteric Fits, are moſt ſubject to both theſe Species.

As this Diſeaſe affects almoſt all the internal Parts, ſo likewiſe the external Parts, and muſcular Fleſh, are ſometimes attacked by it; ſometimes cauſing Pain, and ſometimes a Tumor in the Fauces, Shoulder, Hands, Legs, and Ancles; of which Kind the Swelling of the Legs is moſt remarkable. In dropſical Swellings it is always obſervable, that they increaſe towards Night, and pit, and retain the Print of the Finger, when forced againſt it; but, in this Tumor, the Swelling is largeſt in the Morning, nor does it yield to, or take any Impreſſion from the Finger, and generally ſeizes but one of the Legs. If the Magnitude, Surface, and other Particulars, be obſerved, it, in them, differs ſo little from dropſical Tumors, that the Patient can ſcarcely be perſuaded to believe it any other.

Nor do the Teeth themſelves (which is ſcarcely credible) eſcape this Diſeaſe, tho' free from any Cavity, or apparent Defluxion, that might produce Pain; which, nevertheleſs, is not milder, of ſhorter Duration, or more eaſily expel'd. But the

external Pains and Swellings principally affect thoſe Women, who, by the long Continuance and Violence of hyſteric Fits, are almoſt entirely ſpent, and can ſcarcely be ſaid to live.

Among all the tormenting Symptoms of this Diſeaſe, none is more frequent than a Pain in the Back, which uſually attends even the ſlighteſt Degree of it. But one Conſequence, which follows all the Pains above-mentioned, is, that, after they are removed, the Part which they affected cannot bear the Touch, and continues tender and painful, as if it had been beaten; but this Tenderneſs goes off by degrees.

One Circumſtance, well worthy of Obſervation, is, that all theſe Symptoms are preceded by a remarkable Coldneſs, which generally continues till the Concluſion of the Fit. This Coldneſs, I have obſerved, is equal to that of dead Bodies, though the Pulſe is not in the leaſt diſorder'd. Moſt of the hyſteric Patients, who have been under my Care, have complained of a Lowneſs, or (as they ſay) a Sinking of the Spirits; pointing to the Region of the Lungs, when they would mark the Part affected. And it is well known, that hyſteric Women ſometimes burſt into Laughters, and ſometimes into Tears, without any apparent Provocation.

Of all the Symptoms of this Diſeaſe, the moſt peculiar and univerſal is, a copious limpid Urine, pure as rock Water; which, upon Inquiry, I find to be a diſtinguiſhing Sign of thoſe Diſtempers, which we call Hyſteric in Women, and Hypochondriac in Men. And in Men I have ſometimes obſerved, that ſoon (almoſt the next Moment) after having voided an amber-coloured Urine, being ſuddenly affected with a violent Perturbation of Mind, they have had a plentiful Evacuation of Urine, clear as Cryſtal, with a ruſhing continued Stream. Nor did the Fit diſappear, till the Urine reſumed its former Colour.

Beſides, all hyſteric and hypochondriac Patients, who have long laboured under the Diſeaſe, are troubled with fetid, and, ſometimes, highly acid Eructations, after eating, even moderately, in proportion to the Appetite; the digeſtive Faculty being greatly impaired, and the Juices thereby vitiated.

Hyſteric Patients are frequently troubled with a Diſcharge of thin Saliva, not inferior to an artificial Ptyaliſm, which may be produced by the Spirits diſturbing the Mixture of the Blood; whence it is rendered unfit to perform the natural Excretions; and the Serum is not diſcharged by the Kidneys, but derived to the Glands by the Extremities of the Arteries, and empties itſelf by the ſalival Ducts. To the ſame Cauſe may be aſcribed thoſe profuſe Night Sweats, which ſeize hyſteric Women; for the irregular Motion of the Blood, producing the ill State of the Serum, diſpoſes it to be thrown upon the Habit.

Nor is it their only Miſery, that the Body is ſo ſeverely diſorder'd and ſhaken, and is become like a Houſe every-where threatening to fall into Ruins; for the Mind ſtill ſuffers more grievous Afflictions than the Body. For it is the Nature of this Diſeaſe to be accompanied with an incurable Deſpair; ſo that they cannot endure to be told of the ſmalleſt Hopes of their Recovery; and they eaſily fancy themſelves expoſed to all the Ills that can befal Mankind, which they imagine impoſſible to be avoided, and therefore preſage the moſt diſmal Events to themſelves. Upon little or no Occaſion they indulge Terror, Anger, Jealouſy, Diſtruſt, and other grievous Paſſions; and are Enemies to Joy and Hopes, which, if they accidentally appear, as they ſeldom do, quickly vaniſh away, and agitate the Mind no leſs than the depreſſing Paſſions. They know no Moderation, and are conſtant only in Inconſtancy. Thoſe of whom they are one Minute extravagantly fond, the next they will abhor. Now they propoſe doing one thing, immediately they lay aſide their Deſign, and engage in ſomething of a quite contrary Nature, which ſtill they do not conclude of, continually tormenting themſelves in this manner with new Perplexities. What the *Roman* Orator aſſerts of the Superſtitious, exactly agrees with theſe melancholy Perſons. "Sleep ſeems to be a Relief from Labour "and Inquietude, but even from that many Cares and Fears ariſe;" nothing being repreſented to them in their Dreams, but diſmal Proſpects of the Funerals and Apparitions of their deceaſed Friends. So much are they tormented, both in Body and Mind, that this Life ſeems no better than a Purgatory, in which they muſt expiate the Crimes by them committed in a pre-exiſtent State. Nor is this the Caſe only of Lunatics and Madmen, but even of thoſe, who, excepting theſe violent Commotions of the Mind, are Men of Prudence and Judgment; and who, in Depth of Thought and Solidity, greatly excel thoſe whoſe Minds never felt the Pangs of theſe diſtracting Thoughts. Juſtly then did *Ariſtotle* obſerve, that melancholy Perſons are endow'd with the greateſt Capacities.

But thoſe are only ſubject to this moſt dreadful State of Mind, who have long labour'd under this Diſtemper, and are at length overcome by it; eſpecially if Misfortune, Grief, Anxiety, or too ſtrong an Application to Study, accompanied with a bad Habit of Body, have contributed to the Diſeaſe.

It would require too much Time to enumerate all the Symptoms of this Diſeaſe; ſo different, and even oppoſite, are their Appearances. *Democritus* therefore, tho' he was miſtaken in the Cauſe of the Diſeaſe, yet ſeems to have affirm'd, not without Reaſon, in his Letter to *Hippocrates*, that *the Womb was the Source of ſix hundred Evils, and innumerable Calamities*. Beſides the Variety of theſe Symptoms, they are ſo irregular, as not to be comprehended under any uniform Appearance, like thoſe in other Diſtempers, but they are a mixed diſorderly Train; and hence ariſes the Difficulty of writing the Hiſtory of this Diſeaſe.

The procatarctic or external Cauſes of it are either violent Exerciſes of the Body, or, more frequently, ſome extraordinary Commotion of the Mind, ariſing from ſome ſudden Fit of Anger, Grief, Terror, or the like Paſſions. For this Reaſon, whenever I am conſulted by Women, on any particular Diſorder, the Cauſe of which does not appear from the common Rules of diſcovering Diſeaſes, I always carefully inquire, whether they are not principally attack'd with it, after Sadneſs, Vexation, or ſome other Diſturbance. If this they own, I am well aſſured, that the Diſorder belongs to that Claſs of which we are now treating; eſpecially if the Diagnoſtic is confirmed by a plentiful Diſcharge of limpid Urine. But to theſe Perturbations of the Mind, which generally produce this Diſeaſe, muſt be added, Emptineſs of the Stomach from long Faſting, immoderate Evacuations, either by bleeding profuſely, or adminiſtring Emetics or Cathartics, ſuperior to the Strength of the Patient.

Thus far *Sydenham*. *Frederic Hoffman*, in his Diſſertation on Hyſteric Affections, proceeds thus to diſtinguiſh betwixt theſe and Hypochondriac Diſorders.

We may, ſays he, eaſily diſtinguiſh between this and the Hypochondriacal Affection. For tho' there are Symptoms common to both, each has ſome peculiar to itſelf. The Hypochondriacal Diſeaſe continues very long, and requires a long Regimen; whilſt the other affects principally pregnant or breeding Women, or Women juſt after their Delivery, Widows, thoſe full of Blood, or labouring under any Uneaſineſs of Mind, or Virgins after a ſudden Suppreſſion of the Menſes; and is often ſo perfectly cured, as not to return. Its Attacks are ſometimes ſo unexpected and violent, that the Patient falls down void of all Senſe and Motion, which never happens to Hypochondriac Perſons; and this too is peculiar to Hyſteric Diſorders, that the moſt ſevere of them are often alleviated or removed, by only burning a Feather under the Noſe: Beſides, in the Fit, the abdominal Muſcles are contracted, and the Navel drawn inwards; while, in the other, the Belly is rather diſtended. In the former, the Loins are ſeized with a violent incredible Coldneſs, perceptible to the Hands, and cannot be taken off by the Application of warm Napkins; the Top of the Head ſeems, as if it were bored thro' with an Augre, and therefore this Pain is called *Clavus Hyſtericus*; and many perceive the Aſcent of a little Ball from the Abdomen; all which Hypochondriacal Perſons are free from; nor are they equally ſubject to frequent Faintings, ſudden Difficulty of Breathing, or violent Strangulations at the Fauces; and, laſtly, none of them are ever miſtaken for dead, and interred alive, as it ſometimes happens in Hyſterical Caſes.

With reſpect to the Circumſtance here mentioned, of being miſtaken for dead, we have very antient Accounts of ſuch Caſes, the Truth of which is confirm'd by modern Hiſtories. *Empedocles* is the firſt upon Record who took notice of this; and *Heraclides* is ſaid to have wrote a Treatiſe upon it. See APNOIA.

Theſe Diſtempers differ as to their Cauſes. For, as the Hypochondriac Affection exerts itſelf by Spaſms and Flatuſes in the membranous Canal of the Inteſtines, Ventricle, and Oeſophagus; and theſe Spaſms ariſe from a Stagnation of the Blood in the nervous Coats of the Inteſtines, for want of a due Circulation through the hepatic Veſſels, and the Ramifications of the Vena Portæ, ſo the Origin of hyſteric Convulſions is to be deduced from the Uterus; from whence, by its Conſent with the Bladder, uterine Convulſions are propagated to the Sphincter of the urinary Bladder, and the Patient feels a perpetual Stimulus to make Water, which hypochondriac Perſons do not perceive, according to *Hoffman*; but *Sydenham*, with greater Truth, affirms the contrary. And, from this Diverſity of Cauſes, ſays *Hoffman*, it will manifeſtly appear, that the ſame Symptoms may proceed from different Origins. Thus, a Difficulty of Breathing is common to both; but in one, it takes its Riſe from an Inflation of the Stomach, which hinders the Deſcent of the Diaphragm; and in the other, from a violent Contraction and Compreſſion of the abdominal Muſcles. Laſtly, They vary no leſs in their Events and Changes; for one generally terminates in Melancholy, Scurvy, a ſlow Fever, and the *Morbus Niger*: The other in an Epilepſy, mortal Syncope, *Furor uterinus*, and an acute Fever. Further, upon opening hypochondriac Subjects, we generally find the Viſcera of the lower Belly, the Liver, Spleen, and Pancreas, hard, ſcirrhous, and corrupted; whereas the Cauſe of hyſteric Diſorders is ſeated in the Womb, or Ovaries. I thought it abſolutely neceſſary to be thus particular in the Diſtinction between theſe two Diſtempers, to diſengage Phyſicians from the Error, which they too eaſily run into, of confounding one with the other.

But there ſtill remain other Diſeaſes, which ought to be accurately diſtinguiſhed from this. In a Syncope the Pulſe abſolutely ceaſes, the Face is pinched in, and like a dying Perſon's; but,

but, in a Suffocation of the Uterus, the Face is ruddy, and ſwelled, whilſt the Pulſe is languid, which continues for two or three Days; and this cannot be ſaid of the former. In an Apoplexy, under a Privation of all Senſe, and voluntary Motion, there is a Rattling in the Throat, with Difficulty of Breathing, and Quickneſs of the Pulſe, which never occur in hyſteric Diſorders. It differs, likewiſe, from an Epilepſy, the Cauſe of which is ſeated in the Dura Mater, and the Beginning of the ſpinal Marrow, from whence proceed Convulſions of the whole Body; but this has its Seat in the Uterus; from whence Spaſms are propagated to the ſpinal Marrow, and all the Nerves. *Celſus*, *Lib.* 4. *Cap.* 20. gives a very exact and elegant Deſcription of the different Symptoms of both theſe Diſtempers. The Hyſterics, ſays he, as well as the Epilepſy, ſometimes deſtroy the Patient; but, in the former, the Eyes are never clos'd, there is no Foaming at the Mouth, nor univerſal Convulſions. It differs no leſs from Pains excited by the Stone; for, though they agree in many Symptoms, the calculous Patient is not afflicted with a Strangulation at the Fauces, Fainting, nor Difficulty of Breathing, and the Patient is not injur'd ſo much by the Smell of Perfumes. *Ballonius*, *de Virginum Morbis*, diſtinguiſhes between this and a Flatulence of the Primæ Viæ, in the following Words: "We "commonly obſerve, that young Women, who eat too much, "eſpecially if their Bellies are large, or if they indulge themſelves "in eating Summer-fruits, are afflicted with incredible Pains of "the lower Belly; by which means Faintings, an unequal Pulſe, "and a Difficulty of Breathing, are produc'd, ſo that the Diſ"order is thought to be of the hyſteric Kind, tho' it is not truly "ſuch. But, becauſe, in this Impetus and Perturbation of the "Humours, the Uterus, in conſequence of the Conſent of the "Parts, can hardly remain unaffected, the Diſorder is, therefore, "ſaid to be of the hyſteric Kind, more in Compliance with Cu"ſtom, than in Conformity to Truth."

It is to be obſerved, that all Women are not equally ſubject to this Diſorder, but that it more particularly ſeizes Virgins, before their firſt menſtrual Diſcharge, ſuch as are marriageable, young Widows, and Wives; eſpecially if they are full of Blood and Moiſture, and have not borne Children: As, alſo, ſuch as are brought up in Idleneſs, or are of a ſoft Texture, and delicate Conſtitution. The Antients, and particularly *Galen*, aſſert, that Widows, when their Menſes ceaſe, when they are paſt Childbearing, and when Venereal Inclinations leave them, are ſubject to hyſteric Affections. *Foreſtus*, *Lib.* 28. *Obſerv.* 28. ſays, that robuſt, maſculine Women, if they are corpulent, full of Blood, and continent, tho' inclin'd to Venereal Enjoyments, and live at Eaſe, feeding upon hot, moiſt, and flatulent Diet, and indulging themſelves in generous Wines, and Delicacies, which prove a Stimulus to Venery, are frequently ſeized with this Diſorder, without a Suppreſſion of the Menſes: And this is confirmed by *Ballonius*, in the Book already quoted, and by *Levinus Lemnius*, *Lib. de occultis Naturæ Miraculis*, *Cap.* 6. Beſides, we have, among others, the Teſtimony of *Aretæus*, that young Women, whoſe nervous Syſtems are delicate and weak, who are of a tender Habit, and ſubject to the exorbitant Sallies of lawleſs Paſſion, are in greater Danger of this ſpaſmodic Diſeaſe, than thoſe who are robuſt, hardy, laborious, and of a more ſteady Mind. 'Tis alſo obſervable, that Women of ſanguine, choleric Conſtitutions, and prone to impetuous Commotions of Mind, are ſubject to ſevere Convulſions of the nervous Parts. On the contrary, thoſe of a phlegmatic and languid Diſpoſition are not ſubject to ſo violent Convulſions; but rather fall into more frequent Deliquiums, and are impatient of the leaſt Noiſe, Breath of Wind, and ſweet Odour.

Having premiſed thus much, we ſhall next inquire into the Seat of this Diſorder, which *Highmore*, *Sylvius*, and *Sydenham*, confounding it with the Hypochondriac Affection, aſſert to be the Stomach, Pancreas, Meſentery, and Vena Portæ; and *Carolus Piſo* no leſs erroneouſly places the Seat of this Diſorder in the Brain, or rather the Beginning of the Nerves, without diſtinguiſhing between the Subject of the morbific Cauſe, and of the Patient's Death. But, with the Antients, I am fully perſuaded, that it ariſes from the Womb, and its Membranes and Veſſels, particularly thoſe of the ſpermatic Kind; and that the ſpaſmodic Stricture of theſe Parts communicates itſelf to the adjacent Nerves of the Os Sacrum and Loins; and thence, in conſequence of the mutual Conſent of the Parts, gradually ſeizes the nervous Membranes of the ſpinal Marrow, propagating itſelf from the inferior to the ſuperior Parts. For which Reaſon we find, that when Women, after Delivery, are ſeiz'd with this Diſorder, the Convulſions begin at the internal Orifice of the Uterus, or even of the Vagina, becauſe, theſe Parts becoming cold and dry, the Diſcharge of the Lochia is ſuppreſſed, and the Body render'd coſtive. Then the Spaſms and Pains, accompany'd with a Senſe of Cold, ſeize the Loins, and, paſſing thence to the abdominal Muſcles, produce a Retraction of the Navel, accompany'd with an Hardneſs of the lower Belly; then they mount up to the Diaphragm, the intercoſtal Nerves, and the Par Vagum, and bring on a Difficulty of Breathing, almoſt to Suffocation, with a Strangulation of the Fauces; and this, for want of a free Circulation of the Blood thro' the Heart, is followed by a Palpitation thereof, Fainting, and at length, when the Blood cannot paſs thro' the Brain, by a Privation of Senſe and Underſtanding. From all which, it is very evident, that hyſteric Affections may be juſtly claſs'd among thoſe of the ſpaſmodic and convulſive Kind, which affect the whole nervous Syſtem.

I agree with the Generality of Phyſicians, that the direct and material Cauſes are, partly a Corruption of the ſeminal Juices, and partly a peccant State of the menſtruous Blood in the Uterus; and each of theſe deſerves a very accurate Examination. For we are ſufficiently convinced by Inſpection into human Bodies, that Males are furniſhed with peculiar Organs, call'd Teſticles, where the ſubtile, ſpirituous, ſeminal Liquor is ſecreted from the Blood, which paſſes through the ſpermatic Arteries, and is lodged in proper Receptacles; but in Females no ſuch Organs are found; inſtead of which, Nature has placed, at the Sides of the Uterus, certain globular Bodies, conſiſting of Blood-veſſels, Membranes, and Veſicles, termed Ovaries; and the ſpermatic Veſſels are carry'd in numberleſs Ramifications to the Subſtance of the Uterus. Since, therefore, the modern Naturaliſts look upon theſe Veſicles in the Ovary, wherein is contained an infinitely minute Fœtus, to be fecundated by the Male Sperm, it will be worth while to inquire, whether this can be vitiated, and in what manner; then, how it gives Birth to hyſteric Diſorders, after its Corruption.

For the better underſtanding of which, we muſt premiſe ſome Things, eſpecially with reſpect to the Alterations the human Body undergoes, particularly about the Years of Puberty. We obſerve then, that Girls, about the fourteenth Year of their Age, grow more ruddy, their Faces become fair, and their Breaſts ſwell; that, in Boys of the ſame Age, the Beard grows, the Voice is more ſonorous, the Strength and Vigour of every Part of the Body is increas'd, and that both Sexes are inclined to Venereal Enjoyments. For, as in Males there is a greater Afflux of the Blood to the Teſticles, for the Secretion of the ſeminal Fluid, and Erection of the Penis, ſo in Females a more copious Quantity of Blood is convey'd to the Uterus, and its Veſſels, to fecundate the Ovum, if there is any; and hence, in Caſes where there is no Impregnation, we deduce the Cauſe and Origin of the Menſes. This naturally leads me to conſider the muſical and wonderful Harmony between the Paſſions and the vital Motion of the Blood, towards certain Members, eſpecially thoſe deſtin'd to Procreation. For this copious Afflux is directly followed by a Deſire of Enjoyment; and, on the other hand, when the Contemplation of a deſireable Object provokes Venereal Inclinations, this Circumſtance excites a greater Afflux of Blood and Spirits to the Organs deſtin'd to the Purpoſes of Generation.

Whenever the Humours flow too plentifully through the ſpermatic Veſſels, to the Ovaries and Uterus, whether it proceeds from Age, or ſalacious Inclinations, the nutritious Lymph is collected in thoſe Parts, where it ſtagnates, corrupts, and gives Riſe to hyſterical Diſorders. Conſequently, Girls, about Fourteen, and ſprightly, unmarry'd, wanton, warm, ſanguine Women, are ſubject to this Diſorder in the higheſt Degree. *Charleton*, *Exercit. Pathol.* 7. confirms this Opinion in the following Paſſage: "Some Women, ſays he, of warm Conſtitutions, are "thrown into Hyſterics by the abundant Stimulation of the "ſpermatic Juices." For this Reaſon the Antients attributed it to a Retention of the ſeminal Matter, and either preſcribed Marriage, or gave Medicines to promote the Diſcharge thereof. See *Zacutus Luſitanus*, and *Petrus Foreſtus*; and they add, that, after the Paroxyſm, a large Quantity of moiſt Liquor is diſcharg'd from the relax'd Pudenda. See *Galen. Comment. in Hippocratem*, *Lib.* 6. *de Locis affectis*, *C. V.*

That corrupted ſeminal Juices may produce Hyſterics, appears, firſt, from their Tendency to prejudice the pure Juices circulating in the Nerves and Fibres, by their noxious Effluvia; and it is well known, that many other kinds of Effluvia will excite hyſteric Paroxyſms.

A ſecond Reaſon is, that the violent Diſtention of the Veſſels, and nervous Membranes, by this preternatural Collection of Humours, muſt cauſe ſpaſmodic Motions, which are propagated thro' the whole nervous Syſtem. And this no one can doubt, who will but conſider, that hypochondriacal Affections, and ſevere Convulſions in the Colic, frequently ariſe from a bare Stagnation of Blood, in the Coats of the Stomach and Inteſtines.

That this is really the Caſe, farther appears from the Diſſection of Women, who have died of hyſterical Diſorders. Thus *Veſalius*, *Lib.* 5. *de Humani Corporis Fabrica*, *Cap.* 15. ſays, that he has found the Teſticles of hyſteric Women larger than a Ball, replete, ſometimes, with a yellow, and ſometimes with a fetid Humour of other Colours. *Riolanus*, *Anthropol. Lib.* 2. *p.* 35. ſays he found an hard Teſticle larger than one's Fiſt.

Binnengerus, *Cent.* 2. *Obſ.* 90. relates, that he ſaw the Teſtes (*Ovaria*), together with the Fallopian Tubes, and ſpermatic Veſſel, exceſſively tumid, inflated, and ſtuffed with a thick, white, and ſomewhat indurated Humour, like a Steatoma, and of half a Pound Weight, in a Woman who died of Hyſterics.

Manageta, *in M. N. C. D.* 1. *a.* 1. *Obſ.* 32. ſays, he met with an Uterus and Teſticles turgid with a corrupt ſeminal Matter, not unlike an hard Curd. And *Diemerbroek*, *Anat. Lib.*

de Ventre inferiore, *Cap.* 24. relates, that in hyſterical Women he has generally found ſomething of a Tumor about the Womb, and in that an æruginous or yellow Liquor. From all which it is very evident, in what Manner the vitiated ſeminal Juices produce this Diſorder.

Let us now conſider the ſecond Cauſe, which, we ſaid, was a Corruption of the menſtrual Blood. That Irregularities, however, of this critical Evacuation, are not always the immediate Cauſes of hyſteric Diſorders, I am ſenſible; becauſe Virgins, and Women in Years, have been afflicted with Hyſterics, without any Suppreſſion of the Menſes, or habitual hæmorrhoidal Flux; which *Piſo* acknowledges. In the mean time, we often obſerve, that, during hyſterical Diſorders, this menſtrual Diſcharge often becomes irregular, which ſhould, at that time, be look'd on as an Effect and Symptom of the Diſtemper; becauſe Convulſions are of ſuch a Nature, as to diſturb and prevent Excretions of all kinds. But, certainly, this muſt be acknowledged as one of the Cauſes; ſince Virgins, at the Age of Puberty, from a Cohibition of the Menſes, at that time approaching, and the conſequent Diſtention of the Veſſels; and Women, whoſe Diſcharge is ſomething difficult a little before the Evacuation, are much afflicted with hyſterical Affections. And the *Clavus Hyſtericus*, fix'd in one Point of the Head, which is often accompanied with Cardialgias, and Vomitings, will corroborate this Argument; and we are furniſh'd with Inſtances of Hyſterics, and even Epilepſies, attacking Women of a delicate Frame, after a ſudden Suppreſſion of the Menſes, caus'd by a Fright.

Pregnant Women, eſpecially thoſe of a ſanguineo-choleric Conſtitution, are not exempt from hyſterical Affections; for I have ſeen ſome, about the third or fourth Month, on account of violent Anger, ſeiz'd with a Suffocation, Loſs of Strength, and a Syncope of ſome Hours Duration; but they were happily reliev'd by opening a Vein, and the Application of ſpaſmodic and nitrous Medicines. That, after Delivery, a Suppreſſion of the Lochia will give Birth to Hyſterics, *Hippocrates*, *Lib. de Natura Mulierum*, aſſures us. And I myſelf have known Women fall into violent Hyſterics, from too cold an Air admitted to the Abdomen, an inconſiderable Commotion of the Mind, or ſitting up too long, the firſt Days after their Delivery; and, a Suppreſſion, or Defect, of the Lochia, unleſs ſeaſonably reliev'd by Phlebotomy, will produce the ſame Effects. An immoderate or too long-continued Flux of the Lochia, upon the Acceſſion of any ſlight external Cauſe, will excite hyſterical Diſorders, particularly Faintings, and Refrigeration of the Extremities; which, however, are more eaſily remov'd, provided proper Meaſures are purſu'd.

Whatever, therefore, conduces to a preternatural Afflux of the ſeminal Juices to the Region of the *Uterus*, or produces any Impediment, Difficulty, or total Suppreſſion of the menſtrual Flux, may be eſteem'd an occaſional Cauſe of hyſterical Affections. Among theſe Cauſes we may principally reckon the Years of Puberty, and an Abſtinence from habitual Venereal Enjoyments. To theſe may be added a ſanguine or choleric Conſtitution, Salacity, an heating, vinous, delicate Diet, ſtrong Paſſions, and violent Commotions of the Mind and Body. On the contrary, a ſedentary Life, thick, acid, cold Food, a Neglect of Phlebotomy in Conſtitutions accuſtomed to it, and continual Uneaſineſſes, Sorrow, and Cares, by inſpiſſating the Fluids, weakening the Solids, and, of conſequence, rendering the menſtrual Diſcharge difficult, contribute to excite this Diſeaſe; nor is it promoted leſs by a ſudden Fright, or Refrigeration of the Body, which, particularly at the Time of the menſtrual Flux, puts a Stop to this Evacuation. Laſtly, Perfumes, as Amber, Civet, Musk, and the like, from their peculiar Diſpoſition, induce violent Paroxyſms.

This Diſtemper, however terrible, with reſpect to its Symptoms, is not very dangerous, unleſs it happens in a weak and valetudinary Conſtitution, or is prepoſterouſly treated by ill-adapted Medicines, or an improper Regimen. But no Diſtemper ſo readily induces Epilepſies and Convulſions as Hyſterics, inſomuch that by theſe we may diſtinguiſh hyſteric from hypochondriacal Diſorders. Again, we find Relapſes very common, either from a Miſcarriage, difficult Labour, or any ſlight nervous Diſorder. Nor is it unuſual to meet with a Complication of the hyſterical and hypochondriacal Affections, which is generally of long Continuance, and difficult to be cured, eſpecially in Patients of a ſedentary Life, and ſtrong Paſſions, or ſuch as purſue an improper Diet and Regimen, which diſturb the menſtrual and hæmorrhoidal Diſcharges, and cauſe ſuch a Complication of Diſorders.

Cure.

Having thus fully explained the Genius, Seat, Cauſes, and Differences of hyſterical Affections, we ſhall now proceed to the Method of Cure. But as the Cure of all Diſeaſes requires a thorough Knowledge of the Patient's Conſtitution, and an Adminiſtration of Remedies proper to remove the Cauſe, ſo, in hyſterical Caſes particularly, the Phyſician's principal Care muſt be to make himſelf Maſter of theſe Circumſtances, ſince not only the Cauſes of the Diſtemper, but, alſo, the Nature of Women, are, according to *Hippocrates*, found widely different.

In order to the Cure of Hyſterics, the firſt Inquiry to be made is, whether the Patient's Body is plethoric, or exhauſted of Blood and Strength: In the firſt Caſe, nothing affords ſo immediate Relief as Bleeding, in caſe of Spaſms and Convulſions, which, in ſanguine Conſtitutions, are the moſt exceſſive. This muſt be proportioned to the Redundance of Blood, and if that is very great, it may even be repeated. I have known this give immediate Relief to Women, who had loſt all manner of Senſe and Motion, and lay, as it were, apoplectic, with their Faces very red and tumid; and, alſo, to ſanguine Virgins, almoſt deprived of their Reſpiration, and Speech, or ſeized with an epileptic Paroxyſm, on account of a ſudden Suppreſſion of the Menſes by a Fright. Many practical Authors prefer Bleeding to all other Remedies, when the Diſorder is excited by a Redundance of Blood, or Retention of the Menſes. *Mercatus* and *Rodericus a Caſtro*, *Hæſtederus*, *Dec.* 4. *Caſ.* 2. *Highmore*, *L. de Paſſione Hyſterica*; *Panarolius in Iatrologiſmis*, *Sententia* 2. *Obſ.* 30. *Riverius*, *Septalius*, and *M. N. C. D.* 1. *Anno* 10. *Obſ.* 42. & 58. were ſtrongly of this Opinion, as well as many others.

During the Paroxyſm, all our Endeavours ſhould be directed to mitigate the Violence thereof. Purſuant, therefore, to the Directions of *Hippocrates*, I adviſe the Application of fetid Subſtances to the Noſe, as Caſtor, Aſa-fœtida, and burnt Partridge-feathers, which laſt is a popular Remedy, and of great Efficacy. Among compound Medicines, the acid Water of Swallows, with Caſtor, and urinous Spirits, impregnated with Oil of Rue, and Eſſence of Caſtor, may be applied to the Noſtrils with very good Effect, but, above all, a Rag previouſly dipt in ſtrong Vinegar.

I have ſeen Women, as it were, lethargic, and in all Appearance at the Point of Death, recovered, in a very ſurpriſing manner, by the Uſe of theſe Medicines; for the ſaline volatile Vapours of theſe Remedies, by penetrating into the nervous Membranes of the Brain, inſpire them with new Strength and Vigour, reſtore their loſt ſyſtaltic Power, and diſperſe the Blood and Humours, ſtagnating therein. Women, after Delivery, find great Benefit from a Compreſſion of the Abdomen with a *Ruſſia* Leather Girdle, the Smell of which is very ſerviceable, both to hyſterical and hypochondriacal Perſons. In the Fit, great Relief may be expected from an immediate Evacuation by Stool; for the Patient is, in this Caſe, generally exceſſive coſtive; for this Reaſon Clyſters are of excellent Uſe, if prepared of proper Ingredients, as the Roots and Seeds of Lovage, which, in this Caſe, are Specifics, the Flowers of common Chamomile and Elder, the Herb Paul's Betony, and the Four carminative Seeds, boil'd in Whey, with an Addition of a ſufficient Quantity of Oil of Dill, or Chamomile, made by Coction. But, when the Stricture of the Belly and Rectum will not admit of this Remedy, that Defect muſt be ſupplied by an Injection of pure expreſſed Oils or Lards, ſuch as the Fat of the Badger, or the Beaver, the Oil of Dill, and ſome others of a like Quality, by which the *Menſes* and *Lochia* are, alſo, conſiderably promoted.

For external Remedies, the Antients recommend the Application of fetid Plaiſters, ſuch as thoſe prepared of Opopanax, Bdellium, Galbanum, Sagapenum, and Aſa-fœtida, to the Navel, or Pudenda. *Foreſtus*, in *Lib.* 28. *Obſ.* 32. gives a remarkable Inſtance of the Efficacy of theſe. Nor muſt we omit taking notice of the Application of Perfumes immediately to the Uterus, as theſe are recommended by *Hippocrates* and *Galen*. And though I can affirm nothing of them from my own Experience, I would not abſolutely reject them, as they ſeem very likely to ſucceed, becauſe Perfumes, as Musk, Civet, Storax, and Benzoin, of which Suffumigations for the Uterus are prepar'd, by their ſulphureous and ſalutary Exhalations, relax the conſtricted Fibres of the *Uterus*, inſomuch that, as *Foreſtus* obſerves, their Application frequently cauſes a Diſcharge of thick putrid Humours, immediately from the Part.

Amongſt internal Remedies, the moſt efficacious are, the Eſſence of Caſtor, mixed with three Parts of the anodyne Liquor, and the antipaſmodic Pills, prepar'd of Myrrh, Sagapenum, Opopanax, Aſa-fœtida, Caſtor, Saffron, and the Theriaca, each half a Dram, adding, ſometimes, ſix or eight Grains of Camphire, and Laudanum Opiatum. From each Scruple of this Maſs ten Pills may be made, two of which are to be taken every Hour, with a due Quantity of the Water of Chamomile-flowers. I have often ſeen ſurpriſing and almoſt incredible Effects produced by this Medicine.

Theſe are the principal Remedies, during the Continuance of the Fit; let us now conſider, what is proper to remove the Cauſe, when the Paroxyſm is over. Guided, therefore, at once, by Reaſon and Experience, we aſſert, that the *Primæ Viæ*, which are generally filled with a Load of peccant Humours, are to be purged by proper Medicines; which Practice is ſo much the more neceſſary, becauſe, during the Paroxyſm, large Quantities of Anodynes, fetid Subſtances, and ſuch as ſtop violent Commotions, have been exhibited. For anſwering this Intention, the moſt efficacious Medicines are, the *Pilulæ Becherianæ*, or ſome others of a like Virtue, eſpecially when, by way of Stimulus, a due Quantity of the *Extractum Panchymagogum Crollii*, of pre-

pared Cinnabar, and a Grain or two of the Extracts of Saffron and Caſtor, as Antiſpaſmodics, are added. When, by this means, the *Primæ Viæ* are ſufficiently purged of the peccant Humours, ſuch Medicines are to be uſed, as, being poſſeſs'd, at once, of a ſedative and diaphoretic Quality, may direct the Motion of the Blood and Humours to the external Parts, and, by promoting a free Perſpiration, procure the Diſſipation of the peccant Serum. The Medicines of greateſt Efficacy for anſwering this Intention are, the Spirit of Hartſhorn, or that of Ivory purified by Rectification; the *Spiritus Bezoardicus Buſſii*, the ſuccinated Spirit of Hartſhorn, and the Spirit of Tartar, duly prepared; which volatile Spirits may be commodiouſly exhibited in ſmall Doſes, either by themſelves, or in Conjunction with the anodyne mineral Liquor, the Eſſence of Saffron, Caſtor, or Amber, or even with the Liquid Laudanum, than which Medicine, prudently uſed and exhibited, according to the Circumſtances of the Patient, nothing is more beneficial and efficacious; for, as, by the Aſſiſtance of Nature alone, theſe ſpaſmodic Diſorders are often ſpontaneouſly terminated by profuſe Sweats, it ought to be the Phyſician's principal Care to obtain this End, and act, as it were, in Concert with this Tendency of Nature.

For anſwering the ſame End, with theſe we may interpoſe other Medicines of no leſs Efficacy, ſuch as the Powders which are poſſeſs'd of a kind of peculiar and ſpecific Virtue, in mitigating Spaſms, and convulſive Motions. Of this Kind, ſays *Hoffman*, are the *Pulvis Marchionum*, the *Specificum Cephalicum Michaelis*, my Antiepileptic Powder, as, alſo, that prepar'd of a dry'd human Secundine, Miſleto, Amber, Coral, Saffron, Caſtor, and Cloves By the prudent Uſe of theſe I have often ſeen convulſive and epileptic Motions allay'd and mitigated in a moſt ſurpriſing manner. But Medicines of this Kind muſt not be uſed till the Plethora is removed, and the peccant Humour ſufficiently evacuated by Stool.

Since this Diſorder, unleſs judiciouſly treated, is very ſubject to recur, or to degenerate into ſome other chronical Diſorder, eſpecially of the hypochondriac Kind, theſe Misfortunes are to to be guarded againſt with all poſſible Care; which is done by having a due Regard to the *Menſes*, after the Termination of the Diſeaſe, whether an irregular Evacuation of theſe produced the Diſorder, or whether the Diſcharge was faulty, during the Continuation of the Diſeaſe, as it generally is. For promoting the *Menſes*, therefore, and preſerving them in that State which Nature requires for Health, I have found nothing more efficacious than the internal Uſe of the *Caroline* Waters, in Conjunction with a proper Regimen; for hot mineral Waters are generally obſerved to be more ſafe and powerful in the Cure of Diſorders peculiar to the Sex, than cold mineral Springs. Thoſe Medicines are, alſo, to be uſed, which, by reſtoring the Strength and Tone of the *Uterus*, remove the Diſorders ariſing from its preternatural Weakneſs. The moſt efficacious Medicines of this Kind are temperate Balſamics, prepared of Myrrh, Amber, bitter and carminative Extracts, eſpecially thoſe of Zedoary and Orange peel, reduced to an Elixir, with a gently ſpirituous Menſtruum, and frequently uſed; for theſe both excellently promote the Menſes, and aſſiſt the Digeſtion, eſpecially when, at the ſame time, the inteſtinal Fæces are duly eliminated by temperate Balſamics, and the *Pilulæ Polychreſtæ*.

There ſtill remains another highly natural, and efficacious Method of Cure, which is, that to be expected from Marriage. Reaſon, Experience, and the Authorities of the greateſt Phyſicians, concur in pronouncing Matrimony highly beneficial in removing hyſteric Diſorders. *Hippocrates*, in his Treatiſe *de Virginum Morbis*, recommends it for this Purpoſe. *Valeſcus de Taranta*, in *Philom. Pharm. Lib.* 6. *Cap.* 10. uſes the following Words: "If, ſays he, any young Woman labours under Diſ-" orders ariſing from a Retention of the Menſes, let her marry, " and her Misfortunes will be removed." *Capivaccius* gives ſome very extraordinary Directions on this Occaſion, which are not extremely decent, nor of much Importance. *Duretus, in Enarratione ad Caput* 59. *Hollerij*, and *Zacutus Luſitanus* 52. *Prax. Med. Admirand. Obſ.* 91. give us memorable Inſtances of the happy Effects produced by Matrimony, in the Cure of hyſteric Diſorders.

Practical Cautions.

When hyſterical Affections proceed from an Orgaſm of the uterine Lymph, all warm Medicines are extremely pernicious; as appears from many Inſtances in *Rodericus a Caſto de morbis mulierum*, *Lib.* 2. *Ludovicus Mercatus*, *Lib.* 2. *de Morbis Uteri*, *Cap.* 3. We ſhould, therefore, temperate the Acrimony of the Lymph, and check the Orgaſm of the Blood and Humours, by cooling Drink; as Water, Whey, and nitrous Liquors; the Efficacy of which, for the Extinction of Salacity, *Timæus a Guldenklee* greatly recommends.

Since the Nature of Women is ſo very various, it is no Wonder, that the ſame Remedy differs in its Operation upon different Subjects. Thus I have ſeen ſome unable to bear the Application of Fetids, either internally or externally; whilſt others have found immediate Relief from them. Some I have ſeen, who were oppreſſed with a Syncope in every Paroxyſm, reſtored by only ſprinkling a little Water upon the Face, when ſtronger ſpirituous Remedies had been tried in vain. Some are of ſo hot a Conſtitution, that they cannot bear warm Medicines, either externally or internally; and ſuffer greatly from hot nervous Baths, Fomentations, and Ointments. Some are eaſed by Anodynes and Opiates, whilſt others, whoſe Nerves are very much weakened, find them extremely prejudicial. Some, again, have I met with, who were relieved by a Draught of Water only, which has been very pernicious to others. Of ſuch Conſequence is it, as *Hippocrates* long ago obſerv'd, *Lib.* 1. and 2. *de Morbis Mulierum*, to be well acquainted with the Natures of Women.

Though, in our Days, the hypochondriac Diſorder is never mention'd among the Diſeaſes, which Women are ſubject to, but every Affection attended with Pains, Spaſms, Flatulences, and Anxieties, is termed Hyſterical; yet an accurate Diſtinction between them is abſolutely neceſſary. For as, in hypochondriac Caſes, Exerciſe, carminative, ſpirituous, volatile, ſtomachic, and aromatic Medicines, Salts of a neutral and ſtimulating Kind, Mineral Waters, bitter Purges, and, above all, Chalybeates, are moſt ſerviceable, ſo are they very noxious to hyſteric Women, who are more reliev'd by Bleeding, Reſt, Anodynes, nitrous, antiepileptic, and cooling Remedies, with the drinking cold Water and Whey, and an Abſtinence from all warm Things, even Wine.

To prevent a Relapſe, and ſecure the Diſtemper from becoming chronical, it will be proper to regulate the Evacuations by Stool, and the menſtrual Diſcharge, by a proper Diet and Regimen, always obſerving not to uſe any great Quantity of Aloes and reſinous Gums. For I can affirm, from my own Experience, that they increaſe and prolong the Diſorder, particularly in Women, who are plethoric, or of a ſoft and tender Frame. In ſuch Caſes Currants gently boiled in an Infuſion of Rhubarb, are exhibited with much better Effect. Mean time all ſorts of Cakes, Sweet-meats, and Sallads, are carefully to be avoided; for as an immoderate Uſe of theſe things, together with an idle Life, too ſcanty and incongruous drinking, and ungovernable Paſſions, give Birth to hypochondriacal and hyſterical Diſorders, ſo People already affected with theſe Diſorders ought more rigidly to abſtain from them.

Though daily Experience convinces us of the Uſefulneſs of Caſtor Medicines in both Diſeaſes, yet we muſt not put too much Confidence in them, becauſe they are not capable of removing the Cauſe; and too great a Quantity of them is prejudicial, as their anodyne Vapour induces a dangerous Weakneſs, with reſpect to the Head and Nerves.

If hyſteric Women, after Delivery, are coſtive, they ſhould not be purged with highly ſtimulating neutral, and, as they are called, digeſtive Salts; for by large and frequent Doſes of theſe Salts I have ſeen a dangerous Increaſe of the Symptoms.

In a violent hyſteric Suffocation, nothing is more efficacious in rouſing the Patient, than volatile Sal Ammoniac, mix'd with Eſſence of Caſtor, or the Water of Swallows, with Vinegar and Caſtor applied to the Noſtrils; and Frictions with a rough Cloth about the Præcordia and Feet. Theſe are far more proper than the Smoke of highly fetid Subſtances, ſuch as Feathers; as, alſo, than Aſa-fœtida, or Camphire, which few can bear.

I have found extraordinary Benefit, ſays *Hoffman*, in hypochondriaco-hyſteric Subjects, of a choleric, and very ſenſible Conſtitution, from precipitating nitrous Powder, mix'd with an equal Quantity of Amber, and a ſmall Quantity of Saffron; as, alſo, from the frequent Uſe of my Elixir Viſcerale, mix'd with an equal Quantity of my anodyne Liquor.

For alleviating the Paroxyſms, in the Intermiſſion, nothing is better than Clyſters, compoſed of gentle, paregoric, carminative Herbs, with the Addition of a large Quantity of expreſs'd Oil; for they have an immediate Effect upon the Womb, by relaxing it by their temperate Warmth.

After the Fit, very temperate Baths, for the Feet, are highly efficacious; but, if too hot, I have more than once obſerved, particularly in plethoric Subjects, that they are too ſubject to occaſion a Relapſe. *Frederic Hoffman.*

The celebrated *Sydenham* propoſes the following Methods of Cure for hyſterical Diſorders.

The principal curative Indication, in this Diſeaſe, appears to be that which directs the ſtrengthening of the Blood, which is the Fountain and Origin of the Spirits; that the invigorated Spirits may preſerve an Order, agreeable to the Whole, and every Part of the Body. But as this Diſorder of the Spirits may, by its long Continuance, have vitiated the Juices, it will be proper to diminiſh their Quantity by bleeding and purging, if the Strength of the Patient can bear theſe Operations, before we proceed to ſtrengthen the Blood; and this Deſign is difficult to be executed, whilſt Collections of feculent Humours obſtruct the Paſſages. But as the Pain, the Vomiting, and the Purging, are ſometimes ſo exceſſive, that they cannot ſafely be neglected, we are to diſregard the Cauſe for a time, and begin the Cure by quieting the Symptoms, for that Purpoſe exhibiting an Opiate. And, as we learn from Experience, that there are many fetid Medicines adapted to compoſe the Commotions of the Spirits,

which have, therefore, been named Hyſterics, let them be preſcribed when ſuch Intentions are to be anſwered.

With this View, I firſt order Bleeding in the Arm, and then a Purge, for three or four ſucceſſive Mornings. During theſe Evacuations, the Diſeaſe ſeems rather to increaſe than diminiſh, becauſe of the Commotion by them excited. Of this Circumſtance I carefully inform the Patient, to prevent that Deſpondency which is ſo natural to this Diſorder. However it be, Part of theſe foul Humours, which we ſuppoſe to have been collected by the long Duration of the Diſtemper, muſt be remov'd before the primary Intention can be conveniently anſwer'd.

For the next thirty Days I preſcribe chalybeate Medicines, which ſerve to impregnate the vapid and languid Maſs of Blood with a certain volatile Ferment, whereby the drooping Spirits are rous'd and reviv'd. This is manifeſt from the Effects of Steel in the Green-ſickneſs; for it evidently raiſes and quickens the Pulſe, warms the external Parts, and changes the pale death-like Colour of the Face into a florid Red. But it ought carefully to be obſerv'd, that Bleeding and Purging are not always to be premis'd to Chalybeates, with which we ought to begin when the Patient is extremely weaken'd, and almoſt ſpent with the Duration of the Diſeaſe.

Steel is, in my Opinion, beſt exhibited in Subſtance; for as I have never obſerv'd or heard, that it was prejudicial to the Patient when taken in this manner, ſo repeated Experience has convinced me, that it cures with more Eaſe and Expedition than any of the common Preparations: For officious Chymiſts rather leſſen than improve the Virtues of this and other excellent Medicines, by their Methods of preparing them. I have likewiſe been inform'd, that the crude Ore operates more efficaciouſly than Iron refin'd by Fuſion; and, if this Circumſtance be true, it ſtrongly ſupports our Aſſertion: But I am not certain of it from my own Experience. This, however, I undoubtedly know, that the moſt excellent Remedies hitherto diſcover'd derive their principal Virtues from Nature; and therefore Antiquity gratefully ſtyl'd them the Remedies, or Hands, of God, and not of Man. But, that a Medicine may produce ſurpriſing Effects from its own native Power and Goodneſs, in whatever Form it is adminiſter'd, is evident from the admirable Virtues of the Bark and Opium. Nor does the Skill of a Phyſician ſo much appear in preparing Medicines, as in ſelecting and adapting thoſe which Nature has produced, and liberally beſtows. Our only Buſineſs, therefore, is to reduce them to a Form, by which their Subſtance, or Virtues, may be the more effectually communicated to the Body; a Buſineſs which we are ſufficiently enabled to execute. Next to Steel in Subſtance, I would uſe its Syrup, which is prepar'd by infuſing the Filings of Iron, or Steel, in *Rheniſh* Wine cold, till it is ſufficiently impregnated, afterwards ſtraining it off, and boiling it, with a ſufficient Quantity of Sugar, to the Conſiſtence of a Syrup.

During a Courſe of Chalybeates I never exhibit Cathartics, becauſe they ſeem to deſtroy the Effects of Steel, both in hyſteric and hypochondriac Diſorders. For when I principally intend to quiet the Spirits, and to reſtore and ſtrengthen their Frame, the gentleſt Purge undoes, in one Day, all the good Effects which Steel has produced in a Week. And, doubtleſs, when this Practice of Purging is preſcrib'd during the Uſe of chalybeate Waters, they are thereby render'd leſs efficacious. Nor am I ignorant, that ſome have recover'd, not only when Purgatives have been interpos'd, but even when they have been daily adminiſter'd with Steel; but the Succeſs is here rather to be aſcribed to the powerful Virtues of the Steel, than to the Skill of the Phyſician.

If it be objected, that Steel Filings may ſtick to the Bowels, and do Miſchief, unleſs Cathartics are ſometimes exhibited; I anſwer, that I never obſerv'd any ſuch bad Conſequences produced by them; and it is more probable, that the Steel, without Cathartics, being invelop'd in the mucous and excrementitious Humours of thoſe Parts, will at length be evacuated with them, than if they are agitated by Purgatives, which occaſion unuſual Gripings and Contractions of the Inteſtines; by which means the Particles of Steel, which adhere to their Coats, may be more deeply fixed.

During a Courſe of Chalybeates, in order to ſtrengthen the Blood, and animal Spirits, hyſteric Medicines are to be adminiſter'd, in ſuch a Manner and Form as are moſt agreeable to the Patient; though, if they can be taken in a ſolid Form, they will more effectually influence the Spirits, than in a liquid, ſuch as a Decoction, or Infuſion; for the Subſtance itſelf affects the Stomach longer, and communicates its Virtues more intimately to the Body.

In order to anſwer all the Indications above enumerated, I uſually direct the following few common and ſimple Remedies, with Succeſs.

Let eight Ounces of Blood be taken from the Right Arm.

Take of Galbanum, diſſolv'd in Tincture of Caſtor, and ſtrain'd, three Drams; Tacamahac, two Drams: Mix them together, for a Plaiſter, to be applied to the Navel.

Next Morning let the Patient begin the following Pills.

Take of the greater Pil. Cochiæ, two Scruples; Caſtor, powder'd, two Grains; Balſam of *Peru*, four Drops: Make them into four Pills, to be taken at five in the Morning, ſleeping after them.

Let them be repeated two or three times, either every Morning, or every other Morning, according to their Operation, or the Strength of the Patient.

Take of the diſtil'd Waters of black Cherries, Rue, and Briony, each three Ounces; Caſtor, tied up in a Piece of Linen, and ſuſpended in the Phial, half a Dram; fine Sugar, enough to ſweeten the Whole: Mix them for a Julap; of which let four or five Spoonfuls be taken when the Patient is faint, or low-ſpirited, dropping into the firſt Doſe, if the Fit be violent, twenty Drops of Spirit of Hartſhorn.

After having taken the purging Pills, as above directed, let the Patient proceed to the Uſe of the following Remedies:

Take of the Filings of Iron, eight Grains; Extract of Wormwood, enough to make it into two Pills, to be taken early in the Morning, and at five in the Afternoon, for the Space of thirty Days, drinking after each Doſe a Draught of Wormwood-wine.

Or, for daily Uſe,

Take of the Filings of Iron, and Extract of Wormwood, each four Ounces: Mix them together. Let ſixteen Grains, or a Scruple, of this Maſs be made into three Pills, and taken at the times above-mentioned.

Or, if a Bolus be more agreeable,

Take of the Conſerve of *Roman* Wormwood, and Orange-peel, each one Ounce; candy'd Angelica, Nutmeg, and *Venice* Treacle, each half an Ounce; candy'd Ginger, two Drams; Syrup of Orange-peel, enough to make the Whole into an Electuary.

Take of this Electuary, a Dram and an half; the Filings of Iron, finely pulveriz'd, eight Grains; Syrup of Orange-peel, enough to make them into a Bolus, to be taken every Morning, and at Five in the Afternoon, with a Draught of Wormwood-wine after it.

Take of the fineſt Myrrh, and Galbanum, each one Dram and an half; Caſtor, fifteen Grains; Balſam of *Peru*, enough to make them into a Maſs, of every Dram of which let twelve Pills be form'd; three whereof muſt be taken every Morning during this Proceſs, with three or four Spoonfuls of compound Bryony-water after them.

But if theſe Pills ſhould looſen the Belly, as ſometimes they do, in ſuch as are eaſily purg'd, on account of the Gums they contain, let the following be ſubſtituted in their ſtead:

Take of Caſtor, one Dram; volatile Salt of Amber, half a Dram; Extract of Rue, enough to make them into twenty-four Pills, three of which are to be taken every Night.

But here it muſt be obſerv'd, that Chalybeates, in whatever Form or Doſe they are exhibited, ſometimes bring upon Women great Diſorders both of Body and Mind, not only in the Beginning, which commonly happens, but during the whole Courſe. In this Caſe the Uſe of Chalybeates is not to be interrupted; but, that they may be enabled to bear them, a proper Doſe of Laudanum muſt be given every Night, for ſome time, in any hyſteric Water.

But when the Diſeaſe is gentle, and ſeems not to require the Uſe of Steel, I judge it ſufficient to bleed once, and purge three or four times; and then to order the alterative hyſteric Pills above deſcrib'd, every Morning and Night, for ten Days. This Method is generally ſucceſsful, when the Diſtemper is not ſevere; and the Pills alone have often excellent Effects without Bleeding or Purging.

It is, however, to be carefully remark'd, that ſome Women, on account of a certain Peculiarity of Conſtitution, entertain ſo great an Averſion to hyſteric Medicines, which are ſo generally ſerviceable in this Diſeaſe, that, inſtead of being reliev'd, they are greatly injur'd by them. In theſe, therefore, they are to be entirely omitted; for, as *Socrates* wiſely obſerves, *it is fruitleſs to oppoſe the Tendency of Nature.*

This Idioſyncracy is ſo remarkable, and ſo common, that, unleſs Regard be had to it, the Life of the Patient may be endanger'd. And in this Circumſtance hyſteric Remedies are far from

from being ſingular: I ſhall produce only one Inſtance. Some Women, in the Small-pox, cannot bear Diacodium, becauſe it occaſions Giddineſs, Vomiting, and other hyſteric Symptoms, whilſt liquid Laudanum agrees very well with them.

In this manner hyſteric Diſeaſes, and moſt kinds of Obſtructions, but eſpecially the Green-ſickneſs, are generally cured. But if the Blood be ſo weak, and the irregular Motion of the Spirits ſo conſiderable, that the Diſorder will not yield to a Courſe of Chalybeates, as above directed; the Patient muſt drink ſome Steel-water, ſuch as that of *Tunbridge*. For the chalybeate Virtues of theſe Waters is more intimately communicated to the Blood, on account of the large Quantity that is drank, and, alſo, of their Agreeableneſs to Nature; and proves more effectual in curing Diſeaſes, than the choiceſt Preparations of Iron, however magnified by the Chymiſts. But this Caution muſt be particularly obſerv'd, that if any Diſorder happens, which may be refer'd to hyſteric Symptoms, the Waters are to be omitted for a Day or two, till that Symptom diſappears, which would otherwiſe hinder their Paſſage. For though theſe Waters are not ſo ſubject to agitate the Humours, and occaſion a Diſorder of the Spirits, as the gentleſt officinal Cathartic, yet they, in ſome Degree, occaſion ſuch a Diſturbance by their diuretic Quality, and, beſides, they often purge. But if the Waters themſelves obſtruct their own Paſſage, by raiſing Commotions in the Humours and Spirits, how improper muſt it be to preſcribe Cathartics, once or twice a Week, during the Courſe! and how much more abſurd, to mix Purgatives with them; which occaſion theſe and other mineral Waters to operate more ſlowly and difficultly!

If the Diſorder will not yield to Steel-waters, recourſe muſt be had to hot ſulphureous Waters, as thoſe of *Bath*: Drink them three Mornings ſucceſſively, and bathe in them the fourth; drinking and bathing in this manner alternately for two Months. For the Courſe muſt be continued not only till the Patient finds ſome Relief, but till he perfectly recovers.

Venice Treacle alone, frequently us'd, and continued for a ſufficient time, has an excellent Effect in this Diſeaſe, and many others proceeding from a Want of Heat and Digeſtion.

If the Patient be not of a ſlender and bilious Habit of Body, an Infuſion of Gentian, Angelica, Wormwood, Centaury, Orange-peel, and other ſtrengthening Simples, in *Canary* Wine, does great Service, a few Spoonfuls of it being taken thrice a Day; and I have found ſome hyſteric Women remarkably reliev'd by drinking, for ſome Nights ſucceſſively, a large Draught of *Canary* alone, at Bed-time.

I have known ſeveral hyſteric Women, and hypochondriac Men, who were reduced to great Weakneſs, recover by taking a Scruple of the Bark every Morning and Night for ſome Weeks. But this Remedy proves more effectual, when the Diſeaſe is accompanied with violent Efforts and Convulſions.

But, when any of the Remedies above directed do not agree with the Patient, as it frequently happens in thin and bilious Habits, recourſe may be had to a Milk-diet; by which ſome Women have been cured of long and obſtinate hyſteric Diſorders, eſpecially of the Hyſteric Colic, which can only be relieved by repeated Opiates, the Pain returning as ſoon as the Effect of the Anodyne ceaſes. That Milk, which affords only a cold and crude Nouriſhment, ſhould, nevertheleſs, by Uſe, ſtrengthen the Spirits, does not ſeem repugnant to Reaſon, if we conſider, that, as it affords only a ſimple Aliment, ſo it does not give Nature ſo much Trouble in digeſting it, as Food and Liquors of a more heterogeneous Kind; and that an equal Mixture of the Blood and Spirits neceſſarily follows this perfect Digeſtion. But ſome cannot ſupport the Inconveniences which generally attend the Beginning of a Milk Diet; becauſe it is ſubject to coagulate in the Stomach, and does not afford ſufficient Nouriſhment to maintain the ordinary Strength of the Body.

But the beſt Thing I have hitherto found, for chearing and ſtrengthening, is a frequent and long-continued Practice of Riding on Horſeback: For as this kind of Exerciſe gives a great Shock to the lower Belly, which is the Seat of the excretory Veſſels, appointed, by Nature, to carry off all the excrementitious Parts of the Blood, it ſhould ſeem, that every Diſorder of the Functions, or natural Weakneſs of the Organs, muſt be relieved by the often repeated Agitation of the Body in the open Air: Neither can any Perſon have the innate Heat ſo extinguiſhed, as not to be excited by this Exerciſe: Nor can there be any preternatural Subſtance, or vitiated Juice, ſo intimately lodged in any Cavity of theſe Parts, which cannot, by the Uſe of Riding, either be reduced to ſuch a State as is agreeable to Nature, or diſſipated and expelled: And, by this Motion, the Blood, being continually agitated and mixed, is purified and ſtrengthen'd likewiſe: And though this Exerciſe does not agree ſo well with Women, who lead an eaſy and ſedentary Life, and may be injured by Motion, eſpecially in the Beginning, it is, nevertheleſs, very proper for Men, and ſooneſt recovers their Health.

This is the general Method of curing this Diſorder: But, when the Fit comes on, accompanied with any of the above-mention'd Symptoms, and is ſo violent as to admit of no Reſpite; for ſtrengthening the Blood and Spirits, we muſt have Recourſe to hyſteric Medicines, which, by their ſtrong fetid Smell, compel the diſorder'd Spirits to return to their deſerted Stations, being either taken inwardly, held to the Noſe, or outwardly applied: Such are Aſa-fetida, Galbanum, Caſtor, Spirit of Sal Ammoniac; and whatever has a diſagreeable Odour, whether it be naturally fetid, or is render'd ſo by Art, admirably anſwers this Intention.

When the Paroxyſm is attended with a very violent Pain of any particular Part, exceſſive Vomiting, or a Looſeneſs, beſides the hyſteric Remedies above-mention'd, we muſt exhibit Laudanum, which is the only Medicine that can quiet theſe Symptoms. But, unleſs the Pains occaſion'd by Vomiting be, in a manner, intolerable, we muſt be cautious of mitigating them by any Opiate, before proper Evacuations have been made: Firſt, Becauſe, ſometimes, there is ſo conſiderable a Plenitude of Blood and Juices in the Body, (eſpecially in ſanguine and robuſt Women) as to render the frequent Repetition of the moſt powerful Opiate ineffectual: In ſuch, therefore, bleeding in the Arm is indiſpenſably neceſſary, and a Purge muſt be adminiſter'd; and then the Opiate will anſwer the End, in a moderate Doſe. Secondly, Much Experience hath taught me, that when the Patient has been, by degrees, accuſtomed to Laudanum, and proper Evacuations have not been previouſly made, ſhe has been compel'd, when the Pain return'd, and the Virtue of the Opiate ceaſed, to repeat it every Day, for ſome Years, gradually augmenting the Doſe; ſo that, in time, the Patient cannot forſake it, although it impairs all the digeſtive Faculties, and weakens the natural Functions; tho' I do not conceive, that the Uſe of Laudanum immediately injures the Brain, Nerves, or animal Faculties.

But I judge it neceſſary to evacuate, before the exhibiting of Opiates: For Inſtance, in every robuſt and plethoric Woman, Bleeding muſt precede, which muſt be ſucceeded by Purging: But, when weak ſlender Women have had a quick Return of a Fit, and Pain, of this Kind, it will ſuffice to cleanſe their Stomachs with three or four Quarts of Poſſet-drink, and then to preſcribe a large Doſe of *Venice* Treacle, or Orvietan, and a few Spoonfuls of ſome grateful ſpirituous Liquor, with a few Drops of liquid Laudanum, to be taken immediately after it.

But, if the Vomiting has long continued, before the Phyſician was called, ſo that an Emetic may greatly diſturb the Spirits, and too much debilitate the Patient, Laudanum muſt immediately be exhibited in ſuch a Doſe, and repeated ſo often as the Continuance and Urgency of the Symptom demand; ſo that it may be able to conquer it.

Two Cautions are to be particularly obſerv'd here: Firſt, When, after neceſſary Evacuations, the Uſe of Laudanum is begun, the Doſe muſt be ſufficiently large, and ſo frequently repeated, that all the Symptoms may be remov'd; only allowing ſuch an Interval, that the Effect of one Doſe may be known, before another is exhibited. Secondly, When Laudanum has been adminiſter'd, no Evacuation muſt be attempted; for the gentleſt Clyſter of Milk and Sugar is ſufficient to deſtroy all the good Effects of the Opiate.

But, tho' the Pains above-mention'd remarkably require Opiates, a violent Vomiting indicates much the largeſt Doſe, and a frequent Repetition: For, in this Caſe, the periſtaltic Motion of the Stomach being inverted, the Medicine is ejected, by Vomit, before it can produce any Effect, and muſt, therefore, be exhibited afreſh, and, particularly, in a ſolid Form; or, if in a Liquid, the Quantity of the Vehicle muſt be very ſmall, that it may barely moiſten the Stomach; as a few Drops of Laudanum in a Spoonful of ſtrong Cinnamon-water. The Patient, alſo, muſt be caution'd to compoſe herſelf immediately after taking the Laudanum, and to keep her Head ſteady, the leaſt Motion of which extremely promotes Vomiting. When the Vomiting is, in a manner, overcome, it is proper to repeat the Anodyne, Morning and Night, for ſome Days, in order to prevent a Relapſe; and this ſhould be obſerved in hyſteric Pains, or a *Diarrhœa*, which have been cured by an Opiate.

By this Method the ſymptomatic Pain and Vomiting may be eaſily cured, which, becauſe they often reſemble other Diſeaſes, deceive the Phyſician more than any other Symptom that requires his Aſſiſtance: Thus, in that kind of hyſteric Diſorder which imitates a nephritic Paroxyſm, the Pain attacks the ſame Part in both Diſeaſes, and is, alſo, attended with a Vomiting; but yet their Cauſes are ſo different, and require ſuch different Treatment, that what relieves in the one, injures in the other: The ſame may be affirmed of that Species of hyſteric Diſorders which reſembles the bilious Colic; the violent Pain, and the green Matter diſcharg'd upwards and downwards, being nearly the ſame in both Diſtempers. For theſe Reaſons particular Caution muſt be obſerved, to guard againſt all Errors in the Diagnoſtics; Errors which have often proved fatal to the Patient.

Another Miſtake, which proves equally fatal to Numbers of Women, is, when, after a happy Delivery, they are perſuaded to riſe too ſoon from Bed; which is immediately followed with an hyſteric Diſorder; and, as it increaſes, the Lochia are firſt diminiſhed, and then entirely ſuppreſſed: This unſeaſonable Stop-

page is ſucceeded by a numerous Train of Symptoms, which ſoon are deſtructive, unleſs great Skill and Diligence be uſed to prevent it: Sometimes a Delirium proceeds from the ſame Cauſe, which, augmenting continually, occaſions Convulſions, and then Death; or, if the Patient eſcapes, ſhe loſes her Senſes, for the Remainder of her Life. Sometimes a Suppreſſion of the Lochia is followed with a Fever, which nearly, or, perhaps, entirely, reſembles the then reigning epidemic Diſtemper; and the ſame hyſteric Diſorder, which firſt occaſion'd the Suppreſſion of the Lochia, now rages more violently than before.

In theſe Caſes, the curative Indications are, Firſt, To compoſe the Spirits diſturbed by this Motion. Secondly, To remove the Suppreſſion of the Lochia; this being the immediate Cauſe of theſe Symptoms: This Method, however, muſt not be obſtinately purſued; for, if the ordinary Remedies fail, after being uſed ſome time, they are to be left off; becauſe, as forcing Medicines are not to be adminiſter'd here; ſo neither ought we to perſiſt in exhibiting thoſe of a milder Kind, on account of the extreme Weakneſs and Lowneſs of Spirits, which Child-bed Women, who are thus affected, labour under: For Inſtance, as ſoon as the Lochia are ſuppreſſed, it is proper to put the Woman to Bed, applying an hyſteric Plaiſter to the Navel, and to preſcribe the following Electuary, to be exhibited with all convenient Expedition:

Take of the Conſerve of *Roman* Wormwood, and of Rue, each an Ounce; Troches of Myrrh, two Drams; Caſtor, Saffron, volatile Sal Ammoniac, and Aſa-fetida, each half a Dram; Syrup of the Five opening Roots, a ſufficient Quantity to make them into an Electuary; Of which let the Quantity of a large Nutmeg be taken every three Hours, drinking after it four Spoonfuls of the following Julap.

Take of the diſtilled Water of Rue, and compound Bryony-water, each three Ounces; fine Sugar enough to ſweeten it; mix them for a Julap.

If theſe Medicines be given as ſoon as the Suppreſſion of the *Lochia* appears, they generally effect a Cure; but if the Diſorder continues, after the whole Quantity, here directed, is taken, we muſt exhibit, for once, a ſingle Doſe of Laudanum; which, tho' it be naturally aſtringent, yet, by allaying the Hurry of the Spirits, whereby the uſual Flowing of the *Lochia* is check'd, it does great Service, and may ſometimes remove the Suppreſſion, when Emmenagogues fail: But Opiates are moſt commodiouſly exhibited along with Hyſterics and Emmenagogues; as fourteen Drops of liquid Laudanum, in compound Bryony-water; or a Grain and half of ſolid Laudanum, and half a Scruple of Aſa-fetida, made into two Pills.

But if the *Lochia* do not flow afreſh by giving a ſingle Doſe of Opium, it is by no means to be repeated; becauſe it would ſuppreſs them ſo powerfully, that they could not afterwards be promoted: If, therefore, after having waited ſome time, to be aſſured of its Effects, we find it fail, we muſt return to Emmenagogues, join'd with Hyſterics, and then inject a Clyſter of Milk and Sugar, a Repetition of which, if one does not bring down the Lochia, would tend to divert them another Way.

This Method having been uſed, it is ſafeſt, and incumbent on a prudent Phyſician, to wait and ſee what Effect Time will produce; for the Danger leſſens every Day; and, if the Patient outlives the twentieth Day, ſhe is in a manner ſafe: For, when the Woman has had a Reſpite, and recover'd ſome Degree of Strength, ſhe will be able to ſupport the propereſt Method of removing the Diſorder; whereas, by continuing to give a Multitude of Remedies, when the firſt proves ineffectual, the Diſeaſe, and the Hurry of Spirits occaſioning it, may be increaſed.

But, beſides the natural Weakneſs of the Spirits, which is the primary Cauſe of Hyſteric Diſorders, there is, ſometimes, an adventitious Weakneſs, occaſion'd by an immoderate Flux of the *Menſes*, either in Child-bed, or at other times, which is productive of that Sort of Hyſterics called Vapours. The firſt Species principally happens ſoon after a difficult Labour, and is attended with a numerous Train of hyſteric Symptoms; but it ſoon goes off, being eaſily remedied by an incraſſating Diet, wherewith the following Drink may be joined.

Take of Plantain-water, and Red-wine, each a Pint; boil them together, to the third Part; and then ſweeten the Decoction with a requiſite Proportion of fine Sugar: Give half a Pint of it twice or thrice a Day.

In the mean time, ſome ſufficiently weak hyſteric Julap may be exhibited at times, and the following Compoſition held to the Noſe.

Take of Galbanum, and Aſa-fetida, each two Drams; Caſtor, a Dram and an half; volatile Salt of Amber, half a Dram: Mix them together. Or,

Take Spirit of Sal Ammoniac, two Drams: And let the Patient ſmell to it often.

But, as to an immoderate Flux of the Menſes, in Women who are not pregnant, tho' it ſeizes them at any time, yet it moſt frequently comes a little before the Menſes entirely ceaſe, which happens about the Age of Forty, if they began early to flow; or about fifty, if they began late. In ſuch Subjects, violent and frequent hyſteric Fits are occaſion'd, from the large Quantity of Blood which is continually loſt. Tho' hyſteric Medicines are to be uſed in this Caſe, both internally and externally, avoiding the ſtronger Kind, for fear of promoting the Flux; yet the principal Step towards the Cure conſiſts in checking the menſtrual Diſcharge; which may be ſoon effected, in the following manner.

Take eight Ounces of Blood from the Arm, and, the next Morning, give the common purging Potion; which muſt be repeated every third Day, for twice: And let her take an Ounce of Diacodium every Night, at Bed-time, during the Courſe of the Diſeaſe.

Take of the Conſerve of dried Roſes, two Ounces; Troches of *Lemnian* Earth, a Dram and half; Pomegranate-bark, and red Coral prepar'd, each two Scruples; Blood-ſtone, Dragons-blood, and *Armenian* Bole, each a Scruple; and as much ſimple Syrup of Coral as will make the Whole into an Electuary: Of which let the Quantity of a large Nutmeg be taken every Morning, and at Five in the Afternoon, with ſix Spoonfuls of the following Julap.

Take of the diſtil'd Waters of Oak-buds, and Plantain, each three Ounces; ſmall Cinnamon-water, and Syrup of dried Roſes, each an Ounce; Spirit of Vitriol, enough to give it an agreeable Sharpneſs.

Take of the Leaves of Plantain, and Nettles, each a ſufficient Quantity; bruiſe them well together, in a Marble Mortar, and preſs out the Juice, and, laſtly, clarify it: Let ſix Spoonfuls of it be taken three or four times a Day.

After the firſt Purge, let the following Plaiſter be applied to the Region of the Loins.

Take of Diapalma, and Rupture-plaiſter, each equal Parts: melt them down together, and ſpread the Maſs on Leather.

A cooling and incraſſating Diet muſt be preſcribed; only it will be convenient to allow the Patient a ſmall Draught of Claret, once or twice a Day; which, tho' it be not altogether ſo proper, as it is ſubject to raiſe an Ebullition, may be indulged, in order to repair the Strength.

There is, alſo, another Cauſe of hyſteric Diſorders, tho' it happens more rarely; and this is, a Bearing-down of the Womb, after a difficult Labour, attended with numerous hyſteric Symptoms; which, however, may be eaſily cured, by the following Method.

Take of Oak-bark, two Ounces; boil it in two Quarts of Spring-water, to one; and, towards the End of the Boiling, add of Pomgranate-peel bruiſed, one Ounce; Red Roſe-leaves, and Balauſtines, each two Handfuls; and, laſtly, half a Pint of Red-wine: Strain off the Liquor for a Fomentation, to be applied with Flannels, in the uſual manner, every Morning, two Hours before the Patient riſes; and at Night, after ſhe is in Bed: Continuing the Uſe of it till the Diſorder ceaſes. *Sydenham.*

With reſpect to hyſteric Diſorders, the Subject of this Article; *Hoffman*, we ſee, is of Opinion, that they are different from hypochondriacal Affections, contrary to the Sentiments of moſt medicinal Writers; And it muſt be confeſſed, that the Circumſtance of Tumors being found in the *Ovaria*, and Region of the Uterus, upon the Diſſection of hyſterical Subjects, ſeems to favour his Syſtem. I ſhould, however, ſuſpect, that theſe Tumors, full of ſtagnating Juices, are rather the Effects than the Cauſes of Hyſterics; for when the Veſſels of the Uterus, and thoſe adjacent to it, are extremely relax'd, the Fluids which ought to be propelled through them, or diſcharged from them, ſtagnate, and acquire a Degree of Acrimony, which, producing ſpaſmodic Conſtrictions, increaſe their Propenſity to retain the Fluids; which, in an healthy State, ought to be convey'd through them. It is farther worthy of Remark, that the *Uterus*, and Female Organs deſtin'd to Generation, are extremely nervous and ſenſible Parts: Hence ſome Variety of Symptoms may ariſe; and ſuppoſing hyſterical and hypochondriacal Affections to be excited by the ſame Cauſe, many ſpaſmodic Diſorders, hyſteric Fits, and convulſive Strangulations, may be produced in one Sex, from which the other, deſtitute of ſuch Parts, may, in a great meaſure, be exempted.

Upon the Whole, I apprehend both hysterical and hypochondriacal Disorders to be produced by a Relaxation of the Abdominal Viscera; the Consequences of which are abundantly explained, under the Article FIBRA: For the whole World can furnish us with very few Instances of hypochondriacal or hysterical Persons, amongst those whose habitual Way of Living procures and preserves a due Tenuity and Strength of the Fibres: Thus Women whose Subsistence depends upon their Labour, and Men inured to strong Exercises, especially in the Country Air, who go soon in the Evening to Bed, and rise with the Sun, or before it, who drink their Liquors cold, and those of no very spirituous Sort, may die of acute or chronical Distempers, but are utter Strangers to the very Names of Hysterics, Vapours, and hypochondriac Affections: Whereas those, whose Affluence of Fortune permits them to indulge in Ease and Indolence; who sleep much, and that long in the Morning; and, in consequence thereof, go to Bed unseasonably, and late; who drink copiously of warm Liquors, as Tea; all which debilitate and destroy the Tone of the animal Fibres, Vessels, and Viscera; most of these do a severe Penance for their Folly, and expiate their Disobedience to the Laws evidently pointed out by Nature and Providence, as *Sydenham* expresses it, by a Purgatory of hysterical or hypochondriacal Tortures.

The rational Method of Cure, therefore, consists, first, in clearing the Stomach and Intestines of all the indigested and putrid Sordes retain'd therein, and exciting no very desirable Symptoms: The second Step to be taken is, to attenuate and carry off the Juices stagnating in the Vessels and Viscera; and, for both these Purposes, nothing is more effectual than Mercurials prudently exhibited. When these are accomplish'd, the rest of the Cure will be readily completed, by going to Bed soon, and rising early; by proportioning the Aliments to the Powers of Digestion; by Exercises duly begun, and cautiously increas'd; and by Medicines, which by their gentle and salutary Stypticity, strengthen the digestive Organs, brace up the Fibres, and contribute to procure a due Tone in all the vascular System. Such particular Directions, with respect to these, are already given under the Article FIBRA, that it would be superfluous to repeat any Part of them in this Place. I shall only add, that, so far as I can judge, the Method here recommended is so obvious and successful, that I am persuaded, very few can miss of a Cure, unless their own Obstinacy or Appetites, interfere.

HYSTEROCELE, ὑστεροκήλη, from ὑστέρα, the Uterus, and κήλη, a Rupture. An Hernia caus'd by the Uterus falling through the Peritonæum. *Blancard.*

HYSTERON, ὕστερον, the same as DEUTERION, the Secundines. It is also used in the Plural, *Hysstera*, ὕστερα, *Galen* in 5 *Aph.* 35.

HYSTEROTOMIA, ὑστεροτομία, from ὑστέρα, the Uterus, and τόμος, a Section, a Section of the Uterus, is the same as CÆSAREA SECTIO; which see.

HYSTEROTOMOTOCIA, ὑστεροτοκοτοκία, from ὑστέρα, the Uterus, τόμος, a Section, and τόκος, Birth. A *Cæsarean* Birth, produced by a *Cæsarean* Section.

HYSTRIX. Offic. Charl. Exer. 19. Aldrov. de Quad. Digit. 471. Gesn. de Quad. 563. Jonst. de Quad. 119. Raii Synop. A. 206. *Balatuametinic*, Indis. THE PORCUPINE.

It is found in the Province of *Caragu*, and is of the Size of a Pig eight Months old. What is used in Medicine, is the whole Animal, and the Stone, called *Pedro del Porco*, found in the Gall-bladder, called, also, by the various Names of *Bezoar Histricum*, *Lapis Hystricis*, *Lapis Malacensis*, *Lapis Porcinus*, *Mont. Exot.* 5. and *Lapis seu Pila Hystricis*, *Ind. Med.* 65. This Part is rather to be called an *Ægagropila*, than a Stone, as consisting of a woolly kind of Fibres, and a rediish, bitterish, and friable Matter, with its Outside cover'd in some Parts with a kind of blackish Scales, like Nails. It has neither Laminæ, nor Membranes, and is neither ponderous nor smooth, like the Bezoar, but light, and somewhat like the *Ægagropila*. *Jonst.*

This Animal seems to be endu'd with the same Virtues, as the *Erinaceus*. Dr. *Tancred Robinson* observes, that it is esteem'd an excellent Alexipharmac. *Dale.*

HYVOURAHE, Theveto, Clus. in Monard. *Hyvourai Brasilianis*, *Guaiaci Species.* Lerio.

A large Tree growing in *Brasil*, whose Bark is of a silver Colour on the Outside, and rediish within; and, when newly stript, yields a milky Juice of a salt Taste, and very much like that of Liquorice. The Fruit is of the Size of a moderate Plum, of a gold Colour, tender, of an agreeable Smell, and a very sweet Taste, and including a small Stone. This Fruit is very acceptable to sick Persons, on account of its fine Taste.

The Bark of this Tree is sudorific, drying, and aperitive, and used in *Brasil* for the *Lues Venerea*, in the same manner as we use the Bark and Wood of the *Guaiacum* for the same Disease in *Europe*. The Name *Hyvourahe*, in the *Brasilian* Language, signifies *a rare Thing*. *Lemery des Drogues.*

I.

I. FOR the Signification of this Letter in the Chymical Alphabet, see ALPHABETUM.

JAAROBA, a Species of *Phaseolus*, growing in *Brasil*, and bearing a Fruit like that of the *Cuiete*, or *Higueri Oviedi*, but generally less, of the same Pulp and Seeds, and of the same Use. It grows every-where, but principally in Gardens, where it is cultivated. The Roots are served at Table at a second Course. *Raii Hist. Plant.*

JABATAPITA, Marcg. Pison. *Arbor baccifera racemosa Brasiliensis*, *Bacca trigona prolifera.* A Tree in *Brasil*, of a moderate Height; its Flowers grow in Tufts, are pentapetalous, yellow, and of a very sweet Smell. The Fruit, which is ripe in *March*, grows in Bunches, that is, on every Pedicle grows a Berry of the Size of a Cherry-stone, of a conical, or somewhat triangular Figure, with three or four other Berries seated on it of an oval Figure, and of the same Size with that under them, all of a black Colour like our Myrtle-berries, and giving a Colour like them; they are without Stones, are of an astringent Taste, and serve not only for the same Uses, as our Myrtle-berries, but yield an Oil in common Use for Sallads. *Raii Hist. Plant.*

JABORANDI, Marcgr. A Plant of the Height of two Feet, of a ligneous and round Stalk, nodous, writhed, and unequal; the Root is not thick, but divided into many lesser ones, and Filaments; the Flowers are white and tetrapetalous, and the Seeds cover'd with a double Husk, as in Hemp, are of a brown Colour, flat, and resembling the Figure of an Heart, with a Part cut off from one Side. The Place of Growth of this Plant is not assigned, but the Root is said to be an Alexipharmac.

JABUTICABA, Piso, Marcgr. is a fine, tall, strait, pomiferous Tree in *Brasil*, with very large Branches, and bearing a Fruit of an Ash-colour, of the Bigness of a Lemon, of a sweet Juice, and cover'd with a thin Pellicle, like a full-ripe Grape, of a temperate and salutary Quality, and very grateful to feverish Persons. It bears no Flowers, but produces its Fruit from a tuberous Substance, with which it is invested from the Bottom of the Root, to the Tops of the Branches, in so plentiful a manner, that the Tree seems to be one continued Cluster.

There is another Species of this Tree, which grows in the Woods of *Tabacurana*, but the Fruit is not to be compar'd with the other: The Inhabitants, however, express from it a delicious and sweet Wine, which must be drank presently, for it grows the worse for keeping, and degenerates into Vinegar. Both the Species grow only in vast Forests.

JACA *Indica.* J. B. *Jaaca vel Jaca.* Park. *Tjaka marum.* H. M. *Palma Fructu aculeato ex Arboris Trunco prodeunte.* C. B. THE JACK-TREE.

It is a very large, tall Tree; the Fruit, called *Jaca*, grows out of the Trunk, and the biggest Branches, and is often bury'd in the Earth with the Bottom of the Trunk, to which it adheres. It is of a round-oblong, or rather conical Figure, a Span in Breadth, and two Spans in Length, and frequently weighs above twenty-five Pounds; the Rind of it is green, thick, and cover'd with a Multitude of prickly scaly Tubercles, like Diamonds, but white and lacteous within. *Acosta* says, the Prickles are not at all sharp and pungent, tho' they look threatening. Within these larger Fruits are innumerable smaller ones, under one common Rind, of an oblong Figure, a thick yellowish Pulp, and of a sweet and very grateful Taste and Smell; every one of these contains, in the Middle of it, a Nut, which is lodged within the Pulp, as in a Bag. These Nuts are of an oblong Figure, and cover'd with a thin, cartilaginous, whitish, and transparent Rind, under which is another rediish one, containing a thick Kernel of

the ſame Taſte with our Cheſnuts. Moreover, in the Middle of this large Cone ariſes a thick, whitiſh, and lacteous Style, like a Pillar, on which, as on a common Baſe, the leſſer Fruits are placed in circular Order, having one Extremity inſerted therein, and by the other adhering, in diametrical Oppoſition to the Rind. Among them are obſerv'd Multitudes of whitiſh and yellowiſh coriaceous Ligaments, which are, alſo, affix'd to the Style, and the Rind; and, when the Fruit is cut up, diſcharge together with the Style, and the Rind, a glutinous milky Juice, by which Birds are taken.

The Tree grows in *Malabar*, and over all the *Eaſt Indies*; there are above thirty Species of it, which are diſtinguiſh'd by their Fruits, tho' they are all reduced to two Kinds, one of which bears a Fruit of a ſucculent Pulp, which is of a very grateful and honey-like Taſte; and the other produces Fruit of a looſe, ſoft, and leſs ſavoury Pulp: The former is called *Varaca*, by *Acoſta Barca*; and the other *Tijaka Papa*, by *Acoſta*, *Papa*; or *Giraſal*.

The ripe Fruits, deprived of their Rinds, are eaten at Entertainments; but, when us'd too freely, are difficult of Digeſtion. The Natives uſe the tender Fruits in their *Caril*, a ſort of Food ſo called, or preſerve them in Pickle, or cut them in Pieces, and boil them, or fry them in Oil of Palm. The Nuts roaſted, after the manner of common Cheſnuts, are of a ſweet Taſte, and are ſerved up among Sweetmeats in a ſecond Courſe at Entertainments; but, eaten too freely, they affect the Breaſt and Fauces with a burning Heat, ſucceeded by a Hoarſeneſs. The Natives uſe theſe, alſo, in their *Caril*, or dry them in the Sun, and make Cakes of the Flour, which they call *Apas*; and the thin inner Rind, which immediately incloſes the Pulp, ſerves inſtead of *Arequa*, or *Kanoga*, in chewing of Betel. Of the Aſhes of the tender Fruit, is prepared a Lye with which they waſh their Linen; and the Wood employs the Carpenter and Joiner. *Acoſta* writes, that the yellowiſh viſcous Pulp, which involves the Nuts, is of a grateful Taſte, and much like the Pulp of the fineſt Melon, but difficult of Concoction, and very burdenſome to the Stomach; and that, if undigeſted, it generates noxious and virulent Humours; and that they who frequently indulge themſelves in this Food, eaſily fall into that moſt pernicious and infectious Diſeaſe, called *Morxi*.

Of the Roots of the Tree, they prepare a Decoction, which ſtops a Diarrhœa; and of the Powder of the Leaves, mix'd with the Dung of the *Bubalus*, is prepared a Cataplaſm, which, apply'd hot to the Cheeks, cures the Spaſmus Cynicus. The milky Juice of the Fruits, pounded with the Powder of *Calamus Aromaticus*, and the Eyes anointed therewith, is good for the *Nyctalopia*. The Wood, bruiſed in Vinegar, is effectual in a Relaxation of the Uvula, and an Inflammation of the Fauces and Tonſils. The Root bruiſed with the Pulp of the Fruit, and with an Addition of Sugar reduced to a Plaiſter, and apply'd to the Part, cures a malignant Herpes, attended with Worms, deſtroying thoſe Vermin. *Raii Hiſt. Plant.*

JACAPE. A Species of thickRuſh-like Graſs, growing in *Braſil*, bearing neither Flower nor Seed. It is ſaid to be effectual againſt the Bites of Serpents, if it be ty'd about the Limb above the Wound. *Piſo*, from his own Experience, commends the Decoction of the Roots againſt Poiſons. *Raii Hiſt. Plant.*

JACAPUCAYA *Arbor* Marcgr. *Jacapucaia* Piſon. *Nucifera Braſilienſis, Cortice Fructus ligneo, quatuor Nuces continente.* It is a very tall Tree growing in *Braſil*, and bearing a Fruit which hangs by a thick ligneous Pedicle, as big as a Child's Head, of an elliptical Figure, and its lower Part faſtigiated in manner of an obtuſe Cone, and its upper next the Pedicle depreſſed, reſembling a Cup with a Cover; its Rind is ligneous and hard. The Fruit, when ripe, opens, and the Cover falls off, diſcovering a Fruit divided into four Cells, each containing a wrinkled Nut, of the Size of an ordinary Plum, and of a yellow, inclining to an Aſh-colour, which, broken, diſcovers a white Kernel, of an excellent Taſte: The Nuts, when mature, which is only in the Middle of Winter, are, alſo, diveſted of their Coats, and fall out of their Calyces. The Tree abounds in the Marſhes and midland Places, to ſuch a Degree, as to be ſufficient to ſupport an Army with its Fruit, which, for its Taſte and Goodneſs, may compare with the Piſtachio, and is ſaid to be provocative of Venereal Inclinations.

Potions, Panadas, and ſuch Kinds of Preparations, are made of the Fruit, as well for Medicinal Uſes, as for Food; a pinguious Oil is, alſo, expreſſed from it, which is hotter than that of Almonds. It is better to eat the Fruit roaſted than raw, becauſe it affects the Head; the Boxes, or Cells, are ſo hard as to ſerve not only for Drinking-veſſels, but for Diſhes and Pots.

There are two Species of this Tree, which are alike in Appearance, but differ in Qualities; for one produces more deformed Calyces, whoſe Nuts are of leſs Value, and the immoderate Uſe of them, as we are aſſured by the Inhabitants, produces an *Alopecia*. The Wood of both Species wonderfully reſiſts Putrefaction, and, for its exceeding Hardneſs, is choſen for making the Axes of their Sugar-mills, being vaſtly preferable to other Trees, for that Purpoſe: Of the outer Bark, dry'd and bruiſed, they make Oakum for calking of Ships.

JACARANDA *Braſilienſibus* Marcgr. *Jacaranda alias* Piſonis, *Fructu Manus Magnitudine & Craſſitia.* It is a Tree like the *European* Plum-tree, and grows in the open midland Places of *Braſil*: Its Fruit is of the Bigneſs and Thickneſs of the Palm of the Hand, very remarkable for its gibbous, ſinuous, and writhed Figure, and always pendulous, by reaſon of its Ponderoſity; it is not eatable, unleſs boiled. The Inhabitants prepare of it a ſort of Pottage, or Gruel, called *Manipey*, which is very good for the Stomach.

There is another Species of this Tree, whoſe Wood is black, ſweet-ſcented, and hard: It grows very commonly in the Bay of *All-Saints* in *Braſil*. *Raii Hiſt. Plant.*

JACE *Braſilienſibus.* Marggr. *Citrullo affinis, Melo Indicus, ſive Patheca.* J. B. *Melo Indicus Fructu oblongo.* C. B. *Ray* makes this a Species of *Anguria*, or *Citrullus*, and calls it the *Watermelon.* The Fruit is round, globous, or oval, of the Bigneſs of a Man's Head, more or leſs, cover'd with a green Rind, with a white Pulp, and in the Middle, where the Seed lie, red or Blood-coloured, extremely juicy, and of a good Taſte. The Seeds are numerous, and the Size and Figure of thoſe of the *Pepo*, or Pompion, of a black, and, in ſome, of a rediſh Colour. *Raii Hiſt. Plant.* See the Virtues under CITRULLUS.

JACEA.

The Characters are;

The Leaves and Stalks are deſtitute of Spines, and the Leaves have their Margins equal, not ſerrated. *Boerhaave, Index alter, Pars* 1. *p.* 140.

Boerhaave mentions forty-one Species of this Plant, none of which have any medicinal Virtues attributed to them, except the 1ſt, 2d, 22d and 31ſt.

The firſt is the

Jacea; ſtellata; folio papaveris erratici. See CALCITRAPA.

The ſecond is the

Jacea; ſtellata; ſpina ſolſtitialis dicta; foliis Cyani. See CALCITRAPA.

The twenty-ſecond is thus diſtinguiſh'd:

Jacea; nigra; pratenſis; latifolia. *C. B. P.* 271. *Tourn. Inſt.* 443. *Boerh. Ind. A.* 142. *Jacea.* Offic. *Jacea nigra.* Ger. 588. Emac. 727. Raii Hiſt. 1. 325. Synop. 89. *Jacea nigra vulgaris.* Park. 468. *Jacea nigra vulgaris capitata & ſquamoſa.* J. B. 3. 27. KNAPWEED, or MATFELLON.

Tabernamontanus recommends the Decoction of it for Ruptures: There are ſome that give it in Powder in Pottage. By the chymical Analyſis it yields hardly any thing but a Subſtance loaded with acrid Salt. *Martyn's Tournefort.*

It is too frequent in Paſture-grounds, and flowers in *July* and *Auguſt*. The Herb, which is uſed, is effectual againſt Tumors of the Tonſils; and in Hernias and Wounds. *Dale* from *Schroder.*

The thirty-firſt is thus diſtinguiſh'd:

Jacea; foliis Cichoraceis, villoſis; altiſſima; flore purpureo. *Tourn.* 444. *Boerh. Ind. A.* 142. *Stœbe.* Offic. *Stœbe argentea major.* Ger. 590. Emac. 730. *Stœbe major foliis Cichoraceis, mollibus, lanuginoſis.* C. B. 273. *Stœbe Salmantica prima Cluſii.* Park. 476. Raii Hiſt. 1. 324. *Stœbe Salmanticenſis prior Cluſii, ſive Jacea Iuſybacea.* J. B. 3. 36. SILVER KNAPWEED.

It is cultivated among us in Gardens, flowers in *July*, and the medicinal Parts are the Herb and Seeds. The Leaves and Seeds are aſtringent; for which Reaſon a Decoction of them is uſed in Clyſters for the Dyſentery, and, alſo, inſtilled into purulent Ears. A Litus, prepared of the Leaves, removes a Lividneſs occaſion'd by Blows about the Eyes, and repreſſes an Hæmorrhage. *Dale* from *Dioſcorides.*

So ſhort and imperfect is the Deſcription which *Dioſcorides* has given us of the *Stœbe*, as to occaſion a great Variety of Opinions among Botaniſts; ſome beſtowing that Name upon one Plant, ſome on another. The Plant, whoſe Synonyms I have here given, has as good, and, perhaps, a better Right to that Name, ſince it grows more plentifully in hot Countries, than either the *Jacea magna*, of which *Matthiolus* has given us the Figure, or that which *Dodonæus* took from the Imperial Library; but whether it agrees in Virtue with that of *Dioſcorides*, muſt be tried by Experiments. *Dale.*

JACEA is alſo a Name for ſeveral Sorts of XERANTHEMUM and SERRATULA.

JACENS, κατακείμενος, from κεῖμαι, to lie, Jacent, or Lying, is ſpoken of a Perſon in the Situation or Poſture of Lying; attended with a Ceſſation of the Actions proper to the Muſcles and Tendons. *Galen. de Muſcul.* The Ears are called *jacentes*, lying, which were never erected, as in a newly-fallen Hind. *Scribon. Largus*, No. 13. Nature is ſaid by *Helmont* to be *jacens*, jacent, when the Diſeaſe is riſen to an Head, and intimately connected with Nature; that is, when the morbific Cauſe ſtrives to ſuppreſs the vital Forces or Flame. *Helmont, Natura contr. neſcia.*

IACINTHUS, or HYACINTHUS. See HYACINTHUS.

JACOBÆA.

The Characters are;

The Leaves are pretty deeply jagged, and the Calyx the ſame as of the *Doria*. *Boerhaave, Index alter, Pars* 1. *p.* 99.

Boerhaave mentions eighteen Species of this Plant, none of which have any medicinal Virtues aſcribed to them, except the ſeventh and tenth.

The ſeventh is thus diſtinguiſh'd:

Jacobæa; maritima. *C. B. P.* 131. *Jacobæa marina, ſive Cineraria.*

Cineraria. J. B. 2. 1058. *Cineraria.* Dod. p. 642. *Achaovan. Abiat.* Alp. Ægypt. 37. *Jacobæa fruticoſior, foliis utrinque candicantibus.* M. H. 3. 109. See ACHAOVAN.

The *Egyptians* uſe it medicinally for many Purpoſes: The Decoction of the Leaves, they ſay, expels the Stone from the Bladder and Kidneys; and is good to open inveterate Obſtructions of the Viſcera, eſpecially of the Uterus. It is, alſo, accounted a Remedy for other uterine Diſorders; as Coldneſs, Strangulation, Sterility, and Inflations, and for a Suppreſſion of the Menſes; whence theſe Women, who are ſubject to Hyſterics, find great Relief by Inſeſſions over a warm Decoction of the Leaves and Flowers. *Proſper Alpinus de Plant. Ægypt.*

The tenth is thus diſtinguiſh'd:

Jacobæa; vulgaris; laciniata. *C. B. P.* 131. *Tourn. Inſt.* 485. *Boerh. Ind. A.* 99. *Jacobæa.* Offic. Ger. 218. Emac. 280. *Jacobæa vulgaris.* J. B. 2. 1057. Raii Hiſt. 1. 284. Synop. 82. *Jacobæa vulgaris major.* Park. 668. RAGWORT or SEGGRUM.

The lower Leaves of Ragwort are of a dark-green Colour, about half a Foot long, and about two Inches broad, blunt-pointed, and deeply cut into ſeveral ſmaller jagged Diviſions, thoſe next the Root ſmalleſt. The Stalks are about two or three Feet high, hollow, and ſtriated, having ſeveral paler green Leaves ſet on, without Foot-ſtalks, which are in Proportion broader, and more finely cut. The Flowers grow on the Tops of the Branches Umbel-faſhion, and are each made up of about a dozen yellow Petals, ſet about a yellow fiſtular Thrum, which paſſes away into Down, containing ſmall flatiſh Aſh-coloured Seed. The Root is ſpreading, and full of long whitiſh Fibres. It grows every-where in dry Fields and Banks, and flowers in *June* and *July*.

The Leaves of Ragwort are commended by ſome as good for the Sciatica, or Hip-gout, uſed in Cataplaſms, Fomentations, and Ointments; as alſo for cleanſing foul ſordid Ulcers and Sores; and are good for the Cure of Wounds; but it is ſeldom uſed. *Miller's Bot. Off.*

Its Leaves are bitter, aromatic, a little aſtringent, and give but a very faint Tincture of red to blue Paper: They contain a great deal of Oil, and terreſtrial Parts; their Salt very much reſembles that which is natural in the Earth. *Dodonæus* ſays, that Ragwort is vulnerary, deterſive, and good for the Diſeaſes of the Throat. An Ointment made at *Paris*, with its Juice, is commended for the St. Antony's Fire; but it would be better to bathe the Face with the Juice itſelf warmed. *Martyn's Tournefort.*

It has the ſame Virtues as *Senecio*, or Groundſel: Applied hot, in the Form of a Cataplaſm, to the Belly, it has been ſucceſsful, as *C. Hoffman* obſerves, in giving Relief under intolerable Pains of the Belly, proceeding from the Dyſentery. It is, alſo, good in a Gargariſm for the Quinſey, and Inflammations of the Tonſils, which it diſcuſſes, and perfectly cures. *Dale* from *Schroder.*

JACOBÆA is, alſo, a Name for ſeveral Sorts of DORIA and SENECIO; which ſee.

JACUA ACAUGA. A Name for the *Heliotropium; Americanum; cæruleum; foliis Hormini anguſtioribus.*

JACULUS, The Name of a poiſonous Serpent, the ſame as ACONTIAS, and CENCHRITES; which ſee.

JADE. The Name of a precious Stone, otherwiſe call'd *Lapis Divinus.*

This is a Stone of a greeniſh Colour, ſomewhat inclining to grey; ſo extremely hard and difficult to be cut, that the Powder of Diamond muſt be employed for this Purpoſe. It is very much eſteemed by the Inhabitants of the *Eaſt Indies*, and no leſs valuable in the Eyes of the Natives of *South America*, but for very different Reaſons; the former accounting it a precious Stone, more valuable than the Diamond; and the latter a medicinal Stone, of uncommon Efficacy againſt the Epilepſy and Gravel.

It is by ſome ſaid, that, when worn on the Region of the Kidneys, it is proper to expel the Stone and Sand by Urine; and that it, alſo, contributes to the Cure of an Epilepſy; but the pretended Virtues of this Amulet are unworthy of that Regard which is always due to Truth.

JAGRA. A particular Species of Sugar, prepared from the *Coco* or *Cocker-nut.*

JALAPA.

The Characters are;

The Root is thick, carnous, long, ſucculent, and perennial; the Leaves are conjugated, like thoſe of the Solanum; the Branches and Stalks are geniculated; the Calyx reſembles a Tube, is monophyllous, and quinquefid; within the Calyx, upon the Ovary, grows a monopetalous, Funnel-ſhap'd, and, in ſome meaſure, quinquefid Flower. The Ovary lies conceal'd in the Centre of the Calyx, furniſh'd with a long Tube, with an orbicular Apex. This becomes an oblong, pentagonal, umbilicated Fruit, containing a farinaceous Kernel.

Boerhaave mentions ſix Species of this Plant; which are,

1. Jalapa; flore flavo. *T.* 129. *Mirabilis Peruviana, flavo flore.* H. L. Cluſ. H. 90. *Solanum Mexicanum, flore magno flavo.* C. B. P. 168.

2. Jalapa; flore purpureo. *Tourn. Inſt.* 129. *Boerh. Ind. A.* 78. *Chom.* 58. *Mirabilis Peruviana.* Ger. 272. Emac. 343. Park. Parad. 364. Raii Hiſt. 1. 398. *Solanum Mexicanum flore magno.* C. B. Pin. 168. *Jaſminum Mexicanum ſive Flos Mexicanus multis.* J. B. 2. 814. MARVEL OF PERU.

This Plant is cultivated in Gardens, and flowers in the Month of *Auguſt.* Its Leaves and Root are uſed in Medicine; the former of theſe, when bruiſed, diſſipate cold Tumors, if applied to them; and the Water, in which an Ounce or two of the recent Roots have been boiled, is an excellent Purgative for dropſical Patients. *Boerh. Hiſt. Plant. Hortuſius, ad Cluſium Hiſt. Plant.* informs us, that two Grains of the Root, taken internally, are highly efficacious in evacuating Waters in a Dropſy. *Dale Pharmacologia.*

3. Jalapa; flore ex luteo, albo, & rubro, miſto. *T.* 129.

4. Jalapa; parvo flore. *T.* 130. *Solanum Mexicanum flore parvo.* C. B. P. 168. *Solanum Mexicanum, Jaſminum Indicum dictum, flore minore.* C. B. Prodr. 91.

5. Jalapa; Officinarum fructu rugoſo. *T.* 130.

It was a Root unknown to the Antients, and, alſo, in *Europe*, till the Diſcovery of *America.* It uſually comes from the *Spaniſh Weſt Indies* in tranſverſe Sluices, about half an Inch thick, being rugged, and of a dark-brown Colour on the Outſide, and whitiſh within, full of black, ſhining Reſin. The whole Root is oblong or oval, the lower End being narroweſt; of a pretty firm heavy Subſtance. This has been believed by moſt Authors to be the Root of a *Convolvulus*; Mr. *Ray* calling it *Convolvulus Americanus, Jalapium dictus*; but, if we may rely on the Account which Father *Plumier* gives of it, it is a Species of *Mirabilis Peruviana*, or Marvel of *Peru*, having ſmaller Leaves and Flowers than the common; and is called, by *Tournefort, Jallapa Officinarum, fructu rugoſo:* Which may well enough be; for *Prevotius*, in his *Medicina pauperum*, ſays, that two Drams of the Root of the *Herba mirabilis Hiſpanorum, variegatum Florem gerentis*, which I take to be the common Marvel of *Peru*, purges ſerous Humours very kindly, and is, therefore, of ſingular Service in the Dropſy, Gout, and Rheumatic Pains: It is likewiſe a good Purge for the Itch, and all cutaneous Diſtempers, from half a Dram to a Dram. It is uſed with great Succeſs in Obſtructions of the Viſcera of the Abdomen; being given in a Bolus, in the Quantity of twelve or fifteen Grains, with Mercurius dulcis. It may, likewiſe, be joined with the *Peruvian* Bark, twenty-four Grains to an Ounce of Bark, and made into a ſoft Electuary, with three Ounces of Syrup. A Dram of this Electuary will purge very well; and hence we ſee, that the Bark aſſiſts Jalap in its Action; for, in a Doſe of this Purge, there are about three or four Grains of the Root. It may be advantageouſly given in this Manner, in habitual intermitting Fevers, accompanied with a bad Habit of Body.

The only officinal Preparation from this Root is, the Reſin extracted by Spirit of Wine. The Reſin ought to be given in very ſmall Doſes, that is, from five to twelve Grains at moſt; and it ought to be remembered, that, if this Reſin is not either very well diſſolved or mixed, it ſticks to the Folds of the Inteſtines, and raiſes great Heats, and other Diſorders. Therefore it is always better given in Subſtance. This Reſin loſes its Virtue by being long kept. If given in the Quantity of fifteen or twenty Grains, it purges very briskly; and *Simon Paulli* compares it, on that account, to Scammony. *Wepfer*, in his Treatiſe *De Cicuta Aquatica*, mentions ſome Experiments made with Jalap-roots, on Dogs; the Event of which was, that the Dogs died, and their Inteſtines were found to be perforated.

That which breaks blackeſt and moſt brittle, ſound, and ſhining within-ſide, is beſt, the Parts which give it thoſe Properties, being ſuppoſed to contain its medicinal Virtues. Some take great Pains to extract its Reſin, which is to be done with any ſpirituous Menſtruum, but afterwards it requires Correctors. The moſt common is Salt of Tartar, or Loaf-ſugar; for its being rubbed much with the latter, makes it operate milder, for the ſame Reaſon as the Salt of Tartar does. But if correcting it conſiſts in ſeparating its Parts, what Occaſion was there for drawing them from the Root, and joining them in the Form of a Reſin? The following Experiments made by M. *Boulduc* are taken from the Memoirs of the Royal Academy of Sciences, for 1701.

He ſays it is one of the beſt Cathartics we have, and wonders it is ſo little uſed; for as it is ſo gentle as to need no Corrector, it, on the other hand, wants nothing to promote its Operation; Qualities which can ſcarcely be aſcribed to any other Purgative. Yet, he obſerves, that there are many Methods given to correct it, which rather ſpoil than meliorate it. Some have obſerved, that it binds the Body too much after the Operation; but this Effect is common to other Purgatives, eſpecially Hydragogues. His Experiments of Extraction were made with Spirit of Wine, and common Water. Twelve Ounces of the Root yielded, with Spirit of Wine, two Ounces of a reſinous Extract well dried: The Remainder, being likewiſe well dried, weighed nine Ounces, and ſix Drams. Out of this Remainder, by Water, he got four Ounces of a very ſolid and pure Extract. He took twelve Ounces more of the ſame Root, and digeſted it in common Water, with a gentle Fire; then, by Evaporation, he got a good Extract, weighing ſix Ounces and an half, the thick and muci-

mucilaginous Parts, which he ſeparated by Filtration, being well dried, weighed one Ounce and an half, and the Reſidue weigh'd about four Ounces and an half.

Hence he obſerv'd, that the Extract made with Water, if given from twenty-four Grains, to thirty-ſix, purged gently; but was very diuretic, as he had experienced in many hydropical Caſes: That the Reſidue, which yet contained a little of what was reſinous, purged reaſonably, but with Gripings; that the Remainder, deprived of its ſaline and reſinous Parts, purged very little, but was extremely diuretic. Whence he concludes, that Extracts, to purge effectually, and without Irritation, ought to contain both the ſaline and reſinous Parts; for the former only paſs by Urine, and the other always, if taken alone, occaſions Diſorders; but, both joined together, their Effects are laudable; for the ſaline, opening the reſinous Parts, and diſſolving and accelerating their Diſtribution, thereby hinder them from adhering to, and inflaming the Parts they paſs thro'.

According to his Opinion and Experience, both concerning this, and other Drugs of the like Nature, the more Pains is taken in their Preparation, the worſe they are; becauſe Nature ſeems to have furniſhed them with the beſt Correctors in their Production. The Jalap-root itſelf, therefore, ſimply powder'd, is the beſt way of taking it, which may be mixed into a Draught, or a Bolus. It may be given to Adults, from half a Dram to one Dram; and to Children ſome give ſo many Grains as they are Years old; but that is ſomewhat in too ſmall a Quantity, eſpecially when they are advanced above ten Years. The only Reaſon that can be aſſigned for uſing the Reſin, is, that of the Root itſelf, one Parcel abounds with more, another with leſs, of the purgative Parts, which reſide in the Reſin: Hence the Doſe of the Root will become uncertain; but thoſe of the Reſin, being thought to be all of the ſame Efficacy, may have its Doſe determined very exactly; and its griping Quality may be certainly corrected by fixed Salts, or Loaf-ſugar.

Resina Jalapii. Resin *of* Jalap.

Take of ſelect (that is, black, heavy, and ſound) Jalap powder'd, one Pound; put to it of rectified Spirit of Wine, three Pounds; invert a Bolt-head, and lute it; ſet it upon warm Sand, three or four Days, and ſhake it, every Day, two or three times; when the Spirit is well tinged, decant it carefully, through a Hair Sieve, into a Cucurbit; ſet it in a gentle Heat of Sand, and draw off the Spirit of Wine, to one Pint, which may be returned upon the Jalap, to make a ſecond Extraction: Decant the Spirit as formerly; lute on its Head and Receiver, and diſtil as before: Let all cool, and in the Cucurbit there will be a Reſin, in the Form of Turpentine; which waſh in three or four Waters, and, in a gentle Heat, dry it, till it will beat into Powder.

Many fraudulent Chymiſts, when Jalap is dear, have a Trick of putting Scammony, which is, of itſelf, almoſt all Reſin, amongſt it, and ſometimes Gamboge; by which means they can afford to ſell it cheaper, than the Price it can be honeſtly made for. But their moſt notorious Cheat is, in mixing with it common black Reſin; two Parts of the latter to one of the former, as I have been informed: But this may be known by putting it into rectified Spirit, which will again diſſolve the Reſin of Jalap, but not touch the other. The Virtues are the ſame with thoſe of the Root, but it works rougher, becauſe all ſuch Subſtances ſtick to the Coats of the Stomach and Inteſtines, ſo as to occaſion much Pain and Uneaſineſs; for which Reaſon this is corrected with Sugar, Cream of Tartar, or the like; by which means it is brought into the ſame State as Nature firſt preſented it to us in the Root. For ſome Purpoſes, indeed, where the Form is required to be ſmall, as often in Adminiſtration to Children, this is moſt convenient. Its Doſe is from three Grains to one Scruple. *Quinſey.*

Miller, in his *Gardeners Dictionary*, ſays, theſe Plants are all affirmed, by *P. Plumier*, to be different Sorts of Jalap: But the *Jalapa Officinarum, Fructu rugoſo*, he ſays, is the particular Plant, whoſe Root is commonly uſed in Medicine; but that he has been ſince informed, by Mr. *William Houſtoun*, that the Jalap is the Root of a Convolvulus, and is not akin to either of theſe Plants.

JAMACARU. The Name of ſeveral Species of *American* Fig-trees. *Ray* takes notice of ſix. All theſe are eſteem'd cooling and moiſtening, except the Grains, which are drying and aſtringent. The Gum, therefore, the Fruit, the Leaves, and the Roots, either exhibited internally, or externally apply'd, are eſteem'd good in Fevers.

JAMBLICHI SALES. A ſort of compound Salt was thus called, which is ſaid to have been invented by *Iamblichus*, and was in great Eſteem for concocting the crude Humours, and for gently promoting Stools. It was thus prepar'd:

Take of Sal Ammoniac, one Pound; of Cappadocian Salt, ſix Ounces; of Pepper, three Ounces; of Ginger, three Ounces; of the Seeds of *Cnicus*, eighteen Scruples; of the Seeds of Rocket, ſixteen Scruples; of Biſhop's-weed, eighteen Scruples; of Hyſſop, eighteen Scruples; of Silphium, one Scruple; of the Tops of Thyme, Phyllon, and the Seeds of Smallage, and Parſley, each eighteen Scruples; of Origanum, an Ounce. Let them be all powder'd together, and ſifted. The Doſe is half a *Cochleare*, in a poach'd Egg, or any convenient Liquor, to be taken faſting. *Gorræus.*

JAMBOLONES Garciæ. *Jamboloins* Acoſtæ. A Shrub, which grows in the *Eaſt-Indies*, ſomewhat like Myrtle. It bears a Fruit ſomewhat reſembling large Olives, of a very aſtringent Taſte, which is pickled like Olives. The Fruit is eaten with Rice, and is ſaid to excite an Appetite, but is not eſteem'd very wholſome. *Rati Hiſt. Plant.*

JAMBOS. A Tree, growing in *Malabar*, of which *Ray* enumerates ſix Species.

1. *Prunus Malabarica Fructu umbilicato Pyriformi, jambos dicta minor. Jambos*, Park. J. B. Piſon. *Malacca. Schambu.* H. M. *Perſici Officulo Fructus Malacenſis.* C. B. The *Malabar* Plum-tree, with an umbilicated Pear-ſhaped Fruit, called the *Jambos minor.*

The Fruit is uſually eaten in the Beginning of Meals, before other Meats; it is of a ſweet and grateful Taſte, and of a very pleaſant Roſe-like Smell, which it emits even in eating; its Pulp is cold and moiſt, and extremely tender. Both the Fruits and Flowers are preſerv'd in Pickle, and by their cooling Succulency extinguiſh Thirſt in Fevers, and comfort the vital Spirits.

2. *Jambos prior* Acoſtæ. *Nati-Schambu*, H. M. *Prunus Malabarica Fructu umbilicato Pyriformi, Jambos dicta major.* The *Malabar* Plum-tree, with an umbilicated Pear-ſhap'd Fruit, called the *Jambos major.*

This Tree bears Fruit twice in the Year, which is of a more delicate Taſte than that of the preceding. The Bark of the Tree bruiſed, and taken in ſour Milk, cures the Dyſentery.

3. *Blatti, ſeu Jambos Silveſtris*, H. M. The *Blatti*, or wild *Jambos* of the *Hortus Malabaricus.*

The Natives boil the Fruit of this Tree, and eat it with other Food. The expreſſed Juice, mixed with Honey, cures *Aphthæ*, and is a potent Cooler in feveriſh Heats. A Cataplaſm prepared of the bruiſed Leaves, and apply'd to the Head, ſhaved, in continual Fevers, removes a Delirium, by procuring Sleep.

4. *Jambos ſylveſtris Malabarica, Samſtravadi dictus, Caipa Tijambou.* H. M. The wild *Malabar* Jambos, call'd *Samſtravadi*, the *Caipa Tijambou* of the *Hortus Malabaricus.* It is always ſeen with Leaves, Flowers, and Fruit; whence it is call'd by the Brachmans *Sada-pala*, that is, the Fruit-bearing Tree. The Pagans, call'd *Jogues*, or the Pilgrims, adorn themſelves with the floriferous and fructiferous Sprays of this Tree, and hang them about their Necks as an Amulet, and uſe them in numbering their Prayers. The Leaves are eatable, and their expreſſed Juice, boil'd with Oil of Palm, to the Conſiſtence of an Ointment, cures the Itch. The Kernels of the Fruit, pulveriz'd, and mix'd with Goats Dung, Sugar, and Butter-milk, and exhibited, cure a Diarrhœa; the ſame Powder, mix'd with Ginger, and the Juice of Lemons, cures a Teneſmus; taken in human Urine, is an Antidote againſt all ſorts of Poiſons; drank in Wine, it cures the Colic; when in Water, or outwardly applied, it eaſes the Pains of the Hæmorrhoids; drank in Woman's Milk, it excites Vomiting, and cures the Jaundice, and other bilious Affections; and, applied to the Eyes, is a Remedy for ophthalmic Diſorders.

5. *Jambos ſylveſtris, Samſtravadi dictus alter. Trijeria Samſtravadi.* H. M. The wild Jambos, call'd the Other *Samſtravadi*, the *Tijeria Samſtravadi* of the *Hortus Malabaricus.* The Wood of this Tree is hard and ſolid, and accommodated to the Uſe of Carpenters and Joiners; but the Virtues of the other Parts are juſt the ſame with thoſe of the preceding.

6. *Jambos ſylveſtris montana.* The wild Mountain Jambos, the *Malla-katou, Tijambu* of the *Hortus Malabaricus.* There are no peculiar Virtues aſcrib'd to this Tree. *Raii Hiſt. Plant.*

JANGOMAS, *Prunis ſimilis.* J. B. Pruno ſimilis ſpinoſa. *C. B.* It is a Tree of the Size of an ordinary Plum-tree, which grows ſpontaneouſly in the Fields, and, alſo, in the Gardens of *Raſaim, Chaul*, and *Batequalo*, bearing a Fruit like that of the Sorbus or Service-tree, and of a Taſte like that of a rough and aſtringent Sort of Plum. *Raii Hiſt. Plant.*

JANIPABA *Braſilienſibus.* Piſon. & Marcgr. *Genipat.* Park. *Pomo ſimilis Braſiliana.* C. B. *Junipappeeywa Braſilianorum, Nucum Foliis, ſive Genipat.* J. B. *Junipa.* Rochefort. *Pomifera Indica tinctoria. An. Panittjica Marum Malabarenſibus.* H. M. A very tall and large Tree, growing in *Malabar.*

The tender Leaves, bruis'd in Water, which is the common Form in Uſe among the *Aſiatics*, and the Liquor drank, or the expreſs'd Juice of the tender Fruits, is an excellent Remedy for Aphthæ, and Fiſſures of the Tongue, if it be held in the Mouth. The ſame Juice, inſtil'd into the Eyes, is good for an Ophthalmy. The Bark of the Tree, pulveriz'd, and mix'd with an Infuſion of Rice, and the milky Juice of the mature *Indian* Nut, is an excellent Allayer of Thirſt in the violent Heat of a Fever.

a Fever. They prepare, alſo, a Decoction of the Bark, which, mix'd with Honey, and exhibited, eaſes the Pain of the Gripes. The expreſs'd Oil of the Seeds, taken with Ginger and Cumin-ſeeds, gives Relief in the Dropſy, eaſes the tormenting Pains of the Belly, and evacuates the ſame. The ripe Fruit, with its Kernels, is eaten by the Natives; and the glutinous, gummy, and pellucid Juice of the immature Fruit, concreting and reddening, or blackening, in the Rays of the Sun, becomes an excellent ſort of Glue, us'd on all Occaſions by the Inhabitants, and particularly by the *Jews* and *Portugueſe*, in binding their Books, which, by that means, are ſecur'd from Worms. The immature Fruit, cut in Pieces, and rub'd on the Skin, dyes it of a black Colour, inclining to blue, which can by no means be waſh'd out, but vaniſhes ſpontaneouſly at the End of eight or nine Days. The Savages colour themſelves with it at their Feaſts, and when they go to War, in order to appear more terrible to their Enemies.

JANIPABA is, alſo, the Name of the talleſt Tree in *Braſil*, which has the Appearance of a Beech, and bears an Apple of the Size of an Orange, green when immature, and putrefying when ripe, like Medlars, in which State they are eatable, being us'd raw, not boil'd, and render'd more delicious by candying and preſerving. They are preſcrib'd, with Succeſs, in a Flux of the Belly; allay the burning Heat of the Mouth and Stomach; and are comfortable to ſick and ſound Perſons; only they are ſubject to affect the Head with their ſtrong Smell. The unripe Apples, reduced to a Cataplaſm, are applied to the malignant Ulcers and Nodes of the Lues Venerea. The Wine, or expreſs'd Juice, is preſerv'd for the ſame Uſes; but, when it grows old, it becomes hotter, and leſs aſtringent. The Natives of *Braſil* extract a Liquor from the unripe Fruit, by the Help of Fire, which they reſerve for the Purpoſes aforeſaid. *Rochefort* tells us, that the Fruit, in its Fall, makes a Noiſe like the Diſcharge of a Gun, which, he ſays, is owing to ſome Flatulences included within the Pellicles ſurrounding the Seeds, which, burſting by the Fall, give a ſudden Vent to theſe flatulent Particles, and ſo occaſion ſuch an Exploſion. Both Birds and Hogs, which feed on the fallen Fruit, have their Fleſh and Fat ting'd with a violet Colour. *Raii Hiſt. Plant.*

JANITOR. A Name for the PYLORUS.

JANITRIX. The Vena Portæ is ſo call'd.

JANUA *Emplaſtrum*. The *Emplaſtrum de Betonica*, deſcrib'd in *Lemery's Pharmacopée univerſelle.*

JANUARII CATAPLASMA. A Cataplaſm for the Spleen, invented by one *Januarius*, and deſcrib'd by *Marcellus Empiricus*, C. 23.

JAPARANDIBA. Marcgr. & Piſonis. *Arbor Pomifera Braſilienſis, Flore Roſæ, Fructu rotundo, Segmento ſuperius velut ablato.* A pomiferous Tree in *Braſil*, with a Flower like a Roſe, and a round Fruit, but flat at the Top, as if Part was cut away.

The Leaves, entire or bruis'd, being applied to the Region of the Liver, diſcuſs an Hardneſs of the Hypochondria; and have the ſame Effect, when reduced by Art into the Form of an Apozem, and exhibited; whence they are to be reckon'd in the Number of Aperitives. *Raii Hiſt. Plant.*

JAPONICA TERRA. See TERRA JAPONICA.

JAPONICA VERNIX. A Verniſh made of Gum Lac, and Spirit of Wine, deſcrib'd in the *Collectanea Chym. Leydenſ.* C. 508.

JARUINA, Nieremberg. A Tree growing in the Iſland of *Jucaija*, and reſembling a Fig-tree. It bears a Fruit a Span and an half long, ſoft as a Fig, ſavoury, and a good Vulnerary. The Leaves are ſaid to reſtore Limbs when almoſt pull'd aſunder. *Raii Hiſt. Plant.*

JASMELÆUM. A ſort of medicinal Oil, call'd by the *Perſians*, *Jaſme*, and prepar'd by putting two Ounces of the white Flowers of Violets into a Pint of Oleum Seſaminum, or Oil of Seſamum. It is in Requeſt among the *Perſians*, who uſe it at Entertainments, on account of its Fragrancy. It is very proper to to anoint the whole Body, after Bathing; and for Bodies which require Heat and Relaxation. It has a pretty ſtrong Smell, which is offenſive to many. *Aetius*, *Tetrab.* 1. *Serm.* 1.

JASMINOIDES. A Name for the *Rhamnus*; *ſpinis oblongis*; *cortice albo Monſpelienſium.*

JASMINUM.

The Characters are;

The Leaves are generally pinnated; the Calyx conſiſts of one Leaf, which is quinquefid. The Flower is monopetalous, funnel-ſhap'd, and pentapetaloidal in the ſuperior Margin, with a villous Centre, and generally five Stamina, ſometimes fewer: The Ovary is ſeated in the Centre of the Calyx, is furniſh'd with a long Tube, and becomes a Berry, containing generally two Seeds, but ſometimes only one.

Boerhaave mentions ten Species of this Plant; which are,

1. Jaſminum; vulgatius; flore albo. *C. B. P.* 397. *Tourn. Inſt.* 597. *Boerh. Ind. A.* 2. 216. *Jaſminum.* Offic. *Jaſminum album.* Ger. 743. Emac. 892. Park. Parad. 406. Raii Hiſt. 2. 1599. *Jaſminum, ſive Gelſeminum, flore albo.* J. B. 2. 101. *Gelſeminum, vel Jaſminum album vulgare.* Park. Theat. 1464. *Samback, ſive Zambak, Jaſminum.* Chab. 112. WHITE JASMINE, or JESSAMY.

This is a Tree, or Shrub, ſhooting out long, ſlender, green Twigs or Branches, which muſt be ſupported, or elſe they will hang down; the are cloth'd with long pinnated Leaves, made of ſeveral ſharp-pointed Pinnæ, ſet oppoſite to each other with an odd one at the End, larger than the reſt. The Flowers come forth among the Leaves, ſeveral together on a common Foot-ſtalk, but each ſtanding on a ſlender ſhort one of its own, being longiſh Tubes, ſpreading out at the Top into five broad Segments, ſtanding in very ſhort Calyces, ſo that they eaſily fall off, when full-blown; they are of a white Colour, and of a pleaſant agreeable Smell. Each Flower is ſucceeded by a Berry, divided into two Parts, but ſeldom coming to Perfection here. Jeſſamy is uſually planted in Gardens, and flowers in *June* and *July*.

The Flowers only are us'd, and that but ſeldom in our Shops; though *Schroder* commends them, as good to warm and relax the Womb, to heal any Scirrhi therein, and to facilitate the Birth; as well as to be uſeful for a Cough, Difficulty of Breathing, Pleuriſy, and Pains of the Stomach, Inteſtines, and Womb. The Oil, made by Infuſions of the Flowers, is made uſe of in Perfumes.

The Oil prepar'd of the Flowers diſcuſſes crude Humours, and is ſerviceable to thoſe who are ſubject to Colds and Catarrhs, and uſeful in the Winter Seaſon. In Perſons of an hot Temperature, it excites the Head-ach; and, if long ſmell'd to, endangers an Hæmorrhage from the Noſe. It is principally ſerviceable in Contractions and Hardneſſes of the Limbs; for it heats, mollifies, and relaxes the Joints, Tendons, and Nerves. It cures Diſorders of the Uterus, not only when applied to the Hypogaſtrium and the Pudenda, but alſo drank, or adminiſtred in a Clyſter: It is no leſs effectual in the Colic proceeding from cold and viſcid Humours. The Flowers are principally us'd in Diapaſms, and Perfumes for Gloves and Linen. *Raii Hiſt. Plant.*

2. Jaſminum; humilius; magno flore. *C. B. P.* 398.

The Bark of the Plant, with the Leaves, boil'd in Oil, or Butter, to the Conſiſtence of an Ointment, cures Ulcers and phagedenic Abſceſſes. *Raii Hiſt. Plant.*

3. Jaſminum; humile; luteum. *C. B. P.* 397.

4. Jaſminum; luteum; vulgo dictum bacciferum. *C. B. P.* 398.

5. Jaſminum; Indicum; flavum, odoratiſſimum. *Ferr. Flor. Cult.* 393.

6. Jaſminum; Africanum; folio Ilicis; flore ſolitario; ex alis foliorum proveniente. *Comm. Rar. Exot.* 6.

7. Jaſminum; Azoricum; trifoliatum; flore albo odoratiſſimum. *H. A.* 2. 159.

8. Jaſminum; ſive Sambach Arabum; Alpini. *J. B.* 2. 102. Syringa Arabica, foliis Mali Aurantii. *C. B. P.* 398. Sambac Leſmin Arabicum. *Alp. Ægypt. Cap.* 19. *p.* 182.

The Flowers of this Plant are more ſerviceable for Ornament than Health. There is, however, an Oil prepar'd of them, which the Women uſe in their Baths, in order to warm and relax the Uterus; and they experience it to be very conducive to the diſcuſſing of ſcirrhous Tumors in that Part, and to facilitate the Birth; for which Purpoſe they both take the Oil warm inwardly, and anoint therewith the Region of the Uterus. It is us'd, taken at the Mouth, warm; or outwardly applied to anoint the Thorax, for Coughs, Difficulty of Breathing, and for mortal Kinds of Pleuriſies, in which the Patient is incapable of expectorating but with the greateſt Difficulty; alſo for a Peripneumony, and violent Pains of the Stomach, Inteſtines, and Uterus. *Proſper Alpinus, de Med. Ægypt.*

9. Jaſminum; Arabicum; foliis Limonii conjugatis; flore albo, pleno, odoratiſſimo.

10. Jaſminum; Arabicum; Caſtaneæ folio; flore albo, odoratiſſimo; cujus fructus Coffy in officinis dicuntur nobis. See COFFEE. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 216.

JASMINUM *Indicum, & Mexicanum.* A Name for ſeveral ſorts of JALAPA.

JASMINUM *Perſicum.* A Name for the *Lilac folio Liguſtri*, and for the *Lilac; laciniato, folio.*

JASPACHATES. A precious Stone compounded of the ſmaragdian Jaſper and an Agate. It has a lenient Virtue, and, taken inwardly, is effectual in Dropſies, hepatic Diſorders, a Peripneumony, and Pleuriſy; it renders, alſo, the Body florid, and of a ſpecious Appearance. *Aetius*, *Tetrab.* 1. *Serm.* 2. *C.* 37.

JASPIS. Offic. Boet. 250. De Laet. 79. Calc. Muſ. 253. Schw. 381. Aldrov. Muſ. Metall. 884. Charlt. Foſſ. 32. Worm. 93. Kentm. 50. Mont. Exot. 14. THE JASPER.

It is an opake Gem, of a green, and, ſometimes, a blood Colour. It is found in the *Eaſt Indies*, and agrees in Virtues with the Cornelian. *Dale.*

IATRALEIPTES, ἰατραλείπτης, from ἰατρὸς, a Phyſician, and ἀλείφω, to anoint, is a Phyſician, who pretends to cure Diſeaſes by Ointments and Frictions. Such an one was *Dictus*, mention'd by *Galen*, *de C. M. S. L. Lib* 7. *Cap.* 5. This Method of Cure was call'd ἰατραλειπτικὴ, *Iatroliptice*; and was firſt

inſtituted by *Prodicus*, a Native of *Selymbria*, and a Diſciple of *Æſculapius*, as we are inform'd by *Pliny*, *Lib.* 29. *C.* 1.

IATREON, ἰατρεῖον, in the *Ionic* Dialect ἰητρήϊον, from ἰατρὸς, a Phyſician; in *Hippocrates*, means the Art or Function of a Phyſician, on which Subject he has written a Book, intituled περὶ ἰητρῆς, in which he treats principally of Surgery. *Caſtellus.*

IATRICE, ἰατρικὴ, from ἰατρὸς, a Phyſician, is the Art of Medicine, where τέχνη, Art, is underſtood. *Caſtellus.*

IATROCHYMICUS, a Chymical Phyſician, call'd *Chymiater*. Thus we read, alſo, *Iatrochymia*, and *Iatrochemia*; by which we are to underſtand the Art of curing by chymical Medicines.

IATROPHYSICUS, an Epithet beſtow'd on ſome Writings, which treat of phyſical Subjects with relation to Medicine. *Caſtellus.*

IATROS, ἰατρὸς, from ἰάομαι, to cure. A Phyſician, who is properly one that cures Diſeaſes.

IBA-CURA-PARI *Braſilienſibus*, Marcgr. is a pruniferous umbellated Fruit, growing in *Braſil*, and bearing a kidney-ſhap'd Plum with two Stones, but of no Uſe in Medicine. *Raii Hiſt. Plant.*

IBA-CURU-PARI *Braſilienſibus*, Marcgr. is a nuciferous, or nut-bearing Tree, growing in *Braſil*, and producing a ſtriated Fruit, ſhap'd like a Gourd, and diſtinguiſh'd by as many Striæ as it contains Nuts, which are, perhaps, five, ſix, or ſeven, of the Bigneſs of our Cheſnuts, whoſe Kernels are very white, and eatable, but of no Uſe in Medicine. *Raii Hiſt. Plant.*

IBA-PARANGA, Marcgr. A pruniferous or plum-bearing Tree of *Braſil*, producing a Fruit of a ſweetiſh Taſte, incloſing a Stone of the Shape and Bigneſs of an Almond, which contains three Kernels. The Fruit, or Plum, is eatable; but I find no Virtues aſcrib'd to this, or any other Part of the Tree. *Raii Hiſt. Plant.*

IBEIXUMA *Braſilienſibus*. Marcgr. A bacciferous Tree, growing very plentifully in *Braſil*, bearing a globular Fruit, of the Size of a Tennis-ball, which, before it is ripe, is green, and mark'd all over with brown Tubercles, and contains a ſlimy Matter like Birdlime; but, when mature, turns black, and cleaves into five equal Parts, each containing brown, roundiſh, oblong Seeds, of the Bigneſs of Muſtard-ſeeds. The Bark of this Tree is glutinous, and, when the outer browniſh Skin is ſcrap'd off, excellently ſerves for all the Purpoſes for which *Spaniſh* Soap is us'd, and is much better than the Fruit Saboon, or Quity, which, by its Acrimony, is prejudicial to Clothes. *Raii Hiſt. Plant.*

IBERIS. A Name for the *Lepidium*; *gramineo folio, ſive Iberis*. Sciatica Creſſes; call'd, alſo, *Agriocardamum.*

IBERIS *humilior*. A Name for the *Thlaſpi*; *Virginianum*; *foliis Iberidis amplioribus & ſerratis.*

IBEX. Offic. Aldrov. de Quad. Biſul. 730. Geſn. de Quad. 303. Charlt. Exer. 10. Jonſ. de Quad. 53. Raii Synop. A. 77. *Hircus ferus*. Bellon. Obſ. Ed. Cluſ. 20. THE STONE BUCK.

This Animal is found on the higheſt Parts of the *Alps*. *Geſner* recommends the Blood, taken in Wine, againſt the Stone. The Dung is ſaid to be good in arthritic and iſchiadic Pains. And *Seraphinus* aſcribes the ſame Virtues to the Coagulum, or Runnet, as to that of the Hare.

This is, by ſome, ſaid to be the ἴξαλος αἴξ, mention'd by *Homer*, the Horns of which were employ'd for making Bows.

IBIBIRABA *Braſilienſibus*, Marcgr. & Piſon. A bacciferous Tree of *Braſil*, bearing a roſaceous Flower, and an umbilicated Fruit of the Size of a Cherry, and containing ſeveral ſoft Stones, which are eaten together with the Pulp. The Fruit is ſweet, mix'd with ſomewhat of a reſinous Taſte; and, after frequent Uſe, leaves a burning Heat in the Throat, like what is produced from Pepper.

The Leaves and Flowers, mix'd with Camara, are very effectually us'd in Lotions of the Feet, for Pains of the Head. From the Flowers, gather'd early while the Dew is on them, as, alſo, from the Leaves, a Water is diſtil'd, which, being of a refrigerating, and, at the ſame time, of a mundificant Quality, is of excellent Service in Inflammations of the Eyes. *Raii Hiſt. Plant.*

IBIGA. The ſame as ABIGA, or CHAMÆPITYS.

IBI-PITANGA, *ſeu Ceraſus Braſilianus*. Piſon. & Marcgr. The *Braſilian* Cherry-tree. *Raii Hiſt. Plant.*

IBIRA *Braſilienſibus*. Marcgr. Piſon. A Tree growing in *Braſil*, and bearing a Fruit of an oval Figure, of the Size of a Filbert, of an aromatic and acrimonious Taſte, which, dried and pulveriz'd, is us'd inſtead of Pepper. It is remarkable for its aromatic Virtue, and is not ſo acrimonious as the Pimento. The Bark of the Tree, on account of its extraordinary Viſcidity, ſerves inſtead of Ropes, and for Matches to Guns: When firſt ſtript, it is white, after it is ſeparated from the outer brown thin Rind, and becomes red in a ſquarter of an Hour. *Raii Hiſt. Plant.* Ibira is, alſo, a Name for the PINDAIBA; which ſee.

IBIRACE. A Name for Guaiacum. *Raii Hiſt. Plant. Ind.*

IBIRAEEM, *ſive Liquiritia ſylveſtris*. Piſon. A wild Species of Liquorice, growing in *Braſil*. *Raii Hiſt. Plant.*

IBIRA-PITANGA. See BRASILIA.

IBARAREMO. A Species of *Braſilian* Alliaria, with oval Leaves and Fruit, and a Wood ſo hard, that Cheſts are made of it. *Piſon. Raii Hiſt. Plant. Index.*

IBIRUBA *Braſilienſibus*. Marcgr. Piſ. A *Braſilian* Plum-tree, which, in Bark, Wood, and manner of Growth, reſembles the Guaiaba. The Fruit is of a yellow or gold Colour, umbilicated, of the Size of an ordinary Plum, but pear-ſhap'd, and containing a Stone, and ſometimes two, flat on one Side, where they are cloſely conjoin'd, and round on the other: This Stone is of the Size of a Cherry-ſtone, and like the Ubapitanga, and it is not eaſy to diſtinguiſh them. The Fruit is ſold in the Markets, and very freely eaten with Ham. *Raii Hiſt. Plant.*

There is another Species of the Ibiruba, call'd *Ibiruba alba* or *white Ibiruba*.

IBIS. The Name of a celebrated *Egyptian* Bird, reſembling a Stork. The Fat is eſteem'd reſolutive and mollifying; but, if *Pliny* was well inform'd, this Bird has contributed more to the Improvement of Medicine by its Example, than to the Cure of Diſeaſes by affording any Remedy; for the Hint of injecting Clyſters into the Anus was, according to him, taken from the Ibis, which was frequently obſerv'd to fill its Throat with Sea-water, or that of the *Nile*, and to inject it into the Anus, by introducing its Beak, and, by this means, to procure Stools.

IBISCUS. The ſame as ALTHÆA.

IBIXUMA. A Name for the ARBOR SAPONARIA; which ſee.

ICACO. *American* Plum.

The Characters are;

It hath a roſe-ſhap'd Flower conſiſting of ſeveral Petals, which are placed in a circular Order, from whoſe Flower-cup ariſes the Pointal, which afterward becomes an oval, ſoft, fleſhy Fruit, incloſing a rough Stone of the ſame Form, in which is contain'd a round Kernel.

Miller mentions four Species; which are,

1. Icaco fructu ex albo rubeſcente. *Plum. Nov. Gen.* THE MAIDEN PLUM-TREE.

2. Icaco fructu nigro. *Plum. Nov. Gen.* AMERICAN PLUM-TREE.

3. Icaco fructu purpureo. *Plum. Nov. Gen.* PLUM-TREE WITH PURPLE FRUIT.

4. Icaco fructu luteo. *Houſt.* THE YELLOW PLUM-TREE.

None of theſe have any medicinal Virtues attributed to them, that I know of.

ICESIUM EMPLASTRUM. The Name of a Plaiſter mention'd by *Paulus Ægineta*; for a Deſcription of which, ſee ABSCESSUS.

ICHNEUMON. Offic. Raii Synop. A. 202. Charlt. Exer. 19. Geſn. de Quad. Digit. 568. Jonſ. de Quad. 105. Aldrov. de Quad. Digit. 300. Bellon. de Aquat. 44. Ejuſd. Obſ. Ed. Cluſ. 96. THE EGYPTIAN RAT.

This Animal is remarkable for its Enmity to the Crocodile, whoſe Eggs it takes all Opportunities of deſtroying; and, whilſt the Crocodile ſleeps, the Ichneumon creeps down its Throat, and eats through its Belly, in order, as it is ſaid, to feaſt on the Liver.

The Part principally uſed in Medicine is the Dung, which, together with Muſtard-ſeed, and Vinegar, is eſteem'd a good Topic in the Gout; and is ſaid to cure an *Alopecia*. A Broth, prepar'd of the Fleſh, is ſaid to be ſudorific; to be good for the Colic, and venomous Bites; and to purify the Blood. It is an amphibious Animal.

Ichneumon is, alſo, the Name of an Inſect.

ICHNOS, ἴχνος. The Sole of the Foot. In *Hippocrates*, *Lib. de Art.* it imports a kind of Sock, made of Leather, or Lead, accommodated to the Sole of the Foot.

ICHOR, ἰχὼρ, by ſome is called *Sanies*; by others, an aqueous Humour of the Blood: Some take it for an aqueous and ſerous Humidity, either of the Blood, or of ſome other Humour, and that, moſt properly, when conſider'd as in the Body: For, out of the Body, it is *Sanies*. *Ichores*, ἰχῶρες, according to *Galen*, are the thin and ſerous Humidities, contained in the Body, and its Veſſels; and are obſervable in all the Humours, or are evacuated together with them; and have different Qualities and Appellations, according to the various Nature of the Humours, from which they are ſecreted. *Galen*, *Com.* 2. *in 6 Epid.* The ſame Author, *Com.* 4. *in Lib. de R. V. I. A.* ſays, that *Ichores*, ἰχῶρες, in *Hippocrates*, are thin and ſerous Humidities: *Ichor*, ἰχὼρ, in particular, is the thinner and ſerous Part of the Blood, which is degenerated into an aqueous Nature, like the Serum of Milk, or Whey. But *Com.* 2. *in Lib.* 6. *Epid. & Lib.* 8. *de Placit. Hippocr. & Plat.* he writes, conformably to the Sentiments of *Plato*, that the ſerous Humidities, which are obſerved in all the Humours, correſpond to Whey; for as in Milk there is the Whey, which is thin and watery, and not coagulated into Butter or Cheeſe; ſo, alſo, in the Blood, and the reſt of the Humours, whether conſider'd ſeparately, or as mixed with the Blood, there is an aqueous Kind of Humidity, ſwimming upon its

its reſpective Humour, which anſwers to *Ichor*, partaking of the Quality of the Humour whence it was produced. To this purpoſe, *Plato* writes, *in Timæo*, ἰχὼς ὁ μὲν αἵματος ὀρροῶδης περὶ, ὁ δὲ μυελώδης χολῆς ὀξείας τε, ἅλεος. "The *Ichor* which is the "Whey of the Blood, is of a mild and gentle Quality; but "that which is the Whey of black and ſharp Bile, is of a ferine "and incorrigible Nature." By ἰχωροειδὲς αἷμα, "Ichor-like "Blood," in *Lib.* 6. *Epid. Sect.* 2. *Aph.* 29. as expounded by *Galen*, "We are not to underſtand, ſimply, a thin and watery "Blood, but ſuch as is affected with ſome virulent and malig-"nant Quality." And again, he ſays, that the Epithet of ἰχωροειδὴς, *Ichor-like*, is applied to Blood, containing a thin corrupt Humidity, not ſuch as is aqueous, and void of Corroſiveneſs, but what is acrid and corroding. Ἰχὼς, in *Ariſtotle*, *Lib.* 2. *de Part. Animal. & Lib.* 3. *de Hiſt. Animal.* ſignifies a pituitous Excrement, and a crude, aqueous, unconcocted Blood. And *Homer* calls the thin Humour, flowing from the Skin of *Venus*, wounded by *Diomedes*, by the Name of *Ichor*. *Hippocrates*, *Lib.* 2. *Epidemic.* calls the corrupt, thin, and ſerous Humours, which, by an Irruption, excited an Itching of the Skin, *Ichores*, ἰχῶρες. And, *Lib. de Rat. Vict. in Morb. acut.* he calls thoſe acrimonious and corrupt Humours, which kindle up a burning Fever, δριμέας καὶ χολώδεας ἰχῶρας, "Acrid and bilious Ichors." That ſerous and mucous Humour which flows from the Uterus, during the Birth, and immediately after, is called, by *Ariſtotle*, *Ichor*. A thin Fluid is, alſo, called *Ichor*, which flows from ſome Kinds of malignant Ulcers; eſpecially when the Nerves and Tendons are injured. And when the Parts near the Joints are wounded, or exulcerated, a thin *Ichor* is diſcharged, which the Farriers call Joint-water, and *Hildanus* names *Hydrarthron*.

ICHTHYA, ἰχθύα. The Skin of the *Squatina Marina*. Monk-fiſh; which is ſaid to be ſerviceable in an *Alopecia*. See SQUATINA. It alſo imports an Hook for the Extraction of the Fœtus, ſo called, ſays *Galen*, from the Likeneſs it bears to the Scale of a Fiſh: But it ſeems more probable, that it acquired this Name from its Similitude to a Fiſh-hook. Ἰχθύα is, alſo, explained, by *Erotian*, Raſpings.

ICHTHYELÆUM. The Oil of Fiſhes.

ICHTHYEMATA, ἰχθυήματα, properly imports the Scales of Fiſhes; but, figuratively, the Raſpings, or Scrapings, of the Barks of Trees.

ICHTHYITES. The Name of a Stone; ſo called, becauſe a Cavity is found in it, in Shape reſembling a Fiſh.

ICHTHYOCOLLA. Offic. Bellon. de Piſc. 104. Rondel. de Piſc. 2. 177. Geſn. de Aquat. 50. Raii Ichth. 244. Ejuſd. Synop. Piſc. 114. Aldrov. de Piſc. 567. *Huſo Ichthyocolla*. Schrod. 5. 329. THE ISINGLASS FISH.

Iſinglaſs is drawn from the Entrails, Fins, and Tail, of a large Fiſh, called, according to ſome, by the ſame Name; and *Huſo*, according to others; found in the *Volga*, *Danube*, and ſome other great Rivers. It is an Ingredient in ſome agglutinant Plaiſters, and is, alſo, reckon'd emollient and reſolvent. Wine Merchants uſe it in fining their Wines; for which Purpoſe, they beat up a ſufficient Quantity of it with Wine, and, afterwards, throw this Mixture into the Cask, where it firſt forms a Skin, or fine Network, on the Surface; and, then, precipates to the Bottom, carrying along with it all the groſſer Parts of the Liquor; ſo that the Filtre may, in this Caſe, be ſaid to paſs through the Liquor, and not the Liquor through the Filtre. This is a very harmleſs Way of purifying Wine; which is more than can be ſaid of the other Methods.

The Glue of this Fiſh, commonly called Iſinglaſs, is uſed, and is a yelloviſh Subſtance, made up in a ſpiral Form, of a glutinous Conſiſtence, and of no Smell: It is prepar'd of the Skin, Inteſtines, Stomach, Fins, and Tail, of this Fiſh, in the following Manner. Theſe Parts of the Fiſh, when cut in ſmall Pieces, are macerated in a ſufficient Quantity of Water: Then they are boiled over a ſlow Fire, to the Conſiſtence of a Poultice; after which they are to be moiſten'd, and ſpread into Pellicules, before they become cold, and reduced to a hard Maſs: This Subſtance, according to *Schroder*, is of a drying, incarning, and, in ſome meaſure, of an emollient Quality; it inſpiſſates the Blood, and is of an anodyne Nature: It is uſed in Exulcerations of the Lungs, and Fauces; and, in a Fluor Albus, it is exhibited with Succeſs: Some, alſo, preſcribe it in Dyſenteries. It is of a conglutinating Nature, when externally applied. *Dale*.

ICICARIBA. See ELEMI.

ICTAR, ἴκταρ. *Galen*, in his *Exegeſis*, and *Erotian*, both mention this Word, as occurring in *Hippocrates*: And *Galen* informs us, that it imports the Female Pudenda. But no ſuch Word occurs in the Copies of *Hippocrates* now extant. *Foeſius*.

ICTERIAS. The Name of a Stone, or Gem, mention'd by *Pliny*, *Lib.* 27. *Cap.* 10. and ſuperſtitiouſly recommended againſt the Jaundice, on account of its Colour.

ICTERITIA. The ſame as ICTERUS. *Icteritia Rubra* is an Eryſipelas: *Icteritia Alba* is a Chloroſis.

ICTERUS, ἴκτερος.

Among the various Species of Cachexies, or depraved Habits of Body, there is one, which diſcovers itſelf by a yelloviſh and ſomewhat blackiſh Colour of the Skin; and which is, by Phyſicians, called *Ictterus*, *Morbus Arquatus*, and *Morbus Regius*; which are equivalent to what we call the *Jaundice*. This Diſorder is no more than a vitiated and corrupted State of the Blood and Humours, by means of an excrementitious Bile, ariſing from a Fault of the bilious Ducts, greatly injuring the Functions of the whole Body, and rendering the Skin highly unſeemly, by a yellow or livid Colour.

The Signs by which this Diſorder diſcovers itſelf, are principally theſe following: Firſt, In the Tunica Albuginea of the Eye, there is perceived a certain yellow Colour, with which, in Proceſs of Time, the whole Skin is tinged: The Urine is thick, of a dark-red Caſt, and tinges Linen with a Saffron-colour, whilſt, in the mean time, the Excrements, diſcharged by Stool, are pale. As the Diſorder grows worſe, the Saliva becomes yellow, and every thing the Patient takes, ſeems to have a bitter Taſte. Beſides, thoſe labouring under this Diſorder complain of a certain Senſation of violent Stricture, Preſſure, and Tenſion, in the Right Hypochondrium, as, alſo, of an Uneaſineſs about the Præcordia, a Difficulty of Breathing, and a preternatural Uneaſineſs of the whole Body.

The Hiſtory and Progreſs of this Diſorder are accurately and fully deſcribed by ſome of the moſt antient Phyſicians, and, eſpecially, by *Aretæus*, who, in *Lib.* 1. *Chron. Cap.* 15. uſes the following Words: "The Jaundice is a Diſorder affecting the whole "Habit, and ſpreading its Influence to every Member of the "Body; but, particularly, the Whites of the Eyes, and thoſe "Parts of the Forehead which are moſt contiguous to the Tem-"ples, become preternaturally yellow: Thoſe who labour under "a black Jaundice, are render'd unſeemly, by a Colour reſem-"bling that which reſults from a Mixture of black and green: "They are, alſo, cold, weak, liſtleſs, ſad, and dejected; their "Breath is fetid, and every thing they take has a bitter Taſte; "they breathe with Difficulty, and perceive a kind of biting "Pain in the Stomach; their Excrements are porraceous, black-"iſh, dry, and diſcharged with conſiderable Difficulty; their "Urine is high-colour'd, and ſomewhat inclining to black; they "are, alſo, afflicted with Crudities, loath their Aliments, and "are tormented with Watchings, Sadneſs, and Melancholy. But, "in the whiter Jaundice, the Colour of the Patient reſembles "that which reſults from a Mixture of white and green, his "Mind is more briſk and chearful; he is, at firſt, unwilling "to take his Aliments; but, after he has begun, he eats heartily; "he digeſts more eaſily than thoſe who labour under the other "Species of Jaundice; his Excrements are white, dry, and "chalky, and his Urine of a Saffron-colour. In both Species "the whole Body itches, a ſmall and biting Heat is perceived "in the Noſtrils; bitter Things, when taſted, do not appear "bitter; for, if the Tongue is cover'd with Bile, the Idea of "Bitterneſs is not, by that means, excited in the Mind, whereas "ſweet Things appear bitter to the Taſte. If it is evident, that "none of the Viſcera are over-heated, the Diſorder is not dan-"gerous, but laſts for a long time: If it laſts long, and any of "the Viſcera becomes inflamed, it degenerates into a Dropſy, "and many, who have laboured under it, have died of colli-"quative Sweats, without any Signs of a Dropſy." From what has been ſaid, I think it plainly appears, that almoſt all the Functions of the Body are preternaturally affected in this Diſorder. The Reaſon of this is ſufficiently obvious; for, as a ſound and natural State of the Functions principally depends upon, and is ſupported by, a due and laudable Craſis of the Blood and Humours, ſo, on the contrary, when this due Craſis is vitiated by impure, and more or leſs corrupted Humours, it is not to be wonder'd at, if, by this means, all the Actions of the human Body, whether vital, natural, or animal, ſhould be more or leſs injured.

But the Obſervations of various Authors are ſtill more capable of convincing us of the ſingular Efficacy of the recrementitious Bile, in inducing a Change on the Solids, as well as the Fluids, of the human Body. Thus the Blood, taken from the Vein of a Perſon labouring under the Jaundice, is frothy and yellow, according to *Theodorus Wingerus*, who affirms, that he has ſometimes been ſurpriſed to find, by Veneſection, that, in Patients of this Kind, there was not one Drop of red and florid Blood, but only ſuch as was of a yellow Colour, reſembling that of the Urine of Horſes: "Nay, ſays he, in a Woman, who "labour'd under a violent Jaundice, I ſaw the Blood and Urine, "which ſhe evacuated, highly thick, and ſimilar to each other; "but fifteen Days after, when the Jaundice was almoſt entirely "removed, the Blood taken from her Veins was highly red and "florid." The Viſcera and Inteſtines, ſuch as the Lungs and Stomach, alſo, loſe their natural Colour, and are, as well as the Fat and Membranes, more or leſs tinged with a yellow Colour. With reſpect to this, the Reader may conſult *Zacutus Luſitanus*, in *Prax. admirabili*, *Lib.* 3. *Paiſexius*, in *M. N. C. An.* 4. *Obſ.* 194. and *Thonnerus*, who, in his *Obſervat. Lib.* 3. *de Ictero*, *Obſ.* 1. makes mention of a certain Cardinal, who died of a Jaundice, the whole Parts of whoſe Body he found yellow upon Diſſection. Beſides, *Kerkringius*, in his *Spicileg. Anatom.* tells us, that he found the Bones tinged with a yellow Colour, in a Boy born of a Mother who labour'd under a Jaundice.

And

And *Dolæus*, in his *Encyclopæd. Medica*, *Lib.* 3. *Cap.* 8. informs us, that, in a Man of forty Years of Age, who died of a Jaundice, he ſaw all the Viſcera of the Abdomen and Thorax, the Brain itſelf, together with the Bones and Cartilages, tinged with a yellow Colour. 'Tis, alſo, remarkable, that *Galen* and *Sextus Empiricus* inform us, that, to Perſons labouring under a Jaundice, all Objects appear yellow, in conſequence of the yellow Colour of their Eyes. The Truth of this Obſervation is called in queſtion by *Hieronymus Mercurialis*, in *Prælect. Bononienſibus*, becauſe neither *Celſus*, nor *Cœlius Aurelianus*, *Aetius*, nor *Avicenna*, make mention of this Symptom. But I, myſelf, have had two Inſtances of it, in Perſons pretty far advanced in Years, who labour'd under this Diſorder.

But, that we may the more accurately know the Nature of this Diſorder, and, conſequently, be the better able to form juſt Notions of its Cauſes, Events, and Method of Cure, we muſt obſerve, that the yellow Jaundice, in particular, is of various Kinds, widely different from each other; for we find, from daily Experience, that one Species of it is obſtinate, long continued, and not to be cured without great Difficulty; whilſt another ſoon ceaſes, and is eaſily removed by proper Remedies: That another Species is permanent and continual, whilſt another returns at ſtated Periods, and only continues, for Inſtance, during a few Hours; or is, in ſome Patients, annual. Beſides, there is an idiopathic and ſymptomatic Jaundice: The Cauſes of the former are deeply rooted in the Liver; but the latter appears in Conjunction with ſome other Diſeaſe: Sometimes, for Inſtance, a convulſive and hyſteric Colic, a Cardialgia, or the Iliac Paſſion, a Vomiting or Purging, after the Uſe of too draſtic Emetics, or purgative Medicines. There is, alſo, a critical Jaundice, which, in acute Fevers, is ſometimes a ſalutary Sign; and, at others, a highly unlucky Omen; when, for Inſtance, it is either accompanied or ſucceeded by an Inflammation of the Stomach. There is, alſo, a great Difference between the yellow and black Jaundice, both with reſpect to the Cauſes, from which they proceed, and the Danger with which they are attended, ſince, in the latter, a far greater Corruption of the Humours, and a more conſiderable Injury done to the Viſcera, are to be ſuſpected.

Having thus given the Hiſtory and Differences of the Diſeaſe, we now come to inveſtigate the Cauſes, which give Birth to it, and the ſeveral Symptoms, with which it is attended. 'Tis, therefore, agreed upon among all Phyſicians, that, in a Jaundice, the Liver is almoſt always preternaturally affected. Let us, therefore, inquire, how this Diſorder of the Liver contributes to the Production of a Jaundice. Now, if we conſider, that the Liver is, by Nature, furniſhed with ſuch Plenty and Variety of Ducts, principally for this Reaſon, that it might ſecrete from the Maſs of Blood and Humours that ſulphurous and hot Liquor, which is, as it were, alcaliz'd with the viſcid Lymph, and which we call Bile, and, after having ſecreted it, convey it, by peculiar Ducts, to the Duodenum, in order to promote Digeſtion, we muſt readily perceive, that, when the Courſe of the Bile to the Inteſtines is either obſtructed, or totally intercepted, it muſt, of courſe, regurgitate to the lymphatic Veſſels and Blood, and, conſequently, prove the immediate and principal Cauſe of the Jaundice. And ſince, by this means, the Serum, and nutritious Juices, are infected by the Bile, it will be no hard Task to explain, why the natural Colour of the Skin ſhould be changed to that of yellow, why the Nutrition ſhould be vitiated, and the Urine render'd thick, and tinged with a rediſh Colour. Hence, alſo, the Reaſon is obvious, why the Fæces, diſcharged by Stool, are not yellow; why the Digeſtion of the Aliments becomes languid; and why many Diſorders are perceived about the Primæ Viæ.

But, ſince there are ſo great Differences among the ſeveral Species of Jaundice, as we have above repreſented, 'tis neceſſary we ſhould, in a more particular and accurate Manner, inquire what Parts and Ducts of the Liver are generally preternaturally affected, and from what particular Cauſes their Diſorder ariſes. Now, that theſe Cauſes conſiſt either in the Fault of the Matter obſtructing the Veſſels, or in the ſpaſmodic Motions contracting theſe Veſſels, is univerſally allow'd, by every one who is, in the leaſt, acquainted with the Theory of Medicine. Let us, therefore, take an accurate Survey of each of theſe States.

Firſt, then, 'tis certain from Experience, that Spaſms frequently lay a Foundation for the Jaundice; for when this Diſorder ſeizes the Patient ſuddenly, which it frequently does, and, terminating in a ſhort time, recurs at certain Periods; then the Cauſe ſeems to reſide neither in the peccant Matter, nor the Obſtruction and Infarction of the Veſſels, but rather in the ſpaſmodic Conſtriction of the Ductus Cholodochus, which is furniſhed with a highly ſenſible nervous Coat. For this Reaſon we find, that violent Anger has a powerful Tendency to induce a Jaundice; as, alſo, that corroſive and draſtic Medicines, whether of the emetic or purgative Kind, or the Bile in Choleras, Cardialgias, and the Beginnings of bilious Fevers, ſometimes produce this Diſorder. Now all theſe Things, duly compared with each other, ſufficiently convince us of the ſpaſmodic Agitation of the biliary Ducts: Beſides, in diſſecting thoſe who have died of Dropſies, there are not found in the Duct, which conveys the Bile to the Duodenum, the fainteſt Traces of an Obſtruction, either from a calculous, a mucous, or viſcid Matter.

We now come to conſider the other Cauſe of a Jaundice, the Obſtruction of the Veſſels, of which we have no Reaſon to be in the leaſt dubious, ſince it is certain, from daily Experience, that the Gall-bladder is frequently filled with Stones, of a conſiderable Bulk. This, alſo, holds true, with reſpect to the other hepatic Ducts, eſpecially that called the Cholodochus; which are ſometimes found to contain not only Stones of different Sizes and Colours, but alſo a gritty, tophaceous, and viſcid Matter; but the more ſoft and fine this Matter is, the Symptoms are proportionably the milder. With reſpect to this, the Reader may conſult the *Miſcel. Nat. Curioſ. An.* 1. *Obſ.* 44. and *Bonetus* in *Sepulchreto*, *Lib.* 3. *Sect.* 8. *Obſ.* 36.

But a Jaundice is not always induced by ſmall Stones obſtructing and infarcting the biliary Ducts: Thus, *Ettmuller*, *in Praxi*, *Part* 2. tells us, that, upon diſſecting a Woman, there were ſeveral large and ſmall Stones found in her Gall-bladder; tho', during her Life, ſhe had been perfectly free from a Jaundice. *Petermannus*, alſo, Profeſſor at *Leipſic*, in his *Diſſert. de Scrutinio Icteri ex Calculo Veſicæ felleæ*, informs us, that, in an old Woman, he found ſcarce any Bile, but only ſeventeen Stones in the Gall-bladder; tho', at the ſame time, the Patient, during Life, was entirely free from a Jaundice. Since theſe Phenomena ſometimes happen, we muſt endeavour to account for them, which, in my Opinion, may be done in the following manner. So long as the Stone in the Gall-bladder is not mov'd, but remains at Reſt, like the Stone in the Ducts of the Kidneys, it creates no Uneaſineſs. But, when it is forc'd from its Place, and propel'd to the cyſtic Duct, ſticking there, it, by a violent Diſtention, produces exceſſive Pains and Spaſms, which draw all the biliary Ducts into Conſent. Thus it proves the Cauſe of the Jaundice, and of all the terrible Symptoms, with which it is complicated; and which, when the Stone is diſcharged by Stool, totally ceaſe, as I have frequently obſerv'd.

There are ſome Signs, by which we may be pretty well aſſur'd, that there are Stones in the biliary Ducts; ſuch as an oppreſſive and lancinating Pain in the Right Hypochondrium, about the Pit of the Stomach, conſtantly afflicting the Patient, though with ſome Remiſſions, and attended with a violent Uneaſineſs of the Præcordia, a Difficulty of Breathing, a Compreſſion of the Breaſt, a Nauſea, and ſometimes Vomitings, Conſtipation of the Belly, Reſtleſſneſs, and Watchings. Beſides, Patients who have the Misfortune of Stones in the biliary Ducts, cannot walk erect, but go with their Bodies more or leſs bended, and ſtooping.

But a Jaundice is not only produced by Bile concreted in the biliary Ducts, but, alſo, by an Infarction of the minuteſt Ducts, ſubſervient to the Secretion of the Bile, by a tenacious and viſcid bilious Matter; for, when this happens, the Bile muſt neceſſarily be convey'd, not to the biliary Ducts, but through the diſtended lymphatic Veſſels, along with the Lymph, to the Blood. With reſpect to this, *Jacobus Camenicenus*, in *Epiſt. ad Matthiolum*, informs us, that he ſaw the Veins of the Liver, in its concave Part, before they terminate in the common Trunk of the Vena Portæ, obſtructed and diſtended by ſmall Stones, which were externally black, and internally of a yellowiſh Colour. *Borelli*, alſo, informs us, that he found the Glands, adjacent to the hepatic Artery, and the biliary Duct, which runs to the Inteſtines, ſo tumid and diſtended as to compreſs this biliary Duct to ſuch a Degree, that the ſmalleſt Inſtruments could ſcarcely have Acceſs into it. Beſides, *Cabroleus*, in *Obſer. Chirurg.* 10. and *Meckern*, in *Obſer. Chirurg.* 43. have obſerv'd, that a Jaundice may be produced by a Compreſſion or Obſtruction of the Ductus Cholodochus, by means of fleſhy Excreſcences. And *Argenterius*, in *Lib.* 4. *Aph. Hipp.* tells us, that, upon diſſecting a certain Cardinal, he found the Ductus Cholodochus entirely dry, and totally obſtructed; which Circumſtances had produced the Jaundice, under which he labour'd whilſt alive. But Inſtances of this kind are very rare.

We now come to conſider the immediate productive Cauſes of this Diſorder; the moſt conſiderable of which is a Plethora, or a larger Quantity of Blood and Humours than Nature can bear. That this Circumſtance ſhould produce a Jaundice, is not at all ſurpriſing; for, ſince, in a natural State, the Circulation of the Blood through the Liver is highly languid, in conſequence of the Want of a ſtrong Impulſe in the Vena Portæ, it muſt of neceſſity happen, that, in a plethoric State, the thick and viſcid Blood muſt very eaſily ſtagnate there, and obſtruct the minute Veſſels. Hence, alſo, we obſerve, that, in Leucophlegmatias, Scirrhuſes, and Indurations of the Liver, for want of a Separation of the bilious Parts, the Skin aſſumes a yellow, and ſomewhat greeniſh Colour. Nor is it to be doubted, but the black Jaundice, of all others the moſt terrible and obſtinate, is produc'd by an almoſt irreparable Diſorder of the Liver, and a violent Corruption of the Bile.

Aliments of hard Concoction, ſuch as Peaſe, Beans, Lentils, and Cheeſe, may prove the antecedent Cauſes of a Jaundice, ſince, in conſequence of their firm and coarſe Texture, eſpecially when uſed in large Quantities, they are, with Difficulty, digeſted, and generate a thick and impure Blood. To this Claſs, alſo,

alſo, belong acid and auſtere Wines, aceſcent Ales, and Waters impregnated with clayey and tophaceous Particles; all which produce ſtill worſe Effects, when joined with an idle and ſedentary Life. But nothing contributes ſo powerfully to the Production of thoſe Diſeaſes, which ariſe from Diſorders of the Liver, as the immoderate Uſe of rich Wines, and eſpecially Brandy, by which the Chyle and nutritious Juices are coagulated, and ſuch a Dyſcraſy of the Bile, as is highly prejudicial to Health, induced. Beſides, under a bad Regimen, we may juſtly include the Paſſions of the Mind; among which, beſides Anger, long-continued Grief is of the moſt unlucky Influence, ſince by generating a thick Blood, and conſequently rendering its Circulation proportionally ſlower, it, of courſe, powerfully contributes either to the Production, or Recalling, of a chronical and obſtinate Jaundice.

A Jaundice, alſo, frequently ariſes from ſome previous Diſorder. Hence, that intermittent Fevers, prepoſterouſly ſuppreſs'd by Aſtringents, are frequently ſucceeded by a Jaundice, is not only confirmed by Experience, but, alſo, by the Authority of *Ramazini*, who gives us an Inſtance of a Jaundice produced by the Suppreſſion of ſuch a Fever, by means of the *Peruvian* Bark. It, alſo, frequently happens, that a Jaundice is produced by an Obſtruction, or Diminution, of the menſtrual and hæmorrhoidal Diſcharges.

The Prognoſtics of this Diſorder vary with reſpect to Age, the Habit, the Strength, and Conſtitution of different Patients, as, alſo, according to the Virulence or Mildneſs of the Cauſes, and the Duration or Termination of the Diſeaſe; for, when this Diſorder ſeizes young Perſons, is ſingle, and not complicated with other Diſeaſes, ſuch as a quartan Fever, the hypochondriac Diſorder, an Obſtruction or Scirrhus of the Liver, and is not of long ſtanding, it may be eaſily removed, by proper Remedies both of the dietetic and pharmaceutic Kind. But if, after the Cure, it frequently recurs, accompanied with a yellow-greeniſh Colour, and an Induration of the Liver, it generally terminates either in an Hectic, or a violent Hæmorrhage. A Jaundice ariſing from the violent Tranſports of Anger, or the ſpaſmodic Stricture of the Inteſtines and biliary Ducts, by means of a draſtic Purgative or Emetic, eaſily yields to proper Medicines, if the Cure is attempted in due Time. But this Diſorder is not to be cured without greater Difficulty, if it is encourag'd by long-continued Grief, or if the Body is weaken'd by ſome previous Diſorder.

When a Jaundice is complicated with a Fever, the former often produces a critical Solution and Termination of the latter. Thus, in Practice, I have frequently had an Opportunity of obſerving, that thoſe Fevers which are excited, in hypochondriac Patients, by the Tranſports of Anger, and are accompanied with Spaſms of the lower Belly, bilious Vomitings, and an intenſe Heat, are happily terminated by a ſupervening Jaundice; which is, alſo, confirmed by *Hippocrates*, who, in *Sect.* 4. *Aph.* 63. uſes the following Words: "If, ſays he, a Jaundice ſeizes a "feveriſh Patient, on the ſeventh, the ninth, the eleventh, or "fourteenth Day, it is a lucky and ſalutary Circumſtance, un-"leſs, at the ſame time, the Right Hypochondrium ſhould be "indurated." In like manner a Jaundice appearing in intermittent Fevers, eſpecially about the Beginning of the Paroxyſm, is no unlucky Circumſtance, ſince upon the Ceſſation of the former, the latter generally diſappears. A Jaundice happening in an Inflammation of the Liver, Duodenum, or Stomach, renders the Safety of the Patient precarious and uncertain. A Jaundice, alſo, frequently ſeizes pregnant Women about the End of their Geſtation; but in this Caſe it is eaſily removed by ſeaſonable Veneſection. A Stone contained in the Gall-bladder, of ſo large a Size as almoſt entirely to fill it, is frequently the Cauſe of a Jaundice, and ſome very terrible Symptoms; the moſt conſiderable of which are, a burning Pain, about the Pit of the Stomach, in the Left Side; violent Gripes about the ſame Side, a Nauſea, Vomitings, Faintings, Difficulty of Breathing, and an unſeemly livid Aſpect. When theſe Symptoms appear, the Diſeaſe is dangerous, and terminates in a fatal Aſcites. Hence, in diſſecting Perſons, who have been cut off by theſe Symptoms, I have frequently ſeen the whole Gall-bladder filled with ſmall Stones, the adjacent Parts, ſuch as the Colon, and Bottom of the Stomach, ting'd with a yellow Colour, and their external Parts corroded, perhaps, by the Tranſudation of an acrid Bile through the Pores of the Gall-bladder. In like manner the Repletion of the Gall-bladder, by a large Quantity of calculous Concretions, frequently lays a Foundation for a convulſive Aſthma, which generally brings on a fatal Dropſy, both of the Thorax and Abdomen.

A Jaundice of the black Kind, in conſequence of the violent and malignant Corruption of the Humours, which aſſume a fix'd, terreſtrial, acid, and corroſive Quality, generally induces a Train of fatal Symptoms, and, if at all curable, requires uncommon Pains and Judgment for that Purpoſe. This Species of the Diſorder is principally incident to old Perſons, and eaſily degenerates into a Maraſmus, a Cachexy, œdematous Tumors, a malignant Eryſipelas, a Sphacelus, or violent Hæmorrhages.

The Cure.

In order to the judicious and prudent Cure of the Jaundice, 'tis abſolutely neceſſary, that the Phyſician ſhould pay a due Regard to the various Cauſes, Conſtitutions, Seaſons, and other important Circumſtances; for, in proportion as theſe vary, proportionably different Meaſures of Cure are indicated. Thus, for Inſtance, if by draſtic Medicines, Poiſons, or the Conſent of the Parts, in a ſpaſmodic, hæmorrhoidal, or hyſteric Colic, a Jaundice, which frequently happens, is ſuddenly induced, and is as yet recent, 'tis highly probable, that it ariſes from a violent Stricture of the biliary Ducts, diſtributed through the Subſtance of the Liver; in which Caſe the firſt Intention of Cure is, to relax the tenſe and conſtricted Parts, and, by that means, to reſtore the free and natural Secretion of the Bile, and its Deſcent into the Inteſtines; and then, in the ſecond Place, to mitigate and correct the Acrimony of the Bile, which is the Cauſe of the Spaſms.

The former of theſe Intentions is excellently anſwered by Emulſions of the Four greater cold Seeds, together with thoſe of Poppies, Hemp, and ſome others, which, on account of their highly ſubtile and vaporous Sulphur, are, by *Sylvius*, greatly extolled, and may be commodiouſly prepared with Waters of a ſedative Virtue, ſuch as thoſe of Lime-flowers, of the Flowers of the *Egyptian* Thorn, of Cowſlips, of Lily of the Valley, of common Chamomile, of Yarrow, and of black Cherries, adding a ſufficient Quantity of the Syrup of white Poppies. For anſwering this Intention, the anodyne Liquor is, alſo, highly efficacious, if mixed with a few Drops of the diſtil'd Oil of Mace; or, in Caſes where there are Colics, and hyſteric Diſorders, with the Eſſence of Caſtor, the Eſſence of Saffron, and the Laudanum of *Sydenham*. But, in order to allay and correct the Acrimony of the Bile and Humours, nothing is more efficacious than the abſorbent, and gently nitrous Powders. Thus, for Inſtance:

> Take of Crabs-eyes, Mother of Pearl, and the Pulvis Marchionis, each one Dram; of prepar'd Amber, and purified Nitre, each half a Dram; and of the Oil of Mace, four Drops; to which may be added, according to the Circumſtances of the Patient, a few Grains of the Extract of Caſtor, or Saffron.

As a Vehicle for this Medicine we may uſe Whey, Milk diluted with Water, an Emulſion of ſweet Almonds, or Water-gruel, mixed with a Spoonful or two of the Oil of ſweet Almonds.

Anodyne and paregoric Preparations, applied warm to the Region of the Præcordia, alſo, afford conſiderable Relief. For this Purpoſe we recommend a Bladder, filled with the Flowers of Elder, common Chamomile, Yarrow, and Sage, boil'd in Milk: Or, if this Preparation ſhould prove diſagreeable to the Patient, an Epithem prepar'd of equal Portions of Treacle, expreſſed Oil of Nutmeg, and Sperma-ceti, with the Addition of a little Saffron, and Camphire, may, with great Advantage, be applied to the Pit of the Stomach, eſpecially when the Diſorder is attended with a Cardialgia, or violent Spaſms of the Stomach, and an exceſſive Vomiting. Clyſters prepared of the paregoric Species, boiled in Milk, with the Addition of a ſufficient Quantity of Fat, of the Oil of Chamomile by Coction, are, alſo, of ſingular Efficacy, ſince they prove, as it were, an internal Bath, and remarkably cheriſh and relieve the Parts afflicted with painful and racking Spaſms.

The ſame Method of Cure, and Medicines, are to be uſed, when an obſtinate Jaundice, accompanied with violent Spaſms, ariſes from ſmall Stones firmly impacted in the cyſtic Duct, or the Ductus Cholodochus. Theſe Medicines, alſo, exert their uſual happy Effects, in Caſes where a Stone, lodged in the Ureters, produces violent Symptoms in the adjacent nervous Parts; for, upon the Removal of theſe Symptoms, in conſequence of the Relaxation of the Spaſms, Nature, aſſiſted only by her own Force, often happily expels the Obſtacle from theſe narrow Paſſages.

Theſe are the principal Meaſures and Medicines to be uſed in that Species of Jaundice, which ariſes from a ſpaſmodic Stricture of the biliary Ducts, and which is eaſily remov'd. Let us now inquire, what Steps are to be taken in the Cure of that more obſtinate, and frequently recurring Species, which draws its Origin from an Obſtruction of the Veſſels of the Liver. In this Caſe, therefore, the Intentions to be purſued are theſe following: Firſt,

To diſſolve and remove the Obſtructions of the biliary Ducts, ariſing from the mutual Concretion of the bilious, viſcid, terreſtrial, and cretaceous Sordes, and by this means to reſtore the free Courſe of the Bile to the Duodenum, that the Buſineſs of Chylification may be duly carried on. Secondly,

By proper Medicines to open, and render pervious, the Veſſels ſubſervient to the Secretion of the Bile, and which are infarcted with a tenacious Blood, that by this means they may freely tranſmit the Bile to the biliary Ducts: And, thirdly,

To render the languid and obſtructed Circulation of the Blood, which is the Foundation of the Obſtructions and Concretions, through the whole vaſcular Syſtem of the Lungs, natural and equable.

Theſe Intentions are moſt effectually and commodiouſly anſwered by Decoctions, or Apozems, prepared of ſuch Ingredients as are poſſeſs'd of a kind of ſpecific Virtue in reſolving viſcid Humours, and opening the obſtructed Paſſages of the Liver; ſuch as the Five aperient Roots, and that of Turmeric, either boiled in Water, or reduced to a Syrup, which is commonly ſold in the Shops. To this Claſs, alſo, belong the lactiferous Plants; ſuch as Lettuce, Vipers-graſs, Dandelion, Goats-beard, Sow-thiſtle, Endive, and Hawk-weed, which produce very happy Effects, if boiled in Water, or if their recent expreſs'd Juice is exhibited either with Whey or Aſſes-milk. I am of Opinion, that the ſame Virtues are juſtly to be aſcrib'd to the Juice of recent Graſs. Hence, *Sylvius* and *Boerhaave* inform us, that in the Winter-time, when Cows and Oxen feed upon Straw and Hay, their Livers have been found full of ſmall Stones, which were no longer to be diſcover'd, when, in the Summer-time, they came to eat Graſs; without doubt, becauſe, by the reſolvent Juices of the Herbs, the Liver is powerfully purg'd of viſcid and coagulated Humours. And, for Patients labouring under a Jaundice, I have often, with great Succeſs, preſcribed a Decoction of the Roots of Graſs, Eryngo, Succory, and Fennel.

But, in the Cure of all Diſorders of the Liver, and conſequently that of the Jaundice, nothing affords a more ſpeedy, infallible, and efficacious Relief, than Mineral Waters, both of the hot and cold Kind, drank in Conjunction with a proper Regimen; ſince, not only in conſequence of the Quantity of Waters, impregnated with a ſpirituous elaſtic Principle, but, alſo, on account of the neutral Mineral Salt, with which they abound, they are highly beneficial and powerful in reſolving viſcid Humours, removing Obſtructions of the Veſſels, and promoting all the ſeveral Excretions. And, to declare my Sentiments freely, a chronical and often-recurring Jaundice is rarely or never to be cured in a ſatisfactory manner, without the due Uſe of ſalutary Mineral Waters, ſuch as thoſe of *Egra*, *Spaw*, *Schwalbach*, and the *Caroline* Springs.

Neutral Salts, alſo, which, on account of their aperient, deterſive, diuretic, and purgative Qualities, are accounted beneficial againſt a Jaundice, deſerve our particular Conſideration. Among theſe, the moſt conſiderable are, the Terra foliata Tartari, Tartarus Tartariſatus, Sal Polychreſtum, the Arcanum duplicatum, purified Nitre, antimoniated Nitre, a Solution of Crabs-eyes, with Citron-juice, vitriolated Tartar, and Borax. To this Claſs, alſo, belong the Salts obtain'd from the Mineral Waters of *Epſom*, *Egra*, *Sedlitz*, and the *Caroline* Springs: But the Efficacy of theſe Salts is increas'd, if they are exhibited in a ſufficient Quantity of Whey, or ſome proper Decoction, and their Uſe is perſiſted in for a conſiderable time. Nor are we to omit Rhubarb, which, in Diſorders of the Lungs, is of a ſingular and ſpecific kind of Virtue, in reſolving and correcting the Humours, whether exhibited in Subſtance, mix'd with the abovemention'd Salts, or infus'd in Wine, together with the abovemention'd Herbs, or reduc'd to a Tincture, or an Eſſence, with the Terra foliata Tartari.

The laſt Intention of the Phyſician is, by gently corroborating Medicines, to reſtore the due and natural Tone of the weaken'd Veſſels of the Liver, which is the Cauſe of the Obſtructions and Concretions. This Intention is excellently anſwer'd by chalybeate Preparations, eſpecially of the liquid Kind, ſuch as the Tincture of Steel, prepar'd with Apples, or Quinces; the Tinctura Ludoviciana; the Tinctura Zwolfferi; as, alſo, the Peruvian Bark, and that of Caſcarilla, exhibited either in Powder, or in a Decoction. This Intention is, alſo, excellently anſwer'd by *Pyrmont* Waters, in conſequence of the chalybeate Principle with which they are ſo richly impregnated.

Tho' in a Jaundice Emetics are often indicated as highly proper, and afford a very ſpeedy and inſtantaneous Relief, yet they are frequently found highly prejudicial; when, for Inſtance, the Diſorder draws its Origin from violent Anger, Spaſms of the Stomach, and a Cardialgia, or from a ſpaſmodic Colic, as, alſo, in Caſes where a Stone, lodg'd in the cyſtic Duct, excites a violent Uneaſineſs about the Præcordia. But, if the Propriety of Vomits ſhould be indicated, it is expedient to uſe thoſe of the milder Kind, ſuch as that prepar'd of the Root of Ipecacuanha, with one Grain of emetic Tartar, which, when a bilious Sordes, lodging in the Duodenum, and cloſing up the Orifice of the Ductus Cholodochus, intercepts the Paſſage of the Bile, or when a tenacious, moveable, and not highly-concreted bilious Matter blocks up the hepatic Ducts, are of ſingular Uſe and Efficacy in evacuating it; for ſuch is the Nature and Power of Emetics, as to exert their Influence and Operation on the biliary Ducts, which conſiſt of highly nervous Coats, and by increaſing their ſyſtaltic Motion, to produce a highly beneficial and ſalutary Excretion of the peccant Humours.

Draſtic Purgatives are always obſerved to be prejudicial in a Jaundice, becauſe they increaſe the Spaſms, throw the Blood into violent Commotions, and impair the Strength. Hence, *Hippocrates*, in his Treatiſe *de Ratione Victus in Acutis*, claſſes thoſe, who labour under a Jaundice, among the Number of ſuch as ought not to be purg'd: "For, ſays he, the Phyſician who treats "them with Purgatives, will expoſe them to Danger, without "doing them any manner of Service." And, in the fifth Section of his Book *de Affect.* when he gives the Cure of a Jaundice, he makes mention of Purgatives, in the following Words: "The "external Part of the Body is to be ſoften'd by warm Baths, "but the Inteſtines and Bladder are to be lubricated; for this "Diſorder happens, when the Bile, thrown into a preternatural "Commotion, is lodg'd and depoſited immediately under the "Skin; and if the moſt ignorant Phyſician is but ſufficiently ac"quainted with this Circumſtance, he will not readily prove un"ſucceſsful in the Cure of the Diſeaſe; for, by the ſlighteſt and "moſt inconſiderable Circumſtances, Diſeaſes are long protract"ed, and render'd far more violent than they would have other"wiſe been: All Aliments, Potions, Sorbitions, or Medicines "calculated for the Alleviation of Pain, may be ſafely us'd in "this Diſorder, provided they are exhibited with due Caution "and Judgment. But ſuch Medicines as either purge Bile or "Phlegm, are dangerous, and the Preſcription of them renders "the Phyſician juſtly chargeable with Ignorance, and bad Ma"nagement." From this celebrated Paſſage, I think it is ſufficiently obvious, that, in a Jaundice, *Hippocrates* abſolutely condemn'd the Uſe of ſuch Medicines as depoſited the Bile immediately under the Skin; and branded the Phyſicians, who us'd ſuch a Practice, as Fools and Murderers. *Cœlius Aurelianus*, in the fifth Chapter of his third Book, is no leſs explicit in condemning the Uſe of cholagogue Purgatives in a Jaundice, in the following Words: "The frequent Exhibition of ſuch Medicines, as "purge and carry off the Bile by Stool, is juſtly to be condemn'd "in a Jaundice; ſince, by their means, the Thirſt is increas'd, "the Loathing of the Food augmented, the Strength impair'd, "the Aliments taken corrupted, and all the Parts of the Body "reduc'd to a worſe State, by ſuch a Farrago of Medicines; "which Error we have frequently ſeen thoſe guilty of, who, in a "Jaundice, have preſcribed the frequent and continued Uſe of "Wormwood, Aloes, and Coloquintida."

Sudorifics, eſpecially of a too hot and volatile Kind, which, by their expanſive Sulphur, throw the Humours into a violent inteſtine Commotion, are by no means to be us'd in the Cure of a Jaundice, in which Diſorder the viſcid bilious Humours are far more properly evacuated thro' the Liver and Kidneys, than thro' the narrow ſubcutaneous Emunctories. Nor are we to be leſs cautious in the Uſe of too hot Baths in the Height of the Diſorder, and under an immediate Paroxyſm: Nor is it a hard Task to aſſign a ſufficient Reaſon for this Piece of Practice; for, ſince, in a Jaundice, the cutaneous Emunctories are obſtructed, the Patients do not eaſily ſweat, the exceſſive Heat, by throwing the Blood into Commotions, and rendering the Humours more acrid, produces a Rupture of the Blood-veſſels in other Parts. But tepid and temperate Baths, prepar'd of River-water, with Bran and Milk, may be ſafely us'd in Caſes where there are violent Spaſms about the Primæ Viæ; and Baths ſomewhat hotter, prepared with emollient and deterſive Herbs, may be ſafely us'd, in order to remove the yellow Colour, when the Diſeaſe is on the decline, and the Emunctories of the Skin ſufficiently open and pervious.

Tho' in the Cure of a Jaundice, bitter Medicines, prepar'd of the Root of Gentian, of Marſh-trefoil, the leſſer Centaury, Wormwood, and Carduus Benedictus, are highly extol'd by various Authors; yet I can from my own Experience affirm, that they often do more Injury than Good; for, tho', by ſupplying the Defect of the Bile, they may ſeem to facilitate the Digeſtion and Excretion of the Aliments, yet, when they paſs with the Chyle to the Maſs of Blood, they often render the Diſorder more obſtinate, by increaſing and accumulating the bilious Sordes. And, if at any time we find happy Effects produced by them in the Primæ Viæ, this is principally obſerved to happen, when, during a highly coſtive State of the Patient, they evacuate the impure Sordes by Stool; for neither the Bile, nor other bitter Subſtances, are friendly to the State and Condition of the vital Humours, but ought to be eliminated with the Fæces; for which Reaſon, Rhubarb is, in this Caſe, a highly efficacious Medicine; and the bitter Ingredients above-mention'd may, alſo, be uſed, when infuſed in Wine, and exhibited in Conjunction with ſome gentle Purgative, ſuch as Rhubarb, Sena-leaves, Agaric, or tartareous Salts.

As in a Jaundice, both of the black and yellow Species, there is a great Impurity, or Cacochymy of the Humours, mercurial Preparations, by ſome Phyſicians highly commended, prove greatly prejudicial. Thus, by ſmall Doſes of Mercurius dulcis, exhibited in the Form of Pills, I have ſeen a Swelling of the Gums, a violent Stench of the Mouth, Cardialgias, and a Loſs of Appetite and Strength, produced; for Mercury, when mix'd with acid, and much more with alcaline Salts, aſſumes a highly corroſive and poiſonous Quality.

Veneſections are rather to be uſed with a preſervative, than with a curative Intention; for a Redundance of Blood, by diminiſhing the Circulation of the Fluids, which in the Liver is always

always ſloweſt, contributes greatly to the Generation of the Diſeaſes peculiar to that Organ. Nor, when the Diſeaſe is preſent, and accompanied with a Plethora, are we abſolutely to diſcharge Veneſection; ſince this Practice is productive of very happy Effects, when the Diſorder either draws its Origin from, or is ſupported and ſuſtain'd by, a Suppreſſion of the menſtrual or hæmorrhoidal Diſcharge. Veneſection is, alſo, beneficial, when Women, after the fiftieth Year of their Age, when the Menſes ceaſe, are ſeiz'd with a Jaundice.

As for Topics, we muſt obſerve, that, when applied to the Region of the Liver, they are of ſingular Efficacy in aſſiſting the Circulation of the Blood and Humours through the hepatic Ducts, and, for that Reaſon, contribute greatly to the ſucceſsful and expeditious Cure of a Jaundice. For this Purpoſe I have frequently, with excellent Succeſs, preſcrib'd Cataplaſms, or Bags, prepar'd of the Herbs Wormwood, Horehound, and Mint, together with the Flowers of *Roman* and common Chamomile, boil'd in *Rheniſh* Wine; or the *Emplaſtrum Saponatum* of *Barbette*, well camphorated, or ſimple Diachylon mix'd with Saffron.

In the Cure of a Jaundice, due Regard is, alſo, to be had to the Aliments; and we are carefully to obſerve, whether they are agreeable to the peculiar Conſtitution of the Patient; ſince all Aliments are not equally ſuited and adapted to Perſons of all Habits. But this Caution is, in a particular manner, to be obſerv'd, with reſpect to the Patient's Drink; for ſome, with great Propriety and Succeſs, uſe Whey, others Spring-water, either alone, or with Cream of Tartar and Sugar; others, *Rheniſh* Wine, mix'd with Citron-juice; and others, Ale: Whilſt, on the contrary, others reject theſe Liquors, and find them entirely diſagreeable to them. But, with reſpect to Wines in general, I would have them exhibited in very ſmall Quantities, becauſe, in this Diſorder, all ſpirituous Subſtances do more Injury than Good. Among Aliments, the Patient is, in a particular manner, to abſtain from ſmok'd Fleſh, Fiſh, Sweat-meats, things fried with Butter, and all leguminous Subſtances, except aqueous Fruits, ſuch as Cherries, Currants, Cucumbers, and boil'd Prunes, which are generally ſafely us'd.

The firſt Approaches of this Diſorder, or Relapſes after a Cure, are moſt effectually prevented by Changes of Air, Travelling, and ſufficient Exerciſe; to which may be join'd the liberal Uſe of ſome proper Liquor, and a calm and eaſy State of Mind. Thus, I have known Perſons, who, by a prudent and due Uſe of all theſe, have remov'd an obſtinate Jaundice; whereas it is confirm'd by daily Experience, that thoſe who lead a ſedentary Life, and are addicted to the Uſe of ſpirituous Liquors, or are ſunk in long-continued Grief, are not only highly ſubject to the Jaundice, but, alſo, with great Difficulty, totally freed from it. We ſhall now put an End to this Article, by ſubjoining the Regimen in this Diſorder recommended by *Celſus*, in the twenty-fourth Chapter of his third Book: "Thro' "the whole Courſe of this Diſorder, ſays he, the Patient is "to uſe Exerciſe, Frictions, and Baths; he is, alſo, to have the "Advantage of a warm and delicate Bed and Chamber, Sports, "Mirth, and every other Circumſtance that has a Tendency "to exhilarate and chear the Mind; for which Reaſon the "Diſorder ſeems to have been call'd *Morbus regius*. A Mala-"gma, alſo, of a digeſtive Quality, applied to the Præcordia, "is beneficial." *Frederic Hoffman.*

Methods of Cure, recommended by other Authors, are as follow.

In order to the Cure, if the Pulſe be ſtrong, and will bear it, Phyſicians commonly begin with Bleeding and Vomiting; after which, Purging takes place, eſpecially with the cholagogue Medicines, and, during the whole Courſe, deobſtruent or aperient Remedies ought to be preſcrib'd, but with ſome Variation in regard to thoſe call'd ſelect and ſpecific Remedies, ſome of which we ſhall inſert from Authors of Reputation.

After Bleeding and Vomiting, *Riverius* gives the following purging Bolus:

Take of the Electuary of the Juice of Roſes, and the Diaprunum ſolutivum, each three Drams; of the Powder of Rhubarb, one Dram; and of Saffron, half a Scruple: Mix all together.

Willis firſt orders the following Vomit, in the Uſe of which Regard is to be had to the Strength and Age of the Patient:

Take of the Sulphur of Antimony, ſeven Grains; of Scammony, impregnated with Sulphur, eight Grains; Cream of Tartar, half a Scruple: Mix, and reduce to a Powder, to be exhibited in one Spoonful of Panada.

Or,

Take of Gamboge, prepar'd, eight Grains; and of vitriolated Tartar, ſeven Grains: Reduce to a Powder for Uſe.

He then directs this Purge:

Take of the Electuary of the Juice of Roſes, three Drams; of the Powder of Rhubarb, one Dram; of Salt of Wormword, and Cream of Tartar, each half a Scruple; and Syrup of Rhubarb, a ſufficient Quantity for making a Bolus.

For weaker Conſtitutions thus:

Take of the beſt Rhubarb, two Drams; of the Troches of Agaric, half a Dram; of Cinnamon, and Ginger, each half a Scruple: Infuſe in White-wine, and Succory-water, each three Ounces; let the Infuſion be continued for three Hours, in a cloſe Veſſel, the Liquor being kept warm all the while. To the Liquor, when ſtrain'd, add of the Syrup of Rhubarb, one Ounce; and of the Water of Earth-worms, two Drams: Mix for a Potion.

Or,

Take of the Powder of Rhubarb, between half a Dram and one Dram; and of the Salt of Wormwood, half a Scruple: Mix, and reduce to a Powder.

Or,

Take of the Pilulæ Ruffi, one Scruple, and of the Extract of *Rudius*, half a Scruple: Mix, and make into four Pills, to be taken in the Morning, obſerving a due Regimen at the ſame time, and repeating it after four or five Days.

Forms of deobſtruent Apozems to be taken through the whole Courſe of Cure, ſometimes mix'd with Purgatives:

Take of the Roots of ſharp-pointed Dock, one Ounce; of the Tops of leſſer Centaury, and Roman Wormwood, each two Pugils; of the Roots of Gentian, and Turmeric, each two Drams; and of yellow Sanders, one Dram: Boil in a Pint and an half of Spring-water to one Pint, adding, towards the End, ſix Drams of Sena-leaves; of Rhubarb, three Drams; of Agaric, one Dram and an half; of Coriander-ſeeds, two Drams; and of White-wine, two Drams: Boil in a cloſe Veſſel for two Hours; and let the ſtrain'd Liquor be depurated by ſubſiding. The Doſe is from four to ſix Ounces, with Syrup of Rhubarb, one Ounce; and Water of Earth-worms, three Drams, for a Potion, to be repeated three or four Days ſucceſſively, or alternately. *Willis.*

After univerſal Evacuation, *Riverius* ſays, the Diſeaſe, if recent, may be overcome by uſing the following Preſcription, for a Week together:

Take of the Roots of Madder, half an Ounce; of the Leaves of the greater Celandine, one Handful; of the Tops of *Pontic* Wormwood, and the leſſer Centaury, each one Pugil; of Cinnamon, and Saffron, each half a Scruple: Infuſe, for a Night, in eight Pints of White-wine. To the ſtrain'd Liquor add of the Syrup of the Five aperient Roots, one Ounce. Let the Patient take it every Morning.

Or,

Take of the Whole of Celandine, one Handful; of the Flowers and Leaves of St. John's-wort, each half an Handful; of the Shavings of Ivory, and the Powder of Gooſe's Dung, each three Drams; and of Saffron, half a Dram. Let the Dung and Saffron be tied up in a Bag, and let the Whole be boil'd in equal Parts of Wormwood-water, and White-wine, to one Pint. Diſſolve in the ſtrain'd Liquor one Ounce of white Sugar, and mix up for three Doſes, to be taken in the Morning.

Quercetan, *Fonſeca*, and *Paré*, with many others, greatly extol Gooſe-dung gather'd in the Spring, and taken from half a Dram to a Dram. *Paré* gives two Drams, diſſolv'd in White-wine, and ſtrain'd for a Potion.

The Powder of Millepedes and Earth-worms are, likewiſe, recommended.

Steel, and ſome of its Preparations, are frequently directed with Advantage.

Geſner praiſes the Roots of the Stinging-nettle, bruis'd, to one Pound, with one Scruple of Saffron, to which he adds White-wine; and gives the clear expreſs'd Tincture to four Ounces, for four or five Days.

The Chymiſts, not without Reaſon, recommend their vitriolated Tartar, Salt of Tartar, and Cream of Tartar, which they adminiſter with a chalybeate Wine, for ſome Days. And, for the ſame Purpoſe, their tartaris'd *Elixir Proprietatis*, and the Tincture of Antimony.

Willis

Willis directs the following Electuary:

Take of the Conſerve of *Roman* Wormwood, and the yellow Rinds of Oranges and Lemons, each two Ounces; of the Species Diacurcumæ, one Dram and an half; of the Powders of Ivory, yellow Sanders, and Aloes-wood, each half a Dram; of the Troches of Capers, one Dram; of the Powder of Rhubarb, half a Dram; of the Salt of Wormwood, two Drams; and of the Syrup of Succory with Rhubarb, a ſufficient Quantity for making an Electuary. Let the Patient take the Bulk of a Cheſnut, twice a Day; drinking, after each Doſe, three Ounces of the following Julap:

Take of the Waters of the greater Celandine, Fumitory, Wormwood, and Elder-flowers, each five Ounces; of the compound Waters of Snails, and Earth-worms, each two Ounces; and of Sugar, half an Ounce: Mix all together.

The common Remedy is a Lemon, roaſted under hot Embers, or before a gentle Fire, with Saffron incloſed in it, which, then, is ſteeped, or ſqueezed, into a Glaſs of White-wine.

Sylvius, in ſome Caſes, preſcribes a Decoction of Hemp-ſeed and Caſtile-ſoap; which he believes proper to blunt the Edge of that raging volatile Salt, which, according to his Hypotheſis, renders the Bile, at theſe times, immiſcible with the Maſs of Blood.

Dioſcorides adviſes the Juice and Decoction of the white Horehound: Others, the Decoctions of the Barberry, and Caper-bark.

Sennertus directs the Seeds of Columbine, which he gives in Powder, to half a Dram; with one Scruple of the Powder of Earth-worms, and half a Scruple of Saffron, in a Glaſs of Wine; as, alſo, a Decoction of red Vetches, with Aſparagus-root, for common Drink.

When the Jaundice, ſaith *Sylvius*, ſucceeds the poiſonous Bite of a Viper, or other venomous Creature, as is not unuſual; Sudorifics are neceſſary, abounding with a volatile Salt: To which End conduce the volatile Salt of Hartſhorn, Bezoar Mineral, diaphoretic Antimony, Treacle, and Preparations of Vipers.

Augenius ſays, that one Dram of Gum Ammoniac, diſſolved in two or three Ounces of Oxymel or Hydromel, given four or five Days, or more, together, in the Morning faſting, cure the Jaundice to a Miracle.

The Decoction of Strawberry-leaves is accounted, likewiſe, a great Anti-icteric.

The Vulgar pretend to find Relief from ſwallowing five, ſeven, or nine Lice; for, without an odd Number, no good Effects are expected. Whatever Succeſs they have, ought, certainly, to be aſcribed to their volatile Salt; but, ſince many leſs ungrateful, and more powerful Remedies are diſcover'd, there ſeems to be no Reaſon why one ſo loathſome ſhould be directed.

Some affirm, the beſt Cures have been perform'd by Acids; ſuch as are the vitriolated or chalybeated Tartar, and the Sal Diureticum of *Bates's Pharmacopœia*.

Turner prefers the following Preſcription, which, he ſays, he has tried ſucceſsfully, when many others have failed; and believes it may be relied on, except where the Glandules of the Liver are ſo much conſtricted, that the Bile can no longer be ſecreted; or when the Duct, which empties itſelf into the Duodenum, is entirely obſtructed by indiſſoluble Stones; whence proceed thoſe excruciating Colics, with bilious Vomitings, which attend this Diſeaſe.

Take of white *Venice* Soap, or pure *Caſtile* Soap, two Drams; of the Powder of Rhubarb, one Dram; of Saffron, cut ſmall, half a Dram; and of the liquid Extract of Gentian, a ſufficient Quantity, beat up into a Maſs, of each Dram of which ten Pills are to be made; of which the Patient is to take four every ſix Hours, drinking, after each Doſe, four Ounces of the following Apozem:

Take of the Roots of Madder, one Ounce; of ſliced Turmeric, half an Ounce; of the Herb Celandine, with its Tops, St. John's-wort, the leſſer Centaury, and white Horehound, each half an Handful: Boil them gently, in a ſufficient Quantity of Spring-water, for two Pints of the ſtrain'd Liquor; adding, towards the End, half a Pint of White-wine, to the ſtrain'd Liquor, when depurated by ſubſiding: Add of the Syrup of the Five aperient Roots, one Ounce and an half, for an Apozem.

He acknowledges, however, to have more than once ſeen a ſtubborn Jaundice, which had fruſtrated the Endeavours, both of himſelf and others, at laſt overcome with the Juice of the green Leaves of the Artichoak: This, he adds, is a harſh Medicine, working both upwards and downwards, and, conſequently, improper for weak and worn-out Conſtitutions. The Doſe is three Spoonfuls, with an equal Quantity of White-wine, twice a Day.

But if the Tone of the Blood is broken by Intemperance, and the ſecretory Organs perverted in their Office, or the Liver indurated; whence a Dropſy enſuing upon the Jaundice, and the yellow Complexion changing for one more intenſely deep; the Kidneys, alſo, no longer able to derive the Serum, unleſs in ſmall Quantity, ſaturated with Bile, like an Elixivium in its Colour, through the urinary Paſſages, as formerly; the upper Parts of the Body waſted; with the lower, as the Belly, Thighs, and Legs, upon a Stretch; the Caſe is here, become deſperate, and the Sick by no means to be relieved.

Upon removing the Obſtructions, and recovering a former State of Health, the yellow Complexion, which accompanies this Diſeaſe, inſenſibly waſtes, by the Help of the native Heat, through the Pores, in the ſame manner as black and blue Spots on the Skin, occaſion'd by external Contuſion and Extravaſation. But, in order to haſten the Diſappearance, *Hippocrates*, *Galen*, and others, propoſe Bathing, either in warm Water, or in the natural, nitrous, and ſulphurous Baths: *Sylvius* preſcribes Sudorifics, endued with a volatile Salt; which, he ſays, are profitable, whether Sweating follows or not: *Paulus*, and others, according to *Meſſarias*, preſcribe Sulphur inwardly, to one Dram: But this is a hazardous Remedy, eſpecially if taken by hectical Patients, and ſuch as are of a hot and dry Temperament.

The Yellowneſs, remaining on the Tunica adnata of the Eye, is diſperſed, by receiving into it, at convenient Intervals, the Fumes of Vinegar, after the manner of a Suffitus.

The black Jaundice, ſo called from the deeper Dye, is nearly allied to the former; or is, rather, the ſame Diſtemper degenerated, inducing a Scirrhus upon the Liver, and a Rottenneſs upon the reſt of the Viſcera; by theſe means, the Temperament of the Blood being ſpoiled, and a Dropſy coming on, the whole Conſtitution is broken, and the human Frame quickly deſtroy'd. However, the Cure may be attempted after the ſame manner with the former, or with ſome little Variation, as the Symptoms may happen to indicate.

Sydenham obſerves, that the yellow Jaundice ſometimes ſucceeds the hyſteric or hypochondriac Colic; and, in curing this Species, he is either for refraining entirely from Purgatives, or for exhibiting Rhubarb only, or ſome other gentle Lenitive; becauſe the Purging might raiſe a new Commotion of the Spirits, and, conſequently, occaſion a Return of the hyſteric Symptoms: And the Jaundice, proceeding from this Cauſe, generally goes off, ſpontaneouſly, in a ſhort time: But, if it continues long, or abates ſlowly, he propoſes the following Apozem.

Take of the Root of Madder and Turmeric, each an Ounce; the Roots, together with the Leaves, of the greater Celandine, and the Tops of the leſſer Centaury, of each an Handful: Boil them in equal Quantities of *Rheniſh* Wine, and Spring-water, to a Quart: To which, when ſtrain'd off, add two Ounces of the Syrup of the Five opening Roots: Mix them together for an Apozem, of which let the Patient take half a Pint warm, every Morning and Night, till the Cure is completed.

The *Edinburgh* Diſpenſatory preſcribes this Decoction.

Take the Roots, together with the Leaves of the greater Celandine, the Roots of Turmeric and Madder, of each an Ounce; Spring-water, three Pints: Boil them together till there remains a Quart of the ſtrain'd Liquor; to which, when cold, add the Juice of two hundred Millepedes, and two Ounces of the Syrup of the Five opening Roots; and mix them together.

But, ſays Dr. *Sydenham*, where the Jaundice is the original Diſorder, beſides the Alteratives juſt ſet down, it is convenient to exhibit ſuch Medicines, once or twice, as evacuate the Bile by Stool, before taking the Apozem above preſcribed; and once a Week afterwards, while it is continued.

Take of the Electuary of the Juice of Roſes, two Drams; Rhubarb finely pulverized, half a Dram; Cream of Tartar, a Scruple; Syrup of Succory, with Rhubarb, enough to make them into a Bolus: To be taken betimes in the Morning, drinking after it a Glaſs of *Rheniſh* Wine.

But, if the Diſeaſe ſtill remains obſtinate, he adviſes the Patient to the Uſe of ſome chalybeate Mineral Waters, ſuch as *Tunbridge*, to be drunk every Morning, at the Fountain-head, till he recovers. *Turner* recommends the *Spa* Waters.

Sheeps-dung, infuſed in Beer, is a Remedy uſed, with Succeſs, by the poorer Sort of People.

Ettmuller ſays, that Emetics, Chalybeates, and thin Bitters, perform the whole Cure: Univerſals being premiſed, make uſe of Stomachics, Chalybeates, (crude Filings of Steel, in the black Jaundice) Preparations of Rhubarb, Worms, Vipers; alcaline, volatile, and bitter Subſtances; Mineral Waters, and Gum Ammoniac.

Bleeding and Purging are very rarely uſed in this Diſtemper. The following are the beſt Specifics; the greater Celandine, Horehound, Flowers of St. John's-wort, Saffron, Broom, Wormwood, and Hempſeed boiled in Milk, Turmeric-root, Madder, the Drinking of Urine; the Dungs of all Birds or Animals, Lice, the Stone in the Gall-bladder of an Ox: In general, it is adviſed, that, in the Cure of the Jaundice, anti-icteric Medicines be continued for ſome conſiderable time; becauſe it is a chronical and ſtubborn Diſtemper: And, as long as the Urine looks thin and ſplendid, ſo long the Uſe of them ought to be continued, till the Signs of Concoction appear, and the Urine becomes thick and turbid, and full of Sediment; for, when there are theſe Appearances, they afford great Hopes of a Recovery. When the Cure is effected, Friction and Bathing are proper, to take away the yellow Colour of the Skin.

But, as a Jaundice is always moſt dangerous, when either preceded by a Scirrhus of the Liver, or accompanied with one; this, if curable, may be removed by the following, or ſome ſuch-like Preparations: We are, therefore, after the previous Uſe of ſuch things as are effectual in a Jaundice, to foment the Right Hypochondrium with the following Decoction.

Take of the Leaves of Mallows, and Wormwood, together with the Flowers of Melilot, and Chamomile, each one Handful; of the Leaves of Baum, and Ground-pine, each half an Handful; and of the Seeds of Fenugreek, an Ounce and an half: Boil in four Pints of Water, adding, towards the End, two Pints of White-wine. Let the Side be, every Morning and Evening, fomented with Woollen Cloths, dipt in this Liquor, warm.

Then apply a Plaiſter of the *Diachylon cum Gummi*, and Melilot, malaxated with Oil of Worms, or the *Emplaſtrum de Cicuta cum Ammoniaco*, or the *Emplaſtrum de Ranis cum Mercurio triplicato*.

Decoctions of Sarſaparilla, and Guaiacum, drank warm in the Morning, for a long time, are, of all other Liquors, the moſt proper Drink; and if, by theſe Meaſures, the Diſorder is not removed, we muſt have recourſe to the internal Uſe of Mercurius dulcis. *Pitcarn. Elem. Phyſ. Math.*

But, in the very worſt Jaundices, provided there is no conſiderable Inflammation, nothing is eſteem'd more effectual than *Bath* Waters.

Young Children, ſoon after their Birth, are ſubject to the Jaundice; which, generally, yields to any gentle Purgative, or any Medicine that increaſes the Contraction of the Inteſtines.

For this Diſorder *Sylvius* recommends the following Remedy.

Take of *Engliſh* Saffron, and Bezoar Mineral, of each one Grain: Mix them together for a Powder.

An Infuſion of the Lens paluſtris, in Wine, is eſteem'd a Specific for a Jaundice.

ICTIS, ἰκτὶς, in Zoology, imports either a Kite, or a Ferret.

ICTUS imports either a Stroke, or Pulſation, of the Artery; or a Blow; or a Sting from ſome venomous Inſect. See VENENUM.

IDAM is explain'd, by *Rulandus*, *Pulmentum*.

IDEA. A Name for the Victorialis; ſpotted Ramſons. *Blancard.*

IDEACH. *Paracelſus* ſays, that Ideach occurs in every Plant; but it is not eaſy to determine what he means by it.

IDECHTRUM. A Term coin'd by *Paracelſus*; by which he means the firſt Man, the firſt Plant, or the firſt Creature of any Kind.

IDESTRUM, is another Term of *Paracelſus*, which it is not very eaſy to underſtand, or tranſlate. The Paſſage in his *Fragmenta de Tartaro*, is thus: *Durities Tartari coagulationem ſuam ex ſalibus Mineræ habet. Sal in hac generatione accidens Elementale eſt & aqueum, Liquor humoralis, & Ideſtrum. Ideſtrum autem ſine Compoſito non eſt. Compoſitum eſt de mineralibus per quatuor formas. Ideſtrum Conjunctio humoralis, naturalis, & mineralis.*

IDEUS is another Term of *Paracelſus*: It is not very clear whether he means by it the Chaos, or the Creator, or both, in different Paſſages.

IDIOCRASIA, ἰδιοκρασία. The ſame as IDIOSYNCRASIA; which ſee.

IDIOPATHEIA, from ἴδιος, private, peculiar, and πάθος, an Affection.

This implies a primary and proper Affection of any Part: Thus the Head is affected idiopathically, in a Lethargy; and the Lungs, in a Pleuriſy: But, when theſe Parts ſuffer by Conſent, that is, by Diſorders reſiding in other Parts, they are then ſaid to ſuffer by Sympathy, *Sympathia*.

IDIOSYNCRASIA, ἰδιοσυγκρασία, from ἴδιος, peculiar, σὺν, with, and κεράννυμι, to mix.

Idioſyncraſy. Every Individual has a State of Health peculiar to himſelf; and as different Bodies ſeem to vary from each other, both with reſpect to the Solids and Fluids, tho' each may, at the ſame time, be in a ſound Condition, this Peculiarity of Conſtitutions, by which they differ from other ſound Bodies, is called Idioſyncraſy; and the Diſorders ariſing from this Peculiarity are, ſometimes, accounted incurable; becauſe they are thought to be preſent, from the very firſt Formation of the Body.

Sydenham, treating of hyſteric Diſorders, remarks, that ſome Women, by reaſon of a certain Idioſyncraſy, or Peculiarity of Conſtitution, have ſo great an Averſion to hyſteric Medicines, which are ſo generally ſerviceable in this Diſeaſe, that, inſtead of being reliev'd, they are injur'd thereby. In ſuch, therefore, they are to be wholly omitted; for, as *Hippocrates* obſerves, it is fruitleſs to oppoſe the Tendency of Nature: And, in reality, this Idioſyncraſy, or Antipathy, is ſo remarkable, and ſo common, that, unleſs Regard be had to it, the Life of the Patient may be endanger'd; and this not only from hyſteric Medicines, but from ſeveral others: In Confirmation whereof, I will, ſays he, at preſent, produce only a ſingle Inſtance. Thus, ſome Women, in the Small Pox, cannot bear Diacodium, becauſe it occaſions Giddineſs, Vomitings, and other hyſteric Symptoms; whilſt liquid Laudanum agrees with them very well. I experienced this, whilſt I was writing this, in a young Lady, in the Small Pox, to whom I had given Diacodium on the ſixth and ſeventh Day; and ſhe was ſeized on both Nights with the above-mention'd Symptoms; and the Inflammation of the Puſtules did not go on regularly; but, afterwards, upon uſing Laudanum, ſhe was freed from theſe Symptoms, and the Swelling of the Face increaſed; the Puſtules filled every Day, and the Reſtleſſneſs and Anxiety (which made a kind of Paroxyſm of the Small Pox) were wholly removed, every time this Opiate was exhibited; the Patient being ſtrengthened and revived thereby.

IDIOTA, ἰδιώτης, from ἴδιος, private. This properly imports a private Man, who bears no Office in the Government. But, in the modern or figurative Acceptation, Perſons concern'd in Government are not always exempt from this Appellation; for it implies a ſuperlative Fool. *Hippocrates* particularly compliments unskilful Phyſicians with the Name of Idiot; I ſay, compliments, becauſe a Perſon who practiſes Medicine without underſtanding it, or taking proper Pains in order to inform himſelf, ſatisfies his Honour and his Conſcience very ill, and is ſomething worſe than a Fool.

IDIOTROPIA, ἰδιοτροπία. The ſame as IDIOSYNCRASIA; which ſee.

IDOS, ἴδος, the ſame as ἵδρως, Sweat. It occurs in *Hippocrates's Coac. Prænot.*

IDOU MOULLI, H. M. P. 4. T. 18. p. 41. *Prunus fructu umbilicato, pyriformi, ſpinoſa, racemoſa.*

The Name of a tall *Indian* Tree, which grows ſeventy Feet high, and bears a ſort of Plum. The Bark, Flowers, and Fruit, are eſteemed good againſt Madneſs, a Phrenitis, and other Diſorders of the Head. A Decoction is made of the Bark in common Water, which is ſaid to be powerfully effectual againſt the Jaundice, Dropſy, and other chronical Diſeaſes. A Cataplaſm, made of the Bark of the Root, powder'd together with red Sanders, by the Help of Womens Milk, has the Reputation of curing Venereal Bubos, if applied thereto.

IDROAGIRA. *Rulandus* explains this by *Aqua Alcali.*

JECORARIA VENA. The Hepatic Vein. See VENÆ.

JECTIGATIO. A Palpitation.

JECUIBA. Margraav. The Name of a Tree which grows in *Braſil*, the Wood of which is of a reddiſh Brown, undulated with black, and excellent for Carving; but of no Uſe in Medicine.

JECUR. The Liver. See HEPAR.

The Livers of Animals, conſider'd as Food, are eſteem'd extremely unwholſome Aliments; for no Humours in the Body are ſo ſubject to Putrefaction, as Bile and Urine. But, as a Portion of Bile is always contain'd in the Liver, this diſpoſes the Liver to a ſpontaneous Corruption: Hence it becomes acrimonious, and not only ſtimulates the Stomach and Inteſtines, but cauſes what is uſually call'd a Surfeit, and ſupplies a very bad chylous Juice. Hence, probably, the *Jews* were forbid to eat the Entrails of Animals, among which is the Liver. But, of all others, the Livers of Fiſhes are the worſt.

JEJUNIUM, νῆστις, Faſting, or Abſtinence. See ABSTINENTIA.

JEJUNUM *Inteſtinum*, one of the ſmall Inteſtines; which ſee fully deſcribed under the Article COELIA.

JENTACULUM, a Breakfaſt, or eating early in the Morning; which is reckon'd to be wholſome for thoſe who are accuſtom'd to it, and even neceſſary for Children. *Caſtellus.* See ACRATISMA.

JEQUI TINGUACU, a Species of the Saponiferous, or Soap-bearing Tree. *Ray Index.*

JERASOY, a ſort of exotic Fruit, imperfectly deſcribed by *J. Bauhine*, in *Ray's Hiſtoria Plantarum*, p. 1822. but with no Uſe or Virtues aſcribed to it.

JESE-

JESEMINUM, the ſame as *Jaſminum*. *Blancard.*

JETAIBA. The *Braſilian* Name for the *Locuſta Arbor*, or Locuſt-tree. *Ray, H. P.*

JETICA. A Name by which the *Braſilians* call *Spaniſh Potatoes.*

JETICUCU. The *Braſilian* Name for MECHOACAN. *Ray. H. P. p.* 1723.

IETREION, ἰητρεῖον. See IATREION.

IGBUCAINI *Braſilianorum*. De Laet. A Tree growing in *Braſil*, and bearing a Fruit reſembling a ſmall Apple, full of ſmall Kernels; and, as it is ſaid, a preſent Remedy againſt a Dyſentery. *Raii Hiſt. Plant.*

IGCIGA, & IGTAIGCICA. De Laet. *Weſt India* Plants. The firſt of theſe is a Tree, which produces a kind of Maſtich, of a very pleaſant Smell. The Bark, bruiſed, yields a ſort of white Liquor, which, being condenſed, ſerves inſtead of Frankincenſe, and is effectual in Plaiſters for cold Diſtempers. The other Species, called *Igtaigcica*, which, in the Language of the Country, ſignifies *Stony Maſtich*, produces a Roſin ſo hard and pellucid, that it may be almoſt taken for Glaſs; the Natives commonly uſe it to glaze their earthen Veſſels. *Raii Hiſt. Plant.*

IGNAVIA, Idleneſs, Sloth, beſides other ill Effects, is obſerv'd by *Celſus* to blunt the Forces of the Body, and accelerate old Age. *Celſus, Lib.* 1. *Cap.* 1.

IGNIS, πῦρ. Fire. In Pathology, there are many Diſtempers called by the Name of *Ignis*, but principally a *Cauſus*, or burning Fever: Which is very frequently termed πῦρ, *Ignis*, by *Hippocrates*, in his Books of *Epidemics*, of the *Glandules*, and of *Diſeaſes*. The *Eryſipelas* goes alſo by the Name of *Ignis ſacer*, or *Ignis Sancti Antonii*; and *Herpes ferus*, or *Zona*, and *Ignis Perſicus*. The *Impetigo*, alſo, is called *Ignis volaticus, volagrius*, and *ſylvaticus*. *Ignis*, in a ſpagirical Senſe, alſo bears different Significations; ſome take it for the Oil, which ſwims at the Top in Diſtillations. Mercury is called *Ignis*, by the Conſent of all Philoſophers. *Th. Chymic. Vol.* 4. 756. 767. *& alibi. Ignis algir* is a very ſtrong Fire; *Ignis elementaris* is Sulphur, but not that in common Uſe; *Ignis ſapientum* is hot Horſe-dung; *Ignis extinctus* is extinguiſhed Sulphur; *Ignis pruinus adeptus* is the Quinteſſence of Wine, or, as ſome will have it, of Vitriol, rectified with Tartar; *Ignis lenis* is the Element of Fire, the Æther, *Jupiter argos*; *Ignis Gehennæ* is a Name given by *Paracelſus* to a ſpecific Corroſive.

The Chymiſts, in order to perform their Operations, uſe Fires of various Kinds; ſuch as thoſe of Sand, Filings of Iron, and Aſhes, the Reverberatory Fire, the *Ignis Rotæ*, or Fire for Fuſion, the Lamp Fire, the *Balneum Mariæ*, the Vapour-bath, and the Fire of Suppreſſion. They, alſo, uſe ſeveral other Kinds of Heats, which may be claſſed among the Fires; ſuch as Inſolation, a Bath of Horſe-dung, a Bath of the Skins of Grapes, and the Heat of Quick-lime.

The Fires or Baths of Sand, Filings of Iron and Aſhes, are, when the Veſſel, containing the Matter to be heated, has its Bottom and Sides totally ſurrounded with the Sand, the Filings of Iron, or the Aſhes; that, by this means, the Veſſel may be ſlowly and gradually heated.

The Reverberatory Fire is made in a Furnace, covered with a Dome, that, by this means, the Heat or Flame, which has always a Tendency to make its Eſcape at the ſuperior Parts of the Furnace, may be reverberated, or beat back on the Veſſel immediately expos'd to it.

To expoſe a Veſſel to a naked Fire, or to diſtil with a naked Fire, is, when there is no intermediate Subſtance between the diſtilling Veſſel and the Fire; or when it touches the Fire, or receives its Heat, without the Intervention of any other Body.

The *Ignis Rotæ*, or Fire for Fuſion, is, when a Crucible, or any other Veſſel, containing the Matter deſtin'd for Fuſion, is ſurrounded with live Coals.

The Lamp Fire is, when any Matter, contained in a Glaſs Veſſel, is render'd hot, by the equable Heat of a lighted Lamp. The Fire of a very hot Lamp is, alſo, uſed to ſoften the Necks of ſmall Veſſels, in order to have them hermetically ſealed. The Lamp Fire, or that of a Candle, is, alſo, uſed to heat the Neck of a ſmall Matras, or of any Glaſs Veſſel, at the Part we intend to break it, by applying to it a Rag dipt in cold Water.

The *Balneum Mariæ* is, when the Alembic, containing the Matter to be heated, is placed in a Veſſel full of Water, under which a Fire is put, that, by this means, the Water, becoming hot, may, in its turn, heat the Matter contained in the Alembic.

A Vapour-bath is, when a Veſſel, containing any Matter, is heated by the Steam of hot Water.

The Fire of Suppreſſion is, when, in order to diſtil *per Deſcenſum*, the Fire is laid above the Matter; ſo that the Moiſture forced from it, by means of the Heat, is precipitated to the Bottom of the Veſſels: Or, when the Body of a Retort, or other Veſſel, is cover'd over with Fire, this is called a Fire of Suppreſſion.

Inſolation is, when any Matter, deſign'd either to be put into Fermentation, or dried, is expoſed to the Rays of the Sun.

The Bath of Horſe-dung, called alſo the Horſe's Belly, is, when a Veſſel, containing any Matter, to be either digeſted or diſtil'd, is placed in a large Heap of Horſe-dung.

A Bath of the Skins of Grapes, collected in large Quantities after the Vintage, may, like the Bath of Horſe-dung, ſerve for Digeſtions or Diſtillations. But the principal Uſe made of theſe Skins, in warm Climates, where they become hotter than in ſuch as are temperate, is, to penetrate and produce a Ruſt on Copper, for the Production of Verdegriſe.

The Heat of Quick-lime, moiſtened, may ſerve for ſome Diſtillations. When, for Inſtance, after being mixed with Sal Ammoniac, it makes a very ſubtle Spirit diſtil from it, without the Aſſiſtance of any other Fire.

To make a Fire of the firſt Degree, two or three live Coals, capable of producing a moderate Heat, are only neceſſary.

For a Fire of the ſecond Degree, 'tis neceſſary there ſhould be four or five Coals, which communicate a Heat capable of heating the Veſſels ſenſibly; but only to ſuch a Degree, that the naked Hand may endure it for ſome time.

For a Fire of the third Degree, a large Coal Fire is neceſſary. And,

For a Fire of the fourth Degree, we muſt uſe Coals and Wood together, which produce a violent and intenſe Heat.

The Fires of Sand, Filings of Iron, and Aſhes, have generally their Degrees, from the firſt to the third; but that of the Filings of Iron has a ſtronger Heat than the other, becauſe the Filings eaſily become firſt hot, and then red. The Fire of Aſhes is the moſt moderate, becauſe they do not retain ſo great a Heat as the other Subſtances.

The Reverberatory Fire has its Degrees, from the firſt to the fourth; which is that generally raiſed to the greateſt Violence.

The *Ignis Rotæ* is always a large Coal Fire, without any Degrees, becauſe it only ſerves for Calcinations and Fuſions; in which we only uſe Veſſels of a porous Earth, and ſuch as eaſily reſiſt the ſtrongeſt Fires.

A Veſſel may receive different Degrees of Heat from a lighted Lamp; by either keeping it at a certain Diſtance, or gradually advancing it nearer the Veſſel. But, when the Veſſel is once heated, an equal Heat is always continued, becauſe the Wick of the Lamp burns equally in that Species of ſmall Furnace in which it is plac'd.

The *Balneum Mariæ*, and Vapour-bath, have, alſo, their Degrees; for, according as the Water of the Bath is more or leſs heated, the Diſtillation is more or leſs promoted. We may, therefore, call it the firſt Degree of the *Balneum Mariæ*, or Vapour-bath, when the Bath or Vapour are only moderately tepid, as they ought to be when any Matter is put in a Veſſel, and expoſed to them for the ſake of Digeſtion. Their Heat of the ſecond Degree is, when the Water of the Bath, and the Steam of the Water, are ſo hot, that one cannot hold his Hand in them; as they ought to be when a gentle Diſtillation is to be produced. Their third Degree of Heat is, when the Waters of both Baths boil, in order to haſten the Diſtillation.

The Fire of Suppreſſion has, alſo, its Degrees; ſince ſometimes warm Aſhes are only uſed in order to excite a very mild and gentle Heat; and this is the firſt Degree. At other times a ſmall Quantity of live Coal is mixed with the warm Aſhes, and this is the ſecond Degree; and at other times they place upon a thin Bed of Aſhes a large Quantity of live Coal; and this is the third Degree of Heat, peculiar to the Fire of Suppreſſion.

Inſolation has, alſo, its Degrees, in proportion to the Heat of the Sun, to which the Subſtances are expoſed. The beſt Inſolation is that made in the Months of *July* and *Auguſt*, becauſe the Sun has then more Force and Vigour than at other times.

The Bath of Horſe-dung has, likewiſe, its Degrees, according to the Bulk of the Heap, or the Place in which 'tis lodg'd; for a large Heap of Dung communicates a proportionably greater Heat than one which is ſmaller. And if the Dung is lodged in a Stable, or any other cloſe and hot Place, it will become much warmer, and produce more conſiderable Effects in Digeſtion and Diſtillation, than a Heap of equal Bulk, expoſed to the free and open Air.

The Bath of Grape-skins has, alſo, its Degrees like that of the Bath of Horſe-dung; but in hot Climates it communicates a far greater Heat than in temperate Countries.

The Heat of Quick-lime has, alſo, its Degrees; for, according as we deſire it more or leſs ſtrong, we expoſe it, in Powder, longer or ſhorter, to the open Air: And, when we have occaſion for all its Heat, we uſe it as quick as we poſſibly can. *Lemery, Cours de Chymie.*

Beſides the Degrees of Fire already mention'd, the later Chymiſts reckon a fifth, which is that whereby Gold is made to emit Fumes, and evaporate.

This was firſt diſcovered in the Year 1690. by Mr. *Tſchirnhauſen*, whoſe Burning-glaſs rendered every thing, even Gold itſelf, volatile.

I muſt

I muſt appriſe the Reader, that whenever any Degrees of Fire are mentioned, in Quotations from *Boerhaave*, they are ſuppoſed to be meaſured by a Thermometer, wherein the freezing Point is at about thirty-one, and the Degree ſufficient to make Water boil, at about two hundred and twelve.

IGNITIO, πύρωσις, the ſame as CALCINATIO; for which ſee CALX.

IGNIVORUS, πυροφάγος. See PYROPHAGUS.

IGNORANTIA, ἄγνοια. See AGNOIA.

IGNYS, IGNYE, ἰγνὺς, ἰγνύη. The Ham, or Part behind the Knee; in Latin *Poples*, ἰγνύην τέμνειν, 6 *Epid. Sect.* 1. *Aph.* 5. is to bleed in the Vein of the Ham. *Foeſius.*

JITO *Braſilienſibus*. Marcgr. Piſon. A pomiferous Tree, growing in *Braſil*; its Fruit, or Apple, is of the Size of an ordinary Hand-ball, of a dark-yellow Colour, and containing three oval Seeds, of the Size of thoſe of a common Apple, covered with a dark-yellow Cuticle, and of a whitiſh Subſtance. I find no Virtues aſcribed to it. *Jito* is, alſo, a Name for another very different Tree, the

Jito prior, Piſon. a bacciferous Tree, of *Braſil*, whoſe Fruit grows in Cluſters, like Grapes, and, at a Diſtance, both for Figure and Colour, has the ſame Appearance, but is ligneous on the Inſide, and good for nothing: They hang on the Tree throughout the Year, being of a lively Yellow in the Spring, and afterwards of a dark Vermilion-colour. Neither the Fruit, Leaves, nor Wood, of the Tree are of any Eſteem, but all the medicinal Virtue lies in the hot and acrid Bark of the Root, which purges violently, and diſturbs the Humours to ſuch a Degree as renders it unſafe for vulgar Uſe. The Natives, and the robuſteſt ſort of Labourers among the *Portugueſe*, pulverize the Bark, and take it in an indeterminate Quantity, about half a Pugil, againſt inveterate Obſtructions. I ſeldom uſe it, ſays *Piſo*, and never but for want of a more gentle Medicine, and with Correctors, to diminiſh its cathartic Force. *Raii Hiſt. Plant.*

ILAPHIS. The Name of a Simple, in *Myrepſus*, *Antidot. C.* 412. which is immediately explained to be what the *Latins* call *Bardana*; that is, the Burdock.

ILECH. A Term in *Paracelſus*, by which he ſeems to mean ſomething which is Firſt, or a Principle. *Ilech primum*, in *Rulandus*, is a Principle; *Ileias*, *Ileadus*, *Ilech*, *ſupranaturale*, *vel primum*, is a ſuperceleſtial Conjunction of the Stars, or an Union of the Stars of the Firmament with the Stars of inferior things. *Ilech magnum* is the Aſcendant, or Conſtellation of Medicine, which we receive, together with Medicine, in which it has its Reſidence, like the ſuperior Stars in the Firmament, and the inferior in Man. *Ilech crudum* is a Compoſition of the Firſt Matter of the three firſt Things, which are Mercury, Salt, and Sulphur; and, in this Senſe, it is the ſame as the *Iliaſter*, or *Iliadum*. *Rulandus*, *Caſtellus*.

ILEIDOS, in the ſpagirical Cant, the elementary Air, the *Heoa Pheresbios*, (ἠῶα φερέσβιος) or Life-bringing Morning, Heaven: In Man it is the Spirit, which pervades all the Members. *Rulandus*, *Johnſon*.

ILEUM INTESTINUM. One of the ſmall Inteſtines; for which ſee the Article COELIA.

ILEUS, εἰλεός. The ſame as ILIACA PASSIO; which ſee.

ILEX.

The Characters are;

The Leaves are rather indented than ſinuated, as thoſe of the common Oak; the Flowers are amentaceous, conſiſting of many Stamina, ariſing from a Funnel-ſhaped Calyx. The Fruit is like that of the Oak.

Boerhaave mentions three Species of this Plant; which are,

1. Ilex; aculeata; cocciglandifera. *C. B. P.* 425. *Tourn. Ind.* 583. *Boerh. Ind. A.* 2. 177. *Ilex coccigera*. J. B. 1. 2. 106. Ger. 1159. Emac. 1342. Raii Hiſt. 2. 1392. *Ilex aquifolia ſive coccigera*. Park. Theat. 1394. THE SCARLET OAK.

The Produce of this Plant, uſed in Medicine, is the CHERMES; which ſee.

2. Ilex; folio rotundiori; molli; modiceque ſinuato; ſive Smilax Theophraſti. *C. B. P.* 425. *Tourn. Inſt.* 583. *Boerh. Ind. A.* 2. 177. *Smilax Arborea*. Offic. *Smilax Arcadum glandifera major*. Park. Theat. 1398. *Smilax Dalechampii*. J. B. 1. 2. 101. THE GREAT SCARLET OAK.

This is common in *Italy* and *Languedoc*. The Bark, Leaves, and Acorns, are uſed, which are eſteem'd more aſtringent than thoſe of the Oak.

3. Ilex; oblongo; ſerrato, folio. *C. B. P.* 424. *Ilex arborea*. J. B. 1. 95. *Ilex, anguſtifolia*. Tab. Ic. 969. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 177.

ILEX BACCIFERA. See AGRIFOLIUM.

ILIA (The Plural of ILE). The lateral Parts of the hypogaſtric Region, or Flanks.

ILIACA PASSIO. The Iliac Paſſion.

As to a Suffuſion of the Blood, or Serum, within the Coats of the Inteſtines, by which an Inflammation, or painful Tumors, are excited, I grant it is ſometimes ſo in reality, and have ſeen it with my own Eyes; but I obſerved, that it did not excite a Colic, but an Iliac Paſſion; becauſe, upon opening ſeveral, who died of a Twiſting of the Guts, I found in moſt of them, that an Inflammation and Sphacelus of ſome Inteſtine was the Cauſe both of the Diſeaſe and Death: Nor is this ſurpriſing; for the great Solution of Continuity excited Spaſms and Corrugations, ſo perpetual and violent, in the tender and exquiſitely ſenſible Membrane, that the periſtaltic Motion of the affected Inteſtine, by which the Excrements of the Belly are protruded towards the Anus, was ſtopped, and abſolutely inverted. *Willis de Anima Brutorum.*

The large Inteſtines have the ſame Coats as the ſmall, and, as the Fæces aſcend directly in the *Colon*, there is a Neceſſity for more robuſt, fleſhy Fibres, to produce a ſtronger Contraction: Hence, if an Inflammation, or Sphacelus, (which I have often known) happens about the Beginning of the Colon, ſo that the fleſhy Fibres, being injured, cannot perform the Contractions for the Elevation of the Excrements, they, ſtagnating towards the *Ileum*, induce an incurable *Iliac Paſſion*. *Willis Pharmaceutice Rationalis.*

A certain Woman ſeemed to labour under the Iliac Paſſion, accompanied with Hyſterics; in the Summer ſhe was ſeized with this Pain, and, in three Days time, it ended in a Twiſting of the Inteſtines, of which ſhe died the fourth: She had a ſcirrhous Tumor upon the Confines of the *Colon*, which was replete with very acute Oſſicles, and, as it were, pricking and vellicating the Inteſtine: Wherefore, an Obſtruction being made in the Inteſtine, and an Inflammation ariſing, ſhe died in the utmoſt Agony, vomiting Excrements. *Hippolytus Boſcus.*

I knew a Countryman, who died after long Contorſions, and continued Inflammations of the Abdomen; and, being opened, there was a large Fiſſure in the Inteſtine; out of which I ſaw freſh Grapes diſcharg'd, which he had juſt eaten. *Benevenius.*

In the Year 1668. a Man of Forty died at *Amſterdam*. He, for ſeveral Years, waſted, as if he had been in a Conſumption: At length, fourteen Days before his Death, he was ſeized with a Fever; after the tenth he voided no Excrements downwards, and on the eleventh he diſcharged them by his Mouth; three Days after, he expir'd. In the Opinion of every body, he was afflicted with a Twiſting of the Inteſtines; and that really was his Diſorder.

In the Diſſection I found no Convolution of the Inteſtines, but obſerved, that they were more ſtrictly compreſſed and inflamed about the Beginning of the *Colon*; and, when I had opened them by a cautious, gentle Inciſion, I diſcovered an Ulcer, which denied a Paſſage to the Excrements downwards; and conſequently the Inteſtines, which were below it, were empty, and theſe above full of Excrements; the Stomach, being full of Ordure, was diſagreeable both to the Sight and Smell. Having diſcovered the Cauſe of the Diſeaſe, I ſearched for the Origin of that Cauſe, when the *Pancreas* offered itſelf, half as long again, three Fingers-breadth broader, abundantly thicker, and fourteen Ounces heavier than uſual, for it weighed nineteen Ounces, whereas the common Weight of a Man's is five, of a Horſe's eleven: It was every-where full of ſcirrhous Glandules, as big as Pigeons Eggs. The *Ileum*, compreſſed by this bulky Pancreas, being firſt inflamed, then exulcerated, denied a Paſſage to the Excrements. *T. Kerkringii Obſervat. Anat.*

I formerly opened ſome Subjects, who died of the Iliac Paſſion, in whom the Omentum, and all the Inteſtines, were ſeized with a Sphacelus: The fetid Smell, ariſing from thence, would not permit me to examine thoroughly into the Cauſe of the Diſtemper. *Hildanus*, *Lib. de Gangræna*, *Cap.* 4.

A Clergyman, twenty-two Years old, was ſeized with Shivering and Heat, continual Vomitings of various Subſtances, which were, at laſt, cineritious and blackiſh, with an immoderate Pain in his whole Belly: His Hypochondria were very painful, and diſtended; he could lie on neither Side, had a continual Fever, and great Anxiety; he could bear Bleedings, but was not relieved by them; and his Belly was obſtinately coſtive: Hence there was a great Suſpicion of the Iliac Paſſion. On the fifth Day he died ſuddenly: He vomited perpetually, and perceiv'd an exceſſive internal Heat. When dead, he ſwelled very much.

Upon opening the Body, his *Colon* was, in a manner, become black; his whole *Epipleon* putrid; a purulent Sanies was found at the Region of his Liver: The Whole was ſo fetid, that it was impoſſible to remove the Viſcera. *Ballonius*, *L.* 2. *Epidem. & Ephem.*

The celebrated *Gui Patin* thinks, that this Diſorder always proceeds from an inflammatory Diſpoſition of the *Ileum*; and, therefore, that ſeveral are cured by opening a Vein, warm Fomentations, *Semicupia* of warm Water, and emollient Clyſters: He informed me, by Letter, that, about thirty Years before, this whole Inteſtine, of a certain Archbiſhop's Coachman, who died of the Iliac Paſſion, was corrupted, black, and gangrenous. *Blaſius in Veſlingii Syntagma Anatom.*

I have obſerved a mutual Entrance of the thin Inteſtines into each other, above a Finger's Length; eſpecially in ſome who have died of the Iliac Paſſion. *Columbi. Anat.*

Sometimes the Inteſtine enters into the Cavity of another, which is followed by an Obſtruction, and Corruption of the Fæces, ſucceeded by Death, as I have obſerv'd in an anatomical

Diſſection;

Diſſection; for a young Man, afflicted with this Diſorder, died without any Relief from Quickſilver; which, as it could not paſs, I found near the Obſtruction. *D. Panarollus.*

I diſſected a Woman, who died of the Iliac Paſſion: The ſuperior Part of her Inteſtine was inſerted into the inferior. *Plempii Fundam. Medic.*

The Inteſtine is ſometimes folded, like the reduplicated Finger of a Glove, which abſolutely obſtructs the Paſſage of the Inteſtine; whence proceeds a Vomiting of the Fæces through the ſuperior Parts. *Patin* ſays, this Reduplication is entirely fictitious, becauſe he could never ſee it: But it occurred twice or thrice to *Walæus*, and myſelf, in diſſecting dead Bodies. *Blaſius in Veſling. Anat.*

Towards the latter End of the Year 1676. I diſſected, in our Hoſpital, a Woman: Before her Death, ſhe ſuffered ſevere Pains in her Belly, and Anxieties; had bloody Stools, and, at laſt, Vomitings. Upon opening her Abdomen, I found the *Ilium* plainly contracted in ſome Parts, and, as it were, ſtrangulated with a Cord tied round it: One Part of it, four Fingers-breadth long, being very much contracted, and ſtraitened, was wholly concealed in the Cavity of the next ſuperior Part; and, by its Appearance, ſeemed to reſemble ſuch a real Intro-ſuſception, as is deſcribed by *De le Boe Sylvius*, *Ideæ Prax. Med. Lib.* 1. *Cap.* 15. But internally, not only the Inteſtines, principally the Ileon, but the Stomach, alſo, were inflamed.

A poor Man died in the utmoſt Agony of the Diſtemper termed *Miſerere Mei*: Upon opening him, I found the Ileon ſo twiſted, in ſeven different Places, that there could not poſſibly be any Paſſage for Meat, Drink, or Fæces. *P. Barbette.*

Among the violent Diſorders of the nervous Syſtem, which afflict the Mind with uneaſy Senſations, and the Body with dangerous Symptoms, we may juſtly claſs racking Pains of the Inteſtines; the moſt conſiderable of which is that, which, ſeizing the *Ilium*, an Inteſtine of a highly tender and ſenſible Nature, is, for that Reaſon, called the *Iliac Paſſion*. *Hippocrates* called this Diſorder, *the Pain of the Ilium*, becauſe its Cauſe was ſeated there; whilſt others of the *Greek* Authors ſtyled it *Chordapſus*, becauſe the Inteſtine affected was render'd tenſe, like a Chord. It is, by the *Latin* Writers, termed *Volvulus*; becauſe, in Patients who die of it, the Inteſtines, in ſome meaſure, appear twiſted with each other. *Celſus* calls it the *Diſeaſe of the ſmall Inteſtines*.

It is an highly acute Pain of the ſmall Inteſtines, eaſily degenerating into an Inflammation; and under which their periſtaltic Motion is ſo violently inverted, that they throw up their Contents, and whatever Aliments are taken, by Vomit; whilſt, at the ſame time, no Flatulences are diſcharged by the Anus, which is obſtinately cloſ'd; in conſequence of which, terrible and fatal Symptoms are often brought on.

The Progreſs and Symptoms of this Diſorder happen in the following Manner. 'Tis preceded by a Conſtipation of the Belly, which is ſoon after ſucceeded by acute and violent Pains; accompanied with Inflation, Diſtention, and a hard Tumor in the umbilical Region. The Patient is ſo totally coſtive, that neither Flatulences nor Fæces can be diſcharged by the Anus: Afterwards the Flatulences diſcharge themſelves by the Mouth; and, after a previous Nauſea, a bilious and pituitous Matter is frequently vomited firſt of all. The Patient breathes with Difficulty; and whatever Aliments, or Drink, are taken, tho' they deſcend into the Stomach, are yet ſoon after thrown up, becauſe they cannot paſs thro' the Inteſtines; and the Matter thus vomited is a rediſh Sordes, not unlike Excrements, and frequently diſcharged with an highly fetid Smell. This Condition is ſucceeded by a Loſs of Strength, a preternatural Heat, an hard and contracted Pulſe, an immoderate Thirſt, a Redneſs of the Urine, and a Difficulty in diſcharging it. When the Diſorder has arrived at its worſt State, the Patient is ſeized with a Hiccup, a Delirium, Convulſions, and a cold Sweat, whilſt, in the mean time, violent Convulſions and Faintings frequently put an End to Life. *Hippocrates*, in his third Book *de Morbis*, accounts for this Diſorder in the following Words: "The Inteſtines, ſays he, are "dry'd, and, by the Heat of the Inflammation, ſo block'd up, "that neither Flatulences nor Fæces can be diſcharg'd. But "the Belly is hard, and the Patients ſometimes vomit, firſt a "mucous, then a bilious Matter; and, laſt of all, Excrements."

Celſus thus deſcribes the Iliac Paſſion:

There are two Diſeaſes, which have their Seat within the very Inteſtines, one of which affects the ſmall Inteſtine, the other the great one. The former of theſe Diſorders is acute, the other may continue for a conſiderable time. *Diocles Caryſtius* calls the Diſeaſe of the ſmall Inteſtine, χορδαψὸς, *Chordapſus*, that of the other, εἰλεὸς, *Ileos*; but the Generality of Moderns, I obſerve, give the Name of εἰλεὸς, to the former, and call the other κολικὸς, *Colicus*. The firſt of theſe Diſorders excites a Pain ſometimes above the Navel, ſometimes below it; in either Caſe, there is an Inflammation of the Part, with Conſtriction of the Belly, ſo as not to tranſmit the leaſt Wind below. If the upper Parts are affected, the Patient vomits up his Food; if the lower, his very Excrements: Both Caſes are to be feared, and the Danger is increaſed, if what is thrown up by Vomiting, be bilious, of an ill Smell, of various Colours, or black. *Celſus, Lib.* 4. *Cap.* 13.

Aretæus thus deſcribes it:

Children are much ſubject to the Iliac Paſſion, as being moleſted with Crudities; but the Diſorder proves not fatal to them, both becauſe they are accuſtom'd to it, and, alſo, on account of the Humidity of their Inteſtines, which renders them lubricous. Old Perſons are not often viſited with this Diſtemper, but very rarely eſcape, when ſeized with it. The Diſorder is, alſo, more frequent in Summer, than in the Spring; in Autumn, than Winter; but the Summer affords more Inſtances of it, than both the other Seaſons.

The Patient often ſinks immediately under the griping Torments of the *Ileos*; ſometimes Pus is generated in the Part, and ſometimes the Inteſtine becomes black and putrefy'd, and falls off, and the Patient dies. When the Diſeaſe is more moderate, the Sick are ſenſible of a twiſting Pain, a Redundance of Humidities in the Stomach, a general Faintneſs and Feebleneſs, with fruitleſs Eructations, which afford no Relief; a Rumbling in the Belly from Flatulences, which make their Way as far as the Anus, but are there intercepted, and prevented from being diſcharged.

If the *Ileos* be confirm'd, the Contents of the Viſcera have their Courſe wholly diverted upwards, and Phlegm, Bile, and Flatuoſities, are all diſcharged by Vomit, there is a Paleneſs of the Countenance, and a Coldneſs over all the Body, with much Pain, a Difficulty of Reſpiration, and a Thirſt.

When the Diſeaſe proves mortal, the Patient falls into a cold Sweat, with a Difficulty of rendering his Urine, and a Conſtriction of the Anus, to ſuch a Degree, as not to admit a thin Probe; he vomits up his Excrements; loſes his Voice; and his Pulſe, which at firſt was ſlow and ſmall, at the Approach of Death becomes very quick, ſmall, and weak. Such, then, are the Symptoms of this Diſeaſe, as incident to the ſmall Inteſtines.

But the *Colon* is, alſo, ſubject to the ſame Diſorder, which is attended with the like Symptoms, and bears the ſame Characteriſtics, tho' the Patient, in this Caſe, ſometimes happens to recover, even when there is a Generation of Pus in the *Colon*, becauſe of the fleſhy Thickneſs of that Inteſtine. But, whereas, in ſuch an Affection of the ſmall Inteſtines, there is an acute and ſubtile Pain [πόνος ἰσχνὸς], when the Diſeaſe happens to be ſeated in the *Colon*, it is attended with a Redundance of Humidities, and a Senſe of Weight on that Part; the Pain ſometimes extends itſelf to the Ribs, ſo as to cauſe a Suſpicion of a Pleuriſy, and the more, becauſe the Patient is not free from a Fever; ſometimes it ſhifts from Place to Place under the ſpurious Ribs, ſo as to be thought a Pain of the Liver or Spleen, and thence deſcends again to the Ilia; for the *Colon* is a very large Inteſtine, and extends its Convolutions into every Part; ſometimes the Pain fixes itſelf in the Os Sacrum, the Thighs, and the Cremaſter Muſcles. In Diſorders of the *Colon*, there are more fruitleſs Vomitings, and what is diſcharg'd, is of a thin, bilious, Oil-like Subſtance. The *Colic* is leſs dangerous than the *Ileos*, in proportion as the *Colon* is more fleſhy, thicker, and better provided againſt the Shock of a Diſeaſe, than the ſmall Inteſtines. *Aretæus de Cauſ. & Sign. Acut. Morb.* 2. *Cap.* 6.

Cœlius Aurelianus thus diſtinguiſhes the Iliac Paſſion from ſome other Diſorders, which bear a Reſemblance to it:

The Diſeaſe to which we have appropriated the Name of *Tormentum*, (*Cœlius Aurelianus*'s Term for the Ileos) differs from that griping Diſorder, the Cœliac Paſſion, in Degree; for the Patient, under the latter, is only affected with a ſlight Pain, ſufficient to give him the Denomination of *Ventriculoſus*, or *Torminoſus*. Theſe Diſorders are diſtinguiſh'd, alſo, by their Seats; for the Cœliac Paſſion is higher ſeated in the Belly, and under the Hypochondria, and frequently happens without Gripes of the Inteſtines. The Ileos has, alſo, its Marks to diſtinguiſh it from the Pains of the Colon; for this latter is an Affection principally of one Inteſtine, and one of thoſe Diſeaſes which the *Greeks* call χρόνια, chronical, affecting the Patient for a very long time; whereas the Tormentum (*Ileos*) is always an acute Diſeaſe, and affects all the Inteſtines. Some have given this Diſorder the Name of CHORDAPSUS, (ſee that Word) becauſe the Inteſtines are ſtretch'd out like Cords, and the antient *Greeks* call'd the Inteſtines by the Name χορδαὶ, Cords. Some, as *Hippocrates*, *Praxagoras*, and *Euriphon* the *Cnidian*, make the *Chordapſus* to have one common Signification with *Tormentum*; others have made a Difference betwen them, particularly *Diocles*, in his Book of Diſeaſes with their Cauſes and Cures. For the Tormentum, he ſays, is always attended with Eructations, and Diſcharges of the Wind below, without any Fæces; the Belly, alſo, under this Diſorder, is not neceſſarily conſtricted, but admits Injections of Clyſters, and the Pain, too, begins more from the upper Parts: But in the Chordapſus, if the Diſtemper be moderate, the Patient vomits up liquid Matter; if violent, ſtercoraceous; and will admit of no Injections by Clyſters, but labours under a continual Conſtriction and Tenſion of the Belly, which is alſo elevated into a round Tumor: The lower Parts of the Inteſtines are the principal Seat of the Pain; and the Stomach, alſo, remains in a State of Immobility, or Inflexibility. *Cœlius Arelianus, Acut. Morb. Lib.* 3. *Cap.* 17.

Upon diſſecting thoſe who have died of this Diſorder, the Ilium appears as it were twiſted, and inflam'd, and ſphacelated, and putrefied in the particular Part where the Seat of the Diſorder reſided; whilſt, at the ſame time, above the Inflammation, a large Part of the Ilium free from this Misfortune is render'd ſo turgid with Flatulences, that it ſometimes exceeds the Colon in Bulk.

The immediate Cauſe of this Diſorder conſiſts in an inverted periſtaltic Motion of the nervous and muſcular Coats of the Inteſtines, in conſequence of the violent Coarctation and Conſtriction of the Ilium, by means of which nothing can be tranſmitted to the inferior Parts.

The Cauſe of this terrible and tormenting Diſorder is generally an Hernia of the Scrotum, or Groin, when a Part of the Ilium is forced between the Proceſſes of the Peritonæum, where they go off, in Men, to the Scrotum, and, in Women, where they penetrate the round Ligaments of the Uterus. Now it is certain, from anatomical Obſervations, that, whilſt the Proceſſes penetrate the Muſcles of the Abdomen, they make this Perforation, as it were, in certain Angles or Degrees, in ſuch a manner, that, when they have perforated one Muſcle, they proceed a little between it and the following, before they penetrate the next, in order to paſs farther. This is a Piece of wiſe Contrivance in Nature, to prevent the two eaſy Falling down of any thing from the Cavity of the Abdomen to the Region of the Scrotum, or the Groin. But if a Part of the Ilium ſhould, with Violence, fall down into theſe Parts, and the Annuli, of which it conſiſts, be too much dilated, it eaſily happens, eſpecially when other Cauſes concur, that it cannot be reduced to its former Situation, but remains there, incarcerated, as it were, and abſolutely prevents all Paſſage of its Contents.

In Women this is a Circumſtance of a ſtill more dangerous Nature; ſince the Proceſſes are there narrower, and the prolaps'd Part of the Inteſtine, of courſe, return'd with greater Difficulty. And, though in the Groins of ſome Women the Tumor is ſo ſmall as hardly to equal a Bean in Bulk, yet it may lay a Foundation for this Diſorder. In ſcrotal Hernias there is the leſs Danger of an Iliac Paſſion, in proportion as the prolaps'd Portion of the Inteſtine is larger; for I have frequently ſeen a third Part of the Inteſtines fall down into the Scrotum, where they form'd a large Tumor, without any Danger of a ſucceeding Iliac Paſſion; becauſe, in this Caſe, the Contents may paſs more eaſily.

Beſides Hernias, this violent Diſorder is frequently produced by the mutual Ingreſs of the Parts of the Ilium into each other; which is obſervable upon diſſecting ſome of thoſe who have died of this Diſorder. And though ſome Authors abſolutely deny this, and account it impoſſible; yet the contrary is ſufficiently vouch'd by Experience and Obſervation. Thus the celebrated *Peyer*, *in Tract. de Glandulis Inteſtinalibus*, when giving an Account of the Diſſection of a Woman, who died of an Iliac Paſſion, uſes the following Words: "Upon opening "the Abdomen, we ſaw the Ilium plainly conſtricted, and, as "it were, ſuffocated by a Ligature, for about four Inches; "and, being much contracted, it lay entirely conceal'd within "the Cavity of the adjacent ſuperior Part of the Inteſtine." A Caſe of the like Nature is deſcrib'd by *Sylvius*, *in Prax. Med. Lib.* 1. *Cap.* 15. And ſuch a mutual Ingreſs of the Parts of the Ilium, in three different Parts, was, by *Peyer*, ſhewn in a Girl, who died of an Iliac Paſſion.

Though this Phenomenon may, at firſt, appear pretty hard to be accounted for, it is not, however, abſolutely incomprehenſible; for, if one Portion of the Ilium is violently conſtricted, it may be impetuouſly thruſt into the adjacent Portion now diſtended with Flatulences. Such an Ingreſs may be the Cauſe, not only of an intenſe Pain, but alſo of an Inflammation, which muſt be produced by a Compreſſion and Conſtriction of the Veſſels of the Ilium, together with a Portion of the Meſentery. Beſides, upon diſſecting the Bodies of thoſe who have died of this Diſorder, theſe Parts have been found ſphacelated. And *Lazarus Riverius*, *in Cent.* 3. *Obſ.* 26. gives us a memorable Caſe, in which, upon diſſecting a Body, he found the Extremity of the Ilium wrapt up, as it were, in three Convolutions, and compacted into one Maſs, the Whole of which, together with the adjacent Part of the Meſentery, were affected with a Gangrene, whilſt the other Inteſtines were very large, and ſurpriſingly diſtended with Flatulences.

To ſuch a mutual Ingreſs of the Parts of the Inteſtines, which produces the Iliac Paſſion, many other latent Cauſes may contribute; and the Obſervations of various Authors evince, that this Diſorder may be produced by the gnawing of Worms contain'd in the Ilium, and found there after the Death of the Patient. Thus *Henricus ab Heer*, *in Obſ.* 24. tells us, that he diſſected a Girl, who died of an Epilepſy complicated with an Iliac Paſſion, and who, during her Life, vomited Worms; and that about the Extremity of the Ilium he found five Cluſters of Worms, ſome of which crept from below upwards, and others from above downwards. And, in the *Miſcell. Nat. Curioſ. Decur.* 2. *An.* 5. *Obſ.* 19. we have an Account of a Woman, of thirty Years of Age, who, being ſeiz'd with the Iliac Paſſion, vomited, together with liquid Excrements, ſixteen round large Worms, and, at laſt, died in a cold Sweat. Upon diſſecting her Body, in the Middle of the Inteſtinum Ilium the Membranes appear'd diſtended like a Cap, and there was a Perforation, as large as a green Fig, externally cover'd by a very ſlender Membrane on both Sides a Finger's-length of the Ilium; and two Inches of the Duodenum appear'd black, and corrupted by a Gangrene. This ſeems, alſo, to be aſſign'd as a Cauſe of the Diſorder by *Lommius*, *in Obſ. Med.* when he uſes theſe Words: "When the Diſorder has "arriv'd at its worſt State, Worms are now-and-then vomited "up by the Patients."

Nor are we to exclude from the antecedent Cauſes, capable of producing the Iliac Paſſion, and inducing, not only a Stricture and Coarctation of the Inteſtines, but, alſo, of inverting their periſtaltic Motion, Poiſons, as alſo draſtic Purgatives, and Emetics, eſpecially if the Inteſtines labour under any previous Diſorder. Thus *Cœlius Aurelianus*, who, after *Hippocrates*, wrote the beſt concerning this acute Diſorder, among the Cauſes of it, reckons Poiſon, taken either by way of Aliment, or Drink; as alſo the Eating of Fungi. And *Alpinus*, *Med. Method.* makes mention of one *Guilandinus*, who, by taking Pills, and uſing half an Ounce of Hiera, fell into an Iliac Paſſion, which prov'd mortal. Nor, in ſuch Caſes, can I recommend the Uſe of Pills, in which Aloes is an Ingredient; ſince, after their Operation, they not only dry the Inteſtines, but, alſo, procure a greater Afflux of Blood to them; ſo that, according to my own Obſervation, they produce Coarctations of the Inteſtines here-and-there, which hinder the free Paſſage of the Excrements, and diſpoſe to Colics.

Nor, as Cauſes of the Iliac Paſſion, are we to omit Obſtructions of the Inteſtines, eſpecially of the ſmall Inteſtines, which are generally produced by dry and aſtringent Aliments, or ſuch as are not ſufficiently diluted with Moiſture: Among ſuch, Phyſicians have obſerv'd to be dry Bread, Biſcuits, and Cheſnuts, frequently eaten; as alſo Pears, Apples, and eſpecially Quinces, unripe and ſour Fruits eaten in large Quantities, eſpecially by ſuch as lead a ſedentary Life, are afflicted with Grief, drink little, or have the Strength and Tone of their Stomach and Inteſtines deſtroyed.

Beſides, the large Inteſtines, obſtructed by a long Retention of the Fæces, may produce this terrible Diſorder, whilſt they allow a Paſſage for nothing that is taken by the Mouth; eſpecially when, from a Principle of Modeſty, the Want of a proper Place, or any other Cauſe, the Inclination of going to Stool is ſuppreſſed. By this means a large Quantity of Excrements is accumulated, which afterwards ſo violently diſtends the Coats of the Inteſtines, that their elaſtic, ſyſtaltic, and expulſive Force is totally deſtroy'd. Thus, I remember, ſome Years ago, to have had an Account, from a skilful Phyſician, of a certain illuſtrious Perſon, who, upon a too long and violent Retention of the Fæces, was ſeiz'd with an Iliac Paſſion; and, upon opening his Body, after Death, the Colon was found full of Fæces, and in one Part ruptur'd, whilſt about twenty Pound weight of Sordes was taken away. *Henricus ab Heer*, in his *Obſervat.* alſo, furniſhes us with a memorable Caſe, in which, upon diſſecting the Abdomen of a Perſon who died of the Iliac Paſſion, the Inteſtines burſt ſpontaneouſly, and the Fæces were diſcharg'd with ſuch Violence as to fly over the Cloaths of all the By-ſtanders.

But, among all the antecedent Cauſes of an Iliac Paſſion, none has a more immediate and direct Tendency to produce it, than violent Anger, eſpecially in thoſe who previouſly labour under an *Hernia*, or any Diſorder of the Inteſtines. Nor is it a difficult Task to account for this, ſince ſuch is the Nature of this Paſſion, as to induce Spaſms and Convulſions, eſpecially on the nervous Parts, and eaſily to produce a Stagnation, and conſequent Inflammation, by reaſon of a copious Afflux of Blood to the weaker Parts, among which we may juſtly reckon a Portion of the Inteſtines, prolapſed and fallen out of the Abdomen.

'Tis no eaſy Task to determine whether, according to the common Opinion, and the Doctrine of the Antients, *Fæces*, eſpecially, in that Species of the Iliac Paſſion which ariſes from an incarcerated Hernia, or a mutual Ingreſs of the Parts of the Ilium, can be thrown up by the Mouth. This ſeems highly dubious, firſt, becauſe the Fæces cannot ſlip back and regurgitate through the Valve of the *Colon*, with which the Entrance of the *Ilium* into the *Cæcum* and *Colon* is furniſhed. Beſides, 'tis not poſſible to conceive how the Fæces can penetrate, and make their Way, through a ſmall Part of the Ilion, conſtricted and firmly cloſed up in an Hernia. I have no Intention totally to reject the Authorities of Phyſicians of approved Veracity in other Caſes; but I ſhall only relate what I have, in the Courſe of my own Experience, obſerved in ſome Patients afflicted with this Diſorder; which is, that they have vomited a Matter of a rediſh Colour, in external Appearance not unlike Fæces; but, when this Matter was applied to the Noſtrils, it had no Stench, but rather ſmell'd of the Subſtances taken, and appear'd, as it were, bubling with the Froth. I will not, however, deny, that when the Diſorder neither proceeds from an incarcerated Hernia, nor a Convolution of the Inteſtines, but only from a ſpaſmodic Stricture of the *Ilium*, when, at the ſame time, the large

Inteſtines, the *Rectum*, and the *Colon*, labour under violent ſpaſmodic Strictures, highly liquid Fæces, and, as others have obſerved, Clyſters, may penetrate through the Valve of the *Colon*, to the ſuperior Parts. But I recommend this Obſervation, with reſpect to vomiting the Fæces in an Iliac Paſſion, to the farther Scrutiny, and ſtricter Examination, of Phyſicians.

As for the Prognoſtics of this Diſeaſe, there are tolerable Hopes of Safety left, ſo long as there is no Inflammation; whilſt Clyſters are receiv'd, and return'd by Stool; whilſt the Pains ſhift from Place to Place, and the Pain and Vomiting not continual, but ſeize at Intervals; and the Diſorder is produced by an Obſtruction of the Inteſtines, by means of the Fæces contained in them. But the Hopes of Recovery are ſtill greater, if a laxative Medicine, taken by the Mouth, begins to operate by Stool. But if an Inflammation is already preſent, which may be known from the Fever, the Violence of the Gripes, the Suppreſſion of the Urine, the hard and quick Pulſe, the inſatiable Thirſt, the Toſſing of the Body, the Loſs of Strength, and the Coldneſs of the Extremities, ſmall or no Hopes of a Recovery remain. A ſudden and total Ceſſation of the Pain, accompanied with a great Loſs of Strength, a weak Pulſe, Deliquiums, and a fetid Smell of the Mouth, are infallible Signs, that the Inflammation has degenerated into a Sphacelus. We muſt, alſo, obſerve, that this terrible Diſorder, if in its Beginning proper Remedies are exhibited to prevent the Inflammation, and allay the Pain, may, ſometimes, be protracted for two or three Weeks, before it is totally removed.

The CURE.

In no Diſeaſe is a ſpeedy Relief more neceſſary than in an Iliac Paſſion, ſince, without this, 'tis ſometimes ſo violent as to deſtroy the ſtrongeſt and moſt robuſt Man in three Days; and, as Time hurries away with Rapidity, it frequently carries along with it the ſeaſonable Opportunity of relieving the Patient; for which Reaſon that practical Caution of *Hippocrates*, laid down in his firſt Book *de Morbis*, is, in this Caſe, to be carefully adverted to: "If, ſays he, any Phyſician was ever beneficial to a "Patient in the Cure of a Diſeaſe, he muſt neceſſarily have "employed his Skill at a proper Seaſon." For which Reaſon, if in any Diſorder, certainly in this, which is ſo dangerous and ſo quickly fatal, a skilful Phyſician is immediately to be called, whoſe principal Intention it ought to be, by proper Remedies, both of the internal and external Kind, to mitigate the acute and intenſe Pain which lays a ſufficient Foundation for the Inflammation of the Parts, and the ſubſequent Death of the Patient.

The Man who is in the leaſt converſant with the Works of the antient *Greek* Phyſicians, will eaſily perceive, that they have been very full and accurate, not only in giving the Hiſtory, but, alſo, the Cure, of the Diſorders, and eſpecially the Pains, incident to the nervous Parts; for this Reaſon, no Doubt, that in conſequence of the exceſſive Heat of their Climate, and their intemperate Method of Life, Diſorders of this Kind frequently recur'd, and called for the Aſſiſtance of the Phyſician. Let us, therefore, inquire into the Meaſures *Hippocrates* took for the Cure of this Diſeaſe. The Diſorder itſelf he deſcribes in his third Book *de Morbis*; and for the Cure of it orders a pretty long Suppoſitory, prepar'd of Honey, and whoſe anterior Part is anointed with the Gall of a Bull, to be twice or thrice introduced into the *Anus*: "By which means, ſays he, the indurated "Fæces about the *Inteſtinum Rectum* may be ſoften'd and "brought away." After this he orders the Injection of a Clyſter, and ſubjoins theſe truly memorable Words: "If theſe Mea"ſures prove ineffectual, a Smith's Bellows is to be introduced "into the *Anus*, and, by its means, ſuch a Quantity of Air in"jected as is ſufficient to diſtend the Abdomen, and remove the "Contraction of the Inteſtines." Then, removing the Bellows, he orders a Clyſter to be injected, which conſiſts not of hot Ingredients, but of ſuch as reſolve and colliquate the Fæces. "Then, ſays he, ſtopping up the Anus with a Piece of Sponge, "in order to prevent the Diſcharge of the Clyſter, let the Pa"tient ſit in warm Water." To which he adds, "If this In"jection is retained, and again diſcharg'd, the Patient will be "reſtor'd to Health." We ſhall here ſubjoin what this venerable Author farther ſays, with reſpect to the Method of treating this Diſorder. "The Stomach, ſays he, is, with all Expedition, to be "freed from all Sordes, and a proper Quantity of Blood taken "from the Head, and thoſe Parts of the Arms, where the Joints "of the Elbows are, that, by this means, the Heat of the ſu"perior Belly may ceaſe: Then all the Parts above the Diaphragm, "except the Heart, are to be cool'd; whereas the inferior Parts "are to be kept hot, the Patient is to be placed in a Bath of "warm Water, and carefully anointed with Oil."

I am ſo far from diſapproving of this Method of Cure uſed by *Hippocrates*, that I highly commend it; ſince it has a direct Tendency to procure an Evacuation by Stool, and to remove the ſpaſmodic Stricture of the large Inteſtines, which prevents it; as, alſo, to prevent an Inflammation of the ſuperior Parts, which muſt neceſſarily be productive of the greateſt Danger. But, in the Cure of this Diſorder, we think it incumbent on the Phyſician to direct his Views to its firſt Cauſe and Origin.

When, therefore, this Diſorder draws its Origin from an Incarcerated Hernia, which it frequently does, the Phyſician's firſt and principal Intention ought to be, after having ſoften'd the prolapſed Portion of the Inteſtine, to reduce it to its natural Place and Situation, if it ſhould not ſpontaneouſly ſhrink up. That this may be done with more Eaſe and Expedition, Clyſters muſt be injected every two Hours, in order to expel the Flatulences from the Abdomen. Then the Part affected is to be ſoftened with pinguious and oleous Subſtances. For which Purpoſe, a Swine's Bladder, half full of Human or Dog's Greaſe, is to be applied to the Part affected, and the whole Abdomen is to be covered with the Omentum of ſome Animal, a Calf, for Inſtance; or, if that cannot be had, with a clean Linen Cloth, immerſed in Rape-ſeed or Linſeed-oil. Then the Patient is to be laid on his Back, with his Belly and Abdomen a little rais'd, and his Head ſomewhat lower; and the Surgeon, ſeparating his Legs, is, with his Hand, anointed with Oil of Almonds, gently to attempt the gradual Reduction of the prolapſed Part of the Inteſtine into the Abdomen, but in ſuch a manner, as not to fold, or any ways injure, the Inteſtine; for unleſs an *Hernia*, whether of the ſcrotal, the inguinal, or the crural Kind, is ſpeedily reduced, an Inflammation readily happens, which terminates in a Sphacelus; for when the Blood, in conſequence of a Portion of the *Ilium* being conſtricted, and, as it were, ſuffocated by the Rings of the Abdomen, cannot return through the compreſſed Blood-veſſels, it becomes ſtagnant, and produces a Sphacelus.

The next Intention, of no leſs Importance, is, by proper Medicines, to allay and mitigate the violent Pains; for ſuch is the Force and Influence of the Pain, as, by means of the mutual Conſent between the nervous Parts, to excite all the terrible Symptoms with which this Diſorder is attended, ſuch as the Vomitings, Hiccups, continual Watchings, Uneaſineſs, Fever, Delirium, and Loſs of Strength, as, alſo, the Stricture of the whole inteſtinal Canal, to the inferior Parts, and even the Anus. The Tremors, alſo, of the Extremities, and the Difficulty of diſcharging the Urine, depend upon this Circumſtance. But when the Pain is allay'd, all theſe Symptoms are generally mitigated, and, in a proportionable Degree, remov'd. For which Reaſon, ſays *Hoffman*, in Caſes of this Nature, I generally, with great Succeſs, preſcribe a Spoonful of gently ſpirituous Mint-water, which is, alſo, poſſeſſed of a mild anodyne Quality, to be taken every Hour, mix'd with ten or fifteen Drops of the anodyne Mineral Liquor, and two Drops of the *Laudanum Opiatum*, prepar'd according to the Directions of *Helmont*. And, externally, for allaying the Hiccup and Vomiting, I order a Plaiſter prepared of equal Quantities of old *Venice* Treacle, and Oil of Nutmeg, with an Addition of a ſufficient Quantity of Oil of Mint and Camphire, to be applied to the epigaſtric Region. When the Vomiting and Hiccup are thus ſtopt, gentle Laxatives of Manna, Cream of Tartar, and Oil of ſweet Almonds, are the better retain'd, and, conſequently, the more capable of producing happy Effects, when the Diſorder proceeds from a long Retention of the Fæces, in the Flexures of the Inteſtines.

Nor, among the other Intentions of Cure, are we to neglect the Prevention of an Inflammation, by all poſſible means; becauſe it degenerates, at laſt, into a Sphacelus, and deſtroys the Patient; for, according to the Generality of medicinal Obſervations, no Patient, labouring under an Iliac Paſſion, readily dies without a Sphacelus of the Inteſtines, whether ariſing from an *Hernia*, or a Convolution and Ingreſs of the Inteſtines into each other. In order, therefore, to prevent an Inflammation, beſides Clyſters, external Emollients, and Anodynes, internally exhibited, which not only alleviate the Spaſms, but, alſo, the ſubſequent Inflammation, nothing is of greater Efficacy than Veneſection, which *Hippocrates* orders with an Intention to prevent or alleviate the Fever: The antient Phyſicians, for this Purpoſe, generally preſcribed Phlebotomy in the Arm; but I have, with Succeſs, uſed it in the Feet, eſpecially in Women. Veneſection is both the more uſeful and neceſſary, the greater Quantity of Blood is found in the Veſſels; in which Caſe it is to be repeated as the State of the Patient ſhall require.

In order to check the febrile Heat and Inflammation, as depurated Nitre is ſuperior to all other Medicines, ſo, in this Diſeaſe, 'tis of ſingular Uſe, if, for a Doſe, ſix or eight Grains of it, mixed with the *Pulvis Marchionis*, adding ſometimes a fourth Part of a Grain of Camphire, are, now-and-then, exhibited in a proper Vehicle. The antiſpaſmodic nitrous Powder may, alſo, be exhibited, with Succeſs, in an Emulſion prepar'd of ſweet and bitter Almonds, Seeds of the white Poppy, and paregoric Waters. Externally, in order to prevent an Inflammation, the Parts affected are to be anointed with a Liniment, prepar'd of one Ounce of human Fat, and a Dram of Camphire.

If the Diſorder ſhould prove ſo obſtinate as not to yield to any of theſe Meaſures, we are to have recourſe to Quickſilver; which I have frequently uſed with Succeſs, and indeed no Medicine is either more efficacious, or affords more ſpeedy Relief; when there is a mutual Ingreſs of the Parts of the Ilium unto each other. I know a great many Phyſicians are afraid of preſcribing this Remedy; but their Fear is without any juſt Foundation;

tion; provided it is only exhibited at a proper time: Thus *Rhodius, in Observat. Medicin. Cent.* 2. *Obs.* 80. affirms, that a Patient, labouring under a violent Iliac Paſſion, was cured by five Ounces of Quickſilver, taken in ſolutive Honey of Roſes. *Henricus ab Heer*, who, by means of this Medicine, reſtored many, after they were brought to the very Gates of Death, in his *Obſervat. Medicinal.* gives us an Inſtance of an Iliac Paſſion cured, and the Excrements forthwith diſcharged, by taking half a Pound of Quickſilver. *Zacutus Luſitanus*, as we learn from his *Prax. Adm. Lib.* 2. *Obſ.* 35. with Succeſs, preſcribed a whole Pound of it, for a certain General, who laboured under this Diſorder. And *Paré*, in *Oper. Chirurg. Lib.* 20. *Cap.* 38. affirms, that many, in the moſt imminent Danger of loſing their Lives by the Iliac Paſſion, have been preſerv'd, by taking ſeveral Pounds of Quickſilver in Water.

Practical Cautions.

With reſpect to the Iliac Paſſion, we are carefully to remember, that it is highly unſafe to exhibit draſtic Purgatives, in order to render the Body ſoluble; becauſe they never fail to increaſe the Pains, Spaſms, and all the other Symptoms: Nor is it expedient to uſe Clyſters, prepar'd of exceſſively hot and carminative Subſtances: Much leſs are carminative and ſtomachic Eſſences, or medicated Wines, to be exhibited internally; ſince, tho' theſe may prove beneficial in a flatulent Colic, ariſing from a cold Cauſe, as the Antients uſed to ſpeak, they are yet by no means to be exhibited, when the Diſeaſe is of the acute Kind, and all the Fluids in a violent and preternatural Motion.

But, when the Strength begins to fail, and Deliquiums to ſeize the Patient, mild Analeptics may be ſafely and advantageouſly uſed; ſuch as thoſe, for Inſtance, prepar'd of the Waters of black Cherries, Turkiſh Baum, Lilies of the Valleys, and Cinnamon, without Wine, or a Spoonful of generous Wine, may be now-and-then exhibited, with ſingular Advantage.

If the Patient is plethoric, Veneſection is forthwith to be inſtituted, and, even, repeated, if the Caſe requires it. Great Regard is, alſo, to be had to the judicious Obſervation of the learned *Paſcoli*, who in *Tom.* 2. uſes the following Words: "When "a Fever, and the Signs of an approaching Inflammation of the "Viſcera, are preſent, a Vein is to be forthwith open'd, rather "in the inferior than in the ſuperior Parts: Hence we almoſt "always obſerve, that Leeches, eſpecially when applied to the "Inteſtinum Rectum, have been of ſingular Uſe in the Cure of "an Iliac Paſſion; ſince the Blood, diſcharged from the hæmorrhoidal Veins, relieves the Part affected, in the moſt immediate manner of all others." See Hæmorrhoides.

When the Uſe of Quickſilver is indicated as proper and neceſſary, it is previouſly to be depurated, waſhed, and paſſed through Leather: When thus prepar'd, it is not adviſeable to exhibit more than a Pound, or half a Pound; which is moſt commodiouſly taken in fat Broth. Immediately after it is taken, it is expedient the Patient ſhould lie for ſome time on his Right Side, that it may the more quickly paſs through the Right Orifice of the Stomach: Beſides, if his Strength permits, he is to walk, or uſe Geſtation, that it may the better reach the inferior Parts. But, when an Inflammation is already preſent, and the Strength much impair'd, we are to abſtain from the Uſe of this Medicine, leſt the By-ſtanders, and ſuch as are not capable of forming a right Judgment, ſhould be of Opinion, that the Patient is deſtroy'd by this Remedy, which has the bad Fortune to be ſuſpected almoſt by every one.

In this Diſorder, great Hopes of Safety and Recovery are juſtly placed in Clyſters, provided they are only uſed at proper times, and in due Quantities; for theſe, when the large Inteſtines are conſtricted by violent Spaſms, by relaxing their Fibres, and rendering them flaccid, greatly allay the Inverſion of the periſtaltic Motion. It is moſt expedient, if the Strength of the Patient permits it, to inject a Clyſter of warm Water, mixed with *Fernelius*'s Syrup of Marſhmallows, every two Hours, and that during the firſt Day of the Diſorder, that, by this means, the Fæces may be render'd more liquid.

As for Topics, I cannot help approving of the Caution of *Cœlius Aurelianus*, who adviſes us to abſtain from heavy Cataplaſms, which, by their Weight and Roughneſs, increaſe the Diſorder, and the Pains with which it is accompanied; for ſometimes the Inflation and Diſtention of the Abdomen are ſo great, that the Patient cannot bear it to be moderately touched with the Hand.

When the Anus, in conſequence of the ſpaſmodic Strictures, is ſo braced up, that it cannot admit a Clyſter-pipe, much leſs the Noſe of a Pair of Bellows, it is then expedient to apply to it a moderately warm Fomentation, and, with a ſmall Pipe, to attempt the Injection of pure tepid Oil, that the ſpaſmodically conſtricted Coats of the Inteſtinum Rectum, being, by this means, ſoften'd, may be, afterwards, capable of receiving a larger Quantity of Liquor.

When the Diſeaſe is upon the Decline, Baths are highly commodious; and may be, alſo, uſed in the firſt Days of the Diſorder, when their Propriety is indicated by proper Circumſtances; For theſe contribute greatly to the Termination of the Diſeaſe, and the Expulſion of the peccant Matter, by relaxing the Fibres: Thus Baths were, by the Methodics, with great Succeſs, recommended in the Decline of Diſeaſes, as we learn from *Cœlius Aurelianus*.

In order to mitigate the Pains which are, almoſt, the only Cauſe of ſo many violent Symptoms, and of the inverted periſtaltic Motion of the Inteſtines, we are not to be afraid of uſing Opiates, provided they are exhibited in the Beginning of the Diſeaſe, when the Strength is as yet entire, a Plethora remov'd, and no Signs of a Sphacelus to be diſcover'd. With reſpect to the great Efficacy of Opiates in this Diſorder, the Reader may conſult the Sentiments of *Wedelius*, found in the *Miſcell. Nat. Curioſ. Dec.* 1. *An.* 2. *Obſ.* 238.

If the Iliac Paſſion proceeds from a crural Hernia, and a Sphacelus, and Death is apprehended, from an Impoſſibility of reducing the prolapſed Inteſtine; the laſt Recourſe is Inciſion, which, if dexterouſly perform'd by a skilful Surgeon, in the Preſence of a judicious Phyſician, is without any Danger, and may ſave the Patient from an otherwiſe unavoidable Death: But, in Caſes of this Nature, it is abſolutely neceſſary, the Operation ſhould be perform'd in due time, and before the Signs of a preſent Sphacelus appear.

We muſt, alſo, obſerve, that the Iliac Paſſion is very ready to recur: Thus I have known ſome who have relapſed a ſecond, and a third time, into it; but it is to be remarked, that thoſe laboured under an Hernia. In order, therefore, to prevent this Misfortune, all poſſible Care is to be taken of the Hernia, which is to be retained with a Truſs; or, if that cannot be commodiouſly done, it is to be carefully defended from every Degree of Cold. The Patient is, alſo, to abſtain from all Aliments of a flatulent Quality; ſuch as Summer Fruits, Peaſe, all the Species of Pot-herbs, and Onions, and Turneps: But he is, above all, to abſtain from Subſtances of an aſtringent and drying Quality, that, by this means, his Body may be preſerv'd ſufficiently ſoluble; and, as I have found from Experience, that, in Patients labouring under an Hernia, nothing has a more immediate Tendency to excite the Iliac Paſſion, or produce a Relapſe, than Anger, and draſtic Purgatives, theſe are carefully to be avoided, as things of the moſt pernicious and fatal Conſequence. *Frederic Hoffman.*

As I believe, with *Celſus*, that moſt Iliac Paſſions proceed, originally, from an Inflammation of the Inteſtine, Bleeding ſhould ſeem to be the firſt Step neceſſary to a Cure, and this may be repeated in any Conſtitution capable of an Inflammation. And I have known the moſt powerful Cathartics, and theſe repeated, of no Effect, when adminiſter'd previous to Bleeding, which have, however, operated very well, and produc'd plentiful Stools, immediately after a ſufficient Quantity of Blood has been taken away; for when the Tenſion, and inflammatory Stricture of the Inteſtine, is remov'd by Bleeding, and the intercepted periſtaltic Motion thereby reſtor'd, the Excrements are readily protruded towards the Anus, and expelled. I have, farther, obſerved very ſalutary Effects from anodyne, emollient, and gently diſcutient Fomentations, continued for a long time, and frequently repeated; and if, in the Intervals of the Fomentations, the warm Omentum, or Inteſtines, or both, of ſome Animal juſt killed, are applied, and kept perpetually on the Abdomen, our Endeavours for a Cure will be the more likely to ſucceed. Inſtead of theſe, I have ſometimes known a warm Sheep-skin applied with very good Effect: But this muſt be ſtript off from the Animal with the utmoſt Expedition, the Moment it is kill'd, and laid to the Abdomen reeking hot; and another muſt be applied when that becomes cool, which uſually happens in four, five, or ſix Hours.

An entire Interception of Urine, in the Iliac Paſſion, is eſteem'd a moſt certain Prognoſtic of ſpeedy Death. See Intestina.

Sydenham's Method of treating this Diſorder is ſpecified under the Article Depuratoria Febris.

Celſus, conſidering the Diſorder as an Inflammation, directs it to be treated accordingly, thus:

The Cure of the Ileos conſiſts in Bleeding, and the Application of Cupping-glaſſes to many different Parts, tho' without ſcarifying every-where; for that will be ſufficient, if done in two or three Places: In the reſt, drawing away the Wind will be ſufficient. We are then carefully to ſearch out the Seat of the Diſorder, which has, uſually, a Tumor upon it. If it be ſituated above the Navel, Evacuation of the Belly would be uſeleſs: If it lies in the Parts below the Navel, it will be, ſometimes, very proper, according to the Advice of *Eraſiſtratus*, to evacuate by Stool; and, indeed, this kind of Remedy has been often found ſucceſsful in thoſe Parts. The Method of doing it is by adminiſtring a Clyſter of ſtrained Cremor of Ptiſan, mixed with Honey and Oil, and no other Ingredient. If no Tumor appears, lay both your Hands on the Top of the Belly, and draw them down gently, by which means you will diſcover the Seat of the Diſorder; for it will neceſſarily reſiſt the Touch, and, from this Diſcovery, you will be able to judge, whether you are to evacuate the Belly, or not.

Common Remedies are, Applications of hot Cataplaſms, from the Breaſts as far as the Groins, and the Spine of the Back, often changing them: Strong Frictions of the Arms and Legs, or bathing the whole Body in hot Oil. If the Pain continues, three

or four Cyathi of hot Oil are to be forced into the Belly thro' the Anus: When, by ſuch Methods, we have open'd a Vent for the Tranſmiſſion of Wind, we may allow the Patient to take a moderate Draught of warm Mulſum; but, before this is effected, all manner of Drinking is very carefully to be avoided. If the Mulſum agrees with him, he may afterwards take ſome ſorbile Liquor.

When the Pain and Fever are ceaſed, the Patient may be allow'd to eat pretty freely, tho' not of ſuch Food as cauſes Inflation, or is hard of Digeſtion, for fear of injuring the Inteſtines, not yet ſufficiently confirm'd; but his Drink is to be only pure Water; for whatever is vinous, or acid, is quite improper in this Diſeaſe. After this, all Bathing, Walking, Geſtation, and other Motions of the Body, are to be avoided; for the Patient is ſubject to a Relapſe, upon the leaſt Occaſion; and the Diſeaſe is ſure to return after a Cold, or any Jactation, if the Inteſtines are not well confirm'd. *Celſus, Lib. 4. Cap. 13.*

ILIACA VASA. The Iliac Veſſels, form'd by the Bifurcation of the *Aorta Deſcendens*, and *Vena Cava*.

ILIACUS MUSCULUS. This is a broad thick Muſcle, lying on the whole Inſide of the Os Ilium. It is fixed by fleſhy Fibres to the internal Labium of the Creſt of the Os Ilium, to that of the Slope between the two anterior Spines, to the Inſides of theſe Spines, to the ſuperior Half of the Inſide of this Bone, and to the adjacent lateral Part of the Os Sacrum.

All theſe Fibres, contracting by degrees, run obliquely towards the lower Part of the Muſculus Pſoas, uniting with it, and being fixed, by a kind of Aponeuroſis, to the Outſide of its Tendon, all the Way to the little Trochanter. They cover the Head of the Os Femoris, and ſome of the loweſt are inſerted in that Bone, a little above, and behind the little Trochanter, and others a little lower down.

On the Outſide of the lower Extremity of the Iliacus, there is ſometimes a ſmall ſeparate Muſcle fixed immediately under the anterior inferior Spine of the Os Ilium; from whence it runs obliquely downward, joins the Iliacus, and is inſerted below the little Trochanter. It repreſents, in ſome meaſure, the Roman V, with the Pectineus; and might be reckoned an Iliacus minor, if the large Muſcle had not ſometimes an Inſertion in the Side of the Eminence, called Ilio-pectinea.

The Iliacus and Pſoas, thus united, paſs under the Ligamentum Fallopii, over the Slope or Chanel, between the anterior inferior Spine of the Os Ilium, and Eminentia Ilio-pectinea, in a ſort of ligamentary Capſula, very ſmooth and poliſhed, that Part of it, which covers the Chanel, appearing like a Cartilage. *Winſlow.*

ILIACUS *Externus* is a Name for the MUSCULUS PYRIFORMIS.

ILIADUS, *Iliadum, Iliaſter, Ileidos* (they are, alſo, written with a Y for the firſt Letter). The Firſt Matter of all Things, conſiſting of Mercury, Salt, and Sulphur; the Chaos: For there is nothing in the Nature of Things, which conſiſts not of theſe three, and theſe are the three Principles of *Theophraſtus* (*Paracelſus*) which are diſcovered by ſpagirical Analyſis: We can find nothing but theſe three, which are each in each Element. *Iliaſter*, in general, is the occult Virtue of Nature, whence all Things have their Increaſe, are nouriſhed, multiply'd, and have their vegetable Growth. See *Paracelſ. de Meteor. Generation.* The *Iliaſter* may be underſtood, as in the Elements, or in Man: In the Elements it is the vegetative Power or Virtue of Nature, which is fourfold, according to the Number of Elements: It is called *Chaos*. There are, alſo, four *Iliaſtri* concerned in the Longevity of Man. The firſt or native *Iliaſter* is the Term of Life, or rather Life itſelf, or its Balſam in Man. The ſecond or prepared *Iliaſter* is the Term of Life, which we have from the Elements, or elementary Things, and Life itſelf. The third *Iliaſter* is the prepared Term of Balſam, which we have from the Quinteſſence of Things. The fourth *Iliaſter* is the Retirement of the Soul or Mind into another World, as in the Caſes of *Enoch*, *Elias*, and others. Thus far is from *Rulandus* and *Johnſon*, and ſeems for the moſt part to be taken out of *Paracelſus*'s Books of *Long Life*, where he reckons three *Iliaſtri*, beſides a Quinteſſence; one of them he calls *Sanctitum*, another *Paratetum*, and the third *Magnum*. According to the *Magnum*, which is the fourth of *Rulandus*, he calls Men *Henochdiated*, or *Elizæated*. *Iliadus* is, alſo, a mineral Spirit, which is contained in every Element, and is the Cauſe of all Diſeaſes. *Iliadus*, alſo, is what makes a Criſis. From the *Iliadus* proceed all Diſeaſes; and in the *Iliadus* all Things, all Simples, conſiſt: To ſome it gives Health; to others Sickneſs. To the *Iliadus* are, alſo, aſcribed three Ages: The firſt Age endures as long as it continues uncorrupted, tho' the Subject, or Perſon, be ſeventy Years of Age: for, as long as he remains free from Diſeaſes, he is in the firſt Age of the *Iliadus*; but, as ſoon as the *Iliadus* is infected, he paſſes into its ſecond Age: The third Age commences at the time of Death. In the firſt Age no Medicine is to be uſed, becauſe it is not neceſſary; nor in the third, becauſe it can adminiſter no Relief; and therefore the ſecond Age is the only Seaſon in which Medicines can be proper. *Paracelſus de Tartar.*

ILINGOS, ἰλιγγώς, from ἴλιγξ, a Vortex. A Vertigo, in which all Objects appear to turn round, and the Eyes grow dim. See VERTIGO.

ILISCUS. Madneſs cauſed by Love, according to *Avicenna. Foreſtus.*

ILIUM. See INNOMINATA OSSA.

ILLAMBONIS *Collyrium*. ἰλλάμβωνος κολλύριον. A Name for a *Collyrium* for Ulcers of the Eyes, mentioned by *Paulus Ægineta, L. 3. C. 22.* and *7. C. 16.*

ILLECEBRA. A Name for the *Sedum*; *parvum*; *acre*; *Flore luteo.*

ILLEGITIMUS. Illegitimate. An Epithet for the ſpurious Ribs, and for certain anomalous Fevers, which are, alſo, call'd *ſpurious.*

ILLINCTUS. An *Eclegma*, or *Linctus. Blancard.*

ILLISIO. The ſame as ENTHLASIS; which ſee.

ILLITIO. Inunction, or the Anointing any Part.

ILLOS, ἰλλός. The Eye.

ILLOSIS, ἰλλωσις. A Diſtortion of the Eyes.

ILLOTA LANA. The ſame as *Lana Succida*. See LANA.

ILLOTI *Piſces* are Fiſh which ſmell and taſte of Mud. *Celſus* calls theſe *Viroſi Piſces.*

ILLUTIO. The ſame as ALUSIA; which ſee.

ILLUTATIO. Illutation. This is a Beſmearing any Part of the Body with Mud, and renewing it, as it grows dry, with a View of heating, drying, and diſcuſſing. This is principally done with the Mud found at the Bottom of Mineral Springs.

ILLYS, ἰλλύς. A Perſon whoſe Eyes are diſtorted, or who ſquints.

ILYS, ἰλύς. The Fæces of Wine. Hence the Epithet ἰλυώδης, is applied to the Sediment in Stools, which reſemble the Fæces of Wine; and to the *Hypoſtaſis* in Urine, when like theſe *Fæces.*

IMAGINATIO. Imagination. The Fancy, once excited by the Appearance of an agreeable Object, preſently raiſes Deſire, and produces local Motion, either to approach or avoid the Object according to its different Circumſtances.

If it be agreeable, the whole Bent of the Soul is to court and embrace it, earneſtly endeavouring to be united to it. She is, as it were, expanded in Pleaſure; while the animal Spirits, in a kind of Ovation, being carried within the Brain, are conſtantly exciting the moſt pleaſing Ideas; and, acting in a lively Manner upon the nervous Syſtem, cauſe the Eyes and Countenance to ſparkle, while the Hands and every Member exult for Joy: Beſides, the Influence of the Brain affecting the Præcordia, by means of the Nerves, they propel the Blood with more Rapidity, and pour it with Vigour on every Part of the Body.

But, if the Object appear dreadful or grievous to the Imagination, the Soul, as it were, ſubſides, and is contracted. The Spirits ſeem to retire precipitately, and are ſunk in Fear and Sadneſs. Hence the Countenance is dejected, and the Limbs enfeebled; and, the ſame Affection being carried by the Nerves from the Brain to the Præcordia, they are contracted, and reſtrain the Blood from its due Excurſion. The Blood, being thus collected into one Place, produces an Heavineſs and Oppreſſion at the Heart; while the exterior Parts, being deprived of their uſual Influx, languiſh, and are diſordered. Such are the Effects of the Power of Imagination; Effects which are ſometimes almoſt incredible, and which have been thought ſufficient to reſtore and renovate, to ruin and deſtroy, the human Structure.

To the Virtue of the Mother's Fancy have been aſcribed the Lineaments of the Embryo or Fœtus, with the Marks impreſt upon its Body, both at and after the Time of Conception. Tranſanimation or Ecſtaſy, Tranſformation of Body, Tranſplantation of Diſeaſes, the ſtrange Alterations of Bodies by the Virtue, Reliques, and the Invocation of Saints, are all imputed to this Power of the Imagination. In a Word, Sickneſs and Health, Recovery, and Death itſelf, are within the Limits of its Sway. But it may be proper to premiſe, that, by the Power of *Imagination* or *Fancy*, we do not mean, that this Faculty, as an immediate Efficient, by a direct Property of itſelf, produces any Effect; but mediately, by the Interpoſition of the Blood and nervous Fluid, influenced by Deſire.

Among common Accidents, ſtanding on a Precipice, or going along a narrow Bridge, and looking down from us, are ſubject to make us tremble and grow giddy. The ſeeing a Perſon eat ſome auſtere or crabbed Fruit, will cauſe a kind of Stupor in the Teeth; or the beholding another feeding on Delicacies, of which we are fond, occaſions a real Flux of Saliva; or, according to the common Expreſſion, makes our Chops water. The Sight of a Perſon in Affliction, in Miſery, or in Torture, will make the Compaſſionate fancy, that he feels a Pain like that of the unhappy Sufferer. The longing Deſire of ſuckling a deſtitute Infant has been known to have produced Milk in the Breaſt of an old Woman, as is ſaid. And nothing is more frequent, than for a grating, jarring Noiſe to ſet the Teeth on edge; or the Sight of another Yawning, to occaſion in us the ſame Action.

Thus, alſo, the Imagination, upon Joy, cauſes a pleaſant and ſerene Countenance; of any thing ſhameful, produces Bluſhing. But more remarkable have been the Effects of the dreadful Apprehenſions of an approaching Execution, as may appear by the following Relations.

Schenkius, *Lib.* 1. tells us, that *Don Diego Oſorius*, a noble *Spaniard*, being in Love with a young Lady of the Court, obtain'd of her a private Meeting, under a Grove in the King's Gardens, which was a capital Crime. By the unfortunate Barking of a little Dog, they were diſcovered, and the young Nobleman was ſeiz'd, impriſoned, and condemned to die. After hearing his Sentence, in one and the ſame Night, he was, in Appearance, both young and old, his Hair being turned grey, as in hoary Age. The Gaoler related the Accident to the King as a Prodigy, who was pleaſed to pardon him, ſaying, he had been ſufficiently puniſh'd for his Fault.

The ſame Author informs us, that a young Nobleman of the Emperor's Court had violated a Lady's Chaſtity, though, by her ſmall Reſiſtance, ſhe ſeemed not altogether reluctant. He was impriſon'd, and condemned to loſe his Head the next Day. Being brought into the Imperial Preſence, before the Execution of his Sentence, he was known to none; the Beauty of his Face being vaniſhed, his Countenance like the Countenance of a Corpſe, and his Hair and Beard entirely grey. On ſo wonderful an Alteration, a Counterfeit was reaſonably ſuſpected; but after a ſtrict Examination, no Impoſture appearing, the Emperor was moved to Pity, and pardoned the Criminal.

Mr. *Boyle*, in his Experimental Philoſophy, relates, that, when he was in *Ireland*, an *Iriſh* Captain, coming with ſome of his Followers, to ſurrender to Lord *Broghil*, was caſually intercepted by a Party of the *Engliſh*, his Lordſhip being then abſent. Upon this Misfortune, ſo prodigious was the Captain's Terror of Death, that, before Lord *Broghil's* Return, his Hair changed its Colour in a peculiar manner; ſome of his Locks, which were turned perfectly white, being interſperſed with the reſt, which retained their uſual rediſh Hue.

The bare Imagination of a purging Potion has, I am credibly inform'd, produced Stools, like thoſe called Phyſical. With regard to Vomiting, *Turner* ſays, he, one Morning, viſited a young Gentleman, who had Occaſion for ſeveral Vomits, not of the mildeſt Sort. Being provided with plain Poſſet-drink, he deſired me, ſays he, to ſhew him his Bolus. I had no ſooner opened it, than he began to heave and retch extremely; then I carry'd the Bolus out of the Room, till he had recovered himſelf. He took a Draught of Poſſet-drink, which was ſoon followed by a ſecond; neither of them returning, the Bolus was again preſented, upon the firſt Glance of which, he began to vomit plentifully, ſo continuing, till I made him believe, that it was again removed out of the Room. Having drank more Poſſet-drinks, I unexpectedly pulled the Bolus out of my Pocket, which again had the ſame Effect. He ſaid, he had thus vomited with ſeveral of his laſt Boluſes, and found as much Advantage, and as ſtrong an Operation, as from the firſt, which he had taken into his Stomach. So ſurpriſing was this Gentleman's Idioſyncraſy, though in perfect Health, if a Bolus was mentioned, or if he accidentally thought on it, he would fall a vomiting.

The Fancy, ſays *Fienus*, in his *Tract. de Viribus Imag.* by cauſing a Motion of the Humours and Spirits, is capable of producing almoſt every Diſeaſe: For, as it has Power to determine theſe Humours to any Part, it is able to cauſe the Indiſpoſition incident to the Part. And ſome have been obſerved to have contracted the Small-pox or Plague, by Fear, or Force of Imagination, ſome putrid Humours, with a peſtilent Atmoſphere, prediſpoſing. A condemned Malefactor, the ſame Author takes notice, being carry'd out to Execution, as he believed, having his Cap pulled over his Eyes, and a wet Cloth ſtruck haſtily about his Neck, dropt down dead, imagining he was beheaded. And there are ſeveral ſurpriſing Inſtances of the Force of Imagination in Hypochondriacs.

We ſhall now proceed to take notice of ſome monſtrous, or marked Births, occaſioned by the ſtrong Imagination, or diſappointed Longings, of the Mother; which have had Power not only to divert and diſturb the plaſtic or formative Faculty, but to ſtamp its Characters, to diſmember and diſlocate, and to make large Wounds in the Fœtus, long after Conception, when it has been completely formed.

The Deſire, ſays *Hippocrates*, of the pregnant Woman is capable of marking the tender Infant with the Thing deſired. And St. *Jerom*, in his Lectures upon *Geneſis*, ſays, that a Lady having brought forth a Child of an *Ethiopic* Complexion, was in Danger of ſuffering as an Adultreſs; from which Puniſhment ſhe was delivered by *Hippocrates*, who wiſely imputed this Event to a Picture reſembling the Child exactly, and which he found ſhe had been often very intently viewing. To the ſame Cauſe *Heliodorus* aſcribes the Whiteneſs of *Charicles*, who was born of *Ethiopian* Parents.

Seranus, as St. *Auſtin* obſerves, informs us, that, however deformed and ugly the Tyrant *Dionyſius* was, he would always have a beautiful Picture placed before his Wife in the Bed-chamber. *Galen*, in his *Lib. de Theriac. ad Piſon. C.* 14. ſays, that the Sight of a Picture is ſufficient to change the Fœtus into the ſame Likeneſs. And the Patriarch, in *Geneſis*, *Chap.* xxx. by placing the ſtreaked Rods before the Cattle, at the Time of their Conjunction, ſhewed himſelf no Stranger to theſe Effects.

Heſiod, *Lib.* 2. *de Op. & Dieb.* exhorts his Friends to abſtain from Embraces after their Return from Funerals, or thinking of any Calamity, which has befallen them; leſt the ſorrowful Idea be tranſmitted to the Conception, and the tender Fœtus marked with ſome frightful Character.

Pet. Meſſias, in his *Lib. Lect. var. C.* 7. reports from *M. Damaſc.* that a Girl was born all over hairy, from the Mother's viewing the Picture of St. *John Baptiſt*, drawn in his hairy Veſture hanging by her Bed-ſide. The like Caſe is taken notice of by *Schenkius*, and *Amb. Paré*.

Bartholine, in his *Hiſt. Anat. Cent.* 3. ſays, that a Woman, big with Child, being exceedingly frightened by a Cat, was delivered of a well-ſhaped Child, but with an Head like that of a Cat.

Gulielm. Paradin. in his Hiſtory of *Savoy*, *Epilog. ad Cap.* 46. declares, that a Niece of Pope *Nicolas* III. of the Family of the *Urſini*, had a Birth covered with Hair, with the Claws of Bears, inſtead of Fingers and Toes, which ſhe aſcribed to her looking on the Picture of that Creature, which was every-where repreſented in the Dwellings of that Family. Upon this Event, his Holineſs gave Order for deſtroying all the Pictures of Bears throughout the City of *Rome*.

On *July* 18. 1610. (ſays the ſame Author, in his *Additam. ad Donat. per Hoſt. Lib.* 7. *C.* 3.) a Boy was born at *Prague*, whoſe Liver, Inteſtines, Stomach, Spleen, with Part of the Meſentery, hung out all naked below his Navel; he lived but a few Hours. The Mother, upon Inquiry, ſaid, that, three Months before her Delivery, ſhe was forced by ſome Soldiers to be preſent at the killing of a Calf; at the opening of which, ſhe felt an extraordinary Motion in herſelf, when ſhe ſaw the Bowels tumbling from the Belly. About the ſame Time and Place, another Boy was born, with his Fore-ſkin cut and inverted. Three Weeks before, the Mother had liſtened attentively to one who was deſcribing the Manner of the *Jewiſh* Circumciſion.

Ludovicus Vives, in his Comment upon St. *Auſtin's City of God*, *Lib.* 13. *C.* 25. mentions a looſe Fellow of *Brabant*, who, having perſonated the Devil in a Play, went home in his Habit, and would needs enjoy his Wife, ſaying, he would beget on her a young Devil. The Woman conceived, and afterwards brought forth a Child of the ſame diabolical Figure, in which the Man was dreſſed.

Schenkius, in his *Obſ. Med.* tells of a Woman very big, who, converſing with her Neighbours, told them, that ſhe reckoned to the Time of the *Epiphany*, or the Feſtival of Three Kings. One of them wiſhed ſhe might bring forth Three Kings; and ſhe merrily anſwered, With all her Heart; and, at the time, ſhe bore three Sons, one of them black, as the *Ethiopian* Kings are painted. This Relation is confirmed by *Cornel. Gemma*, in *Coſmocrit. Lib.* 1. *Cap.* 6. who reports of another, near her Time, who being purſued by her Husband, with his drawn Sword, threatening to cut her over the Forehead, ſhe, from the Fright, ſoon fell in Travail, and was delivered of an Infant with a large Wound on its Forehead, of which the Bleeding could not be ſtopt, and the Child preſently dy'd.

Gulielmus Fabricius tells us of a Woman at *Bern* in *Switzerland*, who, being big with Child, and quarrelling with another, fell into a violent Paſſion, after which, falling into Labour, ſhe was brought to-bed of a Daughter, of a courageous and heroic Mind, but her Feet and Hands contracted, as if ready to fight, and her whole Body in a continual Motion; ſo that ſhe walked, as it were, dancing and trembling, like one in the Height of Anger.

A young luſty Woman, big with Child, was much frightened by a Perſon falling down by her, in a Fit of an Epilepſy. At the Expiration of her Time, ſhe was delivered of a Son, who was ſoon after ſeized with epileptic Paroxyſms, which carry'd him off before he was a Year old. This Author adds, that the Cauſe may be aſcribed to the Force of the Mother's Imagination, at the Time of the Fright, communicated to the Brain of the Infant.

The Caſe of a Man born without Arms, and living to a great Age, which was occaſioned by his Mother's Surprize at the Sight of a Beggar in the ſame Condition, is related in *Cent.* 6. *Obſ.* 66. by the ſame Author. And I knew, ſays *Turner*, a Lady, who, being with Child, was frighted at the unexpected View of a Beggar's ſtump Arm upon her Coach-door, and was delivered of a Child wanting one of its Hands. The ſame *Fabricius* gives an Account of an Hydrocephalus contracted by the Mother's Imagination: Of the Infant's Head pierced through, by reaſon of the Mother's receiving a Fright: Of the Small-pox this way communicated: Of a Child born with the Leg broken, or diſtorted, by the Mother's looking on a Crucifix, and viewing the broken Limbs of one of the Malefactors on the Side of our Saviour: Of a Female Child being born with a *Prolapſus Uteri & Veſicæ*, by the Mother's beholding a poor Woman under that Misfortune.

Fienus, *de Virib. Imaginationis*, tells us of a Girl born without an Head, but complete in the reſt of her Body: The Likeneſs of a Shell-fiſh was joined to her Neck, having two Valves, which ſhut and opened, and by which, from a Spoon, ſhe took her Nouriſhment.

riſhment. This was occaſioned by the Mother's longing for Muſſels in the Market, which ſhe could not procure. This Monſter lived eleven Years, but, happening, in an angry Mood, ſtrongly to bite the Spoon with which ſhe was fed, and breaking thoſe teſtaceous Valves, ſhe dy'd quickly after.

The Caſe related by *Sebaſtian Munſter*, in his *Coſmograph. Lib.* 3. of two Children born growing together by the Forehead, occaſioned by two Perſons wantonly ſtriking their Heads together behind the Mother, ſeems leſs ſtrange to thoſe, who have ſeen, in *London*, two Girls, brought from *Germany*, conjoined about the Loins and Buttocks, with one common Anus and Pudendum.

In the *Zodiacus Medico-Gallicus*, *pro Menſ. Nov. & Decemb.* 1682. we are told of a pregnant *Burgundian* Woman, who, being often intent upon looking up to the Images of two Angels, in the Church, with their Arms and Legs acroſs each other, was, on *Auguſt* 24. delivered of two Girls, deprived of Life, on account of the difficult Birth, with their Bodies joined in the ſame manner.

Ambroſe Paré ſays, that in 1517. a Child was born with its Face like that of a Frog, which was occaſioned by the Mother's holding that Creature in her Hand, to allay the Heat of a Fever, about the Time of her Conception.

A Gentlewoman with Child, ſays *Turner*, being cut for the Repoſition of an inguinal Rupture, was delivered of the Infant with a large Wound on the ſame Place, and the Scar continued when he was a Man.

Fienus records a Woman at *Antwerp*, who, in Countenance and Geſture, reſembled an Ape; her Mother, when pregnant, being uſed to play with a Creature of that kind. He likewiſe informs us of a Lizard, that frightened a Woman with Child, by leaping into her Boſom; and ſhe brought forth an Infant, with a fleſhy Excreſcence on the Breaſt, exactly reſembling the Lizard, with its Head fixed in the Child's Fleſh, and the reſt of the Body hanging out.

Schenkius takes notice of a Letter ſent him by *Jacobus Suterus*, where he tells him, that his Wife being deny'd a certain Joint of Meat by a Butcher, ſhe bled at the Noſe, and with her Finger wiped the Blood off her Lip, and was delivered of a Child wanting the upper Lip.

Dr. *Cyprianus*, in *Phil. Tranſ.* abridged, *Vol.* 3. *p.* 222. gives the following Caſe: A Lady was delivered of a Girl, with a Wound in her Breaſt, above four Fingers long, and penetrating to the Muſculi Intercoſtales, being an Inch broad, and hollow under the Fleſh about the Wound: There was, alſo, a Contuſion at the lower Part of the Wound, which, being treated with Suppuratives, came to an Head, was opened, and healed with the Wound. The Birth was eaſy, and, conſequently, the Child received no Harm in it. But, about two Months before, the Mother, being gone to Bed, heard a Report, that a Man had murdered his Wife by wounding her in the Breaſt with a Knife; at which Relation, it was obſerved, that ſhe changed Countenance, and ſeemed concerned.

Mr. *Boyle* acquaints us, that an ingenious Phyſician, being call'd to a young Lady, who, he believed, only fancy'd herſelf Sick, ſcrupled to give her Phyſic; and adviſed her Friends to divert her by little Journeys of Pleaſure. In one of theſe, going to *St. Winifred*'s Well, this Lady, who was a Catholic, continued ſome time in the Water, to perform her Devotions, and attentively fixed her Eyes upon the red Pebbles under the Water. A while after, ſhe was delivered of a Child, whoſe Skin was copiouſly ſpeckled with Spots of the Colour and Size of thoſe Stones; which Marks the Child ever retained.

A Kinſwoman of mine, ſays Sir *Kenelm Digby*, in his Treatiſe of Bodies, being fond of wearing Patches, I uſed to tell her, in Jeſt, that her next Child would be marked with a great black Spot in the Middle of its Forehead. This Apprehenſion was ſo ſtrong in her Imagination, at the time ſhe proved with Child, that her Daughter was born exactly as the Mother imagined.

Horſtius recites ſeveral Caſes, in which he found the Infant not only variouſly diſcoloured, but marked with Strawberries, Cherries, and other Fruits, on ſeveral Parts of their Bodies. Many of which, as *Hildanus* remarks, are not to be deem'd incurable, but may be attempted according to their Situation. But no Part of the Skin or Fleſh, preternaturally coloured, muſt be left behind; for, if it is, they will riſe again. Some have recommended the Blood of the Secundine to be rub'd on the Mark. But *Sergerus* inſtances a Maid, who had the Back of her Left-hand of a fiery red Colour, by the Mother's apprehending a ſudden Burning, when ſhe was with Child. She anointed the diſcolour'd Place with the Blood of an After-birth, which increas'd the Inflammation with much Swelling and Pain. The Surgeon, with Difficulty, ſtopt theſe Symptoms, and the Mark remained.

Willius, *in Act. Danic. An.* 74. *Obſ.* 83. recommends Section for removing the maternal Marks; which is eaſily performed, if the Tumor can be ty'd about with a Thread, and ſuch Medicines apply'd, as may intercept the affluent Humours; but Care muſt be taken, that no Artery, great Veſſel, or Nerve, be hurt. For, ſays he, if Nature permits the Loſs of a Noſe, an Ear, or Eye, why may ſhe not do the ſame in theſe her ſpurious Productions? He gives an Example of a Child, who was cured of many ſoft Excreſcences growing over its Eyelids and Forehead.

To give my own Opinion on this Subject, ſays *Turner*: What Monſters are fit to be deſtroyed, or preſerv'd, ſhould be left to the Determination of the Civil Law, and the Judgment of Phyſicians before conſulted. Diſtorted Members may be ſometimes rectified, of which *Hildanus* gives us an Example, in *Cent.* 3. *Obſ.* 56. And I knew, ſays *Turner*, a Child born with both Feet inverted, and treading on the Ancles; yet, with proper Splints, and Bandage, and a ſmall Steel Plate, from the Shoe to the Knee, continued for ſeven Years, he was perfectly cured. To attempt to remove Diſcolourings of the Skin, is to little Purpoſe, as they penetrate it, and the Scar is like to prove a greater Blemiſh than the Stain itſelf.

In the Extirpation of large Excreſcences reſembling Fruits, or Foods, they are ſubject to degenerate into malignant Ulcers; and ſome of them, being ſupplied with a large Plexus of Veſſels, endanger an Hæmorrhage: And, if they cannot be entirely eradicated, they will riſe again, and be more obſtinate and troubleſome than at firſt. In theſe Attempts, therefore, it is neceſſary to conſider their Situation, Extent, and Depth, what Veſſels ſuſtain them, and whether the Knife or Cautery be moſt proper for deſtroying them. Thoſe which I have undertaken, ſays *Turner*, have been the Currans, Cherry, Rasberry, Mulberry, and the like leſſer Fruits, when they have been ſecurely ſeated, and their Surfaces not too much ſpread; or when their Baſis has been ſmall like a Stalk, and the Excreſcence ſoft and pliable, without Inflammation, livid Complexion, or any Appearance of Malignity; whence I have known them degenerate into Cancers. The Time of Extirpation is, when they look paleſt, are flatteſt, and ſofteſt; for, like the Fruits they reſemble, they have their Seaſons of blooming, ripening, and languiſhing, but never entirely dying.

If they are join'd by a ſlender Stalk, or if their Baſis will admit, I, ſays *Turner*, prefer the Ligature, taking care, when the Excreſcence is dropt off, to penetrate the Root with a Cauſtic. The ſame Caution is to be obſerved in uſing the Knife, when I apply a ſmall, hot, pointed Cautery, which ſtops Bleeding, waſtes the remaining Fibres, and corrects any Malignity, and the Sore may be healed like a common Burn.

Hildanus being call'd to the Son of a Senator of the Canton of *Bern*, three Years old, having an Excreſcence, like half a Cherry, on the upper Part of his Noſe, which, at firſt, was no bigger than a Lentil, but increas'd as he grew, he undertook the Cure in the following manner.

Paſſing a Needle, with a Thread, through the Body of the Excreſcence, he, with his Knife, ſeparated it from its Bottom all round; when, paſſing the Point of the Knife towards the Forehead, a Branch of a Blood-veſſel, being cut, hinder'd his Procedure. He contented himſelf with taking out what he had divided, and dreſſing with Aſtringents. When he open'd the Wound, he found ſome Remains in the diſcolour'd Fleſh, which he waſted with an Eſcharotic, made of the Aſhes of Vine-tendrils, and Quick-lime, digeſting out the Eſchar with a Mixture of Turpentine, and Gum Elemi; he afterwards incarn'd, and brought on a ſeemly Cicatrix. In theſe Caſes he recommends the Uſe of the Precipitate in tender Habits, beforehand waſh'd and edulcorated, which I have ſometimes known, ſays *Turner*, after the Removal of the external Skin, capable of waſting theſe fungous Appearances, to deterge the Ulcer, and diſpoſe it for healing.

Cases from Turner.

A Gentlewoman having been born with the Mark of a Raſberry, near her Eyebrow; about the ripening Seaſon of that Fruit, it, as uſual, aſſumed a florid Complexion, felt tender, and appear'd higher than ordinary, with ſmall Grains, and little Hairs between them. By haſtily running againſt the Edge of a Straw Hat, the Excreſcence was cut through the Middle, which occaſion'd great Pain, and much Trouble, for ſome Days, to ſtop the Bleeding; but, at laſt, dried up with a Scab. Some time after, the Scab, being pull'd off, in her Sleep, occaſion'd a more plentiful Effuſion of Blood than at firſt; upon which Account I was ſent for, only to ſtop the Bleeding. I, however, prevail'd with her to have it entirely eradicated. I, at firſt, applied the Lunar Cauſtic, the Operation of which being impeded by a Diſcharge from a ſmall Artery, I had recourſe to the Lapis Infernalis, which ſecured the Veſſel, and burnt deep into the Body of the Excreſcence. After wiping out the Salts, with an arm'd Probe, I dreſs'd the Ulcer with a Pledget of Baſilicon dipped in the warm Balſam of Turpentine. As it ſeparated, I perceiv'd that I had taken in the whole Compaſs of the diſcolour'd Skin; yet, at the Bottom, the Fleſh, in ſome Places, aroſe granulated, like that already waſted, ſome of which I touch'd again with the Lunar Cauſtic, others with the End of my Probe, dipt in the Butter of Antimony, when, digeſting out the Slough with warm Liniment and Balſam of Turpentine, I found the Fleſh was ſtill of the ſame kind, even as low as the Pericranium. Having proceeded as far with the Eſcharotics as was convenient, I fill'd the Ulcer with red Precipitate, and let it remain two Days, laying over the Digeſtive. Taking off the Dreſſings, there came out a thick Slough, made of the Remains of

of the Excreſcence, under which the Membrane appear'd fair and clear, though ſomewhat inflamed. To prevent it from ſloughing off, I dreſſed with Lenients, and haſten'd Incarnation; yet the Cranium was bare about the Compaſs of a ſmall Spangle; however, it heal'd without the leaſt Exfoliation, and left an handſome Scar.

A Child having the Reſemblance of a Currant on the internal Canthus of the Eye, towards the Top of the Noſe, and it increaſing, ſhe was like to contract a ſquinting Caſt of her Eye, by often endeavouring to view it. In order to remove it, I was conſulted. Obſerving the Baſis would admit of a Ligature, having a Needleful of wax'd Silk, and placing the Child on a Servant's Knee, I made a very cloſe Ligature, apprehending that the Child would not ſuffer it to be ſtraiten'd again, if there ſhould be Occaſion; and applied a Defenſative all round, leaving a Hole in the Middle to let out the Excreſcence. To prevent the Accidents of a Fever, the Child had a Clyſter in the Morning, and had been blooded the Day before. Next Morning the Eye was inflam'd, the Eyelids ſwell'd up, and the Child became feveriſh; the Excreſcence was grown livid, and ſeem'd near mortified. The Child being brought to the Window, with both her Eyes ſhut cloſe, I paſs'd the Point of my Sciſſars under the Ligature, ſnipt off the Excreſcence, which was follow'd with but a few Drops of Blood, nor did the Child complain. Then I preſt the Button-end of the Probe, made red-hot, moderately upon the Root or Stalk; after which, embrocating the Parts with Oil of Roſes, the Tumor went off in two or three Days; and in two or three more the Burn was heal'd with ſo many Dreſſings of my Ointment of Lapis Calaminaris, (the firſt Dreſſing being only a ſmall Pledget dreſs'd with Baſilicon) and ſcarce left any Mark behind.

A Servant-maid having the Mark of a Shrimp upon her Cheek, the Removal of it had been attempted by Eſcharotics, by a Pretender to Surgery. Finding it troubleſome, ſhe applied to me; but it then ſeem'd a phagedenic Ulcer, with jagged and callous Lips on one Side, and on the other an overgrown Fungus. I propos'd to her the hot Iron, but, frighten'd at this fiery Trial, ſhe would not ſubmit to it. Afterwards, applying to an Empiric, her Cheek was overſpread with the Malady, which was deem'd cancerous. *Turner, de Morb. cutaneis.*

IMBIBITIO, in Chymiſtry, imports a kind of Cohobation, when the Liquor aſcends, and deſcends again, upon the ſolid Subſtance it is join'd with, till, at laſt, it is fix'd and coagulated with this Subſtance, ſo as to be no longer capable of riſing. *Rulandus.* It, alſo, ſometimes imports, ſimply, Cohobation; and any Sort of Impregnation.

IMMERSIO. Chymical Immerſion is a Species of Calcination, when any Body is immers'd in any Fluid, in order to be corroded: Or it is a Species of Lotion, as when any Subſtance is plunged into any Fluid, in order to deprive it of a bad Quality, or to communicate to it a good one

IMMERSUS. The Name of a Muſcle. See SUBSCAPULARIS.

IMPAR. An Epithet for the critical Days, importing Odd. See CRISIS.

IMPASTATIO. Impaſtation is a Reduction of Powders, or any other Subſtance, to the Form of a Paſte, by the Aſſiſtance of ſome convenient Fluid.

IMPATIENS HERBA. See BALSAMINA.

IMPERATORIA.

The Characters are;

The Leaves are not very ramous, but divided into three Segments, each of which is ſubdivided into three others. The Seeds are flat, oval, ſlightly ſtriated, and marginated.

Boerhaave mentions three Species of this Plant; which are,

1. Imperatoria; major. *C. B. P.* 156. *Tourn. Inſt.* 371. *Boerh. Ind A.* 53. *Imperatoria & Aſtrantia.* Offic. *Imperatoria.* J. B. 3. 137. Raii Hiſt. 1. 436. Ger. 848. Emac. 1001. *Imperatoria, ſive Aſtrantia vulgaris.* Park. Theat. 942. MASTERWORT.

The Roots of Maſterwort are long, and full of Knots or Joints, about a Finger thick, running obliquely into the Ground, ſhooting out many Fibres from the Joints, of a ſtrong aromatic Smell, and a pretty hot Taſte; the lower Leaves are hardly a Span high, ſomewhat like Angelica, but much leſs, and divided into three Segments of roundiſh Leaves, crenated about the Edges; the Stalks ſeldom grow above a Foot high, with but few Leaves on them, and have, on their Tops, Umbels of ſmall, white, five-leav'd Flowers, each of which is ſucceeded by two round, whitiſh, ſomewhat flat Seeds. It is cultivated with us in Gardens, its native Place being the *Auſtrian* and *Stirian* Mountains, and other *Alpine* Countries, flowering in *July*.

The Roots, which are the only Part uſed, are cordial, ſudorific, and alexipharmic, of great Uſe in putrid malignant Fevers, and all contagious peſtilential Diſtempers; they reſiſt Poiſon, and the Bites of venomous Creatures. They help Pains of the Stomach, and the Colic; in all nervine Affections, and Diſorders of the Head, they are uſed with good Succeſs. *Miller's Bot. Off.*

The Roots are oblong, about an Inch thick, wrinkled, cirrous and geniculated, brown without, white within, of an aromatic acrid Taſte, and fragrant Smell.

The *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave*, aſcribes the following Virtues to theſe Roots: They are attenuating, he ſays, and aperitive; provoke Saliva, if held in the Mouth; and are cathartic, if taken inwardly, whence the Root of *Imperatoria* is called *The Countryman's Purge*. Taken in a leſſer Quantity it proves ſudorific and diuretic. In the hyſteric and convulſive Colic, and the Tympanitis, it often works with ſuch Violence as to require Correctors, ſuch as *Leviſticum*, *Meum*, or ſome other ſweet and viſcid Root. In intermittent Fevers, eſpecially Tertians and Quartans, it is a ſpecific Remedy, as well as in comatous Diſorders. It has the ſame aromatic, hot and igneous Taſte and Smell in every Part of it; and, whether it be uſed in Infuſion or Decoction, is inferior to no Medicine for Speed in giving Relief under the Effects of Poiſons of a volatile Kind, working by gentle Sweat, and, if exhibited in a larger Quantity, by Stool. It is recommended, alſo, in the Dropſy, being taken to the Weight of an Ounce in Honey, provided the Viſcera be ſound: It is, alſo, an Antiſcorbutic. It is highly commended in Caſes where any one of the Viſcera requires to be ſpeedily freed from ſome viſcid Matter. *Baglivi* very much commends it for Diſeaſes of the Breaſt, for the Pleuriſy and Peripneumony, in Caſes where the Matter is concocted, but the expulſive Faculty deficient: For theſe Purpoſes the Root is infuſed in Water, which is afterwards ſweeten'd with Honey, and proves an excellent Promoter of Expectoration, to the Relief of the Patient from the Diſeaſe. It is one of the principal Ingredients in the ſame Antidotes as Angelica: Being heating and aperitive, it is effectual for diſcuſſing of Tumors, where there is no Inflammation, or in thoſe of the ſcorbutic Kind. If the Root be divided in the Middle, you diſcover a Multitude of Veſicles full of an oily and balſamic Subſtance, endued with an igneous Quality, which renders the Root more heating than that of Angelica, and as good a Corrector of a fetid Breath. The Root is to be taken up in the Middle of Winter, in its ſecond Year. The Leaves bruiſed are good to diſcuſs cold Tumors. The diſtilled Oil, as well as the Spirits, are carminative and ſtomachic. The Root is juſtly accounted one of the beſt Antiſcorbutics, and, boiled in Water, affords an excellent Remedy for the Gravel in the Kidneys, and a Stoppage of Urine.

2. Imperatoria; Alpina; maxima. *T.* 317.

3. Imperatoria; quod Laſerpitium. *Proſperi Alpini Exot.* 211. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 53.

The laſt *Proſper Alpinus* takes to be the *Laſerpitium* of *Theophraſtus*, *Dioſcorides*, and *Pliny*. He informs us, that this Plant was raiſed at *Padua*, from Seeds brought from *Thrace*. He ſays, the whole Plant is hot, of a grateful Smell, and acrid Taſte.

IMPERFORATIO. Imperforation is, when any of the natural Paſſages are not perforated. See ANUS, VAGINA, and URETHRA.

IMPERIALIS CORONA. See CORONA IMPERIALIS.

IMPETIGO. The ſame as *Lichen*. See LEPRA.

IMPETUS, when uſed relative to the Heart, and Circulation of the Blood, means, ſimply, Force. With reſpect to Diſeaſes, it is the ſame as a Paroxyſm. Sometimes it imports the ſame as *Impetigo*.

IMPIA HERBA. See FILAGO.

IMPLICATUS, or IMPLICITUS, imports complicated. See COMPLICATIO.

IMPLUVIUM. An Embrocation.

IMPOTENTIA. Impotence, with reſpect to Men, is the ſame as Sterility in Women; that is, an Inability of propagating the Species. There are many Cauſes of Impotence, as a natural Defect in the Organs of Generation, which ſeldom admits of a Cure; Accidents; or Diſeaſes; and in ſuch Caſes the Impotence may, or may not, be remedied, according as theſe are curable, or otherwiſe. But I am inclined to believe, that the moſt frequent Cauſes of Impotence are prepoſterous Methods of Venery, (ſee *Gonorrhœa*) and too often repeated Venereal Injuries.

I have ſome Reaſon to believe, that a ſudden Impotence happening to a Perſon not accuſtom'd to any Diſorders of that Kind, and not accountable for from any preceding Accident, is a Forerunner of ſome great Diſorder. And in ſuch Caſes Provocatives are very dangerous, becauſe 'tis poſſible they may increaſe the Diſorder which cauſes the Impotence, and make it fatal. Thus I have ſometimes met with terrible and fatal Fevers, excited by the Exhibition of warm and ſtimulating Provocatives.

Hippocrates, in his Treatiſe *de his quæ Uterum non gerunt*, adviſes a Man, who has a mind to get Children, not to be drunk, nor drink White-wine, but that which is ſtrong and unmix'd, nor to uſe the warm Bath.

Another principal Cauſe of Impotence is the execrable Habit of drinking Spirits, that is, Drams; inſomuch that, if Legiſlators do not take care to put ſome effectual Stop to it, in a few Centuries the whole Race of Mankind will, probably, be extinct, without a Conflagration, or a ſecond Deluge.

Relative

Relative to Impotence, Dr. *Cockburn*, in the *Edinburgh* Medical Eſſays, gives the following remarkable Caſe: A noble *Venetian*, aged twenty-two Years, was married to a very fine Lady, with whom he cohabited with a good deal of Vigour, but his Embraces were never attended with an Emiſſion; whereas in his Dreams this happen'd very freely. This Misfortune very much afflicted him and his Family; and, as no Remedy could be found at Home, the *Venetian* Ambaſſadors, reſiding in the different Courts of *Europe*, were deſired to conſult ſome of the moſt eminent Phyſicians, in the Parts where they reſided, to account for the Cauſe, and to find out a Cure for this extraordinary Complaint of the Difference of the States when in Sleep, and during actual Embraces.

I was of Opinion it conſiſted altogether in the Urethra being cloſely ſhut up by the Vigour of the Erection, which form'd ſo great a Reſiſtance, that the Powers which throw the ſeminal Juices out of the *Veſiculæ Seminales* could not overcome it; whereas, in Dreams, the Preſſure of the Urethra being much leſs, an Evacuation was made.

The Method of Cure was not leſs ſucceſsful than obvious, from the foregoing Account; for gentle Evacuations, and a ſlender Diet, brought about, and fully completed, their Deſires.

IMPRÆGNATIO. Impregnation.

Upon the Ceſſation of the menſtrual Flux, which happens ſometimes, but rarely, at the Age of thirty-five or forty, generally at forty-five or fifty, the Belly ſwells conſiderably, and, after ſome Months, great Floodings come on, accompanied with ſlight Pains about the Regions of the Loins, and the lower Part of the Belly; and from theſe Circumſtances the Woman is deceiv'd with a Belief, that ſhe is really with Child.

In this Caſe the Belly, though large, is equally ſoft all over, without any more Hardneſs or Reſiſtance in the lower, than the upper Part. But the ſureſt way of diſtinguiſhing this Caſe from Impregnation is, by the Touch; for, if the Woman is not with Child, the *Os Internum* will be found open, and in its uſual State.

When a Woman is really with Child, her Belly grows leſs, or at leaſt not bigger, till the End of the ſecond Month; whereas in any falſe Conception it enlarges from the very firſt Day.

A Woman perceives the Child to move at different Periods, the ſooneſt at the End of forty Days, the lateſt at the End of four Months and an half, or five Months.

It ſometimes happens, that a Woman becomes pregnant without ever having had the menſtrual Flux; others, again, have been with Child, notwithſtanding which, the *Menſes* have not ceas'd till the fifth, ſixth, and even ſeventh Month; others again, though really with Child, have grown big from the very Beginning; and thoſe whoſe *Menſes* have not ceas'd for many Months, but have continued, have, at laſt, proved with Child, though they have ſcarce ever perceiv'd its Motion. Some, alſo, have perceiv'd a Movement not unlike that of a Child, without being really pregnant.

La Motte ſeems to think, that a very large Child, and a very ſmall Quantity of Waters, may be the Reaſon why a pregnant Woman, ſometimes, ſcarcely at all perceives the Motion of the Child.

It is not an eaſy Matter to be certain when a Woman is with Child, before the End of the fourth Month, all the Marks of Pregnancy, till that time, being equivocal, and capable of deceiving; but the ſenſible Motion of the Child makes the thing ſure, which it is eaſy to diſtinguiſh from certain convulſive Motions of the Uterus, and adjacent Parts, which Women ſometimes feel, and thence deceive themſelves into an Opinion of being with Child.

But the moſt infallible way of aſcertaining the thing is, by the Touch; the Method of which is thus: The Woman is to be ſet in a couring Poſture, that is, as if ſhe was going to ſit down, with the ſuperior Parts of her Body bent forwards; then one, or rather two, Fingers are to be introduced into the Vagina, and, in Pregnancy, the *Os Internum* will be found entirely clos'd; the Neck of the *Uterus*, or that Part which protuberates into the Vagina, will be felt but very little, or not at all, according as Pregnancy is more or leſs advanc'd; for, as the Woman approaches nearer the Term of Delivery, the more the Neck of the Womb is dilated, ſo as to diſappear entirely in the laſt Month of Geſtation. At the ſame time the Body of the Uterus will be felt full, and diſtended.

The Motion of a Child in the Uterus, join'd to theſe Circumſtances, renders the Signs of Pregnancy certain.

La Motte, before he makes this Eſſay by the Touch, lays the Woman upon her Back with her Knees elevated, and the Heals near the *Clunes*; and if he finds the Belly more hard and diſtended in the Hypogaſtrium, than in the *Epigaſtrium*, he judges the Woman to be pregnant.

It is not ſo eaſy to diſtinguiſh Pregnancy by the Touch before the End of the fourth Month, as afterwards; and then a Perſon of Experience may foretel the Time of Delivery by the State of the *Os Uteri*.

Some Women are ſenſible of being with Child, from the very Moment of Conception. In this Caſe they perceive a greater Degree of Pleaſure than uſual during the Enjoyment; which is followed by a ſomewhat painful Senſation about the Navel, and a Shivering all over. Mean time the external Parts of the *Pudenda* are more dry than uſual, becauſe the Male ſeminal Fluid remains in the *Uterus*.

The Man, alſo, upon theſe Occaſions, has his particular Senſations, feeling a kind of Suction at the End of the Glans, at the time of Emiſſion, which is attended with ſome Degree of Pain, notwithſtanding the uſual Ecſtaſy. *La Motte. Traité des Accouchemens.*

IMUS VENTER ſometimes, in general, ſignifies the *Abdomen*; and ſometimes the lower Part of the *Abdomen*, or the HYPOGASTRIUM.

INAIA *Guacuiba*. A Name for the *Palma*; *Indica*; *coccigera*; *anguloſa*.

INANITIO. See CENOSIS.

INAPPETENTIA. See ANOREXIA.

INAURATIO. Gilding. This is of Uſe in Medicine, only in beautifying Pills, or Boles.

INCARCERATA HERNIA. See BUBONOCELE.

INCARNANTIA. Medicines which aſſiſt Nature in filling up Wounds, or Ulcers, with Fleſh; or, rather, remove the Obſtructions to it. Internal Incarnants are Aliments which ſupply a balſamic Chyle, and, conſequently, generate Fleſh, and produce a full Habit.

INCENDIUM imports a burning Fever; or, ſometimes, any febrile Heat.

INCENSIO. The ſame as INCENDIUM; or it ſignifies a hot inflammatory Tumor.

INCERATIO. Inceration is the Reduction of any dry Subſtance to the Conſiſtence of ſoft Wax, by the gradual Admixture of any Fluid therewith.

INCERNICULUM. A Sieve, Sierce, or Strainer. In Anatomy, the Pelvis of the Kidney is called *Incerniculum*.

INCIDENTIA. Inciding Medicines. See ALTERANTIA.

INCINERATIO. Incineration is, properly, the Reduction of any Body to Aſhes, by the Application of Fire. This Term is principally uſed, with reſpect to Vegetables, when reduced to Aſhes, in order to make fixed alcaline Salts, which are called Salts by Incineration.

INCISIO. An Inciſion or Cut, or the making an Inciſion.

Inciſion is generally uſed relative to Chirurgical Operations; for, in Surgery, there are various Sorts of Inciſions; which are taken notice of, under the Articles to which they belong.

INCISORES. An Appellation for the four anterior Teeth: See DENS.

INCISORIUM, τομεῖον. A Table whereon a Patient is laid, in order to have an Inciſion made in any Part.

INCLINATIO. Inclination, in Pharmacy, is the changing the perpendicular Situation of a Veſſel, to one which is oblique, that the limpid Liquor, contain'd therein, may flow out of the Mouth, and the ſubſiding Fæces remain behind. With reſpect to the Humours, their Inclination is their Tendency to any particular Part.

INCOCTUS has two oppoſite Significations; for it either imports *not boiled*, or elſe *well boiled*: This Ambiguity ariſes from the Force of the Particle *in*, which has, as the Grammarians expreſs it, both a privative and intenſive Signification.

INCONTINENTIA. Incontinence. Beſides the moral Senſe, it ſignifies, in Medicine, an Inability in any of the Organs, to retain what ſhould not be diſcharged, without the Concurrence of the Will. See ACRASIA.

But Incontinence is moſt frequently uſed, with reſpect to an involuntary Diſcharge of Urine.

The Bladder is ſometimes ſo debilitated in Men, that their Urine flows from them involuntarily: This may proceed from a Stone in the Bladder, or a Palſy of the Sphincter. In the firſt Caſe, the only Remedy is Lithotomy, or an Extraction of the Stone: Nor is Lithotomy infallible; for that Operation frequently cauſes the Diſorder. But, if it proceeds from a Weakneſs of the Neck of the Bladder, ſtrengthening and nervous Medicines are moſt likely to remove it.

But, as this Diſorder often baffles the utmoſt Power of Medicines, the Surgeons have contrived Inſtruments to retain the Urine. Some recommend a Leathern Bag, lined with Pitch, to be worn in the Breeches, between the Thighs, large enough to contain half a Pint: Others prefer a Braſs or Steel Pot, faſten'd to the Penis, (ſee *Tab.* XLVII. *Fig.* 7.), which are to be emptied, when near full. But, as theſe are very inconvenient, ſome of our Moderns have invented more light and eaſy Inſtruments, whereby the Penis and Urethra are gently compreſſed, ſo as to retain the Urine in the Bladder, and diſcharge it at Pleaſure, during either the Day or Night, by opening or ſhutting this light Inſtrument, (ſee *Tab.* XLVII. *Fig.* 8.) which is lined with Leather, and taken from *Nuck*. Another, ſtill more convenient, is repreſented at *Fig.* 9. which may be tightened or relaxed, according to the different Size of the Penis: This, ſays *Heiſter*, I have often uſed with Succeſs; nor was it ever before delineated by any one.

An Inſtrument was formerly recommended by *Nuck*, and lately by *Winſlow*, for this Diſorder; not unlike that uſed for Ruptures (and repreſented *Tab.* XLVII. *Fig.* 10.): It is to be faſten'd round the Body, in the manner directed for compreſſing Fiſtulas in the Perinæum, ſo that the Bolſter F may be fixt tight upon the Perinæum. Thus, by turning the Screw D, the Urethra may be compreſſed or relaxed, and the Urine diſcharged or retained, at Pleaſure. But, tho' I would not abſolutely reject this Method, Experience convinces me, that the other, abovemention'd, is much more eaſy and commodious.

An Incontinence of Urine, in Women, frequently proceeds from a difficult Labour, or from a Weakneſs of the Sphincter, by the violent Extraction of a large Stone; tho' it ſometimes happens from a natural Weakneſs, or Palſy, as in Men. But, whatever the Cauſe may be, when it is inveterate, or proceeds from the Palſy, it will neither ſubmit to internal Medicines, nor external Machines.

If, however, it ariſes from the Extraction of a Stone, eſpecially in Girls, or young Women, it often goes off ſpontaneouſly, or by the external and internal Uſe of Aſtringents: If theſe fail, it is, generally, looked upon as incurable. *Hiſcherus*, however, affirms, in a Diſſertation upon this Subject, that the beſt Method is, to introduce a Peſſary, or Ring, of a proper Size, into the Vagina, as for a Prolapſus Uteri (ſee *Tab.* LV. *Fig.* 6. 7. 8.): For the Introduction of this into the Vagina, under the Urethra, compreſſes the latter ſo firmly, that the Urine may be retained or diſcharged at Pleaſure.

INCORPORATIO. Incorporation is much the ſame as Impaſtation, being a Reduction of dry Subſtances to the Conſiſtence of a Paſte, by the Admixture of ſome Fluid: Thus Pills, Boles, Troches, and Plaiſters, are made by Incorporation. Another ſort of Incorporation is, when things of different Conſiſtences are, by Digeſtion, reduced to one common Conſiſtence.

INCRASSANTIA. Incraſſating Medicines, that is, ſuch as reduce the too fluid Blood, and Juices, to a proper Conſiſtence, and a due Condenſation. See ALTERANTIA.

INCRUSTATIO, in Surgery, is the Induction of a Cruſt, or Eſchar, upon any Part.

INCUBA is interpreted, by *Rulandus*, *Sponſa ſolis*.

INCUBUS. This Word is not found in *Hippocrates*; but *Cœlius Aurelianus*, who calls it *Incubo*, has a Chapter upon it.

The Incubo, ſays that Author, takes its Name, according to ſome, from the Form or Similitude of a Man; others derive it [*quaſi ab Incumbendo*, from lying or preſſing upon] from the Imagination of the Patients, who fancy they feel ſomething aſcending and ſitting upon their Breaſt. *Themiſon*, in the ſecond Book of his Epiſtles, calls this Diſeaſe πνιγαλίων, [from πνίγω, to ſuffocate] becauſe it ſuffocates the Patients. Some of the Antients gave it the Name of ἐφιάλτης, *Ephialtes*, [from ἐφάλλομαι, to leap upon]; others called it ἐπιβολή, *Epibole*, [from ἐπιβάλλω, to preſs upon] an Oppreſſion; becauſe the Patients imagine, that ſomebody leaps upon them, and oppreſſes them: The Diſorder is incident to Perſons after a Debauch, and to thoſe who are continually moleſted with Crudities. A ſingle Fit of the Incubus, not ſucceeded by any Complaint from the Patient, nor any viſible Dyſareſteſis, or Moroſeneſs, but only diſcovering itſelf by a diſturbed Sleep, can by no means be called a Diſeaſe, no more than a ſingle Emiſſion of the Semen in Sleep, which the *Greeks* call ὀνειρογόνον, *Oneirogonos*, can be called a Diſeaſe, unleſs it returns frequently, and is attended with Inconvenience to the Body. The Incubo lays a Foundation for the Epilepſy; for that it is neither a God, nor Demigod, nor *Cupid*, has been very fully demonſtrated, by *Soranus*, in his αἰτιολογούμενα, *Aitiologoumena*, or Books of Cauſes.

The Patient, under this Diſorder, cannot ſtir himſelf, but with the utmoſt Difficulty; is ſeized with a Numbneſs, and a Senſe of Weight, with a Dread of Suffocation, and an Oppreſſion, as from ſomebody falling ſuddenly upon him, with an Intent to deprive him of Life and Senſe, not ſuffering him to cry out: Hence it is uſual with ſuch Perſons to ſtart up, and cry out, in a confuſed inarticulate Voice. Some are affected to that Degree, as to imagine, that they ſee or hear the Voice of the Phantom preſſing upon them, and alluring them to forbidden Pleaſures; but, when they endeavour to lay hold of it by the Fingers, it ſeems to ſlip from them. When they ariſe from Sleep, they feel their Face, Eyes, and other Emunctories, bedew'd with Moiſture, and a Stiffneſs of the Neck, with a gentle tickling Cough. The Diſeaſe, when grown inveterate, is attended with Paleneſs, and Extenuation of the Body, naturally conſequent from want of Sleep, occaſion'd through Fear.

This appears to be a Diſeaſe of Stricture, from the Senſe of Weight attending it; and of the chronical Kind, from the Length of Time; and it is not always without Danger, for ſome have died under the Violence of the Suffocation. *Silimachus*, a Follower of *Hippocrates*, writes, that the Incubo was once contagious at *Rome*; and that Multitudes died under it, as by a Peſtilence. *Cœlius Aurelianus*, *Morb. Chronic. Lib.* 1. *Cap.* 3.

The Incubus is of a bad Kind, when it ſeizes the Patient, tho' awake, in the Night; but, worſt of all, when, after moleſting him in his Sleep, it leaves him to awake under a cold Sweat, and Palpitation of the Heart. This Diſorder ſeldom or never happens to Perſons lying on their Side: They, who have been long and often ſubject to it, have Reaſon to apprehend ſome dangerous Diſtempers of the Head, as a Vertigo, Apoplexy, Epilepſy, Convulſions, or ſudden Death: It is certain, that many, under this Diſorder, have been found dead in their Beds. *Lommii, Med. Obſ.*

The Ephialtes demands our Care in the Beginning; for, when it is grown inveterate, and moleſts the Patient every Night, it is a Prognoſtic of ſome great Diſeaſe, as an Apoplexy, Madneſs, or Epilepſy, when the Cauſe of the Diſeaſe is tranſlated to the Head; for they, who labour under an Incubus, ſuffer after the ſame manner, in their Sleep, by Night, as epileptic Patients in the Day-time.

The Cure conſiſts in Evacuations by Phlebotomy, and Cathartics. A very proper Purge, on this Occaſion, is prepared of a Dram of black Hellebore, half a Dram of Scammony, mixed with ſome ſweet-ſcented Simples, as Aniſe, *Daucus*, and *Petroſelinum*. *Hiera*, prepared of the *Cucurbita Sylveſtris*, relieves the Patient, alſo, to a great Degree: This is *Rufus*'s Preſcription. The Patient muſt be kept to a thin Diet, and avoid all flatulent Food. The Seed of Peony is, alſo, of Uſe in this Caſe, fifteen of the black Seeds being taken every Day, bruiſed in Water. *P. Ægineta, Lib.* 3. *Cap.* 15.

INCURSUS, in *Bellini*, imports the Pulſation of the Arteries.

INCUS. The Name of a ſmall Bone in the internal Ear. See AURIS.

INDARION. The Appellation of a Collyrium, deſcribed by *Aetius*, *Tetrab. Serm.* 4. *Cap.* 113.

INDEX. The fore Finger. The Days on which future Criſes may be preſaged, are, alſo, called *Dies Indices*. See EPIDELOS, and CRISIS.

INDICANTES DIES. See DIES INDICES.

INDICANTIA are thoſe Circumſtances obſerved in a Patient, relative to his paſt, preſent, and future State, which indicate or direct what is to be done for his Relief.

INDICATA. The things indicated to be done by the Circumſtances of a Patient, in order to preſerve Life or Health, or remove Diſeaſes. See FIBRA.

INDICATIO. Indication. This is explain'd under the Article FIBRA. The prophylactic, or preſervatory, Indication relates to the Preſervation of Health, by averting Diſeaſes; the curatory Indication, to the Removal of Diſeaſes; and the vital Indication, to the immediate Preſervation of Life. But there is another Indication, called Urgent, Mitigatory, or Palliative, which relates to the Mitigation of the Symptoms, when too violent to be neglected till the Termination of the Diſeaſe.

INDICATOR. The Name of a Muſcle; the ſame as EXTENSOR INDICIS.

INDICIUM. A Sign, in Diſeaſes, of ſomething future.

INDICO. See INDIGO.

INDICON, Ἰνδικὸν, as *Hippocrates* tells us, *Lib.* 2. *de Morb. Mul.* is what the *Perſians* call Pepper, whoſe round Fruit is call'd *Myrtidanos*. Here *Galen*, in his *Exegeſis*, ſays, that the Compilers of Catalogues of Simples took the Indicon to be Ginger (ζεγγίβεως), from a miſtaken Notion, that Ginger was the Root of Pepper; when it is certain, that Ginger and Pepper belong to different Plants, as appears from *Dioſcorides*, *Lib.* 2. *Cap.* 189, 190. But *Dioſcorides* the younger, who wrote a Gloſſary, ſays, that the Indicon was a Plant, growing in *India*, much reſembling Pepper, and bearing a Fruit called Myrtidanus, from its reſembling a Myrtle-berry: Thus far *Galen*. *Indicum Medicamentum*, and *Indici Potus*, are mention'd by *Hippocrates*, *Lib.* 2. *de Morb. Mulier.* and the former is recommended for a fetid Breath. See INDIGO.

INDIGENA. A Name for the *Eruca*; *Tanacetifolia*.

INDIGESTIO. Indigeſtion.

INDIGNATORIUS MUSCULUS. A Name for the ABDUCTOR *Oculi*.

INDIGO.

Indicum. Offic. *Indigo vera Coluteæ folii utriuſque Indiæ*. Act. Philoſ. Lond. N°. 276. p. 703. & N°. 276. p. 1016. *Nil, ſive Anil, Glaſtum Indicum*. Park. Theat. 600. *Nil, ſive Anil, ſive Indigo Indica*. Hiſt. Oxon. 2. 202. *Anil, ſive Nil, Indorum color*. J. B. 2. 945. *Emerus Americanus ſiliqua incurva*. Tourn. Inſt. 666. *Coronilla Indica, ex qua Indigo*. Volch. 124. *Caachira prima*. Piſ. (ed. 1658.) 198. *Herva de Anil Luſitanis*. Marcgr. 57. *Xivbquilith pitzahac, ſive Anil tenuifolia*. Hern. 108. *Colutea Indica herbacea, ex qua Indigo*. Herm. Cat. Hort. Lugd. Bat. 168. Hort. Monſp. 61. *Colutea Indica humilis, ex qua Indico folio viridi*. Par. Bat. Prod. 325. *Coluteæ foliis Anil*. Chab. 82. *Coluteæ affinis fruticoſa, floribus ſpicatis, purpuraſcentibus, ſiliquis incurvis, e cujus Tinctura Indigo conficitur*. Cat. Jamaic. 141. Hiſt. 2. 34. Tab. 179. f. 2. *Sesban Aniliferum Indicum Coronellæ foliis, vel Indigo Indica*. Breyn. Prodr. 2. 91. *Ameri*. Hort. Mal. 1. 101. f. 54. *Polygala Indica frutreſcens Hermanni*. Raii Hiſt. 1. 926. *Phaſeolus Americanus vel Braſilianus ſextus*. C. B. P. 242. *Iſatis Indica foliis Roriſmarini, Glaſto*

Glaſto affinis. Ejuſd. 113. *Hin awaru, Polygala Indica, ex qua Indigo minor*. Herm. Muſ. Zeyl. 43. BLUE INDIGO. See ANIL.

This Juice is brought both from the *Eaſt* and *Weſt Indies*, made up in different Forms. The moſt eſteem'd is that of *Guatimala*; which is the Fæcula of a Plant term'd *Emerus Americanus, ſiliqua incurva*. I. R. H. Some Phyſicians have recommended Indigo in the Quantity of a Dram; but others look upon it as a Poiſon: And in *Saxony* the internal Uſe of it is prohibited. *Geoffroy*.

INDUCTIO. Induction, in Pharmacy, implies ſpreading a Plaiſter, or the Application of any thing to any Part of the Body.

INDUS. *Indian*. An Epithet for ſome medicinal Compoſitions. Thus, certain purging Pills, deſcribed in the *Auguſtan* Diſpenſatory from *Meſue*, are call'd *Pilulæ Indæ Haly*. And *Galen, Lib. 4. Cap. 13. de Comp. Med. P. G.* mentions the *Emplaſtrum Indum Tharſei Chirurgi*.

INDUSIUM. A Shirt, or Shift. It has been a controverted Point among ſome Phyſicians, Whether it is proper to change the Linen in Diſtempers, or not? I think the Whole may be reduced to this: If a Perſon does not ſweat, there ſeems to be but very little Danger of taking cold; and then clean and freſh Linen is not only agreeable, but of Uſe, as it contributes to promote Perſpiration. If the Patient ſweats, provided theſe Sweats are ſymptomatical, it does no Injury to check them; if critical, it may not be ſo prudent to change the Linen, whilſt they flow plentifully; but, if they remit, there is more Danger of taking Cold from the wet Linen, than from changing it, provided it is previouſly well air'd. In all Caſes the perſpirable Matter, or that of Sweat, impregnates the Linen, and becomes in ſome Degree acrimonious, which muſt have a very bad Influence, in acute Diſtempers particularly. And that the Acrimony contain'd in Linen may have a very bad Effect on the Body, *Diemerbroek* confirms by a memorable Inſtance of a Perſon, or, as I remember, of ſeveral Perſons, upon Recovery from the Plague, who relaps'd immediately, and died, upon putting on Linen waſh'd with Soap.

As many People contract a Habit of wearing Flannel Shirts, or Shifts, in order to ſet them right, I ſhall give the Judgment of *Wainwright* thereon.

By what Fate ſo many of late fall in with an Opinion of the Advantage of wearing Flannel, I cannot tell; but this I am well ſatisfied of, that it does Hurt to two for one that receives Benefit from it, and there is none to whom Flannel is more prejudicial than thoſe to whom it is generally preſcrib'd, being weak, faint, or hectic People. Indeed it muſt be confeſs'd, that there are ſome that receive Benefit by it; but they are very few: And I queſtion not but ſome aſcribe that to Flannel, which is owing to ſome other Cauſe unknown, and which had perform'd the Cure more ſpeedily and perfectly, had the Perſon never uſed it.

A Man of a robuſt Conſtitution, who eats and drinks well, and yet uſes not Exerciſe enough to throw off the Remains and Dregs of a full and nouriſhing Diet, and who is ſubject to Defluxions, Catarrhs, Pains in the Joints, and ſuch Diſtempers as are owing to a Plethora, will receive Benefit by wearing Flannel; though too long a Uſe of it may ſo relax the Tone of the Fibres of the Skin, as to hinder that Perſpiration which before it helped: For, though the Quantity of perſpirable Matter be in proportion to the Wideneſs of the Pores of the Skin, yet they are not the wideſt when the Skin is moſt relaxed; however, it is neceſſary, that the Skin be conſiderably relaxed, that the Pores may be increaſed to their greateſt Diameter.

The moſt certain and conſtant Effect of wearing Flannel is, to make a more free and plentiful Perſpiration; which, though it be attended with great Advantages (according to *Sanctorius*) when moderate, yet, when exceſſive, nothing is more pernicious. The other Effects we obſerve from it, as they are more uncertain, ſo are they but the Conſequences of this: Now, ſince the Increaſing of one Evacuation is the Leſſening of another; therefore, whenever too much is thrown off from the Blood, either by Stool, Urine, or Spittle, it may be proper to wear Flannel.

Both *Waldſchmied* and *Baglivi* obſerve, that Diarrhœas from immoderate Grief are incurable; and that principally from a Suppreſſion of Perſpiration. Grief contracts the Skin, as all troubleſome Paſſions of the Mind do; ſo that the perſpirable Matter, being retained, will be thrown upon ſome other Glands; and, if on thoſe of the Inteſtines, will continue a Diarrhœa. It is, alſo, obſerved, that the Uſe of Venery makes the Body coſtive; and this it does only by promoting Perſpiration by an univerſal Relaxation of all the Fibres, which is always proportionable to the Intenſeneſs of the Pleaſure: And for the ſame Reaſon it is, that weak Perſons are ſubject to a Looſeneſs in Winter, (when the cold Air ſhuts up the Pores of the Skin) which they are free from in Summer. In a Dyſentery, the laſt-mentioned Authors, above all things, order the Body to be kept warm, and eſpecially the Feet, to promote Perſpiration; and the latter obſerves a Conſent between the Skin and the Inteſtines, as *Hippocrates* did before him.

Sanctorius, in his *46 Aph. Sect. 1.* tells us, that the perſpirable Matter retained, neither being reſolved by Nature, nor a Fever ſupervening, diſpoſe the Body preſently to a malignant Fever. And Dr. *Cockburn*, in his Treatiſe of the *Diſtempers of Seafaring Men*, gives Inſtances enough of Fevers from a ſuppreſſed Perſpiration. In ſuch Caſes as this, where, by the preceding Symptoms, (as a Dejection of Appetite, ſpontaneous Laſſitude, ſudden Loſs of Strength, a Stupidneſs with Inclination to ſleep, the Want of uſual Stools, and the like) a Fever is threatened, nothing will contribute more to prevent it, than reſtoring Perſpiration to its wonted Freedom; and Flannel may very well act its Part in this Scene. But theſe Caſes I have taken notice of, are ſuch as Flannel is ſeldom or never order'd in, though in theſe only we may expect Advantage from its Uſe.

That it may appear how prejudicial Flannel is to thoſe who perſpire too much, as moſt weak People do, and to whom the wearing of Flannel is generally preſcrib'd, I ſhall obſerve from *Sanctorius*, that inſenſible Perſpiration is double to all the ſenſible Evacuations made by Urine and Stool put together; and that it is to that made by Stool as Forty to Four, ſo that it is ten times greater than that by Stool: Therefore a Man will be made no weaker by having ten times as many Stools as he uſed to have, than he will be by perſpiring only double the Quantity he does at other times. Further, if we conſider, that the greateſt Part of our Stools are the Remains of our Food, that could not enter the Lacteals, we ſhall find the Difference much greater; for we cannot imagine, that above one tenth of what we void by Stool, is evacuated from the Maſs of Blood by the Liver, and inteſtinal Glands; ſo that upon this Account there is as much derived from the Maſs of Blood in one Day by Perſpiration, as by Stool in an hundred; therefore, if Perſpiration by any means be doubled, in twenty-four Hours it will make a Man as faint, as if he had an hundred times more Stools in the ſame time than uſual. And there are none but who expect a Weakneſs from an unuſual Purging; and we daily experience the ſudden Danger of a Diabetes, wherein the Quantity of Urine is increaſed; but take little notice of an increaſed Perſpiration, becauſe inſenſible; for which Reaſon we are ſubject to aſcribe the Miſchief it occaſions to ſome other Cauſe.

A conſumptive Gentlewoman, in *Sheffield*, by the Advice of a Phyſician, putting on a Flannel Shift, though ſhe was able very well to walk about the Houſe, in two Days time ſhe was confin'd to her Bed, (from whence ſhe never roſe) without any other evident Cauſe than wearing Flannel.

If what I have ſaid be of Force enough to perſuade any to leave off wearing it, I would adviſe them to do it in a warm Seaſon; and, at the ſame time, either to make uſe of the cold Bath, or the Fleſh-bruſh, which will prevent the Inconveniences that would otherwiſe attend it.

I was perſuaded, ſays *Wainwright*, to wear Flannel next my Skin, above ten Years ago, for a ſevere Cough that I had got; by which, I think, I received ſome Advantage. But, after I had worn it a Year or two, I found it very troubleſome, and prejudicial to my Health; it made me ſo exceedingly tender, that I was not able to bear the leaſt Cold; and I found, by the Experiment of leaving it off, how much it diſpos'd me to Faintneſs, which I mightily ſuſpected before; and, therefore, I attempted ſeveral times, in vain, to get quit of it, but could not, without ſome Inconvenience greater than I was willing to bear; till about two Years ſince, in an hot Seaſon, going into a cold Bath, I left it off without any Damage. *Wainwright of the Non-naturals*.

INDUSIUM, alſo, ſignifies the AMNIOS.

INESIS, *ἴνησις*, from *ἰνέω*, to empty. Evacuation.

INFANS. An Infant, or Child.

Mankind is every way ſurrounded with ſo many and ſo great Miſeries, that inexpreſſible Care, Solicitude, and Diligence, are neceſſary, in order to avert the Violence of ſo many Diſeaſes, to which we are ſubjected. New-born Infants are flagrant Inſtances of this our Frailty; ſince, as ſoon as they have well ſaluted this Scene of Woe with their Cries, they are beſet with numberleſs Dangers, and require our perpetual Care for their Preſervation. And at the ſame time that theſe frequent Dangers threaten them, their tender and almoſt defenceleſs Age is not furniſhed with Abilities to diſcover Remedies proper for the Cure of Diſeaſes; or to expreſs the Condition and Violence of them, unleſs they move the Compaſſion of others by Complaints, and other obſcure Signals. How ſtrictly, therefore, is it incumbent on the Phyſician, who ſtudies the Preſervation of Mankind, accurately and diligently to undertake the Cauſe of this feeble Age, and inquire what Diſtempers it is moſt liable to, by what Symptoms they are to be diſcovered and foretold, by what Cautions they are to be prevented, and, laſtly, by what Art and Medicines to be ſubdued? For theſe Reaſons, ſays *Frederic Hoffman*, am I now induced, after all my former Labours, finiſhed with ſome little Succeſs, to ſay ſomething of the Diſeaſes of Infants; eſpecially as I find, that others, who have labour'd in the ſame kind of Studies, have

have left many Things untouched, and not well digeſted; or, at leaſt, capable of Improvement. Nor do I flatter myſelf with leſs Hopes of Succeſs in this, than my former Undertakings; as I ſhall not propoſe Things vain, imaginary, and founded on falſe Opinions, but true, and conformable both to Reaſon and Experience; which I have learnt from the Practice of half an Age and more.

But we will firſt ſhew the principal Diſeaſes of Infants, before we enter upon an Inquiry into the Cauſes of them; and, in this Purſuit, chooſe *Hippocrates*, the great Father of our Art, for a Guide, who, *Lib.* 3. *Aphor.* 24. 25. and 26. thus deſcribes the Diſtempers of that Age, with his uſual Elegance and Conciſeneſs: The Diſeaſes, which the different Stages of Infancy are ſubject to, are generally theſe: To little Children, and thoſe newly born, the Thruſh, Pukings, Coughs, Watchings, Startings, Inflammations of the Navel, Runnings of the Ears, (to which we add Gripes) are familiar. When they begin to breed Teeth, troubleſome Itchings of the Gums, Fevers, Convulſions, Diarrhœas happen, eſpecially when they put forth the canine Teeth; and in thoſe particularly, who, amongſt Children, are very groſs, and inclinable to be coſtive. But, when they are advanced in Years, (which may very properly be ſuppoſed to mean from four to ten, and longer) they labour under Inflammations of the Tonſils, inward Luxations of the Vertebra next the Head, Aſthmas, Stone, round Belly-worms, Aſcarides, penſile Warts, Satyriaſes, Stranguries, ſcrophulous Tumors, and other Tubercles, but principally the above-mentioned afflict them. Whoever conſiders theſe Things thoroughly, will perceive, that ſome Diſtempers are incident to every Age of Infants, which affect the Body differently, are of a longer or ſhorter Continuance, and threaten more or leſs Danger. For the Texture of the Body being changed by Age, and the manner of Living alter'd, the Diſpoſition of the Subjects to receive Diſorders muſt neceſſarily be varied, and the laſt Cauſe of Diſtempers differ widely from the former. If, therefore, we will treat of the Affections of Infants, we ought to include each Period of their Infancy, and not confine the Term, in a ſtrict Senſe, to thoſe newly born, but extend it even to thoſe of ten Years old; leſt, whilſt we are explaining one kind of Diſeaſe, we omit another.

Thus have I, from *Hippocrates*, enumerated the principal Diſeaſes of Infants; ſome of which are diſcovered very eaſily, others not without Difficulty. My next Endeavour ſhall be to ſpecify their proper Diagnoſtics; which, however, are ſo difficult and obſcure, that even the moſt penetrating are deceived in their Judgment. Nor can Children themſelves, for want of articulate Sounds, reveal to us the Nature of their Diſorder, and its manner of hurting them; nor can we form a certain and unerring Judgment, either from the Urine, though examined with the greateſt Care; or from the Beating of the Pulſe, however accurately obſerved; or from the external Habit, which, as it eaſily changes for the worſe, ſo does it ſuddenly for the better. For the Urine of Infants, whether in Health or Sickneſs, is often thick and turbid; and the Pulſe may be altered from almoſt innumerable Cauſes, and either accelerated, or retarded, ſo as to impoſe upon the moſt skilful. But that the Phyſician may not be left uncertain, he ſhould thoroughly examine the Women, who have the Care of the Children, whether they cry, toſs about with Reſtleſsneſs, paſs both Day and Night without Sleep; whether their Eructations are acid or nidorous; whether they have Inclinations to vomit, and Vomitings, and of what ſort; whether they are diſturb'd with Hiccups and Agitations of the Nerves; whether they are afflicted with a Cough and Difficulty of Breathing; whether they diſcharge their Wind and Excrements freely; what Colour the Excrements are of, and of what Conſiſtence, and the like. Further, he may receive great Light, by a narrow Examination of the Body from Head to Foot, whether there appears externally an inflammatory Redneſs of any Part, or any Species of Eruptions, or any other Diſorder: He ſhould, likewiſe, inquire diligently, whether their Breath is hot; whether their Fauces are affected with Puſtules, or their Gums with a Tumor and Inflammation: For from theſe, as from known Principles, he may ſecurely draw Concluſions, with reſpect to what he wants to diſcover.

In explaining the Cauſes of the Diſeaſes of Infants, we ſhall not deviate from the Truth, if we aſcribe the formal and material Cauſe thereof, firſt, to a lax and ſoft Habit of Body, a redundant Plenty of pituitous Juices, and the exquiſitely delicate Senſation of the Fibres and Membranes: For, ſince, in this firſt Age, the ſolid Parts, by reaſon of their exceſſive Softneſs and Tenderneſs, cannot propel the Fluids with ſufficient Celerity, and drive them on through the minute Canals, the Circulation of the Blood and Humours may be eaſily retarded, and the moſt ſalutary Buſineſs of Excretion ſuppreſſed: If this happens, the Juices do not only increaſe more and more in Quantity, but become inſpiſſated, and acquire a ſalino-acrid Temperature. From ſuch a Plenitude of Humours proceed not only Stagnations, and various Corruptions of the retarded Fluids, but, from the Preſſure and Diſtention of the ſubjacent Nerves, violent Spaſms are excited; by the Vehemence of which, all, both the ſolid and fluid Parts, with the whole Oeconomy of the Functions, are diſturbed; and the tender Bodies of the Infants, which are very much diſpoſed to receive even the ſlighteſt Impreſſions, are readily thrown into ſudden and violent Diſorders. From the Phenomena already related, it will be no difficult Matter to give the true Reaſons of the principal Diſeaſes in Infants. For, upon a Suppoſition of the Redundance and Stagnation of the pituitous Humours, it may be eaſily conceived, why this tender Age is ſubject to frequent catarrhous Defluxions, Rheumatiſms, Oppreſſions of the Breaſt, liquid Stools, and Diarrhœas, Tumors of the Glands, humid Sordes of the Ears, and the like Affections. Upon a Suppoſition of the Depravity and Acrimony of the Juices, it is very evident, why Children are often afflicted with the Thruſh, and other Eruptions of the Skin: And, laſtly, upon a Suppoſition of the exquiſite Senſation of the nervous Syſtem, it clearly appears, why they are tormented with Contorſions and Spaſms, as well of the internal as external Parts, upon the ſlighteſt irritating Cauſe. For thus, on account of the ſenſible Texture of the inteſtinal ſmall Fibres, they may fall into painful Gripes, very troubleſome Diſtentions of the Stomach and Inteſtines, and dangerous Anxieties; and becauſe the Membranes inveſting the Brain and ſpinal Marrow are eaſily irritated, they very frequently fall into epileptic Spaſms, and convulſive Twitchings of the Extremities: Moreover, becauſe the Lungs are furniſhed with very fine Ramifications of Nerves, theſe are frequently affected, and the Children very often labour under a convulſive Cough, and Aſthma, ſo as to endanger Suffocation; and, laſtly, becauſe of the exquiſite Senſation of the Membranes, which are ſpread internally in the Mouth, they are affected with violent Symptoms, from a Difficulty in Dentition.

Secondly, A predominant Acid has no inconſiderable Share in conſtituting the material Cauſes of the Diſeaſes of Infants; and to this *Harris*, an excellent Author on the Subject of infantile Diſeaſes, attributes ſo much, that he does not heſitate to deduce every Affection, familiar to that tender Age, from thence. For in many, both from the acid Smell of their Eructations, Vomits, and Excrements, it may be conjectured, or even ſufficiently diſcerned, that not only the Milk, on which Infants ſubſiſt, eaſily becomes acid, and undergoes a Coagulation, but, alſo, that their Juices, which are thin and lymphatic, ſcarcely incline more to any Diſpoſition, than the acid. For, as Men of a more advanced Age, endued with a phlegmatic Temperature, and turgid with a great Plenty of pituitous Juices, are more inclined than others to a noxious Coagulation of the Lymph, and very ſubject to that Species of Eruptions called *Purpura Alba*, which is thence generated; ſo is it the leſs to be doubted, but that, in Infants, an acid Intemperature of the Humours may much ſooner and more eaſily happen.

Let us next inquire into the remote Cauſes: Now, if we conſider the Debility of the Solids, we find that all Infants are in their own Natures altogether weaker than Adults, and of a more exquiſite Senſation: There ought to be, however, ſome particular Cauſes, which may principally contribute to the extraordinary Weakneſs and Mobility of the nervous Syſtem, ſo that in ſome more, in others leſs, perverſe Motions are excited. But nothing, in my Opinion, out of the whole Claſs of Cauſes, conduces more to this, than an hereditary Diſpoſition, deſcended from one of the Parents to the Offspring. For this Reaſon it often happens, that Parents in an ill State of Health, or decayed thro' too frequent an Uſe of Venery, or too cloſe an Application to Study, or worn out with Age, or corrupted with Luxury, propagate Children, who, from the firſt Act of Conception, are infirm, and have connate Defects, which no Art or Skill can cure. If this was not the Caſe, we ſhould not have every-where ſo many gouty and calculous Patients, who, in vain, ſeek Relief for their Miſeries from Phyſicians.

But, if any Diſtemper is transferred to the Child from the Parents, this, I conceive, proceeds principally from the Mother: For it cannot be expreſſed, how inclined many pregnant Women, unleſs reſtrained by Prudence, are, to Appetites altogether depraved; and how much they are agitated by unneceſſary Cares, vain Deſires and Imaginations, Terror, Fear, Sorrow, Paſſion, Pride, Love of Revenge, and other Commotions of the Mind: From whence the Circulation of the Blood muſt neceſſarily be diſturbed in various Manners, and a certain Violence impreſſed, detrimental to the moſt tender, and, at this time, tremulous Stamina of the Fœtus. The ſame Misfortune is to be feared, if the Mothers, given to Intemperance, overcharge their Stomachs with Food, and that often improper; or by ſpirituous Liquors often excite a Plethora, collected during their Pregnancy. To theſe we may add Women who are very ſubject to hyſteric Motions, and, after Conception, often admit the Embraces of their Husbands; for too frequent Enjoyments of this Kind, according to ſome, are thought to conduce very much to the Generation of a ſickly and weak Offspring.

In the very Birth, the tender Progeny is often debilitated, whilſt the Mothers, either through Fear or Indolence, retard, or, thro' Impatience, accelerate, the Excluſion of the Fœtus. The ſame happens from hot Remedies, promoting the Birth, or from the ignorant Performance of Midwives, by a violent Extraction of the Fœtus, and ſome Injury or other thereby done to it; as

the Sutures of the Head, laxly united, are often compreſſed by thoſe careleſs Women. Hence Epilepſies, Palſies, and other dreadful Symptoms, attended with Danger of Death, are excited.

In Children newly born, the tender ſmall Fibres of the Nerves are, alſo, eaſily ſtimulated to anomalous Motions, if, at any time, they are either ſtruck with an unexpected Terror, as by ſudden Clamours, being awakened out of Sleep, or by jocoſe Impertinences of Nurſes made by Words and Geſtures; or if they who ſuckle them, being diſturbed by any Affection of the Mind, eſpecially Terror and Anger, give them the Breaſt too ſoon. Hence nothing is more common, than for Spaſms of various Kinds, Vellications of the Nerves, Corroſions, Heats, griping Pains of the Inteſtines, and Inflammations, to follow immediately, which ſufficiently manifeſt themſelves by Inquietudes, Watchings, Agitations of the Hands and Feet, Startings, Cryings, and even by epileptic Convulſions.

But, beſides theſe, in debilitating and diſturbing the Strength of the Solids, much may be attributed to the exceſſive Intemperature of the Air, eſpecially Cold, or the ſudden Changes of Heat and Cold ſucceeding each other; which, as they are very prejudicial to Perſons more advanced in Years, who are afflicted with a Weakneſs of the Nerves, by ſuppreſſing Tranſpiration, ſo do they much more threaten the moſt dangerous Conſequences to Infants, who themſelves know not how to guard againſt the Injuries of the Air. Nor, laſtly, on the other hand, muſt we exclude a too curious, hot, and delicate Regimen of Infants, and a frequent Uſe of Phyſic without any Neceſſity. For thus Children, unaccuſtomed to the open Air, are not only incapable of bearing the leaſt Breeze, but their very Conſtitution is, in general, greatly alter'd by Medicines, particularly the more active, and diſturbed in regulating the Motions of the animal Oeconomy. And, ſince this is the common Practice of rich and noble Families, it is no Wonder, that their Children are far weaker, and more ſubject to Sickneſs, than thoſe of mean Birth, who are brought up in a manner directly oppoſite.

But all theſe Things have their Effects, not only on ſucking Children, but, alſo, are to be underſtood, in the ſame manner, of thoſe ſomething older: For the Strength of the Solids being impaired, and a Diſpoſition to Diſtempers contracted either in the Mother's Womb, or from a Fault in the Nurſe; it is obvious, that neither leſs nor fewer Diſeaſes may ſucceed, after they are weaned, as, to our Sorrow, numberleſs Examples of diſtemper'd Infants fully demonſtrate.

The Cauſes, which conduce to the Generation of a Redundance of Acid, are again various, ſome of which we have already enumerated. But to theſe ſhould principally be referred every thing, which corrupts the Milk, either in the Nurſe, or the ſucking Infants, and makes it groſs and impure, or entirely condenſates it into a Curd. On the Part of the Nurſes, this may happen ſeveral ways, and principally, if they indulge inordinate Paſſions of the Mind, eat plentifully of Summer Fruits, Cheeſe, Sallads, acid, acrid, and ſalt Food, and drink too freely of ſour Wines, and Brandy, or Spirits of Wine: For by theſe the Milk is render'd viſcid, and groſs; which, when given to Infants, ſoon grows acid, and not only diſpoſes to obſtinate Obſtructions of the Primæ Viæ, and Meſentery, but, alſo, greatly promotes a Generation of the Stone in the Bladder, which is not uncommon to this Age; not to mention, that by too free an Uſe of ſpirituous Liquors, the Milk ſuddenly conceives an Heat, and, being tranſmitted thro' the Breaſts to the ſucking Infants, may excite burning Fevers. Nor is the Quality alone, but the exceeding Quantity of Food, alſo, prejudicial; whilſt Nurſes ſtuff themſelves beyond meaſure with Meats, tho' the beſt, or drink too thick Malt Liquors, and but ſparingly of them, and do not uſe ſufficient Exerciſe, but rather live in a State of the utmoſt Idleneſs; by which means a thicker Conſiſtence cannot but be produced in the Milk, and a Loſs of Health occaſioned. Violent Cold, careleſly admitted to the Breaſt, has the ſame injurious Effect, as, by contracting the Tubes of the Breaſts, which convey the Milk, it greatly diſpoſes it to Inſpiſſation. Beſides, this milky Liquor is altered in an extraordinary manner, and diſpoſed to receive a vitiated Diſpoſition in the Stomach of ſucking Infants, if the Mothers or Nurſes admit the unſeaſonable Embraces of their Husbands, while they give Suck, or if their Menſes, which ordinarily ceaſe in pregnant Women, and thoſe who give Suck, begin to flow: For then the Children generally become languid, full of Tears, and weak, and ſeem by their Geſtures to indicate ſufficiently, that Sucking ſhould be deferred, till theſe ceaſe, and the Mother recovers her former Vigour. Nor, laſtly, is the Milk a little corrupted, when the Nurſe is ſubject to Hyſterics, or afflicted with a Coſtiveneſs; and from Spaſms and Flatulences, collected in the Primæ Viæ, various Accumulations of Blood and Humours are produced in various Parts of the Body.

On the Part of the Infants, many Things, likewiſe, will produce the ſame ill Effects: But they are principally affected, when they take too much Aliment, and when, being out of Temper, they are obliged to ſuck againſt their Inclinations, or are overſtuffed with viſcid Pap: For when Infants, and thoſe eſpecially, who are tender and ſmall, cannot digeſt ſo great a Quantity; this frequently generates acid Fæces, from whence the Tone of the Stomach and Inteſtines is deſtroy'd, and cardialgic Inflations of the Stomach, Straineſs of the Breaſt, and the like, are induced, which greatly interfere with Health. To this Purpoſe, *Ettmuller*, in his Diſſertation, intituled, *Valetudinarium Infantile*, has truly ſaid, "Mothers often deſtroy their Children by feeding them "too much with a ſuperfluous and almoſt coagulated Milk: "For all exceſſive Repletion, as of Bread to Adults, ſo Milk "to new-born Children, is very detrimental." It is, likewiſe, a very great Error, to feed them with Varieties of Meats, and thoſe often incongruous, acid, acrid, or ſalt, and with much unneceſſary Fleſh, or to give often Wine, as the Cuſtom is, in order to ſtrengthen them, and quiet their Cries; for theſe Mixtures, with the Milk, by cauſing a Coagulation, very much weaken the Stomach, and produce many Diſtempers. To this may be added, the frequent Change of Milk and Nurſes: For, as Adults cannot well bear the Alteration of Meat and Drink, ſo, for the ſame Reaſon, is it to be expected much leſs in the tender Bodies of Infants.

All theſe Errors, in the time of Sucking, generally purſue and affect Children, after they are weaned, or, at leaſt, exert themſelves at that very time, eſpecially when, neglecting all Rules of Diet, they ſuddenly paſs from a thin to a more groſs Aliment, to eating of Fleſh, and other improper Aliment.

With reſpect to the Prognoſtic; I muſt firſt remark, that Infants, who have not been generated by tender, delicate Parents, nor thoſe diſtemper'd both in Body and Mind, eſpecially Mothers, are uſually more firm in Body and Mind, more briſk and robuſt, than others; nor do they ſuffer ſo eaſily from external Cauſes; nor are they ſo readily affected with Diſeaſes; and, when they are, the Cure is more ſucceſsful. I apprehend, the ſame Prognoſtic might be made, with reſpect to healthy Children, who are not confin'd exactly and nicely in their Diet and Regimen, but accuſtomed to ſucceſſive ſeaſonable Alterations: For they may be ſo formed, and, as it were, hardened from their Infancy by Cuſtom, as not to be ſo eaſily affected by external Injuries; which is very evident from the Children of Ruſtics, and poor People, who neither ſo ſuddenly contract Diſeaſes, nor are afflicted with ſuch violent and laſting Diſtempers, as the delicate Infants of Perſons of Diſtinction. Farther, it muſt be obſerved, that all Diſeaſes of Infants, though they are innumerable, may be more eaſily cured, than thoſe of Adults, eſpecially if they are properly treated: For, as the very tender Bodies of Infants readily receive a noxious Impreſſion from unſalutary Things; ſo, on the contrary, they very ſoon are ſuſceptible of a better from Medicines and Things agreeable to Nature; ſo that there would be no Neceſſity to lament the Death of ſo many Children, if Phyſicians did not often procure it by Miſconduct. Beſides, it is a conſtant Obſervation, that Infants who are corpulent, and have a ſpongy Fleſh, and eat large Quantities of Milk, or have a Nurſe full of Juices, and corpulent, are more frequently afflicted with Diſorders than others, and are principally ſubject to the Rickets, convulſive Cough, and Thruſh; whilſt, on the contrary, thoſe that are lean, more frequently fall into Fevers and Inflammations. Thoſe that are laxative, generally enjoy a better State of Health, than thoſe who are coſtive. And, laſtly, ſince convulſive Twitchings of the Extremities, and Gripes, deprive moſt Infants of Life, it muſt be obſerved, that it is a very bad Symptom, if theſe are attended with long-protracted Watchings.

The Regimen of young Children.

Whoever would avert the more violent Diſeaſes of Infants, ſhould be particularly cautious in removing, from the firſt Moment of their Birth, all the Cauſes, which are capable of generating Diſtempers, and expoſing their tender Bodies to Danger. I hope, therefore, it will be of ſome Importance, briefly to lay down ſome Rules for the Direction of the Diet, Regimen, and other Non-naturals, as well with regard to the Infant, as the Nurſe; leſt, from an imprudent Uſe of theſe, innocent Children ſhould too early lay a Foundation for future Diſorders, without any Fault of their own; and, in their very Infancy, contract the Principles of a weak Conſtitution. And this ſeems the more neceſſary, in order to prevent Repetitions; for there are ſome general Precautions, which may hereafter be apply'd to ſome Uſe, in the particular Explication of ſeveral Diſeaſes.

As ſoon as the Child is brought into the World, it ought, immediately after the Ligature, and cutting of the umbilical Veſſels, to be waſhed in a warm Bath, prepared of Water alone, or a Mixture of Wine and Water; which is attended with this Advantage, that it promotes an equal Diſtribution of the Blood thro' the whole Body. The Midwife, too, ſhould be allowed a convenient Place and Time, that if there appears, in the Head, or any other Part of the Body, any thing ill-formed by the Birth, ſhe may faſhion it better, and reſtore it to its natural Shape. Let her, therefore, examine every Limb by gentle and frequent ſtroking them; and often contract and expand the Legs and Feet, that whatever Mucus, or Lentor, reſides in the Articulations, may be diſſipated: She ſhould, likewiſe, often ſtroke the Belly with the Hollow of her Hand; and, by gently rubbing the Parts deſtined to Excretion, excite them to a Diſcharge of the Fæces.

But, above all, ſhe muſt obſerve, whether the Child is ſtrong and robuſt, or weak and infirm. This may be diſcovered from its weak Voice and Reſpiration; or, if the Mother is of a tender and morbid Conſtitution, and, in the Courſe of her Pregnancy, was affected with various Diſorders of the Body and Mind, if the Motion of the Fœtus, while in the Womb, was weaker than it ought to be, or if the Birth was difficult, and happen'd before the uſual time, in the ſeventh or eighth Month, we may conclude the Child to be weak: For Infants are, by all theſe things, debilitated, and rendered ſubject to Diſeaſes; whilſt, according to the wiſe Maxim of *Celſus*, Weakneſs paves the Way to all Diſtempers. If the new-born Infant, therefore, is, from theſe Symptoms, concluded to be preternaturally weak, it is proper to refreſh it, which is beſt done, after the received Practice of Midwives, by waſhing it with warm Wine, rubbing it gently, anointing the Breaſt, Back, and Vertex, with ſome analeptic Spirit, or by breathing ſtrongly into its Mouth, after chewing aromatic Cloves, and other Aromatics, or giving it a ſmall Quantity of *Rheniſh* Wine, or Cinnamon-water.

But as the tender Infant muſt be ſecured from the Injuries of the Air by ſoft Linen, and commodious Bandages, great Caution is requiſite, leſt out of Negligence, or Ignorance, ſome Damage be done, and a Foundation laid for future Diſorders: For, beſides that Infants frequently become gibbous from too great a Stricture of the Breaſt by Bandage, and fall into a Conſumption, or often vomit, and are ſubject to Ruptures, many Inconveniencies, on account of obſtructing the Circulation, and exceſſive Crying, proceed from too ſtrict a manner of binding the Body of a tender Child.

Having obſerved theſe things, the next Care is, that Infants, who, for want of a Diſcharge by Stool in the Womb, bring into the World their Inteſtines replete with many Excrements, be ſeaſonably purged: And now, as ſoon as they begin to breathe, and draw the circumambient Air into their Lungs, by that mutual and frequently repeated Action of the Diaphragm and Abdominal Muſcles, the Stomach and Inteſtines are not only compreſſed, and the Fæces, contained in them, diſpoſed to be diſcharg'd, but, alſo, by this ſalutary Act of Reſpiration, the Bile is forced into the Inteſtines, and particularly the *Duodenum*, which, then, from its detergent and ſtimulating Quality, which is very powerful, by gently irritating the ſenſible Membranes of the Inteſtines, excites them to a greater Contraction, and a Diſcharge of the Fæces; ſo that thoſe tenacious Excrements are often ejected by ſpontaneous Vomits and Stools. But if this does not happen, and the weak Nature of the Infants is not ſufficient of itſelf, Providence has kindly furniſhed the Mother, at firſt, with thin, ſerous, ſweetiſh Milk, termed *Coloſtrum*, whoſe deterging and diluting Quality opens the Body much better and ſafer, than the moſt ſelect Evacuants. And, though many Phyſicians adviſe to reject this *Coloſtrum*, as an impure Milk, and very prejudicial to the tender Stomach of Infants, my Experience convinces me, that no Danger is to be dreaded from it, unleſs that milky Liquor flows from an impure Spring, when the Woman, after Delivery, is either infected with any Contagion; or, immediately before the Birth, was afflicted with ſome violent Diſtemper; or, under the Difficulty of the Birth, agitated by convulſive Motions, and is ſtill indiſpoſed; or unleſs any other Circumſtances concur, which forbid the Uſe of ſuch a Medicine elaborated by Nature in the Breaſts of Women.

But if the Nipples of the Mother's Breaſt are ſo ſmall, that the Child cannot conveniently keep them in its Mouth, nor draw any Aliment from them, but by violent Attraction; or if they are ſo thick, that he cannot receive them; or if the Mother, after Delivery, has not a mind to give Suck, or has not Milk in her Breaſts ſoon enough; then it is abſolutely better, for the firſt four-and-twenty Hours, that the Body ſhould be freed by other ſuccedaneous proper Laxatives, from its *Meconium*, than immediately after the Birth to deliver the Infant to a robuſt, fat Nurſe, to be ſuckled. For, ſince the Milk of Women, who have given Suck for a long time, is generally of a groſſer Diſpoſition, and contains a large Quantity of alimentary and pinguious Subſtance, the tender Stomach muſt neceſſarily be overloaded with it; and from thence a more ready Opportunity given for an acid Crudity, and the Coagulation of the Milk. But there are ſeveral Methods of promoting Stools: Thus the Vulgar, in *Germany*, both from Cuſtom, and the Advice of Phyſicians, give Honey, with unſalted Butter, or Barley-ſugar, with Oil of ſweet Almonds, the firſt Days after the Birth. The *French* and *Dutch* preſcribe Wine, ſweetened with Sugar; others give other things for the ſame Purpoſe, with very good Succeſs. But, as theſe do not always anſwer the End, the following more effectual Cathartics may be exhibited in a ſmall Quantity, as ſolutive Syrup of Roſes; of Succory, with Rhubarb; of Peach-flowers; Manna, with ſome Grains of Cream of Tartar, in Broth, and the like. Nor do I diſapprove of their Practice, who with the ſame View of procuring Stools, recommend gentle Suppoſitories, or, when theſe fail, Clyſters. For the *Inteſtinum Rectum*, in Infants, is of ſo exquiſite a Senſation, that, upon the ſlighteſt Vellication, it ſoon parts with the contained Excrements. Whence *Boerhaave*, in *Aphor. de cognoſcendis & curandis Morbis*, 55. 1347. judiciouſly adviſes, to inject a Clyſter of Whey, with Soap or Honey.

There are, however, ſome Phyſicians, who object againſt this early purging off the Meconium; becauſe it is not neceſſary to diſcharge this out of the Body, before it has acquir'd an Acrimony, and Tendency to do Prejudice; but it can never be proved, that theſe Excrements of Infants, which remained for ſo many Months in the Inteſtines without any Detriment, ſhould be immediately diſcharged, as noxious, by a Cathartic. And, indeed, upon an accurate Inquiry, we find, that there is not that acrid and venomous Quality in the Meconium, as is generally thought; for it is contained, for ſeveral Months, in the very tender alimentary Tube; and yet does not produce an Inflammation, or Corroſion, of the Inteſtines, or excite them to diſcharge it, nor ſtimulate the Colon, where it principally reſides; nor does it, on account of any contracted Putrefaction, emit fetid Flatulences and Exhalations; nor is it dried with Heat, but, as the Diſſections of Infants, dying immediately after their Birth, ſhew, has the Conſiſtence of Honey, and is without Smell. And though I, with good Reaſon, reject a premature and forced Purgation of Infants, yet I think we ſhould act otherwiſe, when they neither can by their own natural Strength, nor the Aſſiſtance of the *Coloſtrum*, diſcharge the impure Sordes remaining from the Nutriment received from the Mother; for then it is abſolutely expedient to aſſiſt them with a gentle Stimulus, eſpecially ſince we have known, that violent Gripes, Inquietudes, Watchings, cardialgic Paſſions, Ruptures, obſtinate Coſtiveneſs, convulſive Motions, and other Symptoms, have aroſe from too late an Evacuation of the *Meconium*, becauſe theſe Excrements not only very tenaciouſly adhere to the Coats of the Inteſtines, and often, as it were, glue them together, but, alſo, upon the Acceſs of Milk to them, even the beſt, aſſume a very different Nature, and that very prejudicial; whence many Women are induced to ſuffer their new-born Infants to faſt for twenty-four Hours; and in the mean time give them Honey and Butter, leſt the Milk, the Body not being yet purged, ſhould coagulate into a Curd.

Theſe things being obſerved, a proper Diet, and due Regimen, ſhould be directed for Infants: But Milk deſervedly conſtitutes the principal, and, as it were, univerſal Aliment, becauſe it ſupplies both Meat and Drink at the ſame time, is grateful to the Stomach, and for this Purpoſe was it wiſely ordered by the Creator, that healthy Women, immediately after their Delivery, ſhould accumulate a ſufficient Quantity of it in their Breaſts. But, ſince Infants are nouriſhed by the Breaſts, either of their Mother, or an hired Nurſe, it is certainly the Duty of Parents, and thoſe entruſted with the Health of Children, to take care, that they generate pure and temperate Milk. This is beſt obtained, if Women, who give Suck, obſerve an exact Method of Diet, and avoid all thoſe things, which communicate any Taſte to the Milk, even imperceptible to the Senſes, and eſpecially ſuch as are noxious, and capable of producing Diſtempers. Particularly let the Nurſe, if there is a Neceſſity for one, be healthy, in the Flower of her Age, from twenty to thirty, rather lean than fat, of good Morals, compoſed in Mind, neither melancholic, paſſionate, nor a Drunkard; nor, laſtly, let her Milk be too ſtale. Farther, let her obſerve a regular Diet; and, ſince Women, who are poor, and in a mean Situation of Life, generally undertake this Buſineſs, great Care muſt be taken, that they do not, at once, paſs from their former Method of Living, or from an hard and ſparing Food, to one which is delicate, ſoft, and plentiful; but let them rather accuſtom themſelves to it by Degrees. If, at any time, they are deprived of their Sleep, in the Night, by the Reſtleſſneſs of the Infants, let them recover that Loſs in the Morning; yet, with this Caution, that they do not indulge it too far, and lead a lazy, idle Life.

He that conſiders theſe things, will ſoon find, how blameable thoſe Mothers are, who, without any Danger, either from an Impurity of the Humours, and want of Strength, or any other Reaſon, deliver their tender Progeny to mercenary Nurſes, with a Barbarity exceeding that of the Brute Creation, and do not ſo much as conſider, whether they hire an healthy, or an unſound, a virtuous, or a wanton Nurſe. It is no Wonder, then, according to the Teſtimonies of the moſt approved Authors, that Infants are often affected with Ulcers, the Itch, ſcald Heads, Achors, and other cutaneous Diſorders, by Nurſes, whoſe Diet is irregular; or, if the Nurſes are afflicted with the Venereal Diſeaſe, that the Children contract the ſame; or, as I have often obſerved, are contaminated with Puſtules, and cruſtaceous Eruptions, and a thouſand other Infirmities. And ſince not only Defects of the Body, but of the Mind, alſo, are communicated by the depraved Milk, it certainly is not uncommon for Children born of the beſt Parents, ſometimes, to be corrupted with the worſt Morals. Thus I have known Infants render'd Drunkards, by ſucking the Milk of a Nurſe addicted to drinking. Nor do many Authors ſearch for any other Origin of the Drunkenneſs and Cruelty of ſome great Men, than Nurſes tainted with the ſame Vices. *Wirdig.* in *Medic. Spirit. Lib.* 1. *Cap.* 25. 56. has a very

very remarkable Paſſage to this Purpoſe: Children, ſays he, nurſed by ſtrange Milk, uſually degenerate, and aſſume the Nature of their Nurſes; from the Milk and Spirits of their Nurſes, they aſſume the Natures and Morals of their Nurſes: The wildeſt Animals are tamed by human Milk, from the mild Spirits which they ſuck in with the Milk; as, on the contrary, Men fed with Beaſts Milk become beſtial and fierce, as appears from *Romulus* and *Remus*.

The Quantity of Milk to be ſucked cannot be exactly determined; but the general Practice of Women is, to give the Child the Breaſt, for the firſt Month after its Birth, every two Hours; after three or four Months, ſix or ſeven times, and at laſt only twice or thrice, in a Day, till the Year is completed. But here, in general, I would obſerve, that Women ſhould be cautious of giving the Breaſt too often, and unneceſſarily, but rather, by all means, when they are too greedy, remove them from it, becauſe they are ignorant what Quantity they ought to take; otherwiſe thoſe Symptoms may ariſe, which have been mentioned above.

It often happens, that the Temperature of the Milk is corrupted by various Cauſes: Precautions, therefore, are neceſſary to prevent impending Danger. But the Milk, as we have already obſerved, is moſt of all vitiated by a Terror of the Woman, who gives Suck; and, conſequently, the beſt Preſervative againſt the Injury hence ariſing is, not to give the Breaſt immediately after a Fright. The ſame holds true with reſpect to Anger: And ſince the Injury done to the Milk by violent Paſſion, upon a long Continuance in the Breaſts, endangers both the Child, and the Nurſe, to prevent this, the Milk ſhould be ſeaſonably extracted. It ſometimes, alſo, happens, that either the Infant is incapable of ſucking the Milk out of the Breaſts, or the Nurſe, from Illneſs, or ſome other Cauſe, of affording it. In this Caſe other proper Aliments ſhould be provided; amongſt which are to be accounted ſweet Whey, Barley-broth, Water-gruel, Emulſions of Almonds, or Barley boil'd to the Conſiſtence of a Pulp, with the Addition of the Yolk of Eggs, and the like.

The ſame things are proper, and may be uſed, if the Milk alone is not ſufficient to ſupport the Child; though there are other Aliments contrived for this Purpoſe, ſuited to various Countries and People. The moſt common among us are, ſeveral Kinds of Paps, made of Flour, or Crums of Bread, boiled with Milk or Water, and reduced to a tenacious, and glutinous, and viſcid Conſiſtence. But whether Infants, eſpecially the very tender ones of Families of Diſtinction, on account of the Debility of the Stomach, are capable of diſſolving perfectly this viſcid Food, is what I very much doubt, and rather think, that by them the Way is often paved for Obſtructions of the Viſcera and Meſentery: Thus *Hildanus*, *Cent. 6. Obſ.* 34. obſerved a deſperate Obſtruction of the Pylorus from the Uſe of ſuch Pap. Much leſs ought a weak Stomach to be overcharged with ſuch Aliment, or a freſh Quantity of it again exhibited unſeaſonably, before the former Aliment is digeſted; becauſe we have made it appear, that, by this means, the Infant is greatly injured. Nor can I approve of that pernicious Cuſtom of ſome Women, who give Children Pap, rolled firſt in their Mouths, and mixed with the Saliva; for though this Maſs, impregnated with the Saliva of an healthy Mother, may ſeem more eaſily convertible into Chyle, agreeable to the tender Age of the Child, I cannot heartily approve of it, for the following Reaſons; becauſe, by ſuch Maſtication, not only the moſt ſubtle Part of the Pap is ſuck'd out, and conſumed, but, alſo, any Infection of the Saliva, and corrupted Teeth, which, from the great Subtilty of the foreign Matter, are ſcarce perceptible, are eaſily communicated to the Infants.

When Children, under this Diet, are arrived at ſuch an Habit, that they ſeem fit to take and digeſt other Aliments, which happens within the Space of a Year, or ſomething more, they may be weaned: But, at that time, no leſs than before, great Care ſhould be taken, that the Misfortunes, hitherto eſcap'd, do not oppreſs the tender Patient; but principally a large Quantity and Variety of Food, and Aliments of an hard Conſiſtence, ſhould be avoided. Thus Food too ſalt, viſcid, auſtere, acid, and pinguious, too plentifully taken, and not well concocted, produce a greater Increaſe of acido-viſcid Crudities. So likewiſe, in Summer, Prejudice is done by crude and immature Summer Fruits, which commonly conceal, in the Contexture of their Particles, a latent Acid, which, by irritating and ſpaſmodically afflicting the Fibres of the Inteſtines, may excite Diarrhœas, Dyſenteries, Gripes, and other Symptoms, particularly at the Approach of Autumn. The ſame Conſequence attends Bread not duly fermented, or too new, not excluding ſugar'd and ſweet things, by which the Chyle eaſily degenerates into viſcid Fæces, by which Worms, Gripes, Hardneſs of the Belly, and other troubleſome Symptoms, are induced.

It now remains, that we briefly enumerate ſome Preſervatives. I have found nothing more uſeful for the Prevention of the Diſeaſes of Infants, than to give often, not only to the Nurſe, but the Child alſo, in a large Quantity, Infuſions of Herbs which ſweeten the Blood, made with Water: For this Uſe I cannot but earneſtly recommend an Infuſion of Betony, Root of Viper-graſs, Liquorice, Fennel-ſeed, and the like: For thus the Milk is render'd thin and fluid, ſo that it cannot obſtruct the ſmall Veſſels; but may be more freely convey'd through all the Tubes of the Body, and the winding Ducts of the Glands. Nor do they act amiſs, who, ſometimes, after a Meal, eat a Quantity of Seeds of Fennel and Aniſe, which increaſes the Milk, and prevents Gripes in the Infant.

Since the Milk, ſtagnating in the Stomach and Duodenum, ſoon grows acid, becomes corroſive, and is coagulated, and thus excites a thouſand dangerous Symptoms; it requires the utmoſt Care and Diligence, to prevent this ſo dangerous Coagulation of the Milk: For which Purpoſe Powders are extremely efficacious, which contain Crabs-eyes, Egg-ſhells, the Root of *Florentine* Orris, Saffron, the Seeds or Oil of Aniſe, Sperma-ceti, Cinnabar, and a Solution of Crabs-eyes; of which a Doſe may properly be exhibited twice or three times a Week. But, ſince the Health of Infants greatly depends, alſo, upon a due and ſufficient Diſcharge of the Excrements by Stool, and a Preſervation of the Tone of the Stomach and Inteſtines; ſometimes gentle Laxatives, if neceſſary, ſhould be interpoſed, by which the Injuries from coagulated Milk are, likewiſe, in a great meaſure, prevented.

But I here affirm, that all ſtrong and acrid Purges, as Reſin of Jalap, Scammony, black Hellebore, and the like, are improper, and abſolutely pernicious, to Infants; as they diſpoſe, not only to Gripes and Coſtiveneſs, but, alſo, to Atrophy, and convulſive Affections. Let Infants, likewiſe, abſtain from Aloes; becauſe of the two great Heat, and Ebullition, which it excites; and, alſo, from the Leaves of Sena, becauſe, by the more Remedies the Belly is irritated to Excretion, the greater Difficulty, afterwards, of going to Stool, and Coſtiveneſs of the Belly, follow: Nor are theſe Things prejudicial only, when given to the Children, but, alſo, when given to the Nurſes; for, being mix'd with the Milk, they often excite Convulſions in the tender Infants: Hence *Sydenham* rightly ſays, The Epilepſy of Children often attacks them, in the firſt Month, from too frequent Stools; and *Galen*, in his Time, juſtly aſſerted, that the Bodies of Children ought not to be exſiccated with Purgatives, which would prevent their growing. And, really, it is inexpreſſible, how much the tender and weak Stomach of new-born Infants is prejudiced by Purgatives: For theſe Medicines, from their Acrimony, with which they abound, irritate the Fibres, diſpoſe the Stomach and Inteſtines to ſpaſmodic Strictures, and, at laſt, deprive them of their Tone and Strength; ſo that, then, Digeſtion being deprav'd, the Milk eaſily grows acid, and is corrupted.

I juſtly, and with very good Reaſon, eſteem Remedies of Mercury, however prepared, eſpecially when given to ſucking Infants in Powder, and in conſiderable and repeated Doſes, to be deleterious, and highly prejudicial; partly becauſe, by their Gravity, they firmly adhere, in ſeveral Places, to the Folds of the Stomach and Oeſophagus; and partly, becauſe, by the Addition of a more acrid Bile, and corroſive Acid, they aſſume a more violent and corroding Nature: From whence the Tone of the Inteſtines is not only ſurpriſingly injured, but a Foundation laid for ſuch Diſtempers as ariſe from the Weakneſs of the nervous Syſtem, and Spaſms; and the more ſo, if they are injudiciouſly given to Infants, who have a Collection of corroſive Humours in the Primæ Viæ, which may be known by the Greenneſs of the Excrements. The ſame Effect have other metallic Remedies, as Aurum fulminans, Preparations of Iron, Copper, and Antimonials, as Mercurius Vitæ, and the like; which ought, certainly, to be uſed with the utmoſt Caution, becauſe they are very treacherous and dangerous Remedies, which, as they are reſolved by the Humours reſiding in the firſt Region, exert their Operations, either in a more gentle, or violent manner, and, for the moſt part, almoſt deſtroy the tender Patient.

But, farther, not only the preceding violent Medicines lay a Foundation for bad Symptoms, but even the more gentle cathartic Syrups themſelves, and Powders, given too often, and in too large a Quantity, frequently affect the tender Bodies of Infants very much. Upon this Subject let us conſult *Cardan*, who, *de malo recentium Medicorum medendi Uſu*, *Cap.* 48. ſo very ſeverely reprehends the Practice of the Phyſicians of his own Time, for giving Syrups and Powders. "It is an Error, ſays he, when to "new-born Infants, with a View of relieving them, ſome ad-"viſe Syrups, ſome Powders, and others, other things; for it "is evident, that their tender Conſtitutions ought not to be "changed by any Quality, either purgative, or aſtringent: For "their very tender Compoſition of Members can ſcarcely bear "any thing but Milk, without Injury." Oil of ſweet Almonds, likewiſe, mixed with Sugar, often adminiſter'd, is not abſolutely free from ill Conſequences, as *Harder* aſſures us, in *Apiario Obſ. Med.* 99. where he relates, that a certain Infant, to whom the Women often gave Oil of ſweet Almonds, mixed with Sugar, from its Birth, being ſeized with almoſt continual Gripes, and, at length, with an Epilepſy, died in a few Weeks; and that, upon opening the Body, there were found in him, not only green Excrements, ſuch as he had diſcharged, whilſt alive; but

but the inferior Part of the Ilium was, alſo, affected with a manifeſt Gangrene. And *Weiſius*, in his Diſſertation *de Abuſu Purgantium in recens natis*, furniſhes us with an Inſtance, much of the ſame Kind, of an Infant who died of the like Diſorder, by taking Oil of ſweet Almonds every other Day.

Of Gripes and Flatulences in Children.

Of all the Afflictions which torture tender Infants, violent Pains of the Abdomen, and Inflations, moſt frequently occur; which ſhew themſelves, principally, by theſe Signs: Firſt, The Patients, being very unquiet, toſs and twiſt themſelves into Variety of Poſtures, and kick with their Feet; are averſe to the Breaſt, and almoſt continually crying; the Belly is viſibly turgid with Flatulences, and their Reſpiration is ſhort and difficult; Eructations, ſometimes, burſt impetuouſly out of the Mouth; the Belly is generally coſtive; or, if they have Stools, the Excrements are generally viſcid, tenacious, more or leſs tinctured with a green and æruginous Colour; or fluid, like Water, and yellow; and ſometimes grumous, like the indurated White of an Egg; and ſometimes ſo acrid and corroſive, that the Anus is excoriated, and a perpetual Teneſmus excited.

The immediate Cauſes of theſe exceſſive Tortures are, principally, the ſpaſmodic Strictures of the inteſtinal Membranes, which are of a nervous and very ſenſible Nature: By theſe Strictures, continuing for a long time, the natural Strength, Tone, and periſtaltic Motion, are ſo weaken'd, and deprav'd, that the Excretions, both of the Flatulences and Excrements, are not only retarded, but, alſo, the Digeſtion, Correction, and due Secretion, of the Aliments is impeded: And, tho' theſe intenſe Strictures and Criſpatures of the nervous Membranes are very painful of themſelves; nevertheleſs, becauſe the Flatulence, or ſubſequent Effect of the Spaſms, induces a great Diſtention of the Inteſtines, it neceſſarily follows, that the Oeconomy of all the Functions in the whole Body is ſurpriſingly diſturbed.

The mediate Cauſes of theſe Affections are generally violent Commotions of the Mind, by Anger, Terror, Fear, and Sorrow, in thoſe who give Suck; which, firſt of all, and immediately, exert their Power on the nervous Parts of the Body, principally of the Stomach and Inteſtines, perverting their natural and equable Tone, either by too great Relaxation, or Stricture: And whenever Mothers, during their Pregnancy, are often, and violently, ſeized with theſe pernicious Perturbations of Mind, the Infants, directly from their Birth, are more ſeverely, and for a longer Continuance, affected with excruciating Pains of the Belly.

Acute Pains, and Spaſms of other Parts, are no uncommon Cauſes of Gripes, and Inflations: Thus, frequently, troubleſome Flatulences of the Belly, and Gripes, with preternatural and undigeſted Stools, attend a difficult and painful Dentition of Infants. A careleſs Admiſſion of Cold to the Belly and Feet, by which a free Tranſpiration is not only hinder'd, but the very Texture of the nervous ſmall Fibres injured, and diſpoſed to cauſe Stagnations, alſo, frequently excite theſe Diſorders.

It very often happens, likewiſe, that a too frequent Uſe of Laxatives, and, much more, an incautious Uſe of Purgatives, lay a Foundation for ſuch Diſorders; and this I may obſerve to be the Caſe, not only of Infants, but Adults; for ſometimes, when the latter, upon perceiving an Heavineſs, have been treated with Purgatives, they have not only been tormented with intolerable Pains of the Belly, but have often had their Bellies tumefied and inflated, like dropſical Perſons; ſo that the highly ſenſible alimentary Duct could afterwards ſcarcely, with the utmoſt Care, be reſtor'd to its natural State.

If we examine into the more remote Cauſes, we find that griping Pains of the Inteſtines often proceed from the Meconium being too long retain'd, and not ſufficiently purged off by the Coloſtrum, or ſome other gentle Evacuant; ſince this, accumulated, diſtends the Fibres of the Inteſtines, excites Flatulences, and, being render'd more acrid by the Milk, ſtimulates the ſenſible Membranes of the Inteſtines, ſo as to excite a painful Stricture. Another Cauſe may be, the Milk itſelf corrupted in the Primæ Viæ, growing acrid, and collected, as it were, into Globules, which, by a Mixture of the Bile, and gaſtric Juices, aſſuming a cauſtic Nature, pricks, corrodes, and, as it were, tears the Inteſtines. But this noxious Acrimony of the Fæces, and acid cauſtic Diſpoſition, ſhews itſelf ſufficiently, not only by the green Colour, with which they are tinctur'd, and their Corroſion of the Veſſels, into which they are receiv'd, when diſcharged; but, particularly, by an Experiment, in which the green Colour of the Excrements is changed into yellow, by an Affuſion of Oil of Tartar *per Deliquium*; to ſay nothing of Dogs, who, otherwiſe, readily devour the natural Fæces of Infants, but will not touch theſe green Excrements.

Laſtly, In Infants, eſpecially after Weaning, Summer Fruits, Aliments prepar'd with Honey, too much Sugar, and other things, with which Children willingly overcharge themſelves, contribute very much to induce ſpaſmodic Pains of the Inteſtines: For hence, a Fermentation being raiſed in the Primæ Viæ, very acrid Juices are readily generated, and upon Anger, and taking cold, a large Quantity of uſeleſs Sordes is accumulated; whence Anxiety about the Præcordia, Vomitings, violent Pains of the Inteſtines, and bilious Fevers, are excited.

As to the Prognoſtic, the following Circumſtances ſeem moſt worthy of Obſervation: The longer theſe exquiſite Gripings of the Inteſtines continue, and the more frequently the ſenſible Bodies of tender Infants are affected therewith, the more ſevere and dangerous they uſually are: For Fevers, Palſies, Aſthmas, epileptic Convulſions, and other mortal Symptoms, are eaſily aſſociated with them, which, if they are not ſoon check'd by convenient Remedies, quickly deſtroy the miſerable Patients: Nor, in prognoſticating the Event, is it of ſmall Moment, to conſider the Condition of the affected Subjects: If they are deſcended from weak Parents, and Mothers diſpoſed to hyſteric Spaſms, it is to be feared, the Diſorder will affect the Infants more violently, and return more frequently.

The Cure.

The principal Intention of the Phyſician, in order to cure the griping Pains of Infants, is to abſorb, correct, and gently evacuate, the corroſive Acid of the Primæ Viæ: For which Purpoſe, if the Diſorder, as it generally happens, is cauſed by corrupted or vitiated Milk, it is extremely neceſſary to change the Nurſe; or great Care muſt be taken, that ſhe does not, at that time, indulge herſelf with flatulent Food, Summer Fruits, Pulſes, Wine, Acids, or feculent Aliments; becauſe, by all theſe, the Affection is either much increaſed, or render'd more obſtinate. At that time, alſo, gentle Laxatives, if ſhe is coſtive, are proper for the Nurſe: Among theſe I would, principally, recommend Preparations of Rhubarb: Thus, for Example, half a Dram of the Extract of Rhubarb, diſſolved in half an Ounce of the Liquor of Terra Foliata Tartari, and Cinnamon-water, may be taken Morning and Evening, in the Quantity of ſixty Drops, or more. Nor, at this time, are carminative Medicines leſs beneficial to the Nurſe; and Infuſions, after the manner of Tea, drank in a large Quantity; as they are of great Efficacy in diluting and reſolving the Thickneſs of the Milk: But, for the Infants themſelves, to temper the Acid lodged in the Primæ Viæ, I muſt recommend the following Powder, as of experienc'd Virtue:

Take of Crabs-eyes, Mother of Pearl, diaphoretic Antimony, the Root of *Florentine* Orris, each half a Dram; Saffron, three Grains; Oil of Aniſe, and of Mace, each two Drops: Let five or ſix Grains be taken every two Hours, in a Decoction of Hartſhorn; or in ſome antiſpaſmodic Water, as that of Lime-flowers, of black Cherries, or Baum, with a little Diaſcordium.

But nothing relieves more than Clyſters, which both, by their kindly Warmth, relax the Spaſms of the Inteſtines, and remarkably diſſipate and carry off the Flatulences, which are the Cauſe of, or, at leaſt, accompany the Gripes. For this Purpoſe I have often, with great Succeſs, preſcribed Clyſters prepar'd of Marjoram, Chamomile-flowers, carminative Seeds, thin Water-gruel, and a ſufficient Quantity of Oil of Chamomile; or a ſufficient Quantity of a Decoction of Dill, render'd more efficacious by the Addition of a few Drops of the Oil of Aniſe. The ſame Intention is excellently anſwer'd by the internal Exhibition of Preparations of Rhubarb; ſuch as Syrup of Succory, with Rhubarb: The Medicine before preſcrib'd for the Nurſe, exhibited in a ſmall Doſe, and an Electuary, prepar'd of equal Quantities of Rhubarb, and Crabs-eyes, together with ſolutive Syrup of Succory, or Roſes, and the Addition of a proper Quantity of Manna; to be taken in Barley-water. And I cannot, in this Place, but approve, and greatly commend, the Method of *Heurnius*, who, in *Method. ad Praxin, Lib. 2. Cap. 26.* aſſerts, that he had found by Experience, that, by one Scruple of Aniſeed, pounded in a groſs manner, new-born Children were moſt commodiouſly cleanſed from green Bile, and fetid Phlegm, and, at the ſame time, that the violent Pains of the Belly were quieted, if it was given with the firſt Spoonful of ſugar'd Pap.

If there is a Suſpicion of Worms breeding in the Inteſtines, it is proper to give the Remedies, which, under the Article Vermes, we ſhall ſhew accommodated to kill and diſlodge theſe hoſtile Animals.

External Remedies ſhould, alſo, be applied, againſt the Violence of this Diſorder: For this I would recommend Emollients; ſuch as the Flowers of Chamomile, Elder, Melilot, and Mullein; the Seeds of Fenugreek and Dill; as, alſo, Saffron, boiled in Milk, and applied to the Abdomen, either in a Swine's Bladder, or in a Linen Cloth: Nor is it an improper Piece of Practice, to anoint the Region of the Navel with diſtil'd Oils of Cumin, Carraway, Aniſe, Chamomile, and Fennel; or the expreſſed Oil of Nutmeg, or Oil of Chamomile, prepar'd by boiling, mixed up with ſome Lard.

As for the neceſſary Cautions in this Diſorder; Care muſt be taken to abſtain from all ſalt, acrid, and ſtrongly ſtimulating things, eſpecially Purgatives; for it is very dangerous to convey the highly acrid Sordes, before they are duly corrected, through the long Canal of the Inteſtines. But reſinous things are endued with highly noxious Qualities, ſuch as Reſin of Jalap, which is moſt

moſt imprudently adminiſtered to Children ſubject to Diſorders, in conſequence of their ſucking corrupt and acrid Milk; and though this Reſin ſometimes diſcharges a large Quantity of Humours, yet it proves highly injurious by its continued Stimulus, and Irritation of the Inteſtines. Purging, which, however, is rarely requiſite, is much more ſafely performed by the Powder of white Mechocan, exhibited with ſome proper Syrup: After which the Sordes collected in the Stomach and Duodenum are to be corrected by Abſorbents and Correctors, and eliminated by Preparations of Manna, or Rhubarb, or by means of Clyſters.

Theſe Gripes of the Inteſtines are often produced not ſo much by a material Cauſe lodged in the Primæ Viæ, as by a violent Agitation of the Nerves, from an acute Pain, for Inſtance, in other Members, in conſequence of the Conſent of the Parts: In which Caſe, laying aſide all Laxatives, the firſt and principal Intention of Cure is, to ſooth and alleviate the Pains and Spaſms.

No Medicines, as we have already obſerv'd, are more juſtly commendable for the happy Effects they produce, than Clyſters; ſince they immediately reach the Inteſtines, and afford great Relief, as well by quieting as diſſipating the Flatulences, if the Intention for which we inject theſe warm Fomentations, is attended to, ſo that in preparing them we make a proper Choice. For thus, if the Excrements diſcharged by Stool, are liquid, and ſo highly acrid, that they not only occaſion violent Gripes, but, alſo, an Excoriation of the Anus, Clyſters of Milk and Sugar are ſerviceable, or Turpentine diſſolved in the Yolk of an Egg, which, by moderating the Acrimony, prevent the Corroſion of the large Inteſtines, and the Anus. But if a viſcid Sordes, lodg'd in the Inteſtines, lays the Foundation for Gripes and Flatulences, Clyſters, endued with a greater Power of reſolving, ſhould rather be uſed, which, by ſtimulating the large Inteſtines, cauſe the Mucus, which lodg'd in the reſt of the Inteſtines, to deſcend afterwards more eaſily. For this Intention a Clyſter may be prepared of one or two Ounces of a Decoction of Chamomile-flowers, with the Addition of a Dram or two of Honey of Rue, half a Dram of *Venice* Soap; and a few Drops of the Oil of Aniſe.

Laſtly, ſeveral Women, tired with the Cries of Infants, to procure Sleep, in this Diſeaſe, give various Sedatives, ſuch as Mithridate, the Requies Nicolai Myrepſi, and ſome others; but with the greateſt Hazard, and a very bad Effect; for, beſides many ill Conſequences, a wonderful Dulneſs of Mind uſually follows the imprudent Uſe of Opiates.

Convulsions *of* Children.

Under the Article Epilepsy we have fully deſcribed that Diſorder, and Convulſions; and there, by concluſive Arguments, proved, that the Cauſe of one conſiſts in a Spaſm of the Dura Mater; and that of the other in a ſpaſmodic Stricture of the Membranes inveſting the ſpinal Marrow. However, that it may be known ſeparately, what Cauſes principally ſubject Infants to theſe terrible Affections, and by what Remedies they ought to be removed, I think it expedient, in this Treatiſe of infantile Diſorders, to add ſome things, which have a particular Relation to theſe Indiſpoſitions in Children.

Epilepſies, then, and Convulſions, are generally more incident to Childhood, which continues from the firſt to the ſeventh Year, for no other Reaſon, than that, in Infants, the nervous, membranous and exquiſitely ſenſible Parts, are compoſed of very tender and very moveable ſmall Fibres, which, being irritated, tho' in the ſlighteſt manner, are very eaſily thrown into irregular and ſpaſmodic Commotions: Wherefore it is uſual for an Infant, the more tender and young he is, and the greater Senſibility he has obtained from his Parents, which were either ſubject to Affections of the Mind, or formerly afflicted with the ſame Diſorder, to be ſeized more violently, and readily, with Epilepſies and Convulſions.

Beſides, theſe dreadful Affections eaſily happen, not only when the Mothers, who bore the Infants, have neglected a ſalutary Courſe of Diet, but, alſo, when the Nurſes, who give them Suck, are afflicted with Hyſterics, or other Paſſions of the nervous Kind; if they eat too plentifully of Sallad, Acrids, Summer Fruits, and other incongruous things, drink ſpirituous Liquors too freely, or feed the Children, committed to their Care, with too large a Quantity of groſs and impure Milk. Nor is it uncommon, as I have often obſerv'd in Practice, for ſucking Children readily to fall into epileptic Convulſions, and theſe difficult to be cured, when the Nurſes, ſeized with a violent Affection of Mind, eſpecially Anger, Terror, and Fear, offer the Breaſt immediately, before a due Diſcharge and Correction of the Milk; or if, at any time, the menſtruous Purgations come on, which, from the Beginning of giving Suck, to that time, they have been Strangers to.

Farther, Experience ſhews, that the Falling-ſickneſs, as well as Convulſions, are ſometimes excited, when any nervous Parts are agitated with Spaſms or Pains, and, at the ſame time, by means of the Conſent of Parts, the Membranes of the Meninges, and ſpinal Marrow, are affected. I have obſerved this to happen, principally, from the Meconium being retained in the Primæ Viæ, and, by its Continuance there, render'd more acrid; from Gripes, likewiſe, and Worms, lacerating the ſenſible Coats of the Inteſtines, and from Pains proceeding from difficult Dentition, and ſtrong Purges, eſpecially when often given: For all theſe things are of ſuch a Nature, that, in Patients endued with delicate Conſtitutions, they eaſily excite epileptic and convulſive Motions.

Laſtly, as thoſe Children are preſerv'd or freed from an Epilepſy and Convulſions, upon whom that Species of Eruption, called *Favi*, a Cruſta Lactea, or an Itch with Puſtules, appear; ſo theſe dangerous Diſorders very frequently draw their Origin from theſe Impurities, injudiciouſly repelled: The ſame holds true of the Small-pox, and Meaſles; of which an obſtructed Eruption, noxious Retroceſſion, or improper Cure, deſtroys numberleſs Infants, by Epilepſies and Convulſions.

The Convulſions and Epilepſies, which accompany acute, petechial and variolous Fevers, are bad Signs; and are not without Danger, when, proceeding from difficult Dentition and Gripes, they afflict for a long time. *Hippocrates, Sect.* 3. *Aphor.* 28. and Experience, teſtify, that whoever is not freed from theſe Diſorders about the ſeventh Year, is, for the moſt part, miſerably afflicted with them, till his very Death. Nor, laſtly, are we to neglect to take the Prognoſtic from the Frequency of the Fits; where it is to be obſerved, that the more frequent the Attacks, the more Danger there is, that, Nature being at laſt too much weaken'd, the Patient fall a Victim to his Diſorder.

The Cure.

As in all ſorts of Diſtempers, ſo in the Diſorders now under Conſideration, the Phyſician's whole Intention ſhould be directed to the Cauſes. If, therefore, this Diſorder takes its Riſe from a Fright, or violent Paſſion, of the Nurſe, laying aſide all ſpirituous, acrid, and irritating Remedies, it is proper to give what gently curbs the inordinate and ſpaſtic Motions of the nervous Syſtem; ſuch as Clyſters prepared of emollient and carminative Subſtances, antiſpaſmodic Powders made up of the Pulvis Marchionis, Cinnabar, and a little Muſk, and either exhibited alone, or in ſome Water of a ſedative Quality; ſuch as Water of the Lime-tree, Lilies of the Valley, Cowſlips, or Orange-flowers.

But the Cure is very different, when the Diſorder ariſes from the Milk, corrupted and rendered corroſive in the Infant; for, in this Caſe, beſides demulcent Clyſters, abſorbent Powders, exhibited with Saffron, Muſk, or a ſmall Quantity of the Extract of Caſtor, are of ſingular Service; eſpecially if, at the ſame time, a pretty rich Decoction of Harts-horn is uſed for Drink. But, if the Primæ Viæ are to be purged from any Sordes they contain, this End may be commodiouſly obtained by a Decoction impregnated with Manna, ſucceſſively exhibited with a few Drops of the Oil of Tartar per Deliquium dropt into it.

When too large a Quantity of groſs Milk lays the Foundation of the Diſorder, the Infant ſhould be fed with leſs Milk, and ſuch Aliments given, as render it more fluid and ſerous. In ſuch a State, likewiſe, the Stomach is often very much ſtuffed by ſtagnating and coagulated Milk, where a gentle Emetic, given out of the Paroxyſm, is often ſerviceable. This Emetic may be prepared of a third or fourth Part of a Grain of Emetic Tartar, mixed with Syrup of Violets, and ſome proper diſtilled Water.

When the Meconium, not properly purged off in the firſt Months, and becoming acrid by Continuance, produces this Diſorder, it ought to be evacuated by gentle Laxatives, mixt with Abſorbents; eſpecially by an Electuary, compounded of the Syrup of Succory, with Rhubarb, Crabs-eyes, and the Pulvis Marchionis. Worms, on the contrary, are to be deſtroyed and expelled by Remedies accommodated to them.

If an epileptic Diſorder, at any time, proceeds from a Repulſion of the Itch, a Scald Head, or other Eruptions; thoſe Things ſhould be uſed, which have a Power of recalling the impure Matter to the Surface of the Body; and I have often known particular Advantages ariſe in ſuch a Caſe, from Veſicatories, applied to the Nape of the Neck. And this too ſeems confirmed by the Experience of *Fernelius*, who mentions many epileptic Perſons, as cured by Fontanels and Setons.

It is the Practice of ſome Phyſicians, and thoſe of no mean Note, for appeaſing the violent Commotions of the Solids, to recommend Opiates; ſuch as the Pilulæ de Cynogloſſo, the Theriaca cœleſtis, and ſome others of a like Nature. But, ſince I have frequently ſeen the ill Effects of them, I am of Opinion, they ought to be uſed very cautiouſly. The ſame may be ſaid of Volatiles, which, even externally applied, very often prove injurious.

Atrophy of Children.

Among the various Diſeaſes familiar to Infants, a Tabes is not the moſt inconſiderable: This is a gradual Conſumption of the whole Body, attended commonly with an Inflation of the Abdomen, and an extraordinary Injury of the ſeveral Functions.

At the Beginning of the Diſorder, both the inferior and ſuperior Limbs begin to grow flaccid, and decay; but the Abdomen

is diſtended. The Patient breathes with Difficulty, is ſeized with a Laſſitude of Body, is ſometimes coſtive, and at other times has his Body ſoluble; his Appetite is irregular and uncertain, but principally fond of cold Aliments: In the Increaſe of the Diſorder, the Countenance, in conſequence of a collapſed State of the Temples, becomes unſeemly and pale; the Eye-lids, after Sleep, become tumid; the Ribs are protuberant; the Scapulæ prominent, like Wings; the Food is diſcharged generally half digeſted; and gnawing Pains are often felt about the Region of the Navel; the Urine is ſometimes thick, and ſometimes of a rediſh Colour; Sleep is turbulent; and, about Night, a ſlow Heat, accompanied with Thirſt, and Dryneſs of the Mouth, begin to afflict the Patient.

But this Diſorder ought not to be confounded with Extenuation and Leanneſs of Body; which, proceeding from a Defect of Fat, often poſſeſſes one Part only, without injuring the Functions of the whole Body. It ought, likewiſe, to be carefully diſtinguiſhed from the Rickets, in which ſome Parts are, indeed, waſted; whilſt, at the ſame time, the Limbs are deformed with Tumors, Contractions, and Incurvations. Beſides, we muſt be very careful not to miſtake a primary or original Tabes, for that Extenuation, which, as a Symptom, ſucceeds other Diſeaſes; ſuch as Fevers, Small-pox, Meaſles, Diarrhœas, and Worms. Laſtly, a genuine Tabes differs from that Leanneſs, which ariſes from a Want of Milk; which may be diſcovered, if the Breaſts of the Nurſes are flaccid, and abſolutely without Milk; if the Nurſes themſelves have not good Appetites; if the Children diſcharge but little Urine; cry and complain; if, after taking Aliments, they are quiet; and if they greedily ſnatch at the Breaſts.

Thoſe who die of this Diſtemper, when laid open, are generally found to have the Glands of the Meſentery tumefied, ſcirrhous, or even affected with Abſceſſes. The Liver, alſo, and Spleen, are ſeldom ſeen without ſome Diſorder, Infarction, and a preternatural Magnitude. The Muſcles, particularly of the Abdomen, are ſo extenuated, as to be hardly thicker than a Membrane. The Inteſtines, on the contrary, are very much inflated, and filled with a fetid, and, ſometimes, a black Sordes.

We attribute the immediate Cauſe of this Diſorder, either to a Defect of nutritious, temperate, and gelatinous Juice, or an inſufficient Application of it to the ſolid Parts; but the more remote Cauſes we aſcribe to a depraved Digeſtion of the Aliments, an impure and thick Chyle, and an Obſtruction of its Paſſage thro' the lacteal Veſſels to the thoracic Duct, and Maſs of Blood. But we muſt here principally blame the Defect, or languid Condition, of the Bile, occaſioned by a preternatural State of the Liver, by which Digeſtion is not only very much injured, but alſo the Mouths of the villous Coat of the Inteſtines, becauſe not properly freed from mucous Sordes, receive and tranſmit the Chyle with more Difficulty.

The remote and occaſional Cauſes of this Diſorder are various: Though I have generally obſerved, that this violent and chronical Indiſpoſition has followed Diſeaſes of many Kinds; ſuch as the Small-pox, Meaſles, convulſive Motions from difficult Dentition, and ſome others; eſpecially when the Patients, upon Recovery, indulging their Appetite too much, have taken Aliments of a groſs Texture; ſuch as Cheeſe, Bread not well fermented, farinaceous Subſtances, ſweet Cakes, with Summer Fruits, acid Aliments, and Wines, of the ſame Quality. But nothing, as frequent Experience aſſures us, is more prejudicial, than if Infants, when hot and moiſt with Sweat, often uſe cold Drink in the Night, or when, being hot in Bed, they are, whilſt awake, removed into the cold Air. For, by the Suppreſſion of Tranſpiration, and Conſtriction of the minute Ducts of the external Parts, the nutritious Juice is not only diverted and repreſſed from the Periphery to the Centre, and inferior Parts, but, likewiſe, acquires a depraved ſaline and acrid Quality.

Nor do I heſitate, with the celebrated *Chuden*, to aſſert, that Infants are ſubject to a Tabes, from an Obſtruction of the Pores of the Skin, unleſs they are well waſhed and cleanſed from their Sordes. But they, who affirm that Worms, which they call *Comedones*, are generated in the Skin of new-born Infants by a Neglect of Waſhing, and, as they ſuppoſe, draw off great Part of the laudable Nutriment, will not gain my Aſſent, becauſe this new Aſſertion is not yet to me ſufficiently confirmed by my own Experience.

Nor can it be deny'd, that theſe conſumptive Diſorders happen to Infants from a prepoſterous Uſe of Medicines, eſpecially thoſe of the earthy, abſorbent, and aſtringent Kind, in Diarrhœas, intermitting Fevers, Gripes, and Small-pox. For they, who have diſſected the Bodies of Children, who died of this Diſtemper, teſtify, that they have found, both in the Stomach, and the ſmaller Inteſtines annexed to it, ſome Cruſts of Matter grown ſolid, which could ſcarely be ſeparated from the Subſtance of them; which indicates, that not only the Separation of the gaſtric Liquor was by that means prevented, but, alſo, the Secretion of the Chyle, in conſequence of an Obſtruction of the Mouths of the Lacteals, retarded.

A Tabes, alſo, is properly denominated Scorbutic, when the Children are generated by Parents affected with an impure Dyſcraſy of the Humours; are ſuckled by morbid Nurſes, or ſuch as are troubled with a Cachexy, or any other ſcorbutic Diſorder. Something of a Venereal Taint is too often complicated with this Diſorder, on which the Atrophy depends; as the Effect does on its reſpective Cauſe.

Worms, likewiſe, lodg'd in the Inteſtines, are often the Cauſe of an Atrophy; for they not only deſtroy the moſt laudable Parts of the Aliments and Chyle, but, alſo, taint them with vitious Exhalations. In *A. N. C. Vol.* 3. *Append.* 61. we are furniſh'd with a remarkable Inſtance of a Boy, who dy'd of an Atrophy; and, upon Diſſection, in his Inteſtines, ſeveral Parcels of Worms, ſome larger, ſome ſmaller, were found adhering ſo firmly to the interior villous Coat, that they appeared, in a manner, growing to it, and could not be ſeparated, without injuring the Coat itſelf.

Beſides, Infants, before ſound, and apparently in a State of perfect Health, without any manifeſt previous Cauſe, often begin to languiſh, and become extenuated. But they are expos'd to this Misfortune, when they change the Mother's or Nurſe's Milk, for more ſolid Food; and, tho' before they could ſtand on their Legs, and ſupport the Weight of their Bodies, they now become incapable of ſtanding, and are averſe to touching the Ground; but the genuine Nature of the Diſorder immediately ſhews itſelf, when their Limbs become ſenſibly pendulous, and the Habit of the Body flaccid and corrugated, as appears principally in the Nates and Thighs. In the mean time, ſuch Patients are continually eating, and have Appetites ſo voracious, that they can ſcarcely be ſatisfy'd.

It is very common for many, and even ſome Phyſicians, when the Diſorder continues long, to refer the Cauſe to Faſcination: But as this trifling and empty Excuſe plainly ſhews, that thoſe Men, who fly to ſo abſurd an Aſylum for their Ignorance, neither knew the genuine Cauſes of the Diſtemper, nor are able to cure it by proper Remedies; ſo we deſervedly reject this Method of accounting for the Diſorder, as fooliſh, and unworthy of a Philoſopher and Phyſician.

When the Diſorder proceeds from an imprudent Uſe of Aſtringents, or an exceſſive Uſe of ſaline and abſorbent Medicines, it generally requires a long time for the Cure; but if the Matter of the earthy Abſorbents has already acquired ſome Degree of Solidity, the Hopes of Recovery are doubtful, and many are carry'd off by Death, before the Removal of the Cauſe. When the Diſeaſe is inveterate, and the Meſentery, Liver, Spleen, Pancreas, Kidneys, and Lungs, are already obſtructed and ſcirrhous, then it is ſeldom, or never cured. On the contrary, Hopes of Recovery may be entertain'd, if, the Concoction of the Food being amended, the Appetite becomes more conſtant and regular, the Tumor of the Abdomen decreaſes, and the Strength is recovered. If there is a Diarrhœa, and a mighty fetid purulent Matter mix'd with Blood, diſcharg'd from the Anus, and if, beſides, the Body is very much emaciated, the Diſtemper cannot be cured without very great Difficulty, if at all; for the Diarrhœa ſtill conſumes the remaining Strength, and the fetid Matter ſhews a Corruption already begun in the Abdomen, which Death generally very ſoon ſucceeds. When the Infarction or Scirrhus degenerates into an Exulceration, and an hectic Fever ſucceeds, which we commonly know from a flame-coloured and rediſh Urine, preternatural Heat, and Fluſhings after Aliments, then the Infants moſt certainly die. Laſtly, frequent Obſervation proves, that a Tabes is, ſometimes, happily removed by intermitting Fevers.

The Cure.

Tho' the Cure of this Diſorder is very different, according to the Diverſity of the Cauſes from which it proceeds, yet, in general, we are to take care, that Infants, after weaning, be ſupply'd with Food of ſuch a Kind, as adds Nutriment and Strength to the languid Body, and emaciated Parts. This Intention is excellently anſwer'd by Broths of bruis'd Fowls or Capons, prepar'd without the Fat, or a perceptible Quantity of Salt, as, alſo, by Paps of Apples prepar'd with the Yolks of Eggs and Sugar, together with a little Cinnamon, Mace, and Wine.

When the Mouths of the lacteal Veſſels and Ducts of the meſeraic Glands are obſtructed by a viſcid Sordes, then Broths of old Fowls boil'd with the recent Roots of Graſs, Fennel, Parſly, Aſparagus, and Celery, without the Fat, and adding a ſmall Quantity of the Spiritus Nitri dulcis, or a few Drops of the Spiritus Vitrioli Martis, or a Solution of Crabs-eyes, are of all other Medicines the moſt efficacious. But theſe Broths ſhould be continued for ſeveral Days, and even Weeks, in ſuch a manner, that three or four Ounces ſhould be taken every four Hours.

Among the deobſtruent Medicines of great Efficacy, in this Diſorder, the principal are, the ſaline Liquors of a neutral Quality; thoſe, for Inſtance, prepared of a Solution of Crabs-eyes, with Lemon-juice, the Terra foliata Tartari, and the Arcanum Tartari, diſſolved with the Waters of Fennel, or Parſley, and exhibited in a due Doſe frequently every Day: From which Remedies I have often experienced an extraordinary and wonderful Effect.

In order to promote a laudable Digeſtion of the Aliments, eſpecially when a balſamic Bile is deficient, and acid and viſcid Sordes predominate, the temperate balſamic Elixir, mixed with

the

the Aliments, in a ſufficient Quantity, produces very happy Effects. But in a Complication of Gripes, Pains, Inquietudes, and other Symptoms, the anodyne mineral Liquor, mixed and given with a thin Solution of Salt of Tartar, is a moſt effectual Remedy.

When the Diſorder proceeds from an Obſtruction and Infarction of the ſubcutaneous Ducts, or an interrupted Tranſpiration, Baths prepared of the Roots of Marſhmallows and Ferns, the Herbs Mallows and Melilot, Chamomile-flowers, and *Venice* Soap, with the Addition of a ſufficient Quantity of Milk, are highly beneficial. And it is obſerved, that a frequent Uſe of Baths, the firſt Month after Birth, is an excellent Preſervative.

Externally, for diſcuſſing the Tumor, Oil of Chamomile, or Oil of Dill, boiled, and moderately impregnated with Camphire, are highly efficacious.

When this Tabes draws its Origin from an impure ſcorbutic Milk, the Nurſe muſt be removed, and ſweet Whey, or Aſſes Milk, with ſome Drops of Oil of Tartar *per Deliquium*, exhibited.

To theſe we are to add diluting Infuſions of Paul's-betony, Ground-ivy, the Roots of Liquorice, and Succory, together with a Solution of Salt of Tartar, and Arcanum duplicatum.

In Children who are weaned, ſome other diluting Drink, with ſome Oil of Tartar *per Deliquium* drop: into it, muſt always be ſubſtituted in the room of Beer.

If the Diſorder ariſes from an exceſſive Uſe of Abſorbents, diluting Infuſions, in conjunction with Laxatives prepared of Manna, Rhubarb, or Syrup of Succory with Rhubarb, will prove highly beneficial. It is, alſo, ſometimes expedient to free the Stomach from viſcid Sordes, by a pretty large Doſe of the Powder of *Florentine* Orris.

Purgatives rather exaſperate this Diſorder, and diſpoſe it to an Hectic, eſpecially in Patients of delicate Conſtitutions: For the Stomach and Inteſtines are often inflamed by them, a Circumſtance ſoon ſucceeded by Death.

Cardialgia.

We ſhall now briefly treat of ſome Diſorders incident to Children, not becauſe they are inconſiderable, and unworthy of a particular Examination, but becauſe they do not require ſo long and accurate an Account of their Cauſes; and but very few things are requiſite to the Cure, if they are uſed in a proper Time, a due Order, and in conjunction with a ſuitable Regimen.

We ſhall, firſt, then, conſider a Cardialgia, which diſcovers itſelf principally by an uncommon Straitneſs over the Breaſt, join'd with difficult Reſpiration; by Inflations of the Abdomen and Præcordia under the ſpurious Ribs; by Inquietudes and Eructations often attending them; to which ſlight Fevers and Convulſions are frequently join'd.

This kind of Diſorder proceeds from a violent and ſpaſmodic Stricture of the Orifices of the Stomach, and the Flatulences by that means included in it, which, by diſtending the ſenſible Membranes of the Stomach, produce the utmoſt Anxieties, Inquietudes, and, from an obſtructed Deſcent of the Diaphragm, a Difficulty of Breathing, with the other Symptoms. But this Effect is principally produced by the Meconium, when not properly evacuated; by the Milk coagulating or ſtagnating; or by any other viſcid Humours lodged in the Primæ Viæ, and reſolved into Flatulences: Neither are we to exclude other Cauſes, which, by irritating the nervous Coats of the Stomach, are capable of ſtimulating it to a ſpaſmodic Conſtriction, and, conſequently, of inducing a noxious Retention of the Flatulences.

During the Fit, let but little Milk be given to the Infant, and antiſpaſmodic abſorbent Powders, with ſome carminative Water, be adminiſtered both to the Nurſe and Infant; and, for their Drink, let them uſe gelatinous Decoctions of Hartſhorn, and correcting Emulſions. But, ſince a due Diſcuſſion and Diſcharge of the Flatulences is of the utmoſt Service in ſuch a Caſe, this Intention muſt be anſwered principally by gently carminative and emollient Clyſters: An outward Application of Paregorics is, likewiſe, very beneficial. For this Purpoſe it is expedient to anoint the Abdomen with a Liniment prepared of the Oils of Chamomile and Dill by boiling, with the Addition of a few Drops of the Oil of Cumin, Mint, or Cloves, and a few Grains of Camphire.

When the Body is rendered ſoluble by means of Clyſters, gentle Carminatives are ſerviceable; unleſs an Increaſe of the Fever ſhould contraindicate their Uſe: For which Reaſon *Wedelius*'s carminative Eſſence of Orange-peel, mixed with a due Quantity of the anodyne Liquor, is to be exhibited to the Nurſe; and the Infant is to have an Æleoſaccharum prepared with a few Drops of the genuine Oils of Aniſe and Chamomile, drinking after it a Draught of warm Water-gruel.

After the Fit, in order to remove the Fomes of the Diſtemper, not only the Nurſe, but, alſo, the Infant, ought to be gently freed from the Sordes lodged in their Stomach and Inteſtines; which Intention is excellently anſwered by the following Powder:

Take of the beſt Rhubarb, and Crabs-eyes, each half a Dram; and of Cumin-ſeeds, ſix Grains.

Six, eight, or ten Grains of this Powder are to be exhibited at proper Intervals, not omitting, at the ſame time, the Uſe of corroborating and ſtomachic Medicines, ſuch as the *Elixir Balſamicum Viſcerale*.

Suppreſſion of Urine.

When Infants either diſcharge no Urine, or do it only by Drops, and with Shrieks, this Suppreſſion of Urine often ſubjects them to intolerable Pains; becauſe, at that time, they, in conſequence of their Uneaſineſs and Inquietude, not only ſuck greedily, but are, alſo, incapable of diſcharging the ſuperfluous Milk by Urine. This Difficulty of making Water is produced, when the Nurſe's Milk is corrupted by groſs, acid, and acrid Food; or when ſhe herſelf, by drinking unwholſome Liquors, makes Water with Difficulty; for ſuch, generally, is the Urine, and its Diſcharge, in the Child, as are his Humours; and the State of his Humours is as the Milk he ſucks from the Breaſts of his Nurſe.

Retention of Urine in Children, from the Stone.

An Iſchury is, alſo, frequently produced by a Stone lodged in the Bladder, to which Infants, in conſequence of a copious Production of acid Juices, are highly ſubject, eſpecially if they are inclined to the Generation of a Stone, by an hereditary Diſpoſition, derived from their Parents. If it proceeds from this Cauſe, the Infants ſcratch the Genitals with their Fingers, and the Urine is not only diſcharged by Drops, and with Shrieks, but the ſabulous Particles, alſo, which are, at the ſame time ejected, ſubſide, if the Urine is kept. But, if all theſe Symptoms cannot be depended on, the Stone may be diſcovered eaſily by an artificial Search.

As for the Cure, the Diet of the Nurſe, while ſhe gives Suck, and of the Infant, when weaned, muſt be amended; which is beſt performed by carefully avoiding all improper Aliments, and unwholſome Drinks. But, further, this Diſeaſe is often ſupported by an obſtructed Evacuation by Stool. This, therefore, ought, above all things, to be promoted; unleſs we intend to bring on a greater Afflux of the Humours to the urinary Paſſages. This Intention is commodiouſly anſwered by Reſins impregnated with Rhubarb, taken in proper Aliments, or by Clyſters duly injected.

After this, a convenient Drink, both of a diluting and gently diuretic Quality, ſhould be preſcribed to the Nurſe, as alſo to the Infant; ſuch as Decoctions of light Water, with the Roots of Aſparagus, Carrot, Parſley, Graſs, Fennel, Saxifrage, and Succory, drank warm in the Morning, and through the reſt of the Day cold, as ordinary Drink. Of no leſs Efficacy is the acidiſh Serum of Milk, corrected with Crabs-eyes, which Liquor is, alſo, poſſeſſed of a temperating Quality.

When the Diſcharge of Urine is ſuppreſſed by calculous Fragments obſtructing the Urethra, and irritating its highly ſenſible Coat, ſo as to excite violent and racking Pains, emollient Clyſters are, in like manner, of Service. But, internally, in order to allay the Spaſms, it is expedient to exhibit *Fernelius*'s Decoction of Marſhmallows prepared with *Venice* Soap, or Oil of ſweet Almonds, with a few Drops of the anodyne Liquor, in warm Barley-water, or Water-gruel. When, by means of theſe, the Spaſms are relaxed, we may, with Advantage, uſe Powders of Crabs-eyes, calcin'd Egg-ſhells, Solutions of Crabs-eyes, and other things which gently promote a Diſcharge of Urine.

Externally, if the Pain from the Stone and Iſchury is very violent, Baths of ſweet Water, in which emollient Subſtances, ſuch as Mallows, Marſhmallow-roots, and Chamomile-flowers, have been boiled, are highly beneficial. It is, alſo, of conſiderable Service to apply Bags, filled with the ſame things, warm to the Region of the Pubes, the anointing which with Oil of Scorpions is, alſo, productive of happy Effects.

Catarrhous Diſorders in Children.

Infants, alſo, in conſequence of a large Quantity of pituitous Juices, are highly ſubject to catarrhous and ſerous Diſorders, among which we reckon a Coryza, a Stuffing of the Head, Hoarſeneſs, Coughs, Aſthmas, Infarctions of the Breaſt, accompanied with a kind of Snorting and Wheezing, Inflammations of the parotid Glands, and the Cruſta lactea: All which Diſtempers agree, in general, in this, that they, for the moſt part, derive their Origin from a Fault in the Air, a ſudden Change of Weather, and a Suppreſſion of Tranſpiration.

As to what belongs particularly to the Aſthma and Cough, eſpecially of the dry and violent kind, it muſt be obſerved, that theſe Diſorders, accompanied with a great Difficulty of Breathing, and Dread of Suffocation, not only often rage epidemically, but, alſo, in a particular manner, as Experience teſtifies, attend a difficult Dentition, if the Nerves ſubſervient to Reſpiration

are

are convulſed and vellicated, in conſequence of the mutual Conſent of the Parts. Theſe Diſorders, alſo, frequently happen from an improper Treatment of the Small-pox and Meaſles; eſpecially when, after the Diſeaſe is ſubdued, neither an Evacuation by Stool, nor inſenſible Tranſpiration, are duly promoted; or, alſo, when a certain acrid excrementitious Matter, in an Eryſipelas, Purple Fever, or Cruſta Lactea, has been repelled to the internal Parts; for then Infarctions of the Lungs, and troubleſome Irritations of the pulmonary Nerves, which excite an Aſthma and Cough, are generally produced by the acrid and viſcid Humour. Laſtly, theſe Diſorders are principally produced by an exceſſive Inflation of the Stomach, occaſioned by viſcid Milk ſtagnating there in too large a Quantity, and obſtructing the Deſcent of the Diaphragm. Hence we often obſerve, that Vomiting, either ſpontaneous, or excited by Art, affords conſiderable Relief, as well to Perſons afflicted with a Cough, as to thoſe labouring under an Aſthma.

For the Cure of a Cough and Aſthma, abſorbent Powders internally exhibited, with Root of *Florentine* Orris, Sperma Ceti, and Sugar-candy, are highly beneficial; as, alſo, a balſamic Elixir, prepared of the Tincture of Tartar, the Eſſences of Myrrh, Saffron, Nutmeg, and Orange-peel, together with Spirit of Sal Ammoniac. But, in dry and more delicate Patients, it is more expedient to exhibit a proper Doſe of the following pectoral Elixir:

Take of the Extract of Saffron, four Grains; of the Waters of Paul's betony, and Hyſſop, each half an Ounce; and of the Syrup of white Poppies, or the Syrupus de Eryſimo Lobelii, two Drams: Make into an Elixir.

To theſe we may commodiouſly add, at proper Intervals, warm Infuſions of pectoral Herbs; by which, eſpecially during a moiſt and cold Temperature of the Air, Tranſpiration is not only greatly promoted, but a Reſolution of the inſpiſſated Fluids commodiouſly obtain'd: And theſe are, likewiſe, ſalutary, when an obſtinate and dry Cough ariſes either from, or is accompanied with, an acrid Lymph, irritating the Larynx; eſpecially when, at the ſame time, in order to correct the Acrimony, Sperma-ceti is diſſolved in Broths, or reduced to the Form of an Electuary, with Oil of ſweet Almonds, Sugar-candy, *Fernelius's* Syrup of Marſhmallows, and a few Drops of the Oil of Aniſe, and exhibited at proper Intervals.

If at any time an Aſthma, attended with a Cough, proceeds from acid and viſcid Crudities, fluctuating in the Stomach, and producing an Inflation of it, we often, with Succeſs, give a mild Emetic, prepar'd of half a Grain, or a Quarter of a Grain, of emetic Tartar, mixed with diſſolv'd Manna; or a few Grains of the Root of Ipecacuanha, infuſed in warm Water, which is to be edulcorated by the Addition of ſome proper Syrup. This End is very well anſwer'd, likewiſe, by emollient and carminative Clyſters, which, by preparing a Paſſage downwards for the Flatulences, contribute greatly to a ſucceſsful Removal of the Diſeaſe.

If a repel'd, acrid, and excrementitious Matter gives Birth to the Diſorder; beſides internal Diaphoretics, gentle Veſicatories, applied to the Nape of the Neck, often produce an happy Effect. But, externally, in theſe Diſorders of the Breaſt, conſiderable Relief is afforded, by anointing the Parts affected, with human Fat, and vinous Spirit of Sal Ammoniac.

Achors, Vari, and Tineæ, are ulcerous Tubercles, proceeding from a peccant, corrupted, ſaline, and viſcid Serum, contain'd in the ſubcutaneous Glands and Ducts; and generally draw their Origins from an exceſſive Voracity, corrupted Milk of the Nurſe, and a Suppreſſion of Tranſpiration, by means of Cold. The ſame Cauſes produce Inflammations of the parotid Glands, and a Diſcharge of Matter from the Eyes and Ears.

All theſe Diſorders, as well as other catarrhous Defluxions, are beſt remedied, partly by exhibiting to the Nurſe ſuch Infuſions as dilute the Blood and Lymph, thoſe, for Inſtance, prepar'd of Liquorice-root, the Bark and Root of Saſſafras, and Fennel-ſeed; and partly by means of *Crato's* Pilulæ de Succino, both with and without Mercury; as, alſo, by the pectoral Elixir laſt mention'd. But to the Infant we are to exhibit Powders, prepar'd of diaphoretic Antimony, Crabs-eyes, *Florentine* Orris, Milk of Sulphur, a little Saffron, and Oil of Aniſe. For this Intention we, alſo, exhibit Laxatives, and Preparations of Mercurius Dulcis, Rhubarb, and Manna. Inflammations of the parotid Glands are, beſides the internal Uſe of Reſolvents, to be treated externally with the ſimple Diachylon Plaiſter, mixed with Camphire; and, if the Tumor cannot be diſcuſſed, it is to be maturated by emollient Cataplaſms.

Of Hiccups and Vomiting in Children.

Hiccups, as well as Vomitings, ariſe from the Stomach, and are excited by Crudities accumulated in it: For, if a tenacious acrid Mucus is firmly ſeated in the ſuperior Orifice of the Stomach, this Organ is not only ſtimulated to a Diſcharge of its Contents, or a Vomiting; but, alſo, the Diaphragm, in conſequence of their mutual Conſent, is affected with convulſive Motions; and, the Diaphragm being contracted in Inſpiration, Hiccups, ſometimes of a very obſtinate Nature, are excited: Hence it, alſo, frequently happens, that Infants are afflicted with the Hiccups, and a Vomiting, at one and the ſame time.

Both theſe Diſorders often proceed from too great a Repletion of Milk, or a Corruption of that Liquor in the Stomach: When this is the Caſe, a milky kind of Subſtance, commonly of a bad Colour, and diſagreeable Smell, is, for the moſt part, diſcharg'd by Vomit. But extreme Cold is often productive of theſe Misfortunes; or even difficult and painful Dentition may be the Cauſe, if, in conſequence of the Conſent of the Parts, the Diaphragm and Stomach are affected.

If Vomitings and Hiccups proceed from taking too large a Quantity of Milk, they ſcarcely prognoſticate any Danger; ſince every one knows, that, in this Caſe, Children are generally relieved by Vomiting: But, if they ſpring from a Corruption of the Milk, the State of the Patient is more dangerous, becauſe Epilepſies and Convulſions often enſue, and prove fatal.

The Cauſes of theſe Diſorders indicate a proper Method of Cure: For if Milk, taken plentifully, offends, its Quantity ought to be leſſened for the future; but, if the Diſorder proceeds from its depraved Quality, we ought to procure a proper Excretion of it, both from the Nurſe and Infant. The Method of obtaining this End has been already ſpecified.

But, in both theſe Diſorders, ſingular Relief is generally afforded by Syrup of Mint, or Betony, exhibited with a few Drops of the Oil of Mace, or of the anodyne Liquor, as alſo the Waters obtained from Chamomile-flowers, Yarrow, Mint, and black Cherries, mixed with a proper Quantity of the ſame anodyne mineral Liquor. Externally, great Relief is afforded by Frictions with warm Cloths, and by anointing the Region of the Stomach with the following Ointment:

Take of the Oil of Dill, one Ounce; of the Oil of Mint, half a Dram; of Saffron, one Scruple; and one Yolk of an Egg: Make into an Ointment.

Of Costiveness in Children.

Infants are ſometimes coſtive, and at other times have their Bodies too ſoluble. The former of theſe Misfortunes is produced, when Infants are too voracious; or when the Nurſes, whilſt yet ſuckling them, indulge themſelves in the Uſe of groſs and acid Meats, or ſpirituous Liquors. But though no Injury ariſes immediately from a ſlow Excretion of the Fæces, yet, if they are retained too long, they often lay a Foundation for great and violent Diſorders.

In order, therefore, to render the Body duly ſoluble, the principal Intention to be purſued, is to take care, that the Nurſe uſes a light and reſolving Diet, exhibiting, at proper Intervals, Currants, either reduced to the Form of an Electuary, with Rhubarb and Sugar, or boil'd with Apples. But the Infant is relieved either by Syrup of Succory, with Rhubarb, and a few Grains of white Mechoacan, exhibited at proper Intervals; or by Clyſters prepared either of a Decoction of Oats with Honey and Butter, or of Whey, and *Venice* Soap. It is, alſo, of great Service to anoint the lower Part of the Abdomen, about the Navel, with Oil of ſweet Almonds, mixed with a due Quantity of the Trochiſci Alhandal, reduced to Powder.

Of Fluxes in Children.

The Diſorder oppoſite to Coſtiveneſs is a Diarrhœa, or exceſſive Flux, which happens to numberleſs Infants, from the Tranſports of Paſſion, and the improper Diet of the Nurſe; from an obſtructed Perſpiration; a vitiated Digeſtion of the Food; and an Acrimony of the Bile, occaſioned by theſe means; whence Fæces of various Colours, Smells, and Conſiſtences, and often bloody, are frequently diſcharged, for no other Reaſon, but becauſe the Inteſtines, either ſpaſmodically conſtricted, expreſs the contained Sordes, or, for want of a due Tone, let them ſlip involuntarily through them. For this Reaſon it often happens, that ſuch Stools not only attend violent Pains, thoſe, for Inſtance, produced by difficult Dentition, but are, alſo, very familiar to thoſe who either labour under an Atrophy, or a Palſy.

Though this diſagreeable Diſtemper is very troubleſome both to Infants and others, and often threatens a fatal Event; yet it ought not to be ſuddenly checked, eſpecially if Children bear it well, and if its Suppreſſion is not indicated as proper, by Inquietudes, Watchings, Gripings, an Atrophy, and other Symptoms. But, when this happens, we muſt firſt of all have regard to the Milk of the Nurſe, if the Child ſtill uſes it; and, if ſhe lays a Foundation for the Diſtemper, ſhe muſt be changed, uſing, at the ſame time, for Drink, a Ptiſan prepared with Juice of Quinces; or Broths, boiled with Fowls, Rice, and Millet.

The diſordered Infant may be relieved by taking internally Powders of *Armenian* Bole, and Crabs-eyes, with a few Grains of the Bark of Caſcarilla; to which, according to the Circumſtances, may be added Amber, or a third Part of the Theriaca cœleſtis, for a Doſe: But, externally, nothing is of more Service than anointing the Belly with the following Liniment warm.

Take of the expreſſed Oil of Nutmeg, and of the Oil of Jeſſamine, each half an Ounce; of Peruvian Balſam, and of the Oil of Mint, one Dram. Make into a Liniment.

And, beſides theſe, in ſuch a State of the Diſeaſe, great Advantage accrues from the Uſe of Clyſters, prepared of ſweet Whey, boiled with Millet and Rice, and ſtrained; which, alſo, affords great Relief in a Teneſmus, with which this Diſorder is frequently accompane d; tho' this Misfortune, when of long ſtanding, is moſt effectually removed by Suppoſitories prepar'd of the Yolk of a roaſted Egg, with Saffron, Frankincenſe, and one Grain of Opium. *Frederic Hoffman.*

Boerhaave thus treats of the Diſeaſes of Infants.

New-born Infants are ſubject to ſome Diſorders peculiar to themſelves; and which ariſe, firſt, from glutinous, caſeous, and viſcid Strigments, lodged in the Mouth, the Oeſophagus, the Stomach, and the Inteſtines.

From this Cauſe alone often ariſe Nauſeas, Vomitings, Gripes, Hiccups, and Convulſions, and a conſequent Indigeſtion of the Aliments.

The Diſorders produced by this Cauſe are eaſily cured by Faſting for ten or twelve Hours; by repeated Doſes of a ſmall Quantity of Wine, mixed with Honey, during this time of Abſtinence; or by a gently ſtimulating Purgative. Thus:

Take of Honey, *French* Wine, and Hydromel, each half an Ounce: Mix all together for one Doſe.

A gentle ſtimulating Purgative may be prepared in the following manner:

Take of the Syrup of Succory with Rhubarb, three Drams; of *Venice* Soap, half a Dram; and of diſtilled Baum-water, half an Ounce: Mix all together for one Doſe.

In order to waſh away theſe pituitous and mucous Sordes, Epithems moderately aromatic and ſpirituous are often highly efficacious. For this Purpoſe,

Take of Cinnamon, Mace, Nutmeg, Maſtich, and Olibanum, each two Drams; and of the Spiritus Vini Theriacalis, four Ounces: Make into a Tincture. Then

Take one Yolk of an Egg; of the above preſcribed Tincture, half an Ounce; and of diſtilled Roſe-water, two Drams: Mix with a ſmall Quantity of the Crumbs of Bread, and apply to the Stomach.

Or,

Take of the yellow Rind of Citrons, grated, half an Ounce; of Nutmegs, two Drams; and of Spaniſh Wine, three Drams: Triturate all together in a Mortar, mix with Crumbs of Bread, and apply to the Stomach as before.

Secondly, Infants are generally ſubjected to many Diſorders, when the Meconium is not ſufficiently ſoon expel'd, either by reaſon of the Weakneſs of the Infant; the Hardneſs of the Matter; its exceſſive Quantity; or the Dryneſs of the Parts thro' which it ought to paſs.

Hence, in conſequence of the long Retention of the Meconium, and the Acceſs of the Air to it, it becomes acrimonious, acid, putrid, and is reſolved into Vapours; by which means, Gripes, Convulſions, Nauſeas, Vomitings, Hiccups, Coughs, Sneezings, Shrieks, Cries, Watchings, Startings, Fevers, Leanneſs, and, at laſt, Death, are produced.

The weaken'd Force, which ought to expel the Meconium, is augmented and increaſed by gentle Purgatives, mild Suppoſitories, and ſweet and gentle Cordials. Thus:

Take of the recent Extract of Caſſia, half a Dram; of Rhubarb, three Grains; and of the Syrup of Succory with Rhubarb, two Drams: Mix all together for one Doſe.

Or,

Take of Calabrian Manna, two Drams; of the ſolutive Syrup of Roſes, one Dram; and of diſtilled Elder-flower-water, four Drams: Mix all together for one Doſe.

Or,

Take of Virgin Honey, three Drams; of ſolutive Syrup of Roſes, with Sena, one Dram; and of diſtilled Succory-water, four Drams: Mix all together for one Doſe.

Or,

Take of the beſt Rhubarb, ſix Grains; of the beſt Agaric, two Grains; and of the Syrup of Violets, two Drams: With theſe, when carefully triturated together, mix two Drams of diſtilled Baum-water.

For Suppoſitories,

Take *Venice* Soap, form'd into a ſmall Globule or Cone.

Or,

Take a ſmall Globule or Cone of Loaf Sugar;

Or,

Take Honey, boiled to a ſufficient Degree of Hardneſs, and formed into the Shape of a ſmall Suppoſitory.

Or,

Take a ſmall Quantity of Candle-tallow, and form it into the Shape of a Suppoſitory.

Cordials to be uſed in Caſes of this Nature may be prepared in the following Manner.

Take of Honey, one Dram; of *Spaniſh* Wine, two Drams; and of the Yolk of an Egg, two Drams: Mix all together for a Draught.

Or,

Take of diſtilled Cinnamon-water, two Drams; of Elixir Proprietatis, prepared with Salt of Tartar, ſix Drops; and of the Syrup of Kermes, one Dram: Mix all together for a Draught.

The Hardneſs or Induration of the Meconium is corrected by Draughts of recent Whey, with a little Honey diluted therein, and by Clyſters impregnated either with Soap or Honey. Thus:

Take of recent Whey, four Drams; and of Honey, one Dram: Mix for a Draught.

Or,

Take of recent Whey, two Ounces; of *Venice* Soap, a Dram and an half; and of Honey, two Drams: Mix all together for a Clyſter.

The Inteſtines are lubricated by taking internally Linſeed-oil, Oil of Olives, and that of ſweet Almonds; by injecting theſe Oils by way of Clyſters; and by anointing the Abdomen with Liniments of a ſimilar Nature. Thus:

Take of Linſeed-oil, one Dram; and of the Syrup of Marſhmallows, two Drams: Mix together for a Doſe.

Or,

Take of Oil of Olives, and of the Syrup of Maidenhair, each two Drams: Mix for one Doſe.

Or,

Take of the recent Oil of ſweet Almonds, three Drams; and of the Syrup of Liquorice, two Drams: Mix for one Doſe.

Take of Linſeed-oil, half an Ounce; of the Yolk of an Egg, two Drams; of the Honey of Mercury, half an Ounce; and of recent Whey, one Ounce: Mix for a Clyſter, to be uſed once a Day, till the Inteſtines are lubricated.

Take of the compound Ointment of Marſhmallows, one Ounce; and of Linſeed-oil, half an Ounce: Mix up for a Liniment, with which the Abdomen is to be anointed every Morning and Evening.

By this Method, and the Uſe of theſe Medicines, all the terrible Diſorders, ariſing from a Retention of the Meconium, are eaſily removed.

But if, in any Diſorders, Antiacids are beneficial, they are, in a peculiar manner, ſo, in Caſes of this Nature; and eſpecially Abſorbents. Thus:

Take of Crabs-eyes, Oſteocolla, Chalk, the Jaw-bone of the Pike, and of Oyſter-ſhells, each two Drams: Mix together, and reduce to a Powder; of which ſix Grains are to be taken twice or thrice a Day.

Or,

Take of the diſtilled Waters of wild Poppy-flowers and Fennel, each two Ounces; of Crabs-eyes, two Drams; of *Venice* Soap, ſeven Grains; and of the Syrup of Marſhmallows, half an Ounce: Make into a Mixture, of which let the Patient drink two Drams every Hour, if he is not aſleep.

In theſe Diſorders of Infants, Opiates are rarely, and not without great Circumſpection, to be uſed.

We muſt, alſo, avoid all Medicines of too attenuating a Nature; and all Subſtances of a ſtimulating and volatile Quality.

A Remedy for each of the Diſorders, ariſing from a Retention of the Meconium, is eaſily diſcovered; provided we know the Hiſtory and Method of Cure in other analogous Diſeaſes.

Thirdly, Infants are ſubject to various Diſorders, when the Milk, being ſoon and ſtrongly coagulated in the Stomach, is form'd into one weighty Maſs of an acrid Quality.

This concreted Maſs, becoming gradually more acrid and acid, renders the Fæces of a greeniſh Colour, and acid Smell; and the Matter thrown up by Vomit, acid. Hence ariſe Gripes, Flatulences, Pains, and numberleſs other Diſorders, eſpecially Convulſions.

All theſe Diſorders are cured by antiacid Medicines, of a fixed Nature, mixed with Purgatives, by Clyſters of ſimilar Qualities, by mild Carminatives, and by oleous Subſtances, uſed both internally and externally. Thus:

Take of *Venice* Soap, two Drams; of the Yolk of Eggs, four Drams; of Crabs-eyes, three Drams; and of Rhubarb, half a Dram. By due Trituration mix theſe with four Ounces of diſtil'd Mint-water, and an Ounce and an half of the Syrup of Marſhmallows. Of this Preparation let the Patient take half an Ounce every Hour, till the Symtoms are abated.

Take of *Venice* Soap, half a Dram; of Sal Gemmæ, three Grains; of the Honey of Roſemary-flowers, half an Ounce; and of diſtil'd Fennel-water, an Ounce and an half: Mix together for a Clyſter.

Or,

Take of the Gall of an Ox, half a Dram; of the Honey of Mercury, half an Ounce; and of diſtil'd Mint-water, an Ounce and an half. Mix all together for a Clyſter.

The oleous Subſtances to be uſed internally are the ſame with thoſe before recommended, for lubricating the Inteſtines, in order to procure an Evacuation of the Meconium. But the oleous Subſtances to be uſed externally, in Caſes of this Nature, are the Unguentum Martiatum, and the Unguentum Nervinum; the Oils of Wormwood, Dill, Chamomile, and Rue, obtain'd by Infuſion; and the expreſs'd Oils of Bay, Mace, Nutmeg, and Palms.

From this Coagulation and Concretion of the Milk in the Stomach, generally ariſe the epileptic Fits of Children, becauſe the nervous Syſtem is irritated by means of the vellicating Acrimony, which, in Proceſs of Time, the coagulated Maſs acquires.

Hence theſe epileptic Fits, if capable of being cured, are only to be removed by means of the Remedies laſt preſcrib'd.

Fourthly, when Children have ſurmounted all theſe Diſorders, and begin to uſe crude Aliments, Summer Fruits, Fleſh, Cheeſe, and other things of a like Nature, Worms are generated in their Inteſtines.

Theſe are produced by the Eggs of Inſects, either living on the Earth, or in the Air, taken into the Stomach, and not capable of being deſtroyed by the languid Action of the Parts in Infants.

The Phlegm of the Inteſtines affords a proper Nidus for theſe Eggs, in which they ſtick, are cheriſh'd, hatch'd, and enlarg'd.

Hence Worms are rarely obſerv'd in Adults, and, if they are, they are only found in Patients of languid and leucophlegmatic Habits.

Theſe Worms are either round, broad, or of that Kind commonly called Aſcarides.

Theſe Inſects, by their Irritation of the Parts, produce Nauſeas, Vomitings, Fluxes, Deliquiums; ſmall, deficient, and intermitting Pulſes; as, alſo, an Itching of the Noſtrils, and epileptic Fits.

Theſe Animals, alſo, by conſuming the Chyle, produce exceſſive Hunger, Paleneſs, Weakneſs, Coſtiveneſs, and a conſequent Tumor of the Abdomen, accompanied with Eructations, and Rumblings of the Inteſtines.

Theſe noxious Inſects, alſo, frequently perforate the Inteſtines themſelves.

For which Reaſon they are ſo often obſerved to prove mortal.

The Preſence of Worms may be known from the Age of the Patient, his Food, his peculiar Habit of Body, and from the Effects theſe Inſects produce, and which are already enumerated.

This Species of Diſorder is to be cured, firſt, by deſtroying that Phlegm of the Inteſtines, which affords a proper Nidus for theſe Animals, by means of fix'd Alkalis, ſuch Gums as expel Phlegm, Preparations of Mercury and Antimony, together with aromatic Bitters. Thus:

Take of Gum-opopanax, one Dram; and of the Yolks of Eggs, two Drams: Mix according to Art. Then add of *Venice* Soap, one Dram; of Syrup of Mugwort, one Ounce and an half; and of diſtil'd Fennel-water, three Ounces. Of this Preparation let the Patient take one Dram, every four Hours, for one or two Days, uſing, at the ſame time, a proper Regimen.

Or,

Take of Æthiops Mineral, and Troches of Agaric, each one Dram; and of the fineſt Sugar, one Dram and an half: Reduce to a Powder, to be divided into ten Doſes, one of which the Patient is to take every Morning and Evening, on an empty Stomach.

Or,

Take of the Salt of Carduus Benedictus, two Drams; of the Syrup of the Five aperient Roots, one Ounce; and diſtil'd Fumitory-water, four Ounces: Mix all together, and let the Patient take three Drams, every three Hours.

Or,

Take of common Wormwood-ſeeds, Worm-ſeed, and Tanſey-ſeeds, each two Drams; and of Honey, two Ounces: Mix all together, and let the Patient take two Drams every Morning.

The Phlegm of the Inteſtines, which affords a Nidus for theſe Animals, is, alſo, deſtroyed by anointing the Abdomen with Balſams prepar'd of ſtrong Aromatics, mix'd with purgative and oleous Subſtances. Thus:

Take of the Ointments of Agrippa, and Sow-bread, each an Ounce: Make into a Liniment, with a little of which let the Region of the Navel be now-and-then anointed.

Or,

Take of the Gall of a Bull, and pure Aloes, each one Dram; and of the Ointment of Marſhmallows, one Ounce. Make up into a Liniment, for the ſame Uſe.

Or,

Take of the Oils of Tanſey and Caſtor, each half an Ounce; and of the Unguentum Nervinum, one Ounce: Make all into a Liniment, for the ſame Purpoſe.

But in the Uſe of theſe Medicines we are carefully to obſerve, whether they operate too violently; in which Caſe we are to abſtain from an immoderate Uſe of them, leſt by this means a Dyſentery ſhould be brought on.

The ſecond Intention to be purſued in the Cure of this Diſorder is, to kill the Worms, which is done by Medicines prepared with Honey; by ſaline Subſtances; by ſuch things as cannot be digeſted by theſe Inſects; by bitter Aromatics; by Preparations of Mercury; by Acids; and by Preparations of Vitriol, obtain'd from Iron, or Copper. Thus:

Take of Honey, two Ounces; of Sal Gemmæ, a Dram and an half; and of diſtil'd Succory-water, four Ounces: Mix up for a Liquor, of which the Patient is to drink half an Ounce every Hour of the Day.

Or,

Take of calcin'd Hartſhorn, one Scruple; mix with two Drams of the Syrup of pale Roſes, and exhibit to the Patient four times a Day.

Or,

Take of Sea-coral, two Drams; and of the Filings of Steel, half a Dram. Reduce to a Powder, to be divided into ſixteen Doſes, for the ſame Purpoſe.

Or,

Take of Worm-ſeeds, the Seeds of Rue, Tanſey, and Wormwood, each one Dram; and of Sugar, three Drams: Reduce to a Powder, to be divided into ſixteen Doſes, for the ſame End.

Or,

Take of recent Hydromel, one Pint; of Worm-ſeed, and Tanſy-ſeeds, each an Ounce. Make into a medicated Wine, with which, when depurated, mix two Ounces of Virgin Honey. Of this Preparation let the Patient take an Ounce, in the Morning, on an empty Stomach.

Or,

Or,

Take of Æthiops Mineral, eight Grains; and of Vitriol of Iron, gently calcin'd, two Grains: Reduce to a Powder, to be divided into two Doſes; one of which is to be taken in the Morning, and another at Night, on an empty Stomach.

Or,

Take of Mercurius Dulcis, ſeven Grains; and of Diagrydium, five Grains: Reduce to a Powder, to be taken with Hydromel, in the Morning.

Or,

Take of vitriolated Tartar, four Grains; and of Vitriol of Iron, three Grains: Reduce to a fine Powder, to be divided into three Doſes; of which one is to be taken in the Morning, the other at Noon, and the third at Night, on an empty Stomach.

Or,

Take of common Vitriol, two Grains; and of the Syrup of Violets, four Drams: Mix together for one Doſe, to be taken in the Morning, on an empty Stomach.

The third Intention to be purſued is, to expel and diſlodge the Worms, whether dead or alive, by means of bitter Purgatives, ſuch Medicines as evacuate Phlegm, and Preparations of Mercury. Thus:

Take of Diagrydium, four Grains; and of Mercurius Dulcis, ſix Grains: Reduce to a fine Powder, to be taken for one Doſe.

Or,

Take of Jalap-root, and Æthiops Mineral, each twelve Grains: Reduce to a Powder, to be us'd in the ſame manner with the preceding.

Or,

Take of Agaric, eight Grains; and of Æthiops Mineral, twelve Grains: Reduce to a Powder for the ſame Intention with the former.

Or,

Take of Aloes, three Grains; of Reſin of Jalap, one Grain; and of Vitriol of Iron, two Grains: Reduce to a Powder, to be us'd with the ſame Intention as the former.

Worms, whether dead or alive, are alſo excellently diſlodg'd by means of Clyſters, Suppoſitories, and Ointments externally apply'd. Thus:

Take of the Oil of Linſeed, three Ounces; and inject as a Clyſter.

Or,

Take of Honey, two Ounces; and of diſtil'd Succory-water, two Ounces: Mix and inject as a Clyſter.

Or,

Take of a Decoction of Tanſey, three Ounces; and of Aloes, ſix Grains: Mix for a Clyſter.

Or,

Take of the Vitriol of Iron, fifteen Grains; and of diſtil'd Succory-water, four Ounces: Mix for a Clyſter.

Take of Honey, boil'd to a due Thickneſs, four Ounces; of Aloes, half an Ounce; and of the Vitriol of Iron, two Drams: Make into ſmall Suppoſitories, to be us'd immediately after going to Stool.

The Ointments, in this Caſe, to be us'd externally, are the ſame with thoſe before recommended, for deſtroying the Phlegm of the Inteſtines, which affords a Nidus for the Worms.

When the Teeth, eſpecially thoſe of the ſharp Kind, begin to make their Eruption, by reaſon of the Tenſion, Puncture, and Laceration of the Gums, which are liberally furniſh'd with Nerves and Blood-veſſels, there ariſe Inflammations, Tumors, Gangrenes, Convulſions, Fluxes, the Matter evacuated in which is green; preternatural Diſcharges of the Saliva, Fevers, and Death.

That all theſe Symptoms proceed from one and the ſame Cauſe, is ſufficiently certain.

But, when the Irritation of the Nerves is remov'd, theſe Diſorders ceaſe ſpontaneouſly.

Now, the Irritation of the Nerves is remov'd, firſt, by mollifying, refrigerating, and ſoothing the Gums, by means of emollient, glutinous, and antiphlogiſtic Medicines. Secondly, by frequently rubbing them againſt hard and ſmooth Bodies. And, thirdly, by laying them open with a Lancet. Thus:

Take of Nitre, twenty Grains; of the Spirit of Salt, five Drops; of the Syrup of Violets, one Ounce; and of diſtil'd Elder-flower-water, three Ounces: Mix all together; and with this Mixture let the Gums be fomented.

Or,

Take of the recent Cream of Milk, and the Yolks of Eggs, each an Ounce; of the Syrup of Violets, ſix Drams; and of diſtil'd Roſe-water, three Ounces: Mix all together for the ſame Uſe with the former.

Or,

Take of the Flowers of Roſes and Elder, each half a Pugil; include them in a Linen Cloth with a Piece of Lead hung to it, ſufficient to keep it from ſwimming; then put it into a long cylindrical glaſs Veſſel, and pour upon it new Milk, and let the Whole remain in Digeſtion for a due time: And the Cream, which floats on the Surface of the Milk, is is to be apply'd to the inflam'd Gums.

The Convulſions, produc'd by Dentition, are happily remov'd by a moderate Doſe of the Spirit of Hartſhorn. Thus:

Take of the Spirit of Hartſhorn, three Drops; and of the Syrup of Kermes, two Drams: Mix together, and exhibit to the Patient thrice a Day. *Boerh. Aphor.*

INFECTIO, in Medicine, is Contagion, or Infection.

INFELIX *Lignum*. A Name for Elder.

INFIBULATIO. Infibulation. It was a Cuſtom, among the *Romans*, to infibulate their Singing-boys, in order to preſerve their Voices; for this Operation, which prevented their retracting the Prepuce over the Glans, and is the very Reverſe to Circumciſion, kept them from injuring their Voices by premature and prepoſterous ideal Venery, ſerving as a kind of Padlock, if not to their Inclinations, at leaſt, to their Abilities. It appears by ſome Paſſages in *Martial*, that a leſs decent Uſe was made of Infibulation among the luxurious *Romans*; for ſome Ladies of Diſtinction, it ſeems, took this Method of confining their Paramours to their own Embraces. *Juvenal* too, as I remember, hints at ſome ſuch Practice. *Celſus*, a chaſte Author, ſays, Infibulation was practis'd ſometimes for the ſake of Health, I ſuppoſe he means for the Preſervation of it; for nothing deſtroys it more, than the filthy Practice this Operation ſeems intended to prevent. I believe Infibulation is not likely to be reviv'd: If, however, any one, who has ſuffered much in his Conſtitution by prepoſterous Venery, ſhould be able to get Children, which is not very likely, and ſhould be inclin'd to prevent the ſame Misfortunes in them by Infibulation, the Method of doing it is thus.

The Skin, which is above the Glans, is extended, and mark'd on both Sides with Ink, where it is to be perforated, and then ſuffer'd to retract itſelf. If the Marks recur upon the Glans, too much of the Skin has been taken up, and we muſt make the Marks farther; if the Glans remain free from them, they ſhew a proper Place for affixing a Fibula: Then they paſs a Needle and Thread thro' the Skin, where the Marks are; and, tying the Thread together, take care to move it every Day, till the Parts about the Perforations are cicatrized; which, being perfectly effected, they take out the Thread, and put in the Fibula, which the lighter it is, the better. *Celſus, Lib. 7. Cap. 25.*

Authors have not determin'd what the *Fibula* of the antient Surgeons was, tho', no doubt, they were, for different Purpoſes. In the preſent Caſe, the *Fibula* ſeems to mean a Ring of Metal, not unlike that which the Country People put thro' the Noſes of Swine.

INFLAMMATIO.

That Diſorder, to which we give the Name of *Inflammation*, or *Phlegmon*, is ſo call'd, becauſe it produces Effects ſimilar to thoſe of Fire.

By means of Thermometers we know, that a larger Quantity of Fire is lodg'd in an inflam'd Part, than any-where elſe in the Body; and that, preciſely, the ſame Effects are produc'd by it, as would be produc'd by the Application of elementary Fire. Thus, for Inſtance, when a ſound Man puts his Hand too near a Fire, he will begin to perceive a greater Heat than uſual, and the Part will gradually become red. If he puts it ſtill nearer, a Tumor and Pain will be produc'd; and, if he continues to put it ſtill nearer, the Pain will be greatly increas'd, the Epidermis rais'd in Bliſters will be ſeparated, and, at laſt, by the increas'd Action of the Fire, the Skin will be burn'd into an Eſchar, which, being entirely mortify'd, muſt afterwards be ſeparated from the live Parts by a Suppuration. Now, the ſame Symptoms happening in the ſame Order, ſucceed Inflammations; for an Inflammation in the Back of the Hand is accompany'd with Heat, Redneſs, Tumor, and Pain, all which are increas'd according as the Diſorder is augmented. In a violent Inflammation tending to a Gangrene, the Epidermis is, in like manner, rais'd in

Bliſters, and gangrenous Cruſts are form'd, which muſt afterwards be ſeparated from the live Parts by Suppuration. If the Violence of the Inflammation proceeds ſtill farther, all the Parts to the very Bone are render'd black, as if they had been burn'd to a Coal by live Fire; and, in this Caſe, a Sphacelus is ſaid to be preſent. Hence *Hippocrates* call'd a burning Fever τὸ πῦρ, becauſe, in that Diſorder, ſuch an Heat is often excited about the vital Parts, as to make the Patient believe, that a real Fire is lodg'd there. By this Circumſtance, ſudden Death is often produc'd. And, in a Fever of the moſt intenſely burning Kind, that is, the Plague, whilſt the Malignity of the Diſorder is, by a Tranſlation, conveyed to the other Parts of the Body, theſe are burned in the ſame manner as if the actual Cautery had been applied to them, as is obvious in peſtilential Carbuncles, which afterwards fall off, by a Suppuration happening all round them, juſt as when the Part is burned by the Application of the actual Cautery. Thus the ſagacious Antients, obſerving the Similitude between the Effects of Fire, and an Inflammation, gave the latter its Denomination from the former; ſince the Cauſes and Effects exactly correſpond to each other. This Doctrine is beautifully confirmed by modern Experiments with reſpect to the Nature of Fire.

An Inflammation is a Preſſure and Attrition of the red arterial Blood ſtagnating in the ſmalleſt Canals, produced by the Motion of the reſt of the Blood, thrown into violent and forcible Commotions, by means of a Fever.

Here we have the Definition of an Inflammation from its Cauſes, though the Antients defined this Diſorder from its Symptom. Thus *Galen, in Comment.* 3. *in Lib. Hippocratis de Fracturis*, informs us, that they defined an Inflammation, a preternatural, reſiſting, hard, red, and hot Tumor, accompanied with a pungent Pain, and generally with a Fever. But it is to be obſerved, that this Definition only regards Inflammations, which happen in thoſe Veſſels, which naturally contain the red Blood, or, at leaſt, which, being dilated, are capable of receiving it. But what happens in an Inflammation of the more minute Veſſels, we ſhall afterwards conſider.

In this Definition Author, two things occur, which, when joined together, conſtitute the Nature of an Inflammation; that is, Obſtruction, and an increaſed Celerity of the Blood flowing into the Part obſtructed; for in an Inflammation the Blood ſtagnates, and cannot paſs through the narrow Cavities of the Veſſels, though preſſed forward by an impelling Liquor. Hence it is obvious, that in this Caſe there is an Obſtruction. The obſtructing Matter is red Blood, but of the arterial Kind; becauſe an Obſtruction, properly ſo called, can only happen in the Arteries. The Parts obſtructed are the narroweſt Chanels of the minute Ducts; becauſe it is obvious, that the Molecules, incapable of paſſing through theſe, may be conveyed through the larger Cavities of the Veſſels. Theſe Molecules will, therefore, ſtop about the Ends or Terminations of the converging Veſſels. But here we do not ſpeak of the moſt minute Ducts of the human Body, but only of the narroweſt Ramifications of the larger Veſſels, which contain the red Blood, the thickeſt Part of the human Fluids. Hence theſe Canals are only called minute, as compar'd with the larger Veſſels, but they are, at the ſame time, the largeſt among the minute Ducts; for the Extremity of the Artery containing red Blood is always larger than the Artery containing the Serum, which ariſes from it, and which, in conſequence of the Smalneſs of its Diameter, naturally excludes the red Part of the Blood. Thus, in like manner, the Extremity of the Artery containing the Serum is, for the ſame Reaſon, larger than the Artery containing the Lymph which ariſes from it. Hence it is obvious, that a true Phlegmon can ſcarcely happen except in the minute Arteries containing the red Blood, or in the Arteries containing the Serum, ſo dilated as to receive it. But when Molecules, in conſequence of their Bulk, ſtick in the narrow Cavities of the converging Veſſels, the Fluid acting upon them, in conſequence of the vital Motion, will neceſſarily compreſs them with a pretty great Force; for by the Action of the Heart and Arteries, the Blood is carried to the obſtructed Parts with a Force ſufficient to have conveyed it to the Extremities of the Body with a due Degree of Celerity. Hence the Preſſure will be great, and renewed at every freſh Contraction of the Heart and Arteries. But, ſince theſe obſtructing Molecules ſeem to remain immoveably fix'd in the narrow Chanels of theſe minute Ducts, it may, at firſt, ſeem improbable, that there ſhould be any Attrition, which ſuppoſes the Motion of theſe Molecules backwards and forwards; but it is obvious, that theſe Molecules are not always abſolutely immoveable, but ſometimes forced back to a wider Part of the Artery, by its Contraction, and, at other times, protruded into the narrow Cavities, by the Action of the Heart, which fills the Arteries with Blood. Hence there is, in this Caſe, a true and genuine Attrition.

What has hitherto been ſaid, is equally applicable to Obſtructions formed in the minute Ducts, by a Stagnation of the red arterial Blood, as to Inflammations. Hence, in the Definition of an Inflammation, theſe Words are added, *by means of a Fever*. When an Inflammation ſeizes any conſiderable Part of the Body, or any of the Viſcera, 'tis almoſt always found to be accompanied with a Fever. And it may, alſo, be aſſerted, that ſlight Inflammations, eſpecially of ſmall external Parts, are accompanied with a Fever; tho' Ophthalmias and inflammatory Quinſeys are often found to be unattended with any Change or Alteration of the Pulſe. *Galen*, in his Treatiſe *de Pulſibus ad Tyrones*, *Cap.* 12. has beautifully explained this, when treating of the Nature of thoſe Pulſes, which accompany an Inflammation. His Words run thus: "When an Inflammation is beginning, "the Pulſe is greater, more vehement, quick, and frequent, "than in its natural State; in proportion as the Inflammation "increaſes, all theſe Qualities are augmented, and the Pulſe be-"comes ſenſibly harder." A little after, he ſubjoins; "This "Inflammation is capable of changing the Pulſe thro' the whole "Body, according to the Bulk or Importance of the Part in-"flam'd. If it ſhould not affect the whole Body, there will, "nevertheleſs, be a ſimilar Pulſe in the Part inflamed." Under this Limitation, we are, therefore, to underſtand the Aſſertion, that every Fever is accompanied with an Inflammation; for, if the Strength and Celerity of the Pulſe are not increaſed thro' the whole Body, yet they will be ſo in the inflamed Part; and this is, as it were, a Fever of the Part itſelf, as *Galen*, in his Treatiſe *de Methodo Medendi ad Glaucon. Lib.* 2. *Cap.* 1. juſtly obſerves; for, after he has ſaid, that there are various Kinds of Inflammations, he affirms, that almoſt all of them are accompanied with a Fever. Then he lays down the firſt Difference of Inflammations, which is that between the moiſt, and the dry Kind: "The moiſt, ſays he, is produced by "a Fluxion of hot Humours to the Part; whereas the dry Kind "is the Effect of a preternatural Heat, kindled in the Part, with-"out any Congeſtion of the Humours: And this is, as it were, "a Fever of the Part affected." 'Tis, alſo, confirmed, by the Opinion of the moſt antient Phyſicians, that an accelerated Motion of the Fluids always accompanies an Inflammation. Thus *Celſus*, in his Preface, when recounting the various Sects and Opinions of Phyſicians, uſes the following Expreſſions: "If "the Blood is transfuſed into thoſe Veins, which ought to con-"tain the Spirits, it excites an Inflammation; and that Inflam-"mation produces a Commotion, like that which happens in a "Fever, as *Eraſiſtratus* maintained;" where it is to be obſerved, that 'tis not expreſly ſaid, that a Fever is produc'd whilſt the Inflammation is preſent, but only that ſuch a Commotion, as happens in Fevers, is brought on.

Hence *Simſon*, in his *Syſtem of the Womb*, has, with great Juſtice, given a Caution to Phyſicians, not to be deceived, by imagining that there cannot be an Inflammation where there is no Fever; ſince it often happens, that an Inflammation of the Stomach and Inteſtines produces fixed Pains, when no Fever can be obſerved by feeling the Pulſe. He, alſo, affirms, that he has known ſpurious Epidemical Pleuriſies afflict Patients for ſeveral Months, without a concomitant Fever, unleſs ſpeedily removed by Veneſection, and other Medicines proper for carrying off an Inflammation.

From what has been ſaid, it is ſufficiently obvious, that Obſtructions have many things in common with Inflammations; for no Inflammation can be conceived without concomitant Obſtruction. Beſides, a violent Obſtruction in ſome Veſſels increaſes the Velocity of the Fluids circulating in others, which remain pervious and open; that is, produces a Fever. But as ſoon as a Fever accompanies an Obſtruction, an Inflammation is preſent; which may, therefore, be called an Obſtruction with a Fever, either in the whole Body, or ſome Part of it.

An Inflammation may, therefore, happen in the Extremities of the Arteries, or in the Veſſels which convey the Serum and Lymph, or in other ſmaller arterial Veſſels, which, in conſequence of the Dilatation of their Mouths, have admitted the red Globules, or other thick Elements of the Fluids, but cannot convey them through their Extremities. If the Blood, alſo, is conveyed into thoſe Veins, which ought only to contain the Spirits, an Inflammation is produced. *Celſ.*

An Inflammation, therefore, or Phlegmon, properly ſo called, as is obvious from the Definition, can only happen in theſe Veſſels which naturally contain the red Blood; or in thoſe whoſe Orifices are in certain Diſeaſes, obſerved to be ſo dilated, as to admit ſome Part of the red Blood. In the other ſmaller Veſſels, the Elements of a thinner Fluid, concreted by whatever Cauſe, may, in like manner, ſo remain, as not to find a Conveyance through them; and a ſucceeding Fluid may, alſo, with a conſiderable Velocity, act upon theſe obſtructed Parts; but, ſo long as no Redneſs appears in the Part affected, the Diſorder is not called an Inflammation, but an Eryſipelas, or an Oedema, attended with Heat, as we ſhall afterwards obſerve. But how far the red Part of the Blood may penetrate, or into what particular Number of decreaſing Series of Veſſels it may enter, are Points

not

not as yet ſufficiently aſcertained by Experience. It is, however, certain, that the red Blood may, in certain Diſeaſes, not only enter theſe Veſſels, which, being next in Bulk to the Blood-veſſels, contain the yellow Serum, but, alſo, thoſe far more minute Veſſels, which naturally contain only pellucid Fluids. Thus the White of the Eye, which, in a ſound Perſon, almoſt reſembles the Splendor of Pearls, upon the Approach of an Inflammation, often becomes totally red, and exhibits numberleſs Ramifications of ſmall Veſſels; which, being diſtended with red Blood, may be diſtinctly obſerved by the naked Eye, though in a natural State they contained nothing of a coloured Fluid. In violent Ophthalmias, I have often evidently perceived a Veſſel full of red Blood paſs through the highly pellucid Subſtance of the Tunica Cornea. But that the Veſſels of the Cornea are ſmaller than thoſe of the Adnata, is not to be doubted, ſince thoſe of the former, in a State of Health, appear perfectly pellucid, with their Contents; and, when an Inflammation ariſes in the Eye, the minute Veſſels, about the Diſk of the Cornea, appear diſtended with red Blood, before the Cornea itſelf is affected; till, at laſt, by the Strength and Duration of the Diſeaſe, its Veſſels, being gradually dilated, may admit the red Blood. Hence it is obvious, that a true ſanguineous Inflammation may, ſometimes, happen in highly minute and ſmall Veſſels.

As for the Paſſage here quoted from *Celſus*, it is certain, that the antient Phyſicians, under the Name of Veins, comprehended not only the Veins, but, alſo, thoſe Veſſels by the Moderns called Arteries. *Eraſiſtratus*, and many of his Followers, were of Opinion, that the Blood was not contained in the Veins furniſhed with a Pulſe, or what we call the Arteries; but that theſe contained the Spirits, which produced the Pulſation in them. In the Days of *Galen*, ſeveral Phyſicians confidently affirmed, the ſame thing: And ſome aſſerted, that they could demonſtrate, that the Aorta contained no Blood. But *Galen*, in the ſixteenth Chapter of his ſeventh Book *de Anatom. Adminiſtrat.* beautifully ridicules this Notion, and ſhews it to be falſe, by accurate and ſatisfactory Experiments.

Hence, at leaſt according to *Celſus*, it is obvious, that *Eraſiſtratus* thought an Inflammation was preſent when the Blood paſſed from the Veins into the Arteries, naturally deſtitute of Blood, that is, when it was lodged in Parts where it ought not to be. But now, ſince the Circulation of the Blood is known, we admit of no ſuch Doctrine: However, this Maxim is, in ſome Senſe, to be admitted, ſince an Inflammation is produced when the Blood enters ſuch Veſſels as ought only to contain the thinner and finer Humours.

The Seat, therefore, of an Inflammation is every Part of the Body, in which there are reticular Diſtributions of Arteries, or the Origins of lymphatic and arterial Veſſels.

After *Ruyſch* diſcover'd, that almoſt every-where in the Body the Arteries were diſtributed into highly minute Ramifications, and that almoſt in every Point the ſmall Ramifications ſent off from the larger Trunks had a mutual Communication with each other; it became cuſtomary with Phyſicians, to call theſe Diſtributions of Arteries *Reticula*, or *reticular Plexuſes*; becauſe the Interſtices left between thoſe Ramifications, which meet, and are mutually complicated with each other, very nearly reſemble the Meſhes of a Net. When this great Man, for many Years, applied himſelf carefully to the Cultivation of Anatomy, he often found, that the ſmall Interſtices left between the reticular Plexuſes, which ſeemed to have no Veſſels, contained a large Number of ſmall Veſſels, diſtributed almoſt in the ſame Order as before in the large Ramifications. But where-ever the Arteries are obſerved to be divided into minute Ramifications, the Molecules of the Fluid, becoming incapable of paſſing, either by Concretion, or Change of Figure, may ſtick there; or, by leſſening the Cavities of theſe Veſſels, the Paſſage of the Fluid, which ought naturally to flow in them, may be hindered. Hence Obſtructions, and, in conſequence of the increaſed Motion of the ſucceeding Fluid, Inflammations may be produced. Since, alſo, in almoſt every Part of the Body there are ſmall Ramifications diſtributed from the Arteries containing the Blood, which, in conſequence of their Smallneſs, exclude the red Part of the Blood, the Beginnings of theſe ſmall Veſſels being dilated, through an *Error Loci*, Part of the red Blood may enter theſe ſmall Veſſels, and remain, incapable of paſſing forwards, in their narrow Chanels. Hence all the like Misfortunes will be produced.

Hence Inflammations may happen in the Arteries, Veins, Nerves, Membranes, Muſcles, Glands, Bones, Cartilages, Tendons, all the Viſcera, and, conſequently, almoſt in all the Body; but no-where more frequently, or obſtinately, than in the Fat.

Since it is certain from the anatomical Diſcoveries of the Moderns, that almoſt all the Parts of the Body are furniſhed with Veſſels perceptible by the Eye, it is obvious, that an Inflammation may happen in almoſt the whole Body, and in all the Parts here enumerated.

As for the Arteries and Veins; the Coats of theſe Veſſels are compoſed of other ſmaller Veſſels, as may be demonſtrated to the Eye by anatomical Injections in the larger Trunks of theſe Veſſels; and, in Animals killed immediately after long and faſt Running, the whole external Surface of the Aorta has frequently appeared black, in conſequence of too large a Quantity of Blood diſtending the minute Veſſels, which, by a curious and truly ſurpriſing Texture, are diſtributed through the Membranes of this large Veſſel.

As for the Nerves; theſe may be conſidered in two reſpects, either as they contain the tender Branches of the Brain, Cerebellum, and ſpinal Marrow; or as they conſiſt of tough Vaginæ, furniſhed with all kinds of Veſſels, by which Vaginæ the highly ſoft and pulpous Subſtance of the Brain, and ſpinal Marrow, is ſafely conveyed to all the Parts of the Body. It is not abſolutely certain, that the highly minute and imperceptible Veſſels, which conſtitute the Subſtance of a Nerve, properly ſo call'd, are at any time ſuſceptible of an Inflammation; yet, ſince thro' theſe an incredibly fine Fluid is conveyed from the Brain, the Cerebellum, and ſpinal Marrow, it is not abſurd to ſuppoſe, that an Inflammation may happen even in theſe: But it is ſufficiently obvious, that a genuine Inflammation may happen in thoſe larger Veſſels, which are ſo palpably diſcovered by anatomical Injections, and which, by their Texture, conſtitute the Vaginæ and Coats of the Nerves.

As for the Membranes; we know, from anatomical Injections, that thoſe Membranes which were, by the Antients, accounted the moſt ſolid, and thought to be entirely without Blood, are nothing but a Congeries of Veſſels.

As for the Muſcles and Tendons; it is, from modern Diſcoveries, certain, that numberleſs Arteries are every-where diſtributed through the muſcular Fleſh: We, alſo, know, that Tendons, apparently the moſt ſolid, and entirely white, may, by an artificial Injection, be rendered totally red, not only on account of a Repletion of thoſe Veſſels, which conſtitute the Vaginæ that cover the Tendons; but it is, alſo, certain, that many ſimilar Veſſels run between the Fibrils of the Tendons. Hence it is that Inflammations may happen in the Tendons; and that in violent Rheumatiſms, where the Muſcles are inflamed, ſo violent Pains are produced, upon making the ſlighteſt Attempts to Motion.

As for the Glands; it will amount to the ſame thing whether theſe are Convolutions of Veſſels, or hollow Follicules, diſcharging, through Emiſſories, the Fluid collected in their Cavities, and, which, being ſecreted from the numberleſs ſmall Veſſels which are diſtributed through the Membranes of ſuch Follicules, is conveyed into their Cavities; for in both Caſes numberleſs arterial Veſſels are ſaid to conſtitute the Fabric of the Gland. Hence an Inflammation may happen in them, as we daily obſerve in the parotid, ſubmaxillary, axillary, and inguinal Glands.

As for the Bones; under the Article CAPUT it is ſhewn, that the Veſſels, carried from the Perioſteum to the Bone, run between its Laminæ, whilſt others paſs through particular Perforations, to the Diploe of the Cranium; and, in other Bones, to the Marrow. Hence the Separation of the corrupted Parts, and the Reſtitution of ſuch as are loſt, are to be aſcribed to the Efficacy of the Veſſels diſperſed through the Subſtance of the Bone. An Inflammation may, therefore, be produced here, either in the arterial Veſſels running between the Laminæ of the Bone, or in the minute Veſſels of the Marrow. Hence ariſe deep-ſeated and obſtinate Pains, a Spina Ventoſa, and other Diſorders of a very terrible Nature. See the Article Os. *Galen*, in the ſecond Chapter of his Treatiſe *de Tumoribus præter Naturam*, obſerves, that an Inflammation may ſometimes happen in the Bones; for, after he has affirmed, that the Coats of the Veſſels, the Membranes, Nerves, and Tendons may be inflamed, he adds theſe Words: "Wherefore an Inflammation "may ſometimes happen in the Bones, in ſuch a manner that "they are primarily and originally affected." From what precedes this Paſſage, it is ſufficiently obvious, that *Galen* not only thought, that Inflammations of the exterior Parts might not only reach the Bone; but, alſo, that an Inflammation, originally beginning in the Bone, may ſometimes propagate itſelf to the other Parts.

As for the Cartilages; next to the Bones are the Cartilages, many of which are, in Proceſs of Time, transformed into Bones, as is obvious from the Doctrine of the Generation of Bones. But ſince, in thoſe Bones, which were before Cartilages, there is a vaſcular Structure found, it is highly probable, that a ſimilar Structure pre-exiſted in the Cartilages. Beſides, *Havers*, *Ruyſch*, and other curious Anatomiſts, have, by their Induſtry, diſcovered Veſſels in the Cartilages. Hence it is obvious, that an Inflammation may happen in the Cartilages, as well as in the Bones.

As for all the Viſcera, and, conſequently, almoſt all the Body; it is certain, that the Viſcera conſiſt of a moſt ſurpriſing Texture, which

which differs almoſt in every one of them; and the acute Diſeaſes of the Viſcera evidently prove, that an Inflammation, with all its Conſequences, ſuch as a Suppuration, Gangrene, and Scirrhus, have been ſometimes obſerved in every one of them, the Heart itſelf not excepted. Hence we may juſtly conclude, that almoſt all the Body is ſubject to Inflammations, ſince it is certain from modern Diſcoveries, that almoſt all its Parts are of a vaſcular Structure.

As for frequent and obſtinate Inflammations in the Fat; it is certain, that the Membrana Celluloſa is found in almoſt every Part of the Body, and receives different Names, according to the different Subſtances it contains: For, if a white granulated Matter, capable only of being fuſed by Heat, fills the Cellulæ of this Membrane, it is called the Membrana Adipoſa; but, when the Matter contain'd in it almoſt diſſolves ſpontaneouſly, it is called Membrana Pinguedinoſa. But in thoſe Parts of the Body, in which the Structure of this Membrane is moſt tender, and its Cellulæ ſo ſmall, that their contained Fat eſcapes the Eye, it is only called ſimply Membrana Celluloſa; as, for Inſtance, in the Back of the Hand, and Forehead. How ſurpriſingly this Membrane is diffuſed through the Body, will ſufficiently appear, if we conſider, that not only all the Muſcles and Tendons are covered with ſuch a cellular Membrane, but, alſo, that all the Fibres of the Muſcles, ſo far as the Diligence and Patience of the moſt accurate Anatomiſts can carry them, are covered with ſimilar cellular Vaginæ. Almoſt all the Veſſels run along in ſuch a cellular Subſtance, which, in ſome meaſure, alſo, conſtitutes the Structure of the Veſſels and Viſcera. Hence it is obvious, that Inflammations may very frequently happen in this Membrane, whether diſtinguiſhed by the Epithets *Celluloſa*, *Pinguedinoſa*, or *Adipoſa*. And, when they happen in this Part, they are often ſo obſtinate, as to be incapable of a Reſolution, but generally tend to a Suppuration, or a Gangrene; for, as the Arteries diſperſed through this Membrane in a State of Health, ſecrete a pinguious, unctuous, and oleous Subſtance, ſubſervient to the Lubrication of the Parts, and depoſite it in the ſo eaſily dilatable Cells of this Membrane, it is probable, that when theſe Veſſels are dilated, or ruptured, by an Inflammation, the red Part of the Blood is diſcharged from them, and accumulated in the Cellulæ of this Membrane. Hence a red and hard Tumor, the Characteriſtic of a genuine Inflammation, is produced, and is almoſt always lodged only in the Membrana Celluloſa. Beſides, it is ſufficiently evinced by the Terminations of Inflammations, that they are moſt frequently ſeated in the cellular Membrane; for if a violent Inflammation is ſucceeded by a Suppuration, or a Gangrene, upon opening the Skin, a Collection of Pus, or a gangrenous Sordes, are almoſt always found lodged in the Membrana Adipoſa.

This Stagnation is produced in the moſt minute Arteries, by whatever preſſes, diſtracts, diſtorts, ruptures, contuſes, burns, corrodes, or corrugates the Extremities of the Veſſels, whether conical, or cylindrical, in ſuch a manner that the Diameters of their Cavities are leſs than thoſe of the Particles of Blood which ought to paſs through them. The ſame Misfortune is, alſo, produced by Heat, violent Exerciſe, ſharp Bodies fixed in the Parts, Ligatures, incumbent Weights, acrid Subſtances taken inwardly, or applied externally, intenſe Cold, and ſtrong Frictions: All the Cauſes of Wounds, Contuſions, Corroſions, Fractures, Luxations, and Obſtructions, alſo produce the ſame Effect.

In the Definition of an Inflammation, two things are conſidered; that is, the Stagnation of the red arterial Blood in the moſt minute Canals; and the Preſſure and Attrition made by the ſucceeding Blood on theſe Parts, already obſtructed by ſtagnating Blood. Now in this Aphoriſm are enumerated the Cauſes capable of producing this Stagnation in the moſt minute Arteries, which, however, are naturally capable of tranſmitting the red Part of the Blood.

The Arteries which contain the red Blood, after by lateral Ramifications its finer Part is ſecreted for various Uſes, convey that Part of the red Blood, which, by the determinate Bulk of its Molecules, cannot naturally enter the ſmall Veſſels, to the Veins, with which they make ſo many continued Canals. Where, therefore, ſuch a minute Artery terminates, there a Vein begins. But an Artery, from its greateſt Largeneſs, through its whole Courſe, becomes gradually ſmaller; whereas a Vein, from the narroweſt Part of its Beginning, becomes gradually larger, thro' its entire Courſe. Hence, in the Arteries, the Fluids move from the Baſe to the Apex of the Cone; whereas, in the Veins, they move from the Apex to the Baſe: For which Reaſon the Veins, as well as the Arteries, may be called Conical Canals. But, about the Part where the narroweſt Portion of the Arteries is joined to the ſmalleſt Part of the Vein, the Canal ſeems, for ſome Length, to be cylindrical, and to have its Sides neither converging nor diverging; but, accordingly as we proceed farther, either in the Artery or Vein, the Canal aſſumes the Figure either of a direct, or inverted Cone. But at the very Part where the Artery terminates, and the ſmalleſt Part of the Vein begins, the Canal is narroweſt. Hence the Molecules of Blood, rendered incapable of paſſing by any Cauſe whatever, will, of courſe, moſt frequently ſtick here. Now, if we ſuppoſe, that the Extremities of the Veſſels are, by any Cauſe, rendered narrower, there muſt neceſſarily happen a Stagnation of the Fluids, which cannot paſs through theſe narrow Parts. From what has been ſaid, we, alſo, ſee the Reaſon why, in the Aphoriſm, Veſſels, both of a conical and cylindrical kind, are ſpecified. The moſt minute Particles of Fluids circulating in Animals, and only viſible by Microſcopes, appear ſpherical, and, about the narroweſt Parts of the Veſſels, ſeem to be almoſt only ſingle Molecules, which, however, paſs with a kind of apparent Difficulty. Hence it is ſufficiently obvious, that, when the narrow Extremities of the Veſſels are leſſen'd, the free Paſſage of the Fluids is hinder'd, and the Cavity of the Canal block'd up; ſince the Bulk of the Molecule ſurpaſſes the Diameter of the Veſſels, through which it ought to paſs: Hence happens an Obſtruction, which is the Concomitant of every Inflammation.

Since a Section of the human Canals, perpendicular to their Axis, makes a Circle, a Figure which of all others contains the largeſt Area; it is hence obvious, that every Cauſe which changes the Figure of the Canals, produces a Stagnation of the Fluids, which ought to paſs through their moſt narrow Parts. The moſt conſiderable of theſe Cauſes are here enumerated.

As for whatever preſſes the minute Arteries; whatever preſſes upon them muſt, of neceſſity, leſſen their Diameters, retard the Circulation of the Fluids through them, and, by that very means, tend to induce a Stagnation.

As for whatever diſtracts or diſtorts them; the more any Canal or Veſſel is elongated and ſtretched, the ſmaller its Cavity becomes; as we ſee in Glaſs Tubes, render'd flexible by a Lamp-heat, in order to be ſtretch'd: But this Circumſtance muſt, in the very Nature of the thing, contribute to the Production of a Stagnation: Thus, when, in order to puniſh Malefactors, Weights are hung to their Limbs, or Pullies uſed to diſtort their Bodies, the ſubſequent Pain, Redneſs, and Inflammation, ſufficiently teſtify, that this Elongation or Diſtraction produced a Stagnation.

As for whatever ruptures them; it is certain, that, in conſequence of the Elaſticity of the Veſſels, their divided Orifices will ſpontaneouſly contract themſelves, prevent the Egreſs of the Fluid circulating in them, and, conſequently, induce a Stagnation, which, in its Turn, may lay a Foundation for an Inflammation.

As for whatever contuſes them; ſince the Idea of a Contuſion implies, an Accumulation of ſmall Wounds, it is ſufficiently obvious, from what we have juſt now ſaid, that a Stagnation of the Fluids, and a ſubſequent Inflammation, may be produced by it: Beſides, as a Contuſion is always made by an hard and obtuſe Inſtrument, injuring the Parts of the human Body, it cannot poſſibly happen without a proportionable Degree of Compreſſion, which, by leſſening the Diameters of the Veſſels, retards the Circulation of the Fluids, and, by that means, tends to induce a Stagnation and Inflammation.

As for burning, corroding, or corrugating the Veſſels; by all theſe Methods a Part of the Body is either entirely deſtroy'd, as by the actual Cautery, or ſtrong Cauſtics: Hence, in the Circumference of ſuch a Part, the live Veſſels are obſtructed, and hence a Stagnation and Inflammation enſue: Or, if theſe Cauſes ſhould operate more mildly, the Solids are contracted, the Fluids inſpiſſated, and render'd uncapable of paſſing through many Veſſels: A Circumſtance by which Stagnations and Inflammations will neceſſarily be produced.

As for Heat; this may produce a Stagnation, when its Degree ſurpaſſes that which is found in a ſound Body; for, by this means, the ſolid Fibres are dried, contracted, and render'd rigid: But, in proportion as the Rigidity of the Fibres is increaſed, the Contractility of the Veſſels compounded of them is augmented, and their Cavities, conſequently, leſſen'd: Hence Obſtructions muſt neceſſarily happen. Beſides, if we conſider, that, by intenſe Heat, the moſt fluid Parts of the Humours are diſſipated, and the Blood, and its Serum, coagulated into ſolid Maſſes, which can hardly afterwards be reſolv'd, it will be ſufficiently evident, that intenſe Heat is to be juſtly accounted among the Cauſes of an Inflammation.

As for violent Exerciſe; an Increaſe of Motion, in the very Nature of the thing, produces a proportionable Increaſe of Heat, which we have juſt now ſhewn to be capable of producing an Inflammation.

As for ſharp Bodies fixed in the Parts; theſe, when lodged in any Part, not only injure and compreſs the adjacent Veſſels, but, alſo, produce an uninterrupted Pain, and continual Irritation: Hence, it is obvious, an Inflammation muſt enſue, eſpecially, if ſuch a Body is lodged near thoſe Parts which are furniſh'd with an exquiſite Senſation; for, in this Caſe, the Diſorder is ſeldom removed, till, after a Suppuration, Nature throws out the offending Body.

As for Ligatures; theſe, by compreſſing the Veſſels, diminiſh their Cavities; but they act principally on the Veins, both becauſe their Coats are leſs firm than thoſe of the Arteries, and becauſe

becauſe moſt of them, generally, lie near the Surface of the Body: But, when Ligatures are made very tight, they, alſo, compreſs the Arteries, as well as the Veins: Thus, in Veneſection, if the Ligature is but moderately tight, the Blood, upon opening the Vein, burſts out with Violence; but, if it is ſo tight, as, at the ſame time, to compreſs the Artery, ſcarcely any Blood is diſcharged from the Orifice; ſo that when Surgeons obſerve this, they ſlacken the Ligature, in order to promote a Diſcharge of the Blood. For the ſame Reaſon, any Weight reſting externally on the Body, by compreſſing the Veſſels, produces Obſtructions.

As for acrid Subſtances, whether taken inwardly, or applied externally; almoſt all the Parts of the human Body, whether internal or external, ſeem capable of being contracted by the Application of acrid Subſtances, as may be ſhewn by many Experiments: Thus, for Inſtance, if a Drop of Vinegar is put into the Eye, the Eye-lids are, without the Concurrence of the Perſon's Will, ſo powerfully contracted and ſhut, that they cannot be ſeparated without a conſiderable Force. Acrid Poiſons, taken internally, contract the Stomach and Inteſtines: Hence violent Inflations are produced, by the Retention, and ſubſequent Heat of the Air. When, by means of a Pledget, I applied a ſmall Drop of Oil of Vitriol to the bare Inteſtine of a live Dog, it was immediately contracted in the ſame manner as if a Ligature had been applied to it. Now, 'tis probable, that theſe acrid Subſtances, if conveyed to the ſmaller Veſſels, muſt, alſo, in them produce ſimilar Contractions: Hence Obſtructions, and, upon an Increaſe of the Circulation, Inflammations, may be produc'd. Thus, alſo, when an acid Taint has affected the Blood, Itchings are produced, and Obſtructions, Puſtules, and Ulcers, obſerv'd about the cutaneous Veſſels. When in dropſical Patients the Serum, ſtagnating in the Legs, begins to grow acrid, the Skin is frequently inflam'd by it. If acrid Subſtances, eſpecially when externally applied, are capable of producing a Solution of Continuity in the Veſſels, they muſt, from what has been ſaid, be ſtill more capable of producing an Inflammation.

As for intenſe Cold; 'tis certain, that by Cold the ſolid Parts of the human Body are leſſen'd in all their Dimenſions, by which means the Cavities of the Veſſels muſt neceſſarily be diminiſh'd: 'Tis, alſo, certain, that by Cold the Molecules of the Blood are united with each other. By both theſe Effects of Cold, not only Obſtructions and Inflammations, but, alſo, ſudden Gangrenes, may be produc'd, as is ſhewn under the Article GANGRÆNA. Hence the Reaſon is obvious, why Country-people are ſo frequently ſeiz'd with a Pleuriſy, by fooliſhly expoſing themſelves to a cold Air, after they are over-heated by exceſſive Labour; for the Air, which is cold when inſpired, almoſt immediately touches the intercoſtal Spaces, ſince nothing is interpos'd between it and them, but the ſlender Membrane of the pulmonary Veſicles; whilſt, at the ſame time, the cold Air externally ſurrounding the Body, perhaps not duly cover'd, increaſes the Diſorder.

As for ſtrong Friction; though Friction is of great Efficacy in removing Obſtructions, yet when it is either too violent, or too long continued, it is capable of producing a hot Fever in the coldeſt dropſical Patient, as is ſhewn under the Article FIBRA; for, when the Motion of the venous Blood is augmented, the Heart contracts itſelf more forcibly and quickly, by which means the Circulation of the Blood is augmented; and, if this Circulation ſhould be too briſk, 'tis moſt certain, that it may produce Inflammation; ſince the briſker the Motion, the greater the Heat; and the greater the Heat, the greater the Diſſipation of the fine and fluid Parts of the Humours in conſequence of which a Stagnation and Inflammation may be produc'd. Thus, by ſtrong Friction, we obſerve, that the Parts of the Body are render'd hot, tumid, and painful; but theſe Symptoms denote a preſent Inflammation, which, however, may be ſoon removed, unleſs the Friction is long continued, or exceſſively violent. In Storms at Sea, when the Ropes are ſuddenly drawn through the Hands of the Sailors, the violent Attrition produces ſo intenſe a Pain and Heat, that the Epidermis is inſtantaneouſly raiſed in gangrenous Veſicles. Beſides, if we conſider, that by Frictions the red Part of the Blood is forc'd into ſmall Veſſels, which it does not naturally enter, as is evinc'd by the Redneſs produc'd by Friction, it will be ſtill more obvious, that exceſſive Frictions are capable of producing Inflammations.

How all the Cauſes of Wounds, Contuſions, Corroſions, Fractures, Luxations, and Obſtructions, may contribute to the Production of Inflammations, may be underſtood from what has been already ſaid.

A Stagnation is, alſo, produced by whatever blocks up the Paſſages, and, at the ſame time, applies to the Parts any thing of an acrimonious Quality, ſuch as oleous, ſaline, and acrid Subſtances.

'Tis certain, that the whole internal and external Surfaces of the Body are pervious to a perſpirable Matter; for, in every Moment of Life, a fine and ſubtile Exhalation is forced thro' minute arterial Ducts, whoſe Extremities are open in the external Surface of the Body. This Exhalation, when reverberated by a ſmooth Plate of Metal, or a cold Mirror, is condens'd into a fine Lymph, the Whole of which exhales without leaving any Fæces. Now, if by any means thoſe Paſſages, through which the perſpirable Matter is convey'd, ſhould be obſtructed, they will neceſſarily be dilated by the impel'd Fluid; and, when thus dilated, they will admit the groſſer Humours: Hence an Obſtruction and Stagnation will neceſſarily enſue. When the moſt minute of theſe exhaling Veſſels are thus obſtructed, as the next in Bulk to theſe cannot convey the thinneſt Part of the Fluid they contain to the former, they will, in like manner, be dilated; and thus the Diſorder may be propagated from theſe minute exhaling Veſſels, to thoſe which contain the Blood.

Since this highly fine exhaling Fluid, almoſt in every reſpect, reſembles Water, and ſince Oil hinders, or at leaſt retards, the Ingreſs of Water into minute glaſs Tubes, hence it, perhaps, is, that an Eryſipelas and Inflammations are ſo often produced by the external Application of Oils to the Skin. *Hieronymus Mercurialis*, in his Treatiſe *de Arte Gymnaſtica*, *Lib.* 1. *Cap.* 8. informs us, that, among the Antients, the Bodies of the Wreſtlers were anointed with Oil, leſt their Strength ſhould be diſſipated by profuſe Sweats; and that, after bathing, Unctions were uſed, leſt the Moiſture, convey'd to the Body by the Bath, and the native Heat, ſhould make their Eſcape through the relaxed and open Pores. In many Perſons the Skin is immediately inflam'd by the Application of a pinguious Plaiſter, or Ointment; and the internal Parts of ſome Perſons ſeem to have ſomething of a ſimilar Diſpoſition, ſince they immediately become feveriſh upon eating fat Subſtances, and eſpecially Bacon. If, at the ſame time, there is any Degree of Acrimony in theſe pinguious and oleous Subſtances, they may produce very obſtinate Inflammations. Oil of Almonds, which is highly mild, when recently expreſs'd, in the Summer-time, becomes rancid in a few Days, and acquires ſuch a Degree of Acrimony, that a ſmall Quantity of it, ſwallow'd, forthwith inflames the Fauces. The ſame holds true with reſpect to Butter, either become rancid, or fried too long in a Pan. But an acrid Subſtance, mixed with one of a pinguious Nature, is ſo much the more hurtful, becauſe it tenaciouſly adheres to the Part to which it is applied, and cannot be eaſily waſh'd away by aqueous Liquors. The Berries of the Mezereon, or Spurge-olive, and the Fruit of the Spurge-laurel, when preſſed with the Fingers, diſcharge a pure pinguious Oil; which, when taſted, at firſt, appears mild and gentle, but, immediately after, inflames the Fauces to ſuch a Degree, that it is ready to ſuffocate any one who taſtes it without due Caution. In like manner it has been obſerv'd, that the acrid empyreumatic Oils, by ſtrong Fire obtain'd from Hartſhorn, Guaiacum, and other Subſtances of a like Nature, as, alſo, the expreſs'd Oils, ſo much recommended for curing Rigidities of the Joints, ariſing from Infarctions of Matter, have, when imprudently applied to the Skin, produced the worſt of Inflammations, and ſometimes Gangrenes; for in theſe there is, at once, an oleous Tenacity, by which the Veſſels are obſtructed, and a ſtrong Degree of Acrimony, by which the irritated Veſſels are conſtricted.

Stagnations are, alſo, produced by ſuch things as coagulate the Blood, ſuch as violent Exerciſe, and a Derivation of the fineſt Parts from the Blood, by Sweat, Urine, Saliva, and Diarrhœas. Coagulating Subſtances, alſo, produce the ſame Effect.

An Obſtruction is formed by the Exceſs of the Fluid to be tranſmitted, above the Cavity of the Veſſel tranſmitting; ſo that its general Cauſes muſt be too great a Narrowneſs of the Veſſels, or an increaſed Bulk of the Molecules of the Fluid to be tranſmitted, or both theſe in Conjunction. We have already treated of thoſe Cauſes, which produce a Stagnation in the moſt minute Arteries, which convey the Blood, ſo far as it proceeds from a Coarctation of theſe Veſſels; but we now come to conſider thoſe Cauſes, which, allowing the Capacities of the Veſſels to remain the ſame, ſo coagulate the Blood, that it cannot paſs through the ſmalleſt Parts of the moſt minute Arteries. Among theſe we ſhall, firſt, conſider

Violent Exerciſe. In the Blood there is always a Tendency to Concretion, which is ſtill the ſtronger, the greater the Action of the Veſſels upon the Blood they contain. The Blood of a robuſt Man, taken from the Vein, immediately concretes; and, when left in a State of Reſt for ſome time, exhibits a large Quantity of a red concreted Subſtance, but very little of a fluid Serum; whereas 'tis directly otherwiſe in the Blood of a tender and ſickly Girl. But the Whole of this depends on the weaker or ſtronger Action of the Veſſels on the Blood. Now, by an increas'd Motion, or Exerciſe, the Action of theſe Veſſels, within a certain given Time, both more frequently and forcibly exerts itſelf upon their contain'd Fluids. Hence a proportionably greater Condenſation of them will enſue: Beſides, by an Increaſe of Motion, the moſt fluid Parts of the Humours are diſſipated, becauſe, in the ſame time, a greater Quantity of the Fluid to be ſeparated from the Blood is applied to the Organs deſtin'd for Secretion and Excretion; by which means the Concretion of the Blood is augmented. An Increaſe of Motion is, alſo, ſucceeded by

by an Increaſe of Heat, by which, in like manner, the Blood is ſo inſpiſſated, that it can no longer paſs through the ſmalleſt Parts of the moſt minute Arteries. Hence, in acute Diſeaſes, when the Heat is much increaſed, the injured Actions of the Brain, and a difficult Reſpiration, immediately inform us, that the Blood is ſo inſpiſſated, that it can no longer freely paſs through the Brain, and the Organs deſtin'd for the Purpoſes of Reſpiration.

As for a Derivation of the finer Parts of the Blood by Sweat; Experience has taught us, that red Globules conſtitute the thickeſt Part of the human Blood; and that a large Quantity of a fine and thin Fluid is interpos'd between the Globules, in order to hinder their mutual Contact, and prevent their too eaſy Concretion. When, therefore, by any Cauſe whatever, this moſt thin and fine Part is carried off from the Blood, the larger Molecules, becoming contiguous, and being moſt compreſs'd about the ſmalleſt Parts of the Arteries, are there united, and form'd into Concretions. Hence an Obſtruction of the Canals, and a Stagnation of the Fluids, enſue. Thus, in phthiſical Patients, waſted with Night-ſweats, the Blood begins to ſtagnate about the cutaneous Veſſels, and to produce inflammatory Puſtules. For this Reaſon *Hippocrates* condemned Sweats in the Beginning of acute Diſeaſes. And *Sydenham* obſerv'd, that Sweats always proved injurious in the Beginning of the Small-pox.

As for a Derivation of the finer Parts of the Blood by Urine; hyſteric and hypochondriac Patients often diſcharge an incredible Quantity of thin Urine, like Water, after their Minds have been ruffled by the Tranſports of ſome exceſſive Paſſion. But, when the Blood is thus deprived of its diluting Vehicle, its thicker Part begins to be concreted, and violent Inflammations ſometimes enſue; or the Craſſamentum of the Blood, depoſited about the abdominal Viſcera, produces obſtinate Obſtructions. Hence Melancholy ſo frequently ſucceeds hyſteric or hypochondriac Diſorders.

As for a Derivation of the finer Parts of the Blood by the Saliva; the Saliva, ſpontaneouſly flowing from the Mouth of a ſound Perſon, is ſufficiently thin naturally; and only rendered more tenacious, by an Admixture of the Mucus of the Mouth and Fauces, promoted by the Motion of the Tongue, and adjacent Parts. And, when this Saliva is chymically examined, 'tis found to be almoſt entirely aqueous; ſince, from ſixty Ounces of Saliva, by a gentle Fire, almoſt fifty-nine may be drawn off, which have apparently all the Qualities of Water. The Saliva, in like manner, is not concreted in boiling Water; ſo that it muſt neceſſarily be thinner than the Serum of the Blood. By a copious Diſcharge, therefore, of Saliva, a large Quantity of a thin and fine Fluid is evacuated from the Body; in conſequence of which, the Blood becomes incapable of circulating with its uſual Freedom. For this Reaſon, thoſe who, either thro' a bad Habit, or the Abuſe of Tobacco, loſe large Quantities of Saliva, are ſo often afflicted with obſtinate Obſtructions of the Inteſtines. After all the Parts of the Mouth have been long covered with thick Aphthæ, when theſe fall off, an incredible Quantity of Saliva is diſcharged from the dilated Veſſels. And, unleſs this immoderate Diſcharge is removed by proper Remedies, the Patients are exhauſted to ſuch a Degree, that they either fall a Sacrifice to their Diſorders, or afterwards labour under chronical Diſeaſes; ſince, when this fineſt Part of the Blood is loſt, Obſtructions are very eaſily form'd. Nor to this Doctrine can it be objected, that under a Salivation, protracted for ſeveral Weeks, a large Quantity of Fluids is daily evacuated, without any ſubſequent Inſpiſſation of the Blood; ſince, in this Caſe, it is not the Saliva, properly ſo called, but the diſſolved Humours, which are diſcharged under the Form of a putrid Water. Hence the fineſt Part of the Blood is not loſt, and its thicker Part rendered incapable of circulating; but there is a real Diſſolution even of the red Part of the Blood; for which Reaſon, People are able to bear a Salivation, provided, by a good Diet, freſh Humours are ſupplied, whilſt thoſe before in the Body are evacuated.

As for a Derivation of the finer Parts of the Blood by Diarrhœas; it is ſufficiently obvious, that by theſe the finer Parts of the Blood may be, alſo, diſcharged from the Body. For this Reaſon, if, in a burning Fever, the Patient is ſeized with a violent Diarrhœa, *Hippocrates*, in his *Coac. Prænot.* and elſewhere, pronounces it a mortal Sign; for, as in this Diſeaſe the inſpiſſated Blood already begins to ſtick in the minute Arteries, the Diſorder is rendered incurable when the finer Parts of the Fluids are carried off by Stool.

As for coagulating Subſtances; theſe are either of an acid, auſtere, or ſpirituous Quality; though, at the ſame time, all Acids do not coagulate the Blood, ſince tartiſh Wines, Vinegar, the Juice of ripe acid Fruits, and Butter-milk, rather diſſolve it; but foſſil Acids, as alſo Preparations of Sea-ſalt, and Nitre, induce a Coagulum on the Blood. When theſe Acids are injected into the Veins of a live Animal, the Blood is forthwith concreted into large Clods, which, being conveyed to the Right Ventricle of the Heart, thro' Veins which become gradually large, and being thence propel'd to the Lungs, excite at firſt a great Uneaſineſs, and ſoon after bring on Death. The Mouths, however, of the bibulous Veſſels do not eaſily admit theſe Acids of an highly acrid Quality; ſince they immediately contract themſelves on the Application of a far more gentle Stimulus. When the black Bile, ſometimes ſo acid as to corrode as powerfully as Aqua-fortis, corrodes the Veſſels, and is mixed with the Blood, ſudden Death is frequently produced by the Coagulation of the Blood. Some auſtere Subſtances, alſo, induce a very ſtrong Coagulum on the Blood; ſuch as Alum, and the various Species of Vitriol. Spirituous Subſtances are, alſo, capable of coagulating the human Fluids; for, in Chirurgical Operations, 'tis ſufficiently known, that Alcohol, applied to divided Veſſels, ſtops the moſt violent Hæmorrhages, by means of the Coagulum it induces on the Blood. The Serum of Blood, by an Affuſion of Alcohol, is forthwith indurated. Hence 'tis obvious, that thoſe who indulge themſelves much in theſe fermented Spirits, expoſe themſelves to terrible Misfortunes.

A Stagnation is, alſo, produced in the lymphatic, arterial Veſſels, firſt, by all the Cauſes, which ſo enlarge their Orifices, that the groſſer Parts of the Blood enter them; which, being propel'd farther, arrive at narrower Parts, where they undergo all the Changes mentioned in the preceding Aphoriſm. Among the Cauſes of this Kind, are the Laxity of the Veſſel at its Beginning, and the violent Motion of the arterial Fluid. And, ſecondly, by all the Cauſes common to Inflammations of whatever kind.

We have hitherto conſidered the Cauſes, by which the free Circulation of the thickeſt or red Part of the Blood thro' the ſmalleſt Arteries is hinder'd, which act either by leſſening the Cavities of the Veſſels, or rendering the Fluid, which ought to paſs thro' them, incapable of being tranſmitted. An evident Example of this is found in an Ophthalmia, in which the whole Adnata, and even the Cornea, are red; the Veſſels being filled with red Blood, in ſuch a manner as to be perceptible to the naked Eye, tho', naturally, there is no red Blood contained in them. Such an Inflammation muſt, therefore, have been preceded by certain Cauſes, capable of dilating theſe Veſſels in ſuch a manner as to admit the red Blood. But it is ſufficiently obvious, that the red Part of the Blood, after it has enter'd theſe ſlender Veſſels, muſt create Obſtructions, ſince, in its Progreſs, it continually arrives at narrower Parts of the converging Veſſels. Hence, in this Caſe, a Stagnation will be produced, tho' the Cavities of the Veſſels remain the ſame, and the Molecules of the Fluid to be tranſmitted are not enlarged. Such a Diſorder is juſtly ſtyled *Error Loci*, ſince the red Blood, entering the minute Veſſels, becomes ſtagnant, and is not capable of paſſing thro' the narroweſt Parts of theſe Veſſels; for the Whole of the Diſorder conſiſts in this, that the red Blood is lodged in a Place where it ſhould not naturally be. The ſame Misfortune may happen in all the Parts of the Body, in which the ſmall Veſſels, containing the finer Parts of the Fluids, are derived from larger Veſſels: So that an *Error Loci* can never happen in the Veſſels, naturally containing the red Blood; ſince, in ſound Blood, no Particle is larger than a red Globule: But, in the other decreaſing Series of Veſſels, an *Error Loci* may happen. How far the red Blood may, poſſibly, penetrate, is not yet certain from Experience; only this we know, that in Diſeaſes it enters far ſmaller Veſſels, than thoſe which contain the Serum of the Blood, ſince it ſometimes enters thoſe of the Tunica Cornea. But as all that Fluid, which, in ſound Blood, is thinner than the red and ſerous Globules, is called Lymph; ſo the Veſſels, thro' which it moves, are called lymphatic Veſſels; and theſe are either Veins or Arteries. But an Obſtruction cannot happen in the Veins, unleſs, by an external Compreſſion, the Fluid, which ought to paſs thro' them, is intercepted. Hence, by an *Error Loci*, the thicker Parts of the Fluids may be lodg'd in the lymphatic Arteries; under which Name we comprehend all thoſe Arteries, which naturally exclude the red and ſerous Globules, and only admit the finer Parts of the Fluids.

To the Production of an *Error Loci* 'tis therefore requiſite, that the Beginnings of the lymphatic Arteries ſhould be ſo dilated, as to admit the red Part of the Blood. Now 'tis ſhewn under the Article *Fibra*, that the Largeneſs of the Veſſels depends on two different Cauſes; that is, the Reſiſtance of the Sides of the Veſſels, and the Momentum or Quantity of Motion of the impel'd Fluid; and is, for this Reaſon, in a Ratio compounded of the direct Ratio of the Impetus of the impel'd Fluid, and the inverſe Ratio of the Reſiſtance of the Sides. If, therefore, a greater Laxity is by any Cauſe produc'd in the Beginning of a ſmall lymphatic Veſſel, it will be dilated, tho' the Impetus of the impel'd Fluid continues the ſame. And, on the contrary, the ſame will happen, if the Impetus of the impel'd Fluid is augmented, whilſt, at the ſame time, the Firmneſs of the Veſſels continues the ſame. But this Dilatation will happen moſt conſiderably when theſe two Cauſes concur. See the Article FIBRA; where Reaſons are, alſo, given, why, by an accelerated Motion of the arterial Fluid, the Beginnings of the Veſſels are enlarg'd. This Doctrine is ſufficiently confirm'd by Experience; for a Part of the Body, expoſed to the Steam of tepid Water, becomes more tumid and red than in its natural State, by means of the Ingreſs of the red Blood into the

relaxed ſmall Veſſels: And, after violent Running, we obſerve the whole external Skin to become red, and the Eyes Bloodſhot, in conſequence of the Ingreſs of the red Blood into improper Veſſels, preternaturally dilated by the increaſed Impetus of the impelled Fluid.

When the red Blood has enter'd the lymphatic Veſſels, it is ſufficiently obvious, that all thoſe Cauſes, which were capable of leſſening the Cavities of the larger Veſſels, may produce the ſame Effect, when acting on the ſmaller Veſſels. But theſe Cauſes have been already enumerated.

Hence, a ſimilar Diſorder may happen in every conical Veſſel, where the Fluids are convey'd from wider to narrower Parts; for, as in the red Blood, ſo, alſo, in the Lymph, there is, perhaps, a Part thicker than the reſt.

In ſound Blood, newly taken from the Body, by means of a ſmall Wound, and received into minute Glaſs Tubes, Microſcopes enable us to diſtinguiſh different Parts; and, by their means, we are, alſo, render'd capable of obſerving the Motion of the Fluids in the Veſſels of the pellucid Parts of Animals; for Globules are perceived ſwimming in a thin pellucid Fluid, which itſelf appears homogeneous. But it ſeems highly probable, that, in the thin pellucid Lymph of the Blood, there are ſome Parts thicker than the reſt; which, in conſequence of the determined Bulk of their Maſſes, are contain'd in Veſſels peculiar to themſelves, and cannot, naturally, enter into ſuch Veſſels as are ſmaller; for, unleſs the red Globules were ſo large, that, in a State of Health, they could not enter the Veſſels deſtin'd for containing the Serum, and ſuch as are ſmaller, it is ſufficiently obvious, that all the Blood would be deriv'd to the ſmaller Veſſels, and all the larger ones render'd empty. The ſame holds true in the Veſſels which convey the Serum of the Blood, and the other ſmaller Veſſels of the human Body: Hence, when in any Diſeaſe the Blood becomes too fluid, all the Humours are either diſſipated, or accumulated in the larger and ſmaller Cavities of the Body, as we may obſerve in dropſical Patients: But, in Caſes of this Nature, the large Veſſels always collapſe, for want of that due Quantity of thick Blood which uſed to diſtend them. In like manner, all the decreaſing Series of Veſſels, from the largeſt Blood-veſſels to the ſmalleſt in the Body, ſeem to contain Fluids proper to their reſpective Series, and which contain Molecules ſo large, that they cannot enter the next ſmalleſt Order of Veſſels, but are contained in thoſe peculiar to themſelves: Hence, if, by any Cauſe, the Cavities of theſe converging Veſſels are leſſen'd, or the Molecules which, when ſingle, paſs through their narroweſt Parts, are united, an Inflammation, not of a red, but of a pellucid Colour, may enſue in theſe minute Veſſels. Beſides, if the Orifices of a ſmaller Series of Veſſels ſhould, either by a Relaxation, or an exceſſive Motion of the impelled Fluids, be ſo dilated as to admit the groſſeſt Molecules of the Veſſels next in Bulk, the like Diſorder will be produced from an *Error Loci*. As many intermediate Series of Veſſels therefore, as there are between the largeſt and the ſmalleſt, ſo many different Kinds of Inflammations there may be; and, in each of theſe intermediate Series, theſe Inflammations may be of two Sorts; either ſuch as ariſes from their own proper Fluid becoming incapable of Circulation, either in conſequence of the enlarged Bulk of their Molecules, or the Narrowneſs of the Veſſels; or ſuch as ariſes from an *Error Loci*, by reaſon of the Ingreſs of the groſſer Molecules of the larger Veſſels into the dilated Beginnings of ſuch as are ſmaller: But, in the largeſt Blood-veſſels, an *Error Loci* can never produce an Inflammation; ſince, in the Blood, no Part is found larger than a red Globule. It is highly probable, that Rheumatiſms, arthritic Pains, and Gouts, are produced by an Inflammation in the minute Veſſels.

From what has been ſaid, appears the true Difference between a Phlegmon, an Eryſipelas, an Oedema, and a Scirrhus with Inflammation.

With reſpect to a Phlegmon; tho' the Antients, by this Name, meant any Inflammation in general, yet, in Proceſs of Time, Phyſicians afterwards confined the Word to a preternatural Tumor, which was red, reſiſting, hot, and accompanied with a Pulſation, and Pain, in the ſofteſt Parts, and a Fever, either of the whole Body, or the Part affected. Now a Phlegmon is produc'd by a Stagnation of the red Blood about the Extremities of the Arteries, whilſt the reſt of the Blood, propelled by the Force of the Heart and Arteries, acts with a greater Impetus on the obſtructed Parts: A Phlegmon may, therefore, happen in the narroweſt Parts of the Arteries, which convey the red Blood, which rarely occurs; or it may ariſe from the red Blood, through an *Error Loci*, forc'd into the lymphatic Veſſels, or thoſe deſtin'd for the Serum; which is far more frequently obſerv'd. But it is obvious, from what we have before obſerv'd, that a legitimate Phlegmon is principally lodged in the Membrana adipoſa.

As for an Eryſipelas; this Diſorder, which ſeems highly analogous to a true Phlegmon, is, by *Galen*, in *Lib. 2. Method. Medend. ad Glaucon. Cap. 1.* defined in the following Words: "A Defluxion, *ſays he*, of Blood, and yellow Bile, mixed together, and preternaturally hot, or of Blood alone, but intenſely hot and thin, is called an Eryſipelas, which is much hotter, and of a more yellow Colour, than an Inflammation: And, if it is touch'd, the Blood, which appears exquiſitely thin and red, eaſily recedes, and returns again. But an Eryſipelas is not ſo painful as an Inflammation; nor is it accompanied with a Pulſation, Compreſſion, or Diſtention, like thoſe of any of the Species of Inflammation. Sometimes an Eryſipelas creates but little Trouble, eſpecially when it is diſperſed through the Skin only, without affecting the ſubjacent Fleſh: This Species of Diſorder, which moſt frequently occurs, is a legitimate Eryſipelas." And a little after he ſubjoins, that "A legitimate Eryſipelas is only a Diſorder of the Skin." But, as the Colour of the Part affected with an Eryſipelas ſeem'd to be a kind of Mixture of Yellow and Red, the antient Phyſicians accuſed the Bile as the principal Cauſe of an Eryſipelas; but we are now convinced, that the Serum of the Blood is naturally of a yellowiſh Colour: Hence, when a ſmall Quantity of red Blood is, with a great deal of Serum, lodged in the obſtructed and inflamed Veſſels deſtined for the Serum, this yellowiſh-red Colour is produced in the Part affected. It is, at the ſame time, ſufficiently obvious, how great an Affinity there is between an Eryſipelas, and a Phlegmon; ſince they only differ with reſpect to the Bulk of the obſtructing Molecules: For, in a Phlegmon, the red Part of the Blood is accumulated in the diſtended and obſtructed Veſſels; whereas, in an Eryſipelas, the Serum of the Blood, principally, mixed with a ſmall Quantity of the red Part, remains pent up, and incapable of circulating in the Veſſels. A Phlegmon is principally ſeated in the Membrana Adipoſa; whereas an Eryſipelas affects not only the external Integuments of the Body, but, alſo, the internal membranous Parts. It is, alſo, obvious, that an Eryſipelas may degenerate into a Phlegmon, when, for Inſtance, the Veſſels are ſo dilated as to admit a larger Quantity of red Blood, ſo that the Diſorder is propagated to the Membrana Adipoſa; and that ſometimes ſuch an Inflammation may ariſe, as preſerves a kind of middle State between an Eryſipelas, and a Phlegmon; in which Caſe the Antients gave it a Name compounded of both Diſorders: For to the Words already quoted from *Galen*, that Author ſubjoins theſe following: "As that Species of the Diſorder, *ſays he*, "which affects the ſubjacent Fleſh, and is not produced by a "Defluxion of abſolutely thin Humours, is not only an Eryſi"pelas, but a Diſorder compounded of an Eryſipelas and a "Phlegmon, in which the Symptoms peculiar to an Eryſipelas "are ſometimes the moſt prevalent, this Diſorder is, by the "later Phyſicians, called a phlegmonoide Eryſipelas. Sometimes, "on the contrary, the Symptoms of a Phlegmon are moſt pre"valent; in which Caſe, the Diſorder is called an eryſipelatous "Phlegmon: But, if the Symptoms of neither palpably prevail "over each other, but appear equal, a Phlegmon and Eryſipelas "are ſaid to be complicated with each other."

As for an Oedema; tho' by this Word the Antients meant ſimply a Tumor in general, yet it afterwards came to be generally appropriated to a ſoft Tumor without Pain, eaſily yielding to the Touch, without any Change of Colour in the Skin; and generally produced by aqueous Humours diſtending the Membrana Adipoſa: But the Oedema here treated of is of a quite different Nature; and, in order to diſtinguiſh it from the common Oedema, has the Epithet *hot* generally beſtow'd upon it: For we have already ſhewn, that a true Inflammation may happen in thoſe arterial Veſſels, which are ſo ſmall as to exclude the Serum, and the red Part of the Blood. A painful Tumor then, which is hot, but not red, ſomewhat yellowiſh, and ſometimes entirely white, is called an hot Oedema, which only differs from an Eryſipelas in this, that it is ſeated in far ſmaller Veſſels: It is alſo, called an eryſipelatous Oedema; becauſe it approaches very near to the Nature of an Eryſipelas. It frequently appears in the Face and Head, in which Caſe, it is commonly called *Roſa bullata*.

Since, therefore, this hot Oedema is a legitimate Inflammation, ſeated in the ſmalleſt lymphatic Arteries, it is always to be apprehended, leſt, perhaps, ſuch a State is induced in the fineſt Lymph of the Blood, as, by rendering it ſtagnant, obſtructs the Veſſels in which it ought to move: Hence the Functions, eſpecially of the Brain, which depend on the free Circulation of the Humours through the ſmalleſt Arteries, may be diſturbed; whether the Diſorder is produced originally in the Brain, or, by a Tranſlation, convey'd from the external to the internal Parts. Beſides, if this Species of the Diſorder is violent, it deſtroys the tender Veſſels, and ſpeedily tends to a Gangrene.

As for a Scirrhus, with Inflammation; a Scirrhus is a hard uneven Tumor, almoſt without any Pain, and principally ſeated in the glandulous Parts of the Body. If this Tumor is confirm'd, and of long ſtanding, it conſiſts of ſuch a Matter as can neither be reſolved by any Methods hitherto known, nor ſeparated from the ſound Parts by a benign Suppuration. Hence it is obvious, how dangerous an Inflammation is, in the Parts which are contiguous to a Scirrhus, or in the Teguments which cover it;

ſince, in this Caſe, the Scirrhus ſoon degenerates into a Cancer. *Galen, in Comment. in Text.* 30. *Epidem. Hippocrat. Lib.* 6. beautifully diſtinguiſhes between the Reſiſtance of a Phlegmon, and the Hardneſs of a Scirrhus, in the following Words: "A Phlegmon, ſays he, is not a hard, [σκληρὸν] but a reſiſting [ἀντίτυπον] Tumor, juſt like Bags fill'd with Air, or any liquid Subſtance."

When the Cauſes, already mention'd, have produc'd a Stagnation in the Veſſels, then the Force of the Blood, impel'd by the vital Powers, produces ſuch Effects as are the Signs of an Inflammation.

In every Inflammation, ſeated in whatever Series of Veſſels, there are two Things to be obſerv'd: That is, the Stagnation of the Fluid, in conſequence of the leſſen'd Cavities of the Veſſels, the Concretion of its conſtituent Molecutes, or an Error Loci; and the vital Force of the Heart and Arteries, propelling the Humours with an increaſed Velocity to the obſtructed Veſſels. When theſe two Circumſtances concur, an Inflammation is produc'd. So long as there is only a Stagnation of the Fluid, there is only an Obſtruction, which is the antecedent Cauſe of an Inflammation; but its procatarctic or immediate Cauſe is the increas'd Motion of the Fluids acting upon the obſtructed Part. In the mean time, there happen ſome Changes in the inflam'd Part, which, if duly adverted to, afford the diagnoſtic Signs of a preſent Inflammation. But theſe Signs are conſider'd and enumerated in their due Order, in the following Paragraph.

Firſt, the minute and hardly viſible Arteries, being obſtructed, are enlarg'd by the diſtending Blood; by which means a red Tumor is produced. Secondly, the ſame happens to the arterial lymphatic Veſſels, before pellucid and inviſible; by which means the Redneſs is increaſed, eſpecially when the tender Veſſels and Veſicles in the Membrana Adipoſa are filled with a thick Blood, deprived of its more liquid Parts. Thirdly, the diſtended Veſſels are ready to burſt: Hence ariſes the pungent Pain in the minute nervous Fibres diſpers'd thro' them. Fourthly, the Liquids and Solids are rendered highly compact: Hence ariſe the Hardneſs and Reſiſtance of the Part. Fifthly, by means of the accumulated red Part of the Blood, and the ſtrong Impulſe of the ſucceeding Fluids, the Part aſſumes a ſhining red Colour. Sixthly, by means of the Reſiſtance, Pulſation, Colliſion, and Coarctation of the as yet pervious Veſſels, by the Tumor, there is a violent mutual Attrition produced between the Parts of the Fluid among each other, between them acting upon the Solids, and the Solids upon them: Hence ariſe the Heat and Burning. Seventhly, the Pulſation is produced, becauſe the Impetus of the Blood propel'd from the Heart, acting upon the Extremities of the obſtructed Veſſels, dilates their Sides. Eighthly, by the Irritation of the Fibres, and the accelerated Motion of the Blood, becauſe it is return'd thro' the Veins, and ſtopt in many Arteries, the Pulſe is render'd quick, and a Fever accompany'd with Thirſt, Heat, Watching, Weakneſs, and Uneaſineſs, produced.

1. 'Tis ſufficiently obvious, that obſtructed Veſſels muſt neceſſarily be extended and dilated; for that Force by which the Heart forces the Blood into the Arteries, makes their Sides recede from the Axes of their reſpective Canals, becauſe they are full, and converge, or become gradually narrower. The Reſiſtance, therefore, about the Extremities of the Arteries, and their Fulneſs, are the principal Cauſes, why they are dilated by the impel'd Blood. But in the obſtructed Canals there is the greateſt Reſiſtance, and, at the ſame time, the greateſt Plenitude; becauſe nothing can paſs thro' their Extremities: Here, then, the greateſt Dilatation muſt neceſſarily enſue. Beſides, if we conſider, that an Inflammation accompanies an increas'd Motion of the Blood, it will be ſufficiently obvious, that the Canals muſt be ſtill more extended, when an Inflammation is preſent, than in a ſimple Obſtruction. But when this Dilatation is a producing in thoſe Arteries, which naturally contain the red Blood, or, at leaſt, when after their Dilatation they are capable of receiving it, 'tis evident, that the Tumor ariſing from the Diſtention of the Veſſels muſt be red; for, if the Obſtruction, or Inflammation, is ſeated in the ſmalleſt Veſſels, the red Part of the Blood, as we have already obſerv'd, may be excluded from them, even during the greateſt Dilatation they could bear without a Ruprure. And, 'tis not impoſſible to conceive, that, in Veſſels ſo minute, the Tumor, produced by their Dilatation, ſhould be ſo very ſmall, as not to fall under the Cognizance of our Senſes. But a genuine and legitimate Inflammation always happens in thoſe Veſſels which are either naturally, or by Dilatation, capable of admitting the red Part of the Blood, as is obvious from the Definition of an Inflammation already given. Beſides, an increas'd Degree of Heat, the Concomitant of every Inflammation, as we ſhall afterwards ſhew, contributes to the Augmentation of the Tumor; for 'tis certain, from Experience, that an Increaſe of Heat expands Bodies in all their Dimenſions.

2. The Arteries conveying the Serum are like ſo many Ramifications from a common Trunk, diſtributed from the ſmalleſt Arteries, which contain the Blood. But the Sides of the Arteries, which contain the Blood, cannot be diſtended without, at the ſame time, diſtracting and enlarging the Orifices of the Arteries deſtin'd for the Serum which ariſe from them. Hence the red Part of the Blood may enter the dilated Orifices of theſe Veſſels: The ſame will hold true, with reſpect to the lymphatic Arteries deriv'd from thoſe deſtin'd for the Serum; for that theſe latter may be ſo diſtended, as to admit the red Part of the Blood, is ſufficiently obvious in Ophthalmias, as we have before obſerv'd: Hence, therefore, 'tis manifeſt, that the Tumor and Redneſs muſt be increas'd. Nor would it ſeem probable, that, from a Diſtention of all theſe Veſſels, ſuch enormous Tumors as frequently appear in violent Inflammations ſhould be produced; but we have already ſhewn, that obſtinate Inflammations happen nowhere more frequently than in the Membrana Adipoſa, whilſt not only the tender Veſſels of this Membrane are loaded with red Blood, incapable of circulating, but, alſo, the red Part of it poured thro' the dilated Orifices of theſe Veſſels into the Cellulæ of this Membrane. Hence the Membrana Adipoſa, eaſily capable of Expanſion, is frequently diſtended in a very ſurpriſing Manner. *Galen*, in his Treatiſe *de Tumoribus præter Naturam*, *Cap.* 2. beautifully takes notice of this Origin of the Tumor in a Phlegmon; for, after he has affirm'd, that no Tumor can be produced without an Acceſſion of ſome new Subſtance to the Part affected; or, unleſs the Parts, being, as it were, fus'd by the great Heat, were transform'd into a kind of Vapour, capable of diſtending it to a larger Bulk, juſt, for Inſtance, as Water, by Heat, reduced to Vapours, may poſſeſs an immenſe Space, he proves, that in a Phlegmon the Tumor is not produced by ſuch a Rarefaction of the Fluids, as to convert them to Vapours. "For, ſays he, if "the Part affected with a Phlegmon is laid open, a large Quan"tity of Blood is diſcharg'd, and the whole Part is ſpongious, "and full of Blood; but ſuch a Vapour is neither then, nor after"wards, diſcharg'd." And, in the End of the ſame Chapter, he ſubjoins theſe Words: "But, in Inflammations, all the Parts are "fill'd with Blood, diſcharg'd through the Coats of the Veſſels, "and, like Dew, mix'd with every Part of the Fleſh." That, by the Word Fleſh, *Galen* meant the Membrana Adipoſa, is ſufficiently obvious from ſeveral Paſſages of *Galen*; for, in the Chapter juſt quoted, he obſerves, that the Tumor, which accompanies an Inflammation, is of a quite different Nature from that which is the Effect of an enlarg'd Habit of Body; and uſes the Word πολυσαρκία, in order to denote Corpulence, or Fatneſs.

But, whilſt the red Part of the Blood enters the ſmaller Veſſels when dilated, the Serum and finer Lymph will remain with it in thoſe Veſſels. But the red Part alone will remain fix'd in the narrow Chanels of the Veſſels, whilſt the other finer Parts of the Blood, being compreſſed between this reſiſting Obſtacle, and the impelled Fluids, will be carried off in lateral Ramifications. Hence the red Part alone will be more and more accumulated in the obſtructed Veſſels; by which means the Redneſs of the inflamed Part is increaſed.

3. When, therefore, the Veſſels, obſtructed by a ſtagnant Liquor, are diſtended by the Impetus of an impelled Fluid, their Coats, and, conſequently, the nervous Fibres diſtributed thro' them, will be diſtracted: Thus Pain is produced. But ſince the largeſt Veſſels among thoſe of the moſt minute Kind, that is, the narroweſt Parts of the Arteries, conveying the red Blood, are not equal in Thickneſs to the tenth Part of an Hair, 'tis obvious, that the Diſtraction of the nervous Fibrils, diſpers'd thro' the Coats of ſuch Veſſels, muſt excite a Pain like that which affects the ſmalleſt Point of the Body; for which Reaſon it is called a punctory Pain: But this ſmall Artery, deſtin'd for the Conveyance of the red Blood, far exceeds the Bulk of an Artery deſtin'd for the Serum or Lymph; in which, however, by an Inflammation, a ſimilar Diſtraction, and a Pain poſſeſſing a ſtill ſmaller Space, are produced. Hence, tho' an hundred of theſe ſmall Veſſels ſhould be inflam'd, the Pain ſeems to affect only one Point, and is produced by the Impetus of the impel'd Fluid, which ſo diſtends them, that the nervous Fibres, which conſtitute their Sides, are in Danger of being ruptur'd. Hence, when, in a violent Pleuriſy, the Patient is blooded till he faints, the Pain ceaſes entirely, or, at leaſt, is much diminiſh'd.

4. The human Blood, when left in a State of Reſt, is ſeparated into two Parts, that is, a red concreted Maſs, and a fluid Serum, in which this red Part ſwims. But there are two Cauſes, which principally prevent the Concretion of the Blood; that is, its perpetual Motion, and the Interpoſition of a thinner Fluid between the red Globules, in order to prevent their mutual Contact. But when this red Part becomes ſtagnant, either in the Blood-veſſels, or thoſe which are ſmaller, when dilated, the moſt fluid Parts are expreſs'd from it, as we have already obſerv'd. Hence, an Union and Compreſſion of the red Globules to each other are produced; and, as they are flexible, their ſpherical Figures will be ſo chang'd, that they will come into a great many Points of Contact, and, conſequently, begin to cohere proportionably

tionably ſtronger. Hence, as theſe Cauſes continue to act, this red concreted Subſtance will be accumulated in the diſtended Veſſels, as alſo, in the cellular Subſtance of the Membrana Adipoſa: And by theſe means a greater Hardneſs and Reſiſtance of the inflam'd Part muſt neceſſarily be produced: And as the diſtended Veſſels compreſs thoſe adjacent to them, in conſequence of the leſſen'd Cavities of theſe laſt, the Diſorder will be propagated thro' all the inflam'd Part. For this Reaſon *Hippocrates* often us'd the Words, *Hardneſs accompanied with Pain*, for an Inflammation. Thus, in his Prognoſtics, 71. when treating of an Inflammation of the Bladder, and the Diſorders produced by it, he ſays, Κύστις ϑ σκληραὶ τε καὶ ἀνώδυνοι, "hard and painful Bladders." And in other Places, as *Hollerius*, in *Comment. in Coac. Prænot.* remarks he diſtinguiſhes a Phlegmon from other preternatural Tumors, by the Hardneſs and Pain with which it is accompanied.

When the thinner Fluid is totally expreſs'd, the red Part alone remains accumulated in the diſtended Veſſels. Hence, if all other Circumſtances are alike, the Redneſs is the greater, the more violent the Inflammation is. But the Skin, which in moſt Parts of the Body is lax and moveable, is render'd highly tenſe by the Membrana Adipoſa, which is ſtuffed and tumid with ſtagnant Blood. Hence the Skin becomes ſmooth and ſhining; for ſuch a Tenſion of the Skin is always attended with a kind of bright and ſhining Colour.

6. 'Tis certain from Experience, that not only a conſiderable Heat, but, alſo, actual Fire, may be produced by the mutual Attrition of Bodies on each other. 'Tis, alſo, certain, that by ſuch an Attrition the greater Heat is produced, the more rigid and elaſtic the Bodies are, the more forcibly they are applied to each other, and the briſker their Motion is. 'Tis true, indeed, that Water, or any other Fluid, interpoſed between Bodies in a State of mutual Attrition, prevents ſo great a Degree of Heat as would be otherwiſe produced. Hence it would ſeem, that Heat could not be readily produc'd by the Attrition of our Fluids with the Canals in which they move. But if we conſider, that the Globules of the Blood are not only elaſtic themſelves, but, alſo, move with a rapid Courſe through elaſtic Canals, and are only preſſed almoſt ſingle through the narroweſt Parts of the Arteries which convey the Blood, and that conſequently, the finer Parts being carried off by lateral Ramifications, they produce a ſtrong Attrition with the Sides of the Veſſels, it will be ſufficiently obvious, that Heat muſt be generated by this Attrition. Hence, in robuſt Perſons, whoſe Blood is thick, a greater Heat is always obſerv'd, than in thoſe whoſe Blood is thinner, and leſs elaſtic. For the ſame Reaſon a briſk Circulation of the Blood through the Veſſels is productive of a proportionable Degree of Heat. Nor is it to be objected, that, in the inflam'd Part, the Blood continues ſtagnant in the obſtructed Veſſels; for, by an Experiment of Mr. *Leewenhoek*'s, mention'd in his *Experiment. & Contemplationes*, 'tis obvious, that ſuch an obſtructing Molecule is, at the time the Heart does not act, repel'd by the Contraction of the Artery, and immediately after propel'd to the narrow Part through which it could not paſs, by the Syſtole of the Heart, expelling the Blood into the Arteries. Hence 'tis obvious, that ſuch an obſtructing Molecule may move backwards and forwards in the obſtructed Veſſel. But, ſince from what has been ſaid, 'tis certain, that the finer Fluids are expreſſed, the thick and ſtagnating Part accumulated, and continually condens'd, and, at the ſame time, the Motion of the Fluids accelerated in the inflam'd Part, the Reaſon will be ſufficiently obvious, why ſo great an Augmentation of Heat muſt neceſſarily enſue. But the adjacent Veſſels, as yet not obſtructed, will be compreſs'd, and conſequently have their Cavities leſſen'd, by the dilated and inflam'd Veſſels. Hence in theſe, alſo, the Attrition will be increas'd, partly on account of their leſſen'd Cavities, and partly by reaſon of the increas'd Celerity of the Fluid circulating through them; for if, among an hundred Veſſels, fifty ſhould be obſtructed, the Fluids, unleſs a Stagnation ſhould happen, will circulate with ſo much the greater Celerity through the reſt. All theſe things, therefore, concur, by which we are certain from Experience, that a greater Degree of Heat may be produced; for the Blood, when its moſt liquid Parts are expreſs'd, is concreted almoſt into a ſolid Maſs, which, by the ſtrong Action of the Veſſels, and the Impetus of the propel'd Fluids, is continually more and more condens'd. The Veſſels compreſs'd by the adjacent tumid ones are, at the ſame time, more forcibly applied to the Fluids they contain, and the Motion of the Fluids through the Veſſels is accelerated. Hence we ſee, that an Inflammation, both in its Cauſes and Effects, reſembles a Fire, from which it derives its Name.

7. Since from modern Diſcoveries 'tis certain, that the human Body is almoſt in every Point furniſh'd with Arteries, all of which are dilated when the Heart is in its Syſtole, but next Moment contracted when the Heart is in its Diaſtole; 'tis obvious, that there is a Pulſation in almoſt all the Parts of the Body, every Moment of Life. But we do not advert to thoſe Motions, though very ſtrong, which are always carried on by the ſame ſtated and uninterrupted Law: But, ſo ſoon as they deviate from this Law, we forthwith become ſenſible of them. Thus the ſtrong Pulſation of the Heart, ſo eaſily to be felt by applying the Hand to the Breaſt, is not perceived by a ſound Perſon. But when, by the Paſſions of the Mind, violent Exerciſe, or any other Cauſe, this Pulſation recedes from its natural Order, the Heart is forthwith perceived to palpitate. 'Tis not, therefore, to be wonder'd at, that a Pulſation, before not perceptible, ſhould be perceived in the inflam'd Part; for the Blood, by the Force of the Heart, projected into the Arteries, obſtructed about their Extremities, employs its whole Force in dilating them. Hence the Sides of the Arteries muſt neceſſarily recede more from the Axes of their reſpective Canals. But, when the Action of the Heart ceaſes, the Arteries re-act with ſo much the more Force, the more they have been diſtended. The Pulſation, therefore, in the inflamed Part, being preternaturally increaſed, both with reſpect to its Strength and Celerity, is diſtinctly perceived.

8. When the Extremities of the Arteries are obſtructed, the Fluids contain'd in the Veins correſponding to theſe Arteries are conveyed back to the Heart; but, being afterwards expel'd from that Organ, they cannot paſs through the obſtructed Arteries, but muſt, with ſo much the greater Velocity, be conveyed through the pervious and unobſtructed Arteries; for the Quantity of the Fluid to circulate through the Veſſels is not diminiſhed, but the Number of theſe Veſſels, through which it ought to paſs, is only leſſen'd. Hence 'tis obvious, that the Velocity of the Fluid, to be conveyed through the other pervious Veſſels, muſt be increas'd: But it appears, at the ſame time, that, by this Cauſe, ſuch an increaſed Velocity, in the Motion of the Fluids, cannot be produced, as ſhall be obſervable by the Phyſician, unleſs the Part affected is of ſuch a Bulk, that the Number of obſtructed Veſſels compar'd with thoſe which are pervious and open, are conſiderable enough to induce a remarkable Alteration; for, if the thouſandth Part of the Arteries ſhould be obſtructed by an Inflammation, the Increaſe of Celerity requiſite to convey the Blood through the other pervious Veſſels is not eaſily perceiv'd. There muſt, therefore, be another Cauſe, why a Fever often accompanies or ſucceeds an Inflammation, though it ſhould only affect a very ſmall Portion of the Body. Thus in a Paronychia there is frequently a ſtrong Fever, whilſt the Inflammation only affects a very inconſiderable Part of the Body; for this Reaſon an Irritation of the Fibres is ſpecified in the Aphoriſm. 'Tis certain, that Pain produces a Fever, for which Reaſon the moſt painful Inflammations are accompanied with the ſtrongeſt Fevers; for ſuch as are little or hardly at all painful, are often without any Degree of a Fever. Hence the Fever ſeems principally to be excited by the Irritation of the nervous Fibres diſtributed thro' the inflamed Veſſels, or the adjacent Parts compreſs'd or diſtracted by them. That there is ſuch a Tendency to Irritation in our Veſſels as is capable of accelerating the Circulation of the Humours, is ſufficiently obvious from ſeveral Obſervations; for whilſt, in acute Diſeaſes, the reſolv'd Matter of the Diſorder flows through the Veſſels, in order to be depoſited by a Tranſlation in other Parts, or expelled from the Body by critical Evacuations, great Commotions are frequently produced in the Body, and the Pulſe is accelerated and diſorder'd in a ſurpriſing manner. Whilſt the Chyle, generated from too large a Quantity of Aliments, ſuch as the Patient is not accuſtomed to, or ſuch as are acrid, or of hard Digeſtion, circulates with the Blood through the Veſſels, a Fever is produc'd; which frequently ſhews, that an Irritation of the Fibres may produce a Fever.

But the Fever thus produced is accompanied with the principal Symptoms of a Fever; ſuch as Thirſt, Heat, Watching, Weakneſs, and Uneaſineſs. But we muſt obſerve, that theſe Symptoms do not accompany every Inflammation, but only appear when the whole Maſs of Blood has acquir'd ſuch an inflammatory Spiſſitude, that it cannot, without ſome Difficulty, paſs through the ſmalleſt Veſſels; for 'tis certain, that in ſound Blood there is a natural Propenſity to Coheſion, which is ſtill the greater, the more robuſt the Perſon is. But as long as this Tendency to Concretion can be ſurmounted by the Energy and Efficacy of the Veſſels and Viſcera, ſo long Life remains ſafe. Thus we daily obſerve, that, in acute Diſeaſes, the Blood ſo degenerates as ſcarcely to remain any longer fluid, and is forthwith concreted as ſoon as the Attrition of the Veſſels, which prevented its Concretion, ceaſes. Thus, in a burning Fever, Drops of Blood, falling from the Noſe, are forthwith concreted. And theſe Drops, ſometimes, ſo obſtruct the open'd Arteries of the internal Noſe, as entirely to fruſtrate the ſalutary Effort of Nature attempting the Solution of ſuch Diſeaſes by profuſe Hæmorrhages. Hence *Hippocrates*, in his *Coacæ Prænotiones*, juſtly condemns theſe ſmall Drops as a bad Symptom: And, in the firſt Book of his *Epidemics*, he gives us Inſtances of three Perſons, who died after having diſcharged a ſmall Quantity of Blood from the Noſe, on the fourth and fifth Days. When, therefore, this Propenſity of the Blood to Concretion begins to be increaſed, 'tis ſufficiently obvious, that it muſt, with Difficulty, paſs through the ſmalleſt Arteries. Hence a greater Reſiſtance is made to the Heart, and ſince the Lungs muſt immediately receive and convey through the narroweſt Parts of the pulmonary Artery, the Blood expel'd from the Right Ventricle of the

Heart, the ſmalleſt Degree of ſuch a beginning Concretion is perceiv'd in the Lungs. Hence, by an increas'd Reſpiration, the Patients endeavour to procure a Paſſage for the Blood, thus diſorder'd, through the Lungs. Then ariſes that Uneaſineſs which is a bad Sign in all acute Diſeaſes, eſpecially thoſe of the inflammatory Kind: The Reſpiration becomes laborious and difficult, and the Patients teſtify their uneaſy State, by continually changing the Poſture and Situation of their Bodies. This is the δυσφοια of *Hippocrates*, which, though it may be produced by other Cauſes, yet frequently draws its Origin from a Concretion of the Blood.

From what has been ſaid, 'tis obvious, that a Phlegmon may be known by theſe Signs; that it is a red Tumor, attended with a pricking Pain, and Pulſation, hard, ſhining, hot, and accompanied with a Fever, either of the whole Body, or, at leaſt, of the Part affected.

This is a Species of the Diſorder as yet not arriv'd at its full Height.

All the Signs enumerated in the preceding Paragraph are obſerved in a Phlegmon not as yet arrived at its full Height, but which is approaching to it; for Phyſicians have, in all Diſeaſes, obſerv'd three Periods, or Stages; the Increaſe, the State, and the Decline. The Increaſe is that Stage, in which all the Symptoms are ſtill increaſing: The State is, when they are arriv'd at their full Height, and are not obſerv'd to be either ſenſibly increas'd or diminiſh'd: And the Decline is, when both the Violence and Number of the Symptoms are diminiſh'd; for, when a Phlegmon is arriv'd at its State, it then begins to be diſpos'd to various Terminations, either in Health by a Reſolution, for Inſtance, or in other Diſorders, a Suppuration, a Gangrene, a Sphacelus, or a Scirrhus. But, then, moſt of thoſe Phenomena, which accompany a Phelgmon not as yet arriv'd at its full State, are charg'd; new Symptoms, before not preſent, are brought on. Thus the Redneſs, Tenſion, Pain, and Hardneſs of a Phlegmon, begin to be diminiſh'd, when it tends to a Gangrene; at laſt they entirely ceaſe, and the Senſation of the Part is deaden'd; it aſſumes a pale, cineritious, or brown Colour; then it becomes flaccid, and Puſtules full of Ichor ſucceed. In a Phlegmon, therefore, as well as in other Diſorders, theſe Stages are carefully to be adverted to; that ſomething certain may be determin'd, both with reſpect to the Diagnoſtic, the Prognoſtic, and the Intention of Cure.

In Inflammations, Blood freely diſcharg'd from a large Orifice made in a Vein, and receiv'd in a Baſon, when it becomes cold, forms a white, hard, thick, and rigid Pellicle, almoſt like a Swine's Skin.

When, in violent Inflammations, Blood is taken from the Veins, a pretty ſurpriſing Phenomenon appears therein. Every one knows, that Blood, received in a clean Veſſel, as it flows from the Vein, is ſoon after coagulated, and then ſeparated into two Parts; that is, a thin yellowiſh Liquor call'd Serum, and the red concreted Part generally floating in this Serum, like an Iſland But, in moſt inflammatory Diſorders, the ſuperior Part of this Iſland is cover'd with a white, and ſomewhat blueiſh Pellicle, frequently ſome Lines thick, firmly adhering to the Iſland, and often ſo tough, that it can hardly be divided by a Razor. But, becauſe, in the Blood of Perſons labouring under a Pleuriſy, ſuch a coriaceous Pellicle is frequently obſerved, Phyſicians have, for this Reaſon, call'd ſuch Blood pleuritic Blood, tho' the Pellicle is, alſo, frequently obſerv'd in other Diſorders. Various Authors have made ſurpriſing Obſervations, with reſpect to this Phenomenon. Thus *Sydenham*, in his Treatiſe *de Pleuritide*, obſerves, that if the Blood does not flow horizontally from the Vein, but, running along the Skin, falls perpendicular, tho' with a pretty quick Motion, there is not then ſuch a coriaceous Pellicle produced on the Blood: and that incomparable Author ingenuouſly confeſſes, that he was ignorant of the Cauſe of this Phenomenon. He obſerves, at the ſame time, that in Caſes of this Nature the Patients were not ſo much reliev'd, as if the Blood had been forcibly diſcharged in a full Stream, and been cover'd with this Pellicle. He, alſo, tells us, that the Formation of this Pellicle is prevented by whatever hinders the free Diſcharge of the Blood from the Vein; and that the Patient is leſs reliev'd by ſuch a Veneſection. And what ſeems more ſurpriſing is, that tho' the Blood is freely diſcharged from a large Orifice, yet, if it is agitated with the Finger, this Pellicle is not form'd. The Origin, therefore, of this Pellicle in the Blood ſeems to be ſufficiently obſcure. Some are of Opinion, that it is produced by the Serum of the Blood rendered prone to a greater Concretion by the Diſeaſe. But this Pellicle of the Iſland, which floats in the Serum, always retains the ſuperior Part. Others are of Opinion, that this Pellicle is form'd of crude Chyle, as yet not elaborated into perfect Blood. This is the Opinion of the accurate *Simpſon*, in his *Diſſert. de Re Medica*. But, I think, it may be objected to this Doctrine, that the Chyle, when mix'd with the Blood, and not ſufficiently elaborated, always ſwims fluid in the Serum of the Blood, but does not adhere to the Iſland. The ſame Author affirms, that if a Ligature is tightly apply'd to the Arm or Thigh, and, after three or four Hours, a Vein ſo open'd, that the Blood is freely diſcharg'd, this Pellicle will always be form'd; as, alſo, in the Blood of pregnant Women. And, for the Reaſon of it, he advances, that, for ſome time after the Application of the Ligature, the Blood is ſtopt in the obſtructed Veſſels; and that, about the Uterus of pregnant Women, the Blood, in ſome Degree, ſtagnates, or, at leaſt, moves very ſlowly. To ſpeak my Sentiments freely, I am in Suſpenſe what to determine, with reſpect to this tenacious Pellicle always adhering cloſely to the red Part of the Blood. Some celebrated Phyſicians have been of Opinion, that this Pellicle was produced, when, by an increas'd Velocity of the Circulation, the condens'd Blood was rendered more diſpos'd to a Concretion; and, conſequently, that it is not the prediſpoſing Cauſe, but rather the Effect of the Diſeaſe. But I myſelf have often ſeen ſuch a Pellicle form'd on the Blood of the moſt ſound and robuſt Perſons, when, in the Spring, Blood has been yearly taken from them. And, in a weak Man, who, in order to prevent a Spitting of Blood, to which he was ſubject, was blooded every three Months, I always obſerv'd ſuch a Pellicle. There was, therefore, a Diſpoſition of the Blood to generate this Pellicle, tho' no Inflammation was preſent. On the contrary, in the moſt violent inflammatory Diſorders, ſuch a Pellicle has ſometimes been found wanting, which, however, is always look'd upon as a bad Sign.

In proportion as the Diſeaſe increaſes, the ſame Train of Symptoms we have already enumerated, are proportionably augmented, the expreſs'd Lymph is ſeparated, and the red Part of the Blood condenſed.

All the Symptoms already enumerated, draw their Origin from this, that the concreted Fluid ſticks in the narrow Parts of the Arteries, whilſt, at the ſame time, the Impetus of the more quickly impel'd Blood acts upon the obſtructed Parts. If, therefore, the Toughneſs of the obſtructing Matter is increaſed, or if the ſame Misfortune ſhould happen in a large Number of Veſſels, and increaſe the Quantity of Motion in the impel'd Fluid, it is ſufficiently obvious, that all theſe Symptoms muſt be by theſe means augmented. Hence ariſe the greater Swelling of the Part affected; the deep-red Colour inclining to a Purple; the burning Heat; the intenſe Pain from the Fibres ſo diſtracted, that they are ready to be burſt; and an highly ſhining Colour of the tenſe Part. And ſince the Blood, forced into the obſtructed Veſſels, cannot paſs thro' them, the fineſt Part of it will be carry'd off by lateral Ramifications, the red Part alone will remain ſtagnant, and, being apply'd to the obſtructing Matter, and compacted to it by the Impetus of the impel'd Fluid, the Quantity of the obſtructing Matter will be, by this means, continually increas'd, and, conſequently, not to be removed without proportionably greater Difficulty.

If the circulating Humours are mild, their Motion not exceſſive, the obſtructing Cauſe not too much confirm'd, the Obſtruction itſelf ſmall, and that eſpecially in the Arteries, or Beginnings of the lymphatic Veſſels; if the Canals are moveable, and a ſufficient Quantity of diluting Lymph is contain'd in the Blood, the concreted Humours are render'd fluid, thoſe that were ſtagnant put in Motion, and the Inflammation is terminated by Reſolution.

Every Diſeaſe terminates either in Health, ſome other Diſorder, or Death. This general Rule holds in Inflammations, and is the principal Circumſtance, by which their various Events are to be eſtimated. When an Inflammation terminates in ſuch a manner, that no Diſorder remains, and all the Functions of the Part affected are reſtored to their natural Soundneſs, without any ſucceeding Diſeaſe, then a Cure is ſaid to be performed. But, if the Inflammation degenerates into a Suppuration, the former is indeed removed; but another Diſorder, that is, an Abſceſs, ſucceeds it. The ſame holds true in Caſes where the inflam'd Part is indurated into a Scirrhus. But when an Inflammation is ſo violent, as totally to prevent the Influx and Efflux of the vital Fluids, the Inflammation indeed ceaſes, but is ſucceeded by a Gangrene, and afterwards by a Sphacelus, which is a true and legitimate Mortification of the Part.

The moſt deſireable Termination, therefore, of an Inflammation, is what Phyſicians call Reſolution. When, for Inſtance, by means of the remaining Principle of Life, and the Uſe of proper Medicines, the ſtagnating Matter, lodg'd in the obſtructing Veſſels, is ſo reſolved, or the Veſſels, in which 'tis contain'd, ſo diſpoſed, that it may paſs into the Veins, or be forced back into the larger Veſſels; ſo that, the Veſſels remaining entire, a free Circulation of the Humours thro' Canals before impervious is reſtored; and the concreted Part of the Fluids, being now reſolved, and mix'd with the circulating Humours, is without any Difficulty capable of paſſing thro' theſe narrow Chanels, which, according to the ſtated Laws of Health, it ought to pervade. When theſe happy Circumſtances concur, the Inflammation is ſaid to be terminated by a Reſolution.

We are, therefore, carefully to inquire into thoſe Signs which denote the Poſſibility of ſuch a Reſolution; for a widely different

Method

Method of Cure is requiſite, when 'tis certain, that any other Termination of the Inflammation is to be expected. The Signs of the Poſſibility of ſuch a Reſolution are theſe following.

When the circulating Humours are mild. All the Humours of the human Body, except thoſe of the excrementitious Kind, and, perhaps, the Bile, are of a Quality ſo mild and gentle, that the Eye, or bare Nerves, in recent Wounds, can bear their Contact without any Senſe of Pain. This was requiſite, that, in a State of Health, the Fluids might, with a due Impetus, be carried through the Veſſels, without injuring them. Since, therefore, the Reſolution of an Inflammation ſuppoſes the Motion of the ſtagnating Fluids, and the reſtor'd Fluidity of ſuch as were concreted, without any Deſtruction of the Veſſels, 'tis ſufficiently obvious, that, in this Caſe, there can be no great Acrimony of the Juices; for, whilſt the Blood, by the Force of the Heart, is preſſed into the ſmall obſtructed Veſſels, and by them repreſſed when the Heart is in its Diaſtole, there muſt be, as it were, a continual Attrition of the Blood upon the Sides of theſe Veſſels: If, therefore, the Blood abounds with Particles of an acrid Quality, 'tis ſufficiently apparent, that theſe Veſſels muſt be reſolved and deſtroyed. This is the Reaſon why, in Patients of a ſcorbutic Habit, the ſlighteſt Inflammation, tho' produced in the Legs by external Cauſes, cannot be cured by Reſolution, but almoſt always degenerates into an ulcerous State and Condition. The ſame is, alſo, obſerv'd to hold true in all other cacochymic Habits, where there is an Acrimony of the Juices.

When the Motion of the Fluids is not too violent. When an Obſtruction happens, the obſtructed Veſſel is, by the Impulſe of the vital Fluid, extended, dilated, attenuated, and, at laſt, its Coheſion deſtroyed, even when the Celerity of the circulating Fluids is no greater than it uſually is in a State of Health. Now 'tis ſufficiently obvious, that when the Impetus of the Humours upon the obſtructed Part is increaſed, the Coheſion of the obſtructed Veſſels muſt be proportionably ſooner deſtroyed. But, in order to the Reſolution of an Inflammation, 'tis requiſite the Veſſels ſhould remain entire. When, therefore, an Inflammation is accompanied with an highly accelerated Motion of the Fluids, no Hopes of a Reſolution are to be entertained.

When the obſtructing Cauſe is not render'd too ſolid. Too quick a Circulation of the Juices is not only injurious, as it may break the obſtructed Veſſels, but, alſo, becauſe, by its means, the obſtructing Molecules are, with proportionably greater Force, compacted and united to each other. But to the Reſolution of an Inflammation 'tis neceſſary, that the obſtructing concreted Matter ſhould be again reſolved into thoſe Molecules, by the Union and Combination of which it is form'd: But the more thoroughly the thin Fluid, hindering the mutual Contact of the groſſer Molecules, is expreſs'd, and the more ſtrongly theſe Molecules are compreſſed and united to each other, the more firmly they will cohere, and their future Reſolution become proportionably the more difficult. But, when the Velocity of the Circulation is increaſed, the finer Parts of the Fluids are diſſipated, the groſſer Parts united, and the Cauſes, combining the Molecules lodg'd in the obſtructed Veſſels, more frequently applied to theſe Molecules in a certain given Time. This is the Reaſon why, in Pleuriſies, and other Diſorders, where there is a violent Fever of about twelve Hours Continuance, Phyſicians deſpair of a Reſolution, and direct their whole Intentions of Cure to the Concoction and Excretion of the inflammatory Matter.

When the Obſtruction is ſmall, and that eſpecially in the Arteries or Beginnings of the lymphatic Veſſels. An Obſtruction is ſaid to be ſmall, either with reſpect to the Place it poſſeſſes in the obſtructed Veſſel, or becauſe it is only lodg'd in few Veſſels of the affected Part. Thus, for Inſtance, if, in the dilated Beginning of one of the Veſſels deſtined for the Conveyance of the Serum, a red Globule ſhould remain incapable of paſſing, ſuch an Obſtruction will be far more eaſily removed, than if this Globule had penetrated and made its Way to the narroweſt Parts of ſuch an Artery. Thus, alſo, if the greater Number of the Veſſels of any Part of the human Body ſhould be obſtructed, each of theſe, being dilated, will, of courſe, compreſs and leſſen the adjacent Veſſels: Hence the Reſolution of ſuch an Obſtruction will always be proportionably more difficult. But, all other Circumſtances being alike, the Reſolution of an Inflammation in the larger Veſſels is, of all others, the moſt eaſily obtain'd; for Veneſection, and moſt of the other Remedies for an Inflammation, exert their Efficacy principally in the larger Veſſels. Thus, for Inſtance, if the red Part of the Blood remains ſtagnant in the narroweſt Part of an Artery, deſtined for the Conveyance of the Blood, or, thro' an Error Loci, has enter'd the Veſſels deſtin'd for the Serum, or the lymphatic Veſſels, which are next in Bulk to them, this obſtructing Matter muſt be ſo reſolved, or the obſtructed Veſſel ſo relax'd, that it may paſs thro' it; or the obſtructing Matter muſt be repelled from ſuch narrower to wider Parts: But a red Globule of Blood, according to the Obſervations of *Leewenhoeck*, is eaſily reduced to the ſerous Globules, of which it is compoſed. Thus a ſerous Globule may, in like manner, be reſolved into other ſmaller Globules. Such an Obſtruction, therefore, in the Arteries deſtin'd for the Blood, or for the Serum, or the Beginnings of thoſe appropriated for the Lymph, may be reſolved. But if a red Globule of Blood ſhould enter far ſmaller Veſſels, whoſe Beginnings are dilated, tho' it ſhould be reſolved into ſerous or ſmaller Globules, it cannot, however, paſs thro' the narroweſt Parts of ſuch Veſſels. Hence, in ſuch a Caſe, the Difficulty of a Reſolution is ſufficiently obvious. Another Remedy of great Efficacy in reſolving Inflammations is, by liberal Veneſection, ſo to diminiſh the Quantity of the Blood, and weaken the Impetus of the ſucceeding Fluids, that, by the proper Contraction of the Veſſel, the obſtructing Matter may be forced from a narrower to a wider Part. But this Effect depends entirely on the Reaction of the Veſſels, when the diſtending Cauſe is removed; for which Reaſon it muſt be moſt efficaciouſly produced in the largeſt Veſſels, which have the moſt firm and elaſtic Coats: But, in the moſt minute and tender Veſſels, no great Degree of Benefit is to be expected from this Circumſtance. Hence the Reaſon is obvious, why, in order to the Cure of an Inflammation by Reſolution, 'tis requiſite that the Obſtruction ſhould not be ſeated in the moſt minute Veſſels. Practical Obſervations ſufficiently confirm this Doctrine, but in no Inſtance more palpably or beautifully, than in Inflammations of the Eyes, where the inflamed Veſſels are ſubjected to our Senſes; for ſo long as only the Veſſels of the Tunica Adnata are red, without any apparent Diſorder in the Cornea, there are great Hopes of the Poſſibility of a benign and gentle Reſolution, without the Diſadvantage of any remaining Misfortune. But when the highly tender and pellucid Veſſels of the Cornea, being dilated, admit the groſſer Humours, the Diſorder will never be totally reſolved, but a Suppuration will always enſue, or a dark Speck remaining, will, for a long time, ſpoil the Beauty of the Cornea, or even continue during the Patient's Life.

When the Canals are moveable. In order to the Preſervation of Health, 'tis neceſſary that the Canals of the human Body ſhould be capable of yielding to the impel'd Fluids, and of returning to their former Largeneſs, when the diſtending Cauſe ceaſes to act. This is called the Mobility of the Canals. Now there are two Circumſtances by which the due Mobility of the human Canals is diminiſh'd, and ſometimes totally deſtroyed; when, for Inſtance, their Sides are ſo relaxed, that they eaſily yield to the Fluids impel'd by the Force of the Heart; but, when the Action of that Organ ceaſes, have ſo little Strength and Vigour, that they cannot propel the Blood impel'd from the Heart to them. On the contrary, ſo great a Rigidity is ſometimes produced in the Sides of the human Canals, that they will not ſuffer themſelves to be ſufficiently dilated by the impel'd Fluids. The former of theſe Misfortunes is called the too great Weakneſs, and the latter the too great Strength, of the Veſſels. In Caſes of too great Debility, the Veſſels capable of being dilated by the ſmalleſt Force may, by an *Error Loci*, admit the groſſer Fluids; and, ſince they eaſily yield, their Extremities may, in this Caſe, be ſo dilated, as to convey thoſe groſſer Fluids, which have enter'd them, to the Veins. Hence, in ſuch a Caſe, the Obſtruction is eaſily removed. Beſides, in theſe Caſes, the Motion of the Humours is always languid; and, in conſequence of the Weakneſs of the Veſſels, the Fluids are never thick and compacted. Hence 'tis ſufficiently obvious, that, in Conſtitutions of this kind, Inflammations not only rarely happen, but are, alſo, eaſily cured when they are produced. But, when the Veſſels are too ſtrong, the Blood is always thick and compact, and its moſt liquid Parts diſſipated. Hence its groſſer Parts become united, and the Inflammation produced is, with Difficulty, reſolved; partly by reaſon of the greater Incapacity of the condenſed Fluid to paſs thro' the Veſſels, and partly by reaſon of the ſtrong Contraction of the obſtructed Veſſels, by which they not only cloſely confine the obſtructing Molecules, but, alſo, reſiſt their own Dilatation. It is often obſerv'd in Practice, that in Women, and young Perſons, acute and inflammatory Diſorders are frequently cur'd by a benign Reſolution, which rarely happens in Adults, or thoſe accuſtomed to hard Labour. *Hippocrates*, in his *Coacæ Prænotiones*, makes the ſame Obſervation in the following Words: "Perſons of denſe Habits of Body, and "thoſe accuſtomed to Exerciſe, are ſooner cut off by pleuritic "and peripneumonic Diſorders, than thoſe not habituated to "Exerciſe."

When there is a ſufficient Quantity of diluting Lymph. When, in the Beginning of acute Diſeaſes, the moſt liquid Parts of the Juices are diſſipated by Sweat, Stool, or any other Evacuation, an unlucky Termination of the Diſorder is always to be dreaded; for the groſſeſt Molecules of the Blood are hinder'd from mutual Contact, and Concretion, by the Interpoſition of the finer and more ſubtile Parts of the Fluids.

Blood flowing from the Vein of a ſound Perſon appears an homogeneous Fluid, but, after remaining for ſome time in a State of Reſt, ſeparates into two diſtinct Parts; for the red Molecules, being united, are concreted, whilſt the fluid Serum is ſecreted from them. But if Blood, immediately after 'tis taken from the Vein, is agitated with a Spatula or Stick, till it becomes cold, this Separation of the Serum from the red Part of the Blood is prevented, and the whole Maſs remains fluid. Hence appears the Neceſſity of a fine diluting Liquid, in order

to prevent the Concretion of the Blood. For this Reaſon *Hippocrates*, in the Beginning of acute Diſeaſes, always condemn'd an Excretion of the more fluid Parts of the Blood by Sweat, Stool, or any other Evacuation. Thus, in his *Prorrhet. Lib.* 1. *Num.* 57. he tells us, "that profuſe Sweats are bad in acute "Fevers." And in his *Coacæ Prænotiones*, *Num.* 30. he informs us, "that, in burning Fevers, immoderate Fluxes prove mortal." *Sydenham*, alſo, who accurately obſerv'd the various Efforts of Nature in curing Diſeaſes, informs us, that in the Beginning of the Small-pox all the Symptoms are increaſed by profuſe Sweats.

When all, or at leaſt moſt, of the Conditions above enumerated happen, then a Reſolution, or a Change of the inflammatory Diſorder into a State of perfect Health, is to be expected without an Expulſion of the Matter of the Diſeaſe, or a Deſtruction of the Veſſels; ſince the Matter is only render'd capable of Circulation, and the obſtructed Veſſels open'd, and render'd pervious. But, if any of theſe Conditions requiſite for a Reſolution ſhould be wanting, we are to endeavour to ſupply this Defect by Art. By a mild Regimen, and ſoftening Medicines, a due Degree of Lenity is procured to the Humours. By Veneſection, Reſt, and the Influence of a pretty cool Air, the Velocity of the Circulation is check'd. By Fomentations applied to the Part affected, the Veſſels are ſo relax'd, that they become capable of yielding more eaſily. By thin and aqueous Drink, the diluting Vehicle of the Blood is ſupplied. In the mean time all thoſe things are to be avoided, by which the moſt fluid Parts of the Humours are eliminated, and carried out of the Body. But all theſe ſhall be afterwards conſidered under the Cure of an Inflammation.

If the circulating Humours are mild, their Motion accelerated, the Obſtruction great, incapable of a Reſolution, and attended with a violent Train of Symptoms, the Veſſels diſtended, and ruptur'd with Pain, Heat, Pulſation, and Tumor, diſcharge their contained Fluids, which are reſolv'd, become gently putrid, and produce an Attrition on the tender Solids, which they diſſolve, and mix with the Fluids into one homogeneous, white, thick, glutinous, and pinguious Humour, called Pus. This is Suppuration, the other Manner in which Inflammations terminate.

When the obſtructing Molecules are ſo impacted in the Extremities of the converging Veſſels, that there is no Acceſs for a diluting Vehicle, by which being diſſolv'd, they may penetrate into the Veins, whilſt, in the mean time, the ſucceeding Fluid, by an accelerated Motion, continues more and more to protrude the obſtructing Matter into narrower Parts of the Veſſels, 'tis obvious, that, at laſt, the ſtagnating Fluid, being much preſs'd, will remain abſolutely immoveable in the obſtructed Veſſel, and become incapable of being forced from theſe narrow to wider Parts thereof. All this Part, therefore, of the inflamed Veſſel will be totally deprived of the Influx of the vital Humours, and muſt conſequently be ſeparated from the other live and ſound Parts. A careful Obſervation of Nature, in her Efforts to cure Diſeaſes, has taught Phyſicians, that a Suppuration ariſing, produces a moſt perfect Separation of all that which is affected by the Inflammation, from the remaining ſound and live Parts. Hence it is obvious, that a Suppuration is not highly dangerous, except in thoſe Parts of the Body, the Soundneſs of which is abſolutely neceſſary to Life and Health, ſuch as the Brain, for Inſtance, or in Caſes where Pus, already form'd, cannot be eliminated without Danger, as in Inflammations of the intercoſtal Parts: But how, by a Suppuration, all thoſe Parts, rendered totally unfit for the vital Motion of the Fluids, are ſeparated, is beautifully illuſtrated by the various Phenomena which happen in every Wound, inflicted in a ſound Body, from the very Beginning to the perfect Cure: For, firſt, the Blood is diſcharged from the Veſſels divided by the wounding Cauſe; then, their Orifices being contracted, a rediſh thin Ichor is eliminated. Then the Surface of the Wound becomes almoſt dry, and a true Inflammation is produced by the vital Motion of the Humours acting upon the Extremities of the obſtructed Veſſels; as is obvious from the Pain, the Redneſs, the Heat, the Swelling, the gentle Fever, and the Thirſt. Afterwards the impervious Extremities of the Veſſels are ſeparated, together with that Part of the ſtagnating Liquor which is impacted in the Extremities of theſe Veſſels. Then, in the Wound, appears a tenacious, white, and pinguious Liquor, called Pus. When this is cautiouſly wiped off, the whole Surface of the Wound appears equably moiſt; a manifeſt Sign, that the Orifices of the Veſſels, before obſtructed, are open'd, the contracted and impervious Extremities of the Veſſels being ſeparated. A Suppuration, therefore, is the ſalutary Effort of Nature, by which all thoſe Parts, become unfit for the vital Motion of the Humours, are ſeparated from the other live and ſound Parts. Hence *Hippocrates* juſtly obſerv'd, that Wounds made with ſharp Inſtruments might be cured without a Suppuration; whereas contuſed and lacerated Fleſh muſt become putrid, and be converted into true Pus. But though in treating of a Suppuration we uſe the Word Putrefaction, yet we do not mean that Kind of Putrefaction, which happens in a Carcaſe, where there is no Life; but a particular Change and Depravation of the Humours, brought about by the remaining Principle of Life. *Galen*, in his Treatiſe *de Febribus*, *Lib.* 1. *Cap.* 7. beautifully diſtinguiſhes between theſe two Species of Putrefaction; for he commended a white, ſmooth, and equal Sediment of the Urine, as the beſt Sign of the Reſolution and Evacuation of the Matter of the Diſeaſe. This Change he calls Putrefaction, in the following Words: "But the Putre- "faction of the Humours, which happens in Abſceſſes, is ſimi- "lar to that which happens in Inflammations, Abſceſſes, and "other Tubercles." He informs us, that there are two Kinds of this Putrefaction. "One, ſays he, happens by the ſuperior "Power and Energy of Nature; and the other in conſequence "of her being overcome and foil'd. When Nature is victo- "rious, Pus is form'd, as in Inflammations, and all Tumors of "the tuberculous Kind. But, in the Humours of the Arteries "and Veins, that which ſubſides in the Urine is analogous to "Pus. But this Putrefaction is not ſimply Putrefaction, but, in "ſome meaſure, partakes of the Nature of Concoction; for, ſo "long as the Faculty of Concoction remains in the Veſſels, the "putreſcent Humour is thus chang'd." Hence it appears, that the Formation of Pus is widely different from a ſpontaneous Degeneration of the Humours into Putrefaction.

The Tranſition of an Inflammation incapable of a Reſolution, into a Suppuration, ſeems to be in this manner: The ſucceeding Fluid, the Celerity of whoſe Motion is increas'd by the concomitant Fever, is, by each Pulſation of the Heart, forced upon the obſtructed Part. Hence, by this continued Pulſation, the diſtended Sides of that Part of the Veſſel between the Heart, and the Part obſtructed, begin gradually to be lacerated, and the Coheſion of the obſtructed Extremity with the reſt of the Veſſel is deſtroy'd. Whilſt this happens, the Humours are diſcharged from the open Veſſels. By the Heat of the Parts theſe are diſſolved, and begin to become, as it were, putrid. The ſtagnant Fluid, lodged in the ſeparated Extremities of the Veſſels, alſo, begins to be diſſolved by the ſame Cauſes. The highly tender ſolid Parts, before containing this ſtagnating Liquor, ſuffer, alſo, an Attrition, are divided, and, being changed by their Stagnation, and the Heat of the Parts, are converted, together with the diſcharged Fluids, into an homogeneous Liquor, called Pus. It may, perhaps, appear ſurpriſing, that the ſolid Sides of the Veſſels ſhould be ſo diſſolv'd, that a Mixture of them with the diſcharg'd Humours ſhould appear an homogeneous Fluid: But the Truth of this will be ſufficiently obvious, if we conſider the almoſt incredible Smalneſs of theſe Veſſels; for from the Experiments of Mr. *Leewenhoeck*, and others, mention'd in the ſecond Volume of the Medical Eſſays, 'tis obvious, that, according to an accurate Calculation, almoſt fifty Millions of red Globules of Blood are only equal in Weight to one Grain. But the ſmalleſt Arteries, deſtin'd for the Conveyance of the Blood, tranſmit only one ſuch Globule. Hence it appears how ſmall and tender theſe Veſſels muſt neceſſarily be. But the ſmalleſt of the Arteries deſtin'd for the Conveyance of the Blood are the largeſt among the minute Veſſels. We have before proved, that an Inflammation of the ſanguineous Kind may, alſo, happen in the Veſſels deſtin'd for the Serum, and the ſmall lymphatic Arteries. 'Tis, therefore, no Wonder, that the ſolid Stamina of ſuch Veſſels ſhould, by Attrition, be ſo mixed with the Fluids, as totally to diſappear. In phthiſical Patients the whole Subſtance of the Lungs is ſometimes ſo conſum'd and evacuated by way of Spit, that upon viewing the Patient's Body, after Death, Phyſicians are often ſurpris'd to find Life ſo long protracted, whilſt ſo ſmall a Portion of ſo noble an Organ was left.

But this Humour, conſiſting of the diſcharged Fluids, and the tender Solids, as it were, triturated and mix'd together, is called Pus; the Properties of which, when the Maturation is perfect, and the Concoction of the inflam'd Fluids duly made, are here enumerated; for, in this Caſe, the Pus always appears white, of the Conſiſtence of the Cream of Milk, pinguious to the Touch, every-where equable, and containing nothing heterogeneous. But the Pus, which recedes from theſe Conditions, is juſtly to be condemn'd. *Hippocrates*, in his *Prognoſtics*, 42. takes notice of all theſe Circumſtances, in the following Words: "That "Pus is the beſt, which is white, equal, ſmooth, and not at all "fetid: That, on the contrary, is worſt, which moſt palpably "recedes from theſe Qualities." *Celſus*, alſo, in the twenty-ſixth Chapter of his fifth Book, when treating of the various Matters diſcharged from Wounds and Ulcers, that is, Sanies, Blood, and Ichor, uſes the following Words: "Among all theſe Pus is the "beſt: But this, alſo, is of the worſt Kind, when it is diſcharg'd "in large Quantities, or is thin and diluted, eſpecially at firſt; "as, alſo, when its Colour reſembles Serum; or when it is pale, "livid, feculent, or fetid; unleſs the Place itſelf excites the "Smell. On the contrary, it is the better, the ſmaller its Quan- "tity, the thicker, and the whiter it is; as, alſo, when it is "ſmooth, without any Smell, and equable." A little after he beautifully obſerves, that Inflammations are terminated by the Formation of Pus; for he goes on in theſe Words: "But the "Pus ought to be proportion'd both to the Bulk of the Wound,

" and the Time; for a larger Quantity may be naturally ſo diſ-
" charg'd from a large Wound; and in Caſes where Inflammations
" are not as yet terminated." But, when the inflammatory Matter, to be concocted into Pus, is of an obſtinate and rebellious Kind, or when the concocting Powers are weak, or when both theſe Misfortunes concur, then a Pus, with the above enumerated Conditions, is not form'd; but another Liquor, degenerating more or leſs from them, as *Galen*, in *Comment.* 1. in *Prognoſt. Hippocr.* beautifully obſerves, when explaining this Paſſage of *Hippocrates*; for, after he has told us, that, in a Phlegmon, the Blood diſcharged into the Interſtices adjacent to the Veſſels, that is, into the Tunica Celluloſa, could not be reſtored to its former Nature, but muſt be changed, and become putrid, juſt like all other Subſtances, which become exceſſively warm in an improper Place, he ſubjoins the following Words: " If, therefore, *ſays he*, the innate
" Heat recedes much from its due Temperature, the Blood be-
" comes putrid, as in a Carcaſe. But ſo long as this innate Heat
" retains its proper Energy, a kind of mixed Change is produced
" in the Blood; partly by a preternatural, and partly by a natural
" Cauſe; of which, as the former putrefies, ſo the latter con-
" cocts: Whichever of theſe is moſt prevalent, their proper
" Symptoms neceſſarily enſue, both in the Colour, the Smell,
" and the Conſiſtence of the Matter."

The Formation of Pus, therefore, depends on the remaining Principle of Life: For this Reaſon *Hippocrates* juſtly reckon'd it among the worſt Signs, when an Ulcer, appearing before or during a Diſeaſe, diſcharged no more Pus, but became dry; for in his *Prognoſt.* 22. he affirms, that the Patient, whoſe Fate this is, will die.

But that the inflamed Part tends to a Suppuration, may be known from the following Conditions.

If the circulating Humours are mild: For, if there is a conſiderable Acrimony of the Humours, this, by the Stagnation and great Heat of the Part, will be increaſed: Hence an Eroſion and Deſtruction of the Veſſels will happen; but not that mild and gentle Separation of the Extremities of the obſtructed Veſſels, which ought to be in a legitimate Suppuration.

If the Motion of the Humours is very violent. In the Reſolution of the Inflammation, the Mildneſs of the Humours, and their regular Motion, are requiſite: But, where a Suppuration is to enſue, there is always a proportionably greater Velocity of the Circulation: Hence a Suppuration is a kind of Medium between a benign Reſolution, and a Gangrene. In a Reſolution, without any farther Injury done to the Veſſels, or an Evacuation of the obſtructing Humours, the concreted Fluids are reduced to their former Fluidity, and thoſe which were ſtagnant put in Motion. But, in a Gangrene, a true Mortification of the Part affected happens; and the Whole of this mortified Part muſt afterwards be ſeparated from the adjacent live Veſſels: But, in a Suppuration, the Extremities of the obſtructed Veſſels are torn aſunder, and the extravaſated Fluids to be converted into Pus, with the tender Solids, muſt be eliminated. In this it differs from a Reſolution, and from a Gangrene; becauſe by a Suppuration the Whole of the Part affected is not deſtroy'd. For this Reaſon the increaſed Velocity of the Humours, which accompanies an Inflammation, muſt be very moderate, before a Reſolution can be expected. On the contrary, if a violent Fever is preſent, a Gangrene will ſoon enſue: But, in a Suppuration, the Motion of the Humours is neither ſo moderate as in a Reſolution, nor ſo briſk and ſwift as it generally is in a Gangrene: Hence, when there are no Hopes of a Reſolution, it may prove equally dangerous to leſſen the Fever, as it is imprudent to excite it; as will afterwards appear.

When the Obſtruction is great. When the Obſtruction is ſaid to be ſmall, or great, as, alſo, what the Signs of a Reſolution are, we have already ſpecified: But it is principally known, that an Inflammation tends to a Suppuration, if the Tumor, Heat, Pain, Redneſs, and other Symptoms, already enumerated, are increaſed; not with the greateſt Velocity, for then a Gangrene would enſue; but by a kind of continued and uninterrupted Increaſe. It may ſeem difficult accurately to aſcertain the preciſe Boundary, where the Poſſibility of a Reſolution ceaſes, and the Beginning of a Suppuration happens: This however, is certain, that the Pain, Pulſation, Fever, and Heat, are manifeſtly increaſed at the time the inflamed Part is ſuppurating. But, when the Pus is formed, all theſe are again leſſen'd, as *Hippocrates*, in the forty-ſeventh Aphoriſm of his ſecond Section, juſtly obſerves, in theſe Words: " About the time Pus
" is forming, Pains and Fevers rather happen, than when it is
" already form'd." Nor is this ſurpriſing, ſince the diſtended Veſſels, ready to burſt, are capable of exciting the moſt intenſe Pain; but, when they are ruptured, the Pain produced by this means ceaſes.

If the Humours are acrid, and their Motion violent, the Obſtruction great, the Veſſels rigid, and all the Symptoms violent; then the Veſſels are ſuddenly ruptur'd, the Fluids become putrid, and the Ichor diſcharg'd is collected under the Skin, like the Waſhings of Fleſh, or a yellow Sanies: The Colour of the Part becomes cineritious, pale, brown, and at laſt black. The Redneſs, Pain, Heat, Pulſation, and Tumor, ceaſe in the Part affected, but appear in thoſe adjacent: The Part affected becomes mortified: And this is called a Gangrene, the third Manner in which Inflammations terminate.

We now come to treat of the third Manner in which Inflammations terminate, which is a Gangrene: When by any Cauſe whatever, in a ſoft Part of the Body, the Influx of the vital Humours through the Arteries, and their Return through the Veins, are deſtroy'd, then the Mortification of ſuch a Part happens; which, from its Beginning as it increaſes, is called a Gangrene. This Termination therefore of an Inflammation differs from a Suppuration, ſince, in the former, all Motion of the Humours ceaſes in the Part affected, in conſequence of the ſudden Rupture of the Veſſels; whereas, in a Suppuration, the obſtructed Extremities of the Veſſels are gradually ſeparated by the Motion of the ſucceeding vital Juices. An Inflammation principally tends to a Gangrene, when the following Circumſtances happen.

When the Humours are acrid. All highly acrid Subſtances, externally applied to the Body, produce a Gangrene; nor is it matter of any Moment, whether theſe acrid Subſtances are of an acid, an alcaline, or any other Nature: Thus Oil of Vitriol, the potential Cautery uſed by Surgeons, and prepar'd of an acrid alcaline Salt, boiled with Quick-lime, acrid empyreumatic Oils, or the expreſſed Oils of Guaiacum, and volatile alcaline Salts, when applied to the Skin, produce true gangrenous Eſchars. The ſame will happen, if the Maſs of Blood is contaminated with acrid Subſtances. It is true, ſuch highly acrid Things cannot eaſily enter the Blood; yet, in ſome Diſeaſes, there happen ſuch ſurpriſing Depravations of the Humours, that, acquiring the higheſt Degree of Acrimony, they ſuddenly deſtroy all the Parts. In a malignant putrid Scurvy, the Gums have an intolerable Stench, and are affected with a true Gangrene; then malignant Ulcers, which ſoon become gangrenous, appear in various Parts of the Body, and eſpecially in the Legs. The like Diſorders are obſerv'd to be produced by the black Bile, when redundant, and put into Commotions: Hence it is obvious, that, if an inflammatory tenacious State of the Blood is at the ſame time accompanied with a conſiderable Acrimony, the Veſſels muſt ſoon be deſtroy'd, and a Gangrene produc'd.

When the Motion of the Humours is violent. A moderate Motion of the Humours favours the Reſolution of an Inflammation; a Motion ſomewhat briſker promotes a Suppuration; but an highly violent Motion acts with ſuch Force on the obſtructed Extremities of the highly minute Arteries, that all the Parts are ſuddenly ruptured, and not gradually ſeparated, as in a Suppuration. The briſk Motion of the Humours through the whole Body is known by the increaſed Velocity of the Pulſe, and a preternaturally quick Reſpiration: The intenſe Pain, and violent Heat, in the inflam'd Part indicate the ſame. If at the ſame time the Velocity of the Humours is accompanied with an Acrimony, it is ſufficiently obvious, that the tender Veſſels muſt be very quickly deſtroy'd, ſince acrid Fluids are both with a greater Impetus, and more frequently, applied to them within a given Time: Beſides, it is certain, that, by an increaſed Celerity alone of the Circulation, the Salts and Oils of the Blood are render'd more acrid; and that thus freſh Stimuluſes are produced, which increaſe that Velocity of the Circulation which firſt gave Birth to them. From all theſe Circumſtances it is ſufficiently obvious, that the inflam'd Part is in imminent Danger, when there is a violent Fever.

When the Veſſels are rigid. It is ſhewn under the Article FIBRA, that by an increaſed Rigidity of the Veſſels the Blood is highly condenſed, and its moſt liquid Part diſſipated, by which means it is rendered more prone to Concretion; and, as we have already obſerved, the due Mobility of the Canals, and the diluting Vehicle of the Blood, are juſtly reckoned among thoſe things from which the Reſolution of an Inflammation is to be expected. If the contrary Circumſtances ſhould happen, a proportionably worſe Event will always enſue. And ſince, in this Caſe, the Humours are moved through the Veſſels with great Velocity, the whole Impetus will act upon the obſtructed Extremities of the Veſſels, whereas otherwiſe a great Part of it is employed in dilating the Sides of the flexible Veſſels. Thus the Extremities of the Veſſels, together with the concreted Fluid, with which they are loaded, will be ſuddenly torn aſunder by this violent Force, and all the Circumſtances to be afterwards mentioned will happen. Hence the Reaſon is obvious, why inflammatory Diſorders are generally ſo fatal to Perſons worn out by hard Labour.

When all the Symptoms are violent. If the Tumor of the inflamed Part very ſuddenly increaſes, if the Redneſs is very deep, and tending to a purple Colour, the Heat burning, the Pain intenſe, and continually increaſing, the Pulſe exceſſively quick, and the Reſpiration difficult, a Gangrene will ſoon be brought on.

In this Caſe the Veſſels are ſuddenly ruptured. If we conſider, that an acrid Fluid, moved with a violent Motion, acts upon the Extremities of the Veſſels ſo loaded with a ſtagnating Matter,

ter, that nothing can paſs through them, it eaſily appears, that a ſudden Rupture of the Veſſels is to be expected, eſpecially if their too great Rigidity prevents their being eaſily diſtended without a Rupture. But from the ruptured Veſſels the Fluids are diſcharged, and, by a ſpontaneous Principle of Change, are very ſoon corrupted; ſince an intenſe Heat, the perpetual Concomitant of a violent Inflammation, greatly favours a Putrefaction. Whilſt all theſe Circumſtances happen in the inflamed Part, ſome ſenſible Changes are obſerved, which manifeſtly inform us, that ſuch a Diſorder is either already preſent, or will ſoon be ſo. But all theſe Phenomena are perfectly ſimilar to thoſe produced by Fire, when applied to any Part of the Body, as we have already obſerved: for then the Epidermis begins to be ſeparated from the ſubjacent Skin, and, by the diſcharged Humours, raiſed into Bliſters, generally full of a rediſh Ichor; or, in a worſe State of the Diſorder, a thin yellow Sanies is contained in theſe Bliſters. This ſhining red Colour is changed into a cineritious, pale, brown, and, at laſt, a black Colour; and, according as the Colour recedes from cineritious, or pale, and approaches to that of black, the greater or ſmaller Progreſs of the Diſorder is to be eſtimated. Then almoſt all the Symptoms of the Inflammation are mitigated, and ſometimes appear to be totally removed. Nor is this to be wondered at, ſince they draw their Origin from the increaſed Celerity of the vital Motion of the Humours in the Part affected. Hence the Redneſs diſappears, ſince, when the Influx of the Humours ceaſes, the Blood is no longer carried through the Veſſels of the Part thus affected. And when, for the ſame Reaſon, the nervous Fibres are no longer diſtended, the Pain is, of courſe, removed. As the Heat and Pulſation ſuppoſe a violent Attrition of the impelled Fluid on the Sides of the Veſſels, they, in like manner, ceaſe, when a Gangrene ſucceeds an Inflammation. This ſudden Remiſſion of the Pain, and other Symptoms, in acute and inflammatory Diſorders, without previous good Signs, is, therefore, juſtly accounted ſo fatal a Symptom; for, when in an external Part of the Body a Gangrene happens after a violent Inflammation, the Preſence of ſuch a Diſorder may be known from the above enumerated Signs. But, if the internal Parts of the Body labour under the like Diſorder, the principal Sign is to be taken from the ſudden Ceſſation of the Pain. Thus in a violent Pleuriſy, and highly painful Inflammations of the Inteſtines, the intenſe Pain frequently ceaſes ſuddenly; and, whilſt the miſerable Patients fondly believe, that the Diſorder is happily ſubdued, an End is ſoon after put to their Lives. Theſe are the fallacious Intervals of Reſpite, which, in violent Diſorders, ſo often impoſe upon judicious Phyſicians; whilſt thoſe not much converſant in Practice often both hope and predict a ſalutary Termination of the Diſorder, which, in ſuch Circumſtances, never fails to prove ſoon mortal.

When, therefore, the Veſſels are deſtroyed, the Influx and Efflux of the Humours in the Part affected is totally aboliſhed, that is, a Mortification is produced; and then all the ſubſequent Diſorders ariſe from the ſpontaneous Corruption of the Part already mortified: For, if we conſider thoſe Changes which happen eſpecially in a warm and moiſt Air, to the Fleſh of newly kill'd Animals, it is obvious, that they are almoſt ſimilar to thoſe which happen in gangrenous Parts; for the red and lively Colour of recent Fleſh begins to be gradually deſtroyed; a pale cineritious Colour ſucceeds, which, by degrees, becomes more and more brown; at laſt, ſuch putrefied Fleſh becomes almoſt black, and is diſſolved into a kind of putrid Gore, though before it was ſufficiently firm. But all theſe Phenomena happen ſooner in a gangrenous Part, becauſe the Heat of the adjacent live Parts augments the Putrefaction of that which is mortified.

Though the Parts adjacent to ſuch a mortified Part are as yet pervious to the vital Humours, yet in the Boundary between the mortified and live Parts there muſt neceſſarily be an Obſtacle put to the Humours conveyed thither, ſince they cannot poſſibly penetrate into the mortified Parts. Hence in this Boundary a kind of new Inflammation is produced, after which a Suppuration happening, the mortified and gangrenous Part is ſeparated from the adjacent live Parts, and the Gangrene ſpreads, the vital Motion of the Humours being ſuffocated in the contiguous Parts. This Phenomenon has ſometimes impoſed upon unskilful Practitioners, whilſt they believed, that a Gangrene was not yet preſent, becauſe Pain was perceived in the Part affected; though, properly ſpeaking, there is no Power of Senſation in the gangrenous Part, ſince the Pain ariſes from the ſubjacent and circumambient live and inflamed Parts. But it is always reckoned a good Sign, when, in the whole Circumference of the Part already gangrenous, Redneſs, Pain, Heat, and Tenſion, are perceived, provided theſe Symptoms are not ſo violent as to lay a Foundation for dreading, leſt this Inflammation, alſo, ſhould degenerate into a Gangrene; but in this Caſe we know, that the remaining Life in the other Parts of the Body attempts the Separation of the gangrenous and corrupted, from the live and adjacent Parts.

When an external Compreſſion happens to a Part thus affected, or when an intenſe Heat diſſipates the Fluids, the mortified Part becomes indurated like a Piece of dried Leather, and ſuffocates and corrupts the Parts which are inferior to it.

In a Part already gangrenous there is no Motion of the Humours through the Veſſels, but a perfect Reſt and Stagnation: Hence Changes will happen, ſimilar to theſe, which, by the ſame Cauſes, are produced in Carcaſes. The Heat of the ſubjacent and circumambient live Parts, if, at the ſame time, there is any Moiſture, will convert the whole mortified Part into a putrid Gore. But if, by an external Compreſſion, or an intenſe Heat, the moſt fluid Parts of the Humours are diſſipated, then the mortified Part is dried, indurated, and perfectly reſembles a Piece of black Leather; and is often ſo tough, that it can ſcarcely be divided by a Razor. But this Phenomenon is principally obſerved in the external Parts, covered with Skin; for in other Parts the gangrenous Portions are rather colliquated into a kind of Gore. Thus in a Man formerly in good Health, who died of an incarcerated Hernia, *Van Sweiten* informs us, that he ſaw the Inteſtines converted into a putrid kind of Poultice during the two Days the Diſorder laſted. But when, in acute Diſeaſes, a Gangrene is produced about the Os Sacrum, and Os Coccygis, by lying in Bed, highly black and dry Spots appear in the Part affected. How ſoon, by external Compreſſion alone, a Gangrene is not only produc'd, but, alſo, the Skin rendered black and indurated like a Piece of Leather, even in the ſoundeſt Perſon, may be learned from numberleſs Caſes, which daily occur in Practice. But when ſuch an hard and coriaceous Covering firmly adheres to the ſubjacent Parts, theſe will, of courſe, become inflamed, ſo that being rendered tumid, if this Covering cannot be raiſed and ſeparated from the live Parts, to which it adheres, theſe will in like manner be compreſſed, and the Diſorder will penetrate deeper.

Things actually, or potentially, cold, Aſtringents, coagulating Subſtances, Repellents, pinguious and acrid Subſtances, thoſe of an emplaſtic Nature, Narcotics, ſtrong Ligatures, and external Compreſſion, ſoon promote this Change of an Inflammation into a Gangrene.

In this Paragraph are enumerated ſuch things as we know from Experience, when applied to an inflamed Part, ſoon change the Inflammation into a Gangrene.

As for the Things actually or potentially cold; among the Things which diſpoſe an Inflammation to degenerate into a Gangrene, we may juſtly reckon a great Obſtruction, and the Rigidity of the Veſſels. But the Effects of Cold are a greater Contraction and Strength of the Solids, and an increaſed Stagnation of the Fluids. The higheſt Cold, therefore, by conſtringing the Solids, and coagulating the Humours, totally prevents the Circulation of the Humours. Hence a ſudden Mortification of any Part is produced by intenſe Cold. But, when the Principle of Life is able to ſurmount theſe Obſtacles, in any Part of the Body pinched with Cold, then a violent Heat is produced by the Attrition of the condenſed Fluids circulating thro' the contracted Veſſels. Thoſe who rub their Hands with Snow, find this to be experimentally true; for, after the uneaſy Senſation of Cold, a pretty intenſe Heat is perceived. Hence 'tis obvious, that cold Subſtances, applied to inflam'd Parts, prove injurious; either as they entirely ſuffocate the Motion of the Fluids, or as they afterwards increaſe the Heat, which is already too great. Sometimes, however, cold Subſtances applied may prove beneficial; when, for Inſtance, in conſequence of an *Error Loci*, the groſſer Humours, having enter'd the ſmaller Veſſels, would be repel'd into the larger Ramifications, in conſequence of the Contraction of the Veſſels by Cold, eſpecially if the Diſorder ſhould prevail in the finer Fluids; for the red Part of the Blood is immediately coagulated in cold Water, but not the Serum, and finer Part of the Lymph. But 'tis ſufficiently obvious, that no Advantage is to be expected from the Application of cold Subſtances, unleſs the Diſorder is at once recent and mild; for, if the obſtructing inflammatory Matter ſhould be immovably pent up, and impacted in the narroweſt Parts of the Veſſels, the Diſorder will be rather increaſed by them. Theſe Sentiments exactly agree with the Doctrine of the Antients; for, after *Hippocrates*, in the 17th and 20th *Aphoriſms* of his fifth Section, has inform'd us, that Cold, among other Misfortunes, produces *Blackneſſes* [μελασμους], he, in the 23d *Aphoriſm* of the ſame Section, when recounting the Advantages of Cold, affirms, that it is uſeful in Caſes where "Inflammations and Heats, pro-
"duced by recent Diſcharges of Blood, begin to appear red,
"and, as it were, bloody; for, ſays he, it induces a Blackneſs
"on inveterate Inflammations, helps an Eryſipelas when not ul-
"cerated, but does Harm to that which is of the ulcerated Kind."
And tho' *Galen*, in his *Method. Medend. Lib.* 13. *Cap.* 6. recommends the Uſe of cold Subſtances in a Phlegmon, he yet ſubjoins very proper Cautions in the following Words: "In
"beginning Phlegmons we are rather to uſe cold and aſtringent,
"than diſcutient Subſtances, eſpecially when the congeſted
"Matter is not thick; for, when there is a violent Incuneation
"or Impaction [σφιξις] in the inflamed Part, we are no longer

"to

" to uſe Repellents, but Diſcutients." *Galen* could not have ſpoken more juſtly upon this Subject, if, from a Knowledge of the Circulation of the Blood, he had been acquainted with the general Nature of an Inflammation. And in his *Method. Medend. Lib.* 14. *Cap.* 3. when treating of the Cure of an Eryſipelas, he tells us, that it requires a greater Degree of Refrigeration than a Phlegmon, and then ſubjoins the following Words: " But let " Refrigeration be no longer uſed, than a Change of Colour " happens in the Part; for, upon ſuch a Change, a genuine " Eryſipelas ceaſes; but, by too much refrigerating an Eryſi- " pelas, which is not genuine, but, in ſome meaſure, of the " phlegmonoide Kind, the Skin is rendered livid; and if we do " not then give over the Refrigeration, it becomes black, eſpe- " cially in old Perſons; ſo that ſome Parts, thus refrigerated, are " not to be perfectly cured by the Uſe of Diſcutients, but con- " tinue with a kind of ſcirrhous Tumor upon them." Hence 'tis ſufficiently obvious, how dangerous the Uſe of cold Subſtances is in the Cure of Inflammations; ſince, by their means, they ſo eaſily degenerate into worſe Diſorders, unleſs, when uſed in the Beginning, or in Caſes where the Misfortune ariſes, not from the Entrance of the red Blood, but of the finer Humours, into Veſſels not naturally deſtin'd for their Conveyance; as, for Inſtance, in an Eryſipelas, an hot Oedema, and other Diſorders of a like Nature.

Things potentially cold are thoſe, which, when applied to a ſound Body, deſtroy or leſſen the Heat, tho' they themſelves are actually hot, or, at leaſt, not much colder than the Part of the Body to which they are applied. They are, therefore, ſuch Subſtances as either leſſen, or entirely remove, the Cauſes of Heat in the Part: But Heat ariſes from the Motion of the Humours thro' the Veſſels. When the latter is diminiſhed, the former decreaſes; and the Heat is increaſed in proportion as the Motion is augmented. 'Tis therefore obvious, that potentially cold Things are ſuch as either deſtroy or leſſen the Velocity and Strength of the Circulation. Thus, for Inſtance, warm Water, applied to the Part affected, may by relaxing the Veſſels, and diluting the obſtructing Molcules, remove the Heat of the inflamed Part. Hence ſome Things are ſaid to be potentially cold, tho' they are, at the ſame time, actually hot. But 'tis ſufficiently obvious, that theſe, and other Things of a like Nature, rarely prove prejudicial in Inflammations, as we ſhall afterwards ſhew; for they do not deſtroy the Motion of the Humours thro' the Veſſels, but, removing the Obſtacles, reſtore a free and equable Circulation. But thoſe Things would prove highly injurious, which, by ſuffocating the Life of the Part, ſhould induce a Coldneſs, as is reported concerning ſome Poiſons. Thus the divine *Socrates*, after having drank the poiſon'd Draught, ſuppoſed to conſiſt of Hemlock-juice, perceived his Legs becoming cold; and, when this Coldneſs aſcended above his Pubes, he calmly expir'd.

As for aſtringent and coagulating Circumſtances; by theſe the Cavities of the Veſſels are diminiſh'd, and the Fluids render'd incapable of Circulation. Such Subſtances, therefore, contribute to increaſe the Cauſes of the Obſtruction, and, conſequently, deſtroy the free Motion of the Humours thro' the Veſſel. But, when this Motion is entirely deſtroyed in the Part, a Gangrene is preſent.

As for Repellents; the inflamed Part, for the Reaſons already aſſign'd, becomes tumid, and that frequently in a very high Degree. Hence the antient Phyſicians concluded, that a certain Matter was here congeſted, which was not lodged in the Part before, but came from ſome other Quarter. But, as they frequently ſaw this Accumulation very ſoon form'd, they imagin'd that it was produc'd by Fluxion. For this Reaſon a Part of their Cure conſiſted in repelling what had flowed into the Part, eſpecially in the Beginning of the Diſorder, as we have before ſhewn from *Galen*. That ſuch a Repulſion of the Blood from the Extremities of the Arteries to their Baſes is poſſible, we know from certain and undeniable Obſervation; for, when the ſtoundeſt Man is ſuddenly frighted, the Paleneſs of the Face and Lips ſufficiently informs us, that the Blood has retir'd towards the Heart, and larger Veſſels. Hence a Palpitation of the Heart, and a kind of Uneaſineſs, immediately ſucceed this Paleneſs. The ſame is, alſo, ſufficiently obvious in Deliquiums. But, by this Repulſion, the Molecules of the Blood, which, thro' an *Error Loci*, had enter'd ſmaller Veſſels, may be again forced back into ſuch as are larger; and thus the Obſtruction would be removed. But, how far Things of this Nature may prove beneficial, we have already conſider'd, when treating of the Application of cold Subſtances to inflam'd Parts. But as all Things externally applied, in order to promote this Repulſion, act only by increaſing the Contraction of the Veſſels, 'tis ſufficiently obvious, that their Uſe is dangerous, except in the Beginning of an Inflammation ariſing from an *Error Loci*; and that the Diſorder is increaſed by them, unleſs they prove beneficial on their firſt Application.

As for pinguious and acrid Subſtances, or ſuch as are of an emplaſtic Nature; we have already ſaid ſomething concerning theſe: For, ſince they are ſubject to produce an Inflammation, they will, of courſe, augment one already produced by other Cauſes, eſpecially if the emplaſtic Subſtances adhere ſtrongly to the Part affected; for, in this Caſe, they render it ſtill more imperſpirable, and the acrid Subſtance mixed with them will adhere to it for a long time.

As for Narcotics; theſe, from their Nature, may, perhaps, appear not ſo much to be condemn'd, eſpecially if they are judiciouſly uſed. But as all the Medicines of this Claſs blunt the Senſe of Pain whilſt its Cauſe remains, by this means an Inflammation is often increaſed every Moment; and, the Veſſels being deſtroyed without any Senſe of Pain, a Gangrene enſues. But the intenſe Pain, the Heat, the Pulſation, and other Symptoms, would have ſufficiently admoniſh'd both the Patient, and thoſe who have the Charge of him, that the worſt of Misfortunes were to be dreaded, if the Senſe of Pain had not been allay'd by theſe Narcotics. Hence the moſt efficacious Remedies are neglected, which might have prevented the Tranſition of this Inflammation into a Gangrene.

As for tight Ligatures; how a Gangrene may be produced by this means, we have already ſpecified; but 'tis ſufficiently obvious, that this Diſorder is much ſooner to be expected, when an inflamed Part is violently conſtricted by a tight Ligature.

As for external Compreſſion; we have already conſider'd its Effects.

Then a Continuation of the Uſe of the above-mentioned Things augment the Diſorder into a Sphacelus.

We have already ſhewn, that a true Phlegmon has its Seat moſt frequently in the Tunica Celluloſa, and that it is ſometimes diſtended to an enormous Bulk. Thus, when an Inflammation ariſes in the Back of the Hand, where this Coat or Membrane is moſt tender, a Tumor ſometimes happens two Inches thick, and frequently more. But, when a Gangrene ſucceeds an Inflammation in this Part, this whole corrupted Maſs muſt afterwards be ſeparated; and, in ſuch a Caſe, a Knife may be thruſt pretty deep, without any Senſe of Pain, from which Circumſtance all the ſubjacent Parts might be thought mortified. But it often happens, that the ſubjacent Tendons and Muſcles remain alive, in which Caſe the Diſorder is not as yet a Sphacelus; for a Sphacelus is only ſaid to be preſent, when all the Parts, to the very Bone, are mortified. But when the Membrana Adipoſa, highly diſtended, already corrupted with a Gangrene, and at the ſame time pent up within a tough Skin, preſſes upon all the ſubjacent Parts, the vital Circulation of the Humours may be, alſo, totally ſuffocated in them; and then the Gangrene degenerates into a Sphacelus, that is, a perfect Mortification of the Part. All the Things, therefore, enumerated in the preceding Paragraph, as capable of converting an Inflammation into a Gangrene, may ſo increaſe a form'd Gangrene, as to convert it into a Sphacelus.

If the Part inflamed is glandular, the internal or external Heat great, the impacted Matter immoveable and thick, the Emunctories of the Glands obſtructed, and their Follicules and Sides diſtended, an hard Tumor, free from Pain, is form'd in the Glands, which is called a *Scirrhus*, the fourth Manner in which an Inflammation terminates.

This is the laſt Manner in which an Inflammation terminates, when, for Inſtance, it is neither reſolved, nor that which is render'd unfit for the carrying on the vital Motion of the Humours, ſeparated from the ſound adjacent Parts. This morbid Part, therefore, remains ſo united to the ſound Parts, that it, at laſt, acquires ſuch an obſtinate Diſpoſition, as to be incapable of a Separation from the ſound Parts by all the future Efforts of Nature, or the Efficacy of any Medicine hitherto known; but muſt be removed by the Knife, or the Cautery. But in thoſe Parts of the Body, through which the Blood is continually convey'd, with a rapid Motion, 'tis ſufficiently obvious, that the Veſſels, infarcted with a ſtagnating Matter, cannot remain long unchang'd: For, by this continual Pulſation, all that which reſiſts the free Motion of the Humours through the Veſſels, will be either ſeparated by a mild and gentle Suppuration, or ſoon corrupted by a Gangrene, or a Sphacelus. But when ſuch is the Condition of the Part affected, that the Impetus of the arterial Blood can act but little, or not at all, upon it; 'tis then to be apprehended, that the impacted Matter, when its more liquid Part is diſſipated, may remain there, and form that Species of hard Tumor, which is without Pain, and is called a Scirrhus. But this Termination of an Inflammation is moſt frequently obſerv'd in the glandular Parts; for, the Emunctories of theſe Glands being obſtructed, none of the ſecreted Fluids can be diſcharged through their Fabric. Theſe Fluids, being inſpiſſated by their Continuance and Stagnation, will fill and diſtend their Cavities, or their intricate vaſcular Fabric. And, as the Impetus of the circulating Fluids cannot act directly on this impacted Matter, it will remain, be deprived of its moſt liquid Part, and form a Scirrhus. Of this we have a palpable Inſtance in Inflammations of the Breaſt; for the Milk ſecreted from the Blood convey'd through the mammary Arteries, remaining in the Ducts, which prepare the Milk, begins to be coagulated, a thin Serum drops through the Tubes of the Nipple. The Remainder is in-

ſpiſſated there, as it were, without the Sphere of the Circulation; and, after the Inflammation is allay'd, often leaves a hard Tumor free from Pain, all the reſt of the Patient's Life. For the ſame Reaſon a Scirrhus ſo frequently ſucceeds an Inflammation of the Teſticles; for if we conſider, that the highly ſmall ſpermatic Artery ariſing from the Trunk of the Aorta, by Ramifications ſent off by a true Anaſtomoſis, communicates the red Blood to correſpondent ſmall Veins, and then, by innumerable ſmall Ramifications, wreath'd up and ſeparated from each other, conſtitutes the Subſtance of the Teſticles, it will be ſufficiently evident, that the Impetus of the arterial Blood on theſe Parts is ſcarcely any at all. Hence a Matter once impacted here often produces Tumors, which prove ſo obſtinate againſt the Efficacy of the beſt Medicines. But an Inflammation in the glandular Parts is principally ſucceeded by a Scirrhus, when the following Circumſtances appear.

When the internal and external Heat is great. Women in Child-bed frequently commit the Cure of inflam'd Breaſts to their Nurſes, and often to other doating old Women. And as they generally dread nothing more than a Suppuration, and the laying open of the ſuppurated Part by a Lancet, they endeavour by all poſſible means to prevent this Misfortune. But if by the Application of the ſofteſt Fomentations they endeavour to procure the Reſolution of the Inflammation, their Conduct would not be in the leaſt culpable. But, by a dangerous Error, they expoſe the inflam'd Breaſt to live Coals, or continually cheriſh it with dry and hot Linen Cloths, or they apply Spirit of Wine, almoſt boiling, to it. But this Procedure is often ſo far from being ſucceeded by a Suppuration, that the moſt liquid Parts of the Fluids being diſſipated, and the Remainder by that means inſpiſſated, an incurable Scirrhus is form'd; then the miſerable Women, who were before ſo much afraid of the Prick of a Lancet, are often, afterwards, forced to undergo a cruel and ſometimes a pretty dangerous Operation. The ſame Misfortune, alſo, frequently enſues, if a violent Fever accompanies the Inflammation of a glandular Part, for the ſame Reaſons.

When the Matter impacted is immoveable or thick. Since the Milk contains in it ſo large a Quantity of a thick caſeous Coagulum, which by its Continuance and Stagnation is ſo eaſily ſeparated from the ſerous Part with which it was diluted, Scirrhuſes are, for this Reaſon, more frequently formed in the Breaſts than in any other Parts. When the Fæces of the Blood, deprived of its moſt fluid Parts, and conſtituting what the Antients called the Black Bile, or Melancholy, has, by its pitchy Tenacity, infected the Maſs of Fluids, the ſlighteſt Obſtructions, happening in glandular Parts, eaſily degenerate into Scirrhuſes.

When the Emunctories of the Glands are obſtructed. All that which, by the Fabric of the Glands, is ſecreted from the Blood conveyed to the Arteries, ought to be diſcharged thro' their Emiſſaries for proper Purpoſes. Now, if by any Cauſe the Diſcharge of the ſecreted Liquor is prevented, this Liquor will be accumulated, and diſtend the Follicule in which it is contain'd. But the moſt fluid Part of the ſecreted Humour being either reabſorb'd, or diſſipated, the reſt is by that means render'd thicker, and will remain ſtagnant there. But the Impetus of the circulating Humours may act upon the Veſſels, which conſtitute the Sides of ſuch an infarcted Follicule, but not at all on the Matter contained in its Cavity, as is ſufficiently obvious. Hence this Matter will often remain incapable of a Reſolution by any means but by Stagnation, and a Diſſipation of the moſt liquid Parts. We certainly know, that the fineſt Humours in the human Body are capable of being ſurpriſingly concreted. The Bile ſtagnating in the Gall-bladder, when its Emunctory is obſtructed, is often concreted into ſmall Stones. The moſt limpid Urine, by too long a Stay in the Body, lays a Foundation for the Stone; and 'tis certain from Experience, that ſuch calculous Concretions have been found in the Ventricles of the Brain, and the Cavity of the Abdomen, which Places are only water'd, as it were, with a fine and ſubtile Dew, exhaling from the ſmalleſt Arteries. In a ſound Perſon, when the Noſtrils are perfectly clean, their internal Surface is wet with a ſufficiently fine Lymph; but in the Space of a few Hours, the moſt fluid Part being diſſipated, the remaining Part is concreted. More Inſtances might be produced; but theſe are ſufficient to ſhew, that the fineſt Humours in the Body may lay a Foundation for the moſt terrible Concretions.

The Cauſe, the Part affected, the Largeneſs, the Deepneſs, the quick Increaſe, and Symptoms of the Inflammation, together with the Nature of the Patient, compar'd with the Signs and Effects, give the moſt infallible Prognoſtic.

Having already enumerated the Signs and various Terminations of an Inflammation, we now come to conſider the Prognoſtic which determines what Diſorders are to be dreaded, and what lucky Events expected. But that we may know whether an Inflammation will terminate either in a benign Reſolution, a Suppuration, a Gangrene, or a Sphacelus, we muſt advert to the following Circumſtances.

The Cauſe. Thus, for Inſtance, the Contagion of the Small-pox, in three Days time, ſo changes the Body of the ſoundeſt Perſon, that the whole external Skin, and frequently the internal Surface of the Oeſophagus and Stomach, are full of inflammatory Puſtules. A Reſolution, in this Caſe, is never to be expected, but always a Suppuration, or, in the worſt Species of the Diſorder, a Gangrene, ſucceeds. But by the Contagion of the Meaſles the external Skin is, indeed, inflamed, but a Suppuration never follows, ſince, upon a Deſquamation, or Scaling off of the Epidermis, the Diſorder is terminated. Authors who have treated of the Plague, inform us, that in various Parts of the Body there ſometimes ariſe Inflammations ſo violent as in a few Hours to burn the Part affected to a Coal; which when a Suppuration happens all around it, is ſeparated from the ſound Parts, and falls off. 'Tis therefore obvious, that the Terminations of Inflammations are various, according to the different Cauſes from which they ariſe.

As for the Part affected; 'tis to be carefully conſider'd, whether this is more or leſs neceſſary to Life and Health. Thus, for Inſtance, a pretty large inflammatory Tumor in the Hand is eaſily ſupported: But if, about the Fiſſure of the Glottis, the Membrane covering theſe Parts ſhould be render'd tumid by an Inflammation, the Patient will be ſuffocated by a very ſmall Tumor there. If, in the Hand or Foot, a Phlegmon ſhould degenerate into a Gangrene, in theſe Parts the mortified Portion may be ſeparated from that which is alive: But, if the alike Diſorder ſhould happen in the Brain, 'tis ſufficiently obvious, that there are hardly any Hopes of the Patient's Recovery left. Not only a greater or ſmaller Danger depends on the Diverſity of the Part affected, but, alſo, for the ſame Reaſon, the quite different Termination of the Inflammation. In glandular Parts a Scirrhus is to be dreaded. But in thoſe Parts of the Body where the largeſt Quantity of Fat is, Inflammations ariſing often degenerate into obſtinate Suppurations and Fiſtulas, as about the Anus, for Inſtance, and ſome other Parts.

As for the Largeneſs of the Inflammation; the larger the Part affected with a Phlegmon is, the more Veſſels are obſtructed, the greater Quantity of ſtagnating Fluids remain fix'd in the Veſſels, and as has been already obſerved, the greater is the Velocity of the Circulation through the other pervious and unobſtructed Veſſels. But all theſe Circumſtances are repugnant to the Conditions requiſite to the Reſolution of an Inflammation. Hence, in ſuch a Caſe, a Suppuration or a Gangrene are always to be expected.

As for the Deepneſs of the Inflammation; we have already ſhewn, that almoſt all the Parts of the Body are ſubject to Inflammations, but that they happen no-where more frequently than in the Tunica Pinguedinoſa. Hence Inflammations may be ſeated either in this Coat, or in other Parts. If an Inflammation is ſeated in the Fat, which runs pretty deep in the Interſtices of the Muſcles, the Efficacy of Remedies externally applied can ſcarcely penetrate to it, and a Suppuration, or a Gangrene, happening after ſuch an Inflammation, are not to be cured without the greateſt Difficulty. But, if an Inflammation affects the Tendons, Muſcles, Veſſels, Membranes, Perioſteum, and Bones, the Difficulty of the Cure is, for the ſame Reaſon, ſufficiently obvious. The Diſorders which may happen when the Viſcera are inflamed, are well enough known to thoſe who have frequent Opportunities of treating acute inflammatory Diſtempers.

As for the quick Increaſe of the Inflammation; whilſt the Liquids remain ſtagnant in the obſtructed Veſſels, the Fluids propel'd to theſe Parts by the remaining Principle of Life produce ſome Effects, which are the already enumerated Signs of an Inflammation; but if theſe increaſe very quickly, if the Redneſs, Tumor, Heat, and Pain, are continually augmented, we may eaſily foreſee, that the tender Veſſels will be ſoon ruptured; that a Reſolution is by no means to be expected; but that a Gangrene will ſpeedily enſue: For this Reaſon we reckoned a moderate Motion of the Blood among the Conditions requiſite to the Reſolution of an Inflammation; whereas an accelerated Circulation of the Humours prognoſticates a Suppuration, or a Gangrene.

As for the Nature of the Patient; every Man has a State of Health peculiar to himſelf: And tho' the Qualities of the Solids and Fluids may, in two diſtinct Perſons, ſeem entirely different, yet they often both enjoy perfect Health; tho' the one may be diſpos'd to ſome Sorts of Diſeaſes, and the other to others. If a Countryman, inur'd to hard Labour, is ſeiz'd with a Pleuriſy, he will ſcarcely recover; for the Denſity of his Blood, and the Rigidity of his Veſſels, leave but little Hopes of a benign Reſolution. But, in Perſons of lax and weak Habits of Body, ſuch Diſorders are far more eaſily cured. The morbid Temperament, alſo, of thoſe who labour under Inflammations, will produce different Terminations of an Inflammation. Thus, Perſons of cold and mucous Conſtitutions rarely labour under Inflammations; and thoſe, with which they are afflicted, are generally of the gentleſt Kind. But, if a putrid Scurvy has tainted the Humours, the gentleſt Inflammation, or even a ſlight Wound, degenerates into an obſtinate Ulcer, or a Gangrene.

As for the Symptoms of an Inflammation; theſe we have before conſidered. From all theſe, duly adverted to, we may eaſily foreſee

ſee in what manner an Inflammation will terminate. And thus a due Prognoſtic is made.

'Tis, alſo, obvious, that various Intentions of Cure muſt be purſued, according to the various States of this Diſorder.

From what has been ſaid, we now come to deduce curative Intentions, with reſpect to the moſt proper Method of removing this Diſorder, when known. Nothing is certainly more prejudicial in the Art of Phyſic, than to preſcribe a general Method of Cure for any Diſeaſe, without having a due Regard to its various States and Conditions. Thus, under the common Name of Pleuriſy, are comprehended Diſeaſes widely different, which, tho', at firſt, they might reſemble each other, yet, in their Progreſs, they vary much, and require widely different Methods of Cure; for far different Meaſures are to be taken in the Beginning of a Pleuriſy, from thoſe to be us'd after it is of two or three Days ſtanding, and the manifeſt Signs of a Suppuration appear. A general Cure, therefore, cannot be preſcribed for Inflammations, but the Meaſures muſt vary according to the particular manner of Termination to which the Inflammation tends. 'Tis true, that, in the Cure, the Reſolution of an Inflammation is always to be attempted, provided it ſeems in any Degree poſſible. But, if the Signs of a Gangrene are preſent, the only remaining Relief is, a Separation of the corrupted Part, by means of a Suppuration ariſing in all its Circumference, and the whole Intention of Cure ought to be directed to this End. But a Suppuration is carefully to be guarded againſt, ſo long as there are any Hopes of the Poſſibility of a Reſolution, eſpecially when the Inflammation has ſeiz'd any internal Part of the Body. The four different Manners, therefore, in which Inflammations terminate, are to be conſider'd ſeparately, and the Method of Cure, proper in each, deſcrib'd.

Firſt, then, we ſhall conſider the Method of curing an Inflammation by Reſolution; that is, when, by rendering the concreted Humours fluid, and putting thoſe that are ſtagnant in Motion, the Inflammation is terminated.

If any of the Cauſes, therefore, already enumerated, produce an Inflammation in any Part, ſo that the firſt enumerated Symptoms and Conditions are preſent, the following Intentions of Cure are to be purſued.

1. The farther Injury of the Veſſels is to be prevented.
2. The Injury already done them, is to be removed.
3. Fluidity and Mildneſs, are not only to be reſtored to, but alſo preſerved in, the obſtructing Matter.
4. Or, if this End cannot be obtain'd, it is to be forced back into larger Veſſels.

Since theſe Intentions are of ſingular Uſe in the Cure of Pleuriſies, Peripneumonies, Quinſeys, and other Diſorders of a like Nature, we ſhall conſider them accurately, and apart.

The Condition of the Diſorder, whoſe Cure we are to deſcribe, is exactly determined in the Aphoriſm; for from whatever Cauſe the Inflammation ariſes, or whatever Part of the Body it affects, whether internal or external, provided it is recent, and the Conditions firſt enumerated preſent, a Reſolution may be attempted, and is to be obtain'd, if the following four Intentions can be effectually anſwered.

1. To the Reſolution of an Inflammation, 'tis requiſite the concreted obſtructing Matter ſhould be rendered fluid, and that which is ſtagnant put in Motion, as we have already obſerv'd. But, unleſs the Veſſels are preſerv'd entire, the Fluids diſcharg'd from them, will neceſſarily become ſtagnant. Now, in every Inflammation, the Tumor, in conſequence of the Diſtention of the Veſſels, and the Pain ariſing from the Diſtraction of the Fibres, which are ready to be broken, ſufficiently teſtify, that the Veſſels would ſoon be ruptured, if the ſame Cauſes continued to act. But, when a Solution of Continuity is made in the Veſſels, a Suppuration enſues, or, if the Solution ſhould be ſudden, a Gangrene. 'Tis, therefore, obvious, that in order to the Reſolution of an Inflammation, 'tis neceſſary the farther Injury of the Veſſels ſhould be prevented.

2. So long as the inflam'd Veſſels are as yet entire, the Injury to be done to them conſiſts in too great a Dilatation, their Sides being diſtracted by the vital Fluid impel'd upon the obſtructed Part. If, therefore, the too great Diſtention of the Veſſels is remov'd, this Intention is anſwered.

Both theſe Intentions reſpect the Solids, whereas thoſe which follow, have a relation to the Fluids.

3. The concreted ſtagnant Fluids remain in the obſtructed Veſſels, and as an Inflammation, properly ſo call'd, can only happen in the Arteries, as we have already obſerv'd, the Impetus of the ſucceeding Fluids will always force the obſtructing Matter into narrower Parts of the Veſſels: 'Tis, therefore, requiſite this Matter ſhould be ſo attenuated, as to become capable of paſſing thro' the narroweſt Part of the obſtructed Veſſel. But the Attenuation of the concreted Fluid is not enough, unleſs the mild and benign Diſpoſition of the Humours be at the ſame time preſerv'd; for, when a Putrefaction ariſes, the concreted Blood is indeed reſolv'd, but, at the ſame time, acquires a great Degree of Acrimony. But the acrimonious Subſtance, mix'd with the Blood, and, with a rapid Motion, carry'd thro' the tender Veſſels, already too much weaken'd by the previous Diſtention, muſt certainly ſoon deſtroy them. Hence, in this Caſe, a Gangrene, inſtead of a benign Reſolution, will enſue; for we have already ſhewn, that the Acrimony of the Humours ſoon converts an Inflammation into a Gangrene. 'Tis, therefore, obvious, that the Mildneſs of the Humours ought always to accompany the Reſolution of the concreted Matter.

4. It ſometimes happens, that Molecules ſo large enter the dilated Beginnings of the Veſſels, that they cannot be ſo far attenuated, as to paſs freely thro' their narroweſt Parts. Thus, in violent Inflammations of the Eyes, the red Blood enters the Veſſels of the pellucid Cornea, which are ſtill far ſmaller than thoſe of the Adnata; but theſe are naturally ſo narrow, as to exclude every coloured Fluid. Though, therefore, the red Blood, remaining ſtagnant here, was reſolved into Serum, and that Serum into Lymph, which is ſtill finer, yet it could not paſs thro' the Extremities of theſe highly minute Veſſels. In this Caſe, the only remaining Method to bring about a Reſolution is, to attempt a Retropulſion of the obſtructing Molecules from the narrow Parts in which they are fix'd, to wider Parts of the Veſſels, and thence into larger Veſſels, that thus the Impetus of the Blood being weakened, its Motion, and Attrition on the Veſſels, and adjacent Molecules, may be taken away, and the Inflammation determin'd.

The farther Injury of the Veſſels is prevented,

Firſt, *By removing, or correcting, the known productive Cauſes of the Inflammation.*

In the Cure of Diſeaſes, all the Efforts of Art can do no more than reſtore Health. But the Cauſes of an Inflammation, before enumerated, are of ſuch a Nature as to produce an Inflammation, when apply'd to the ſoundeſt Body: All Attempts, therefore, to promote a Cure, are vain and ineffectual, unleſs theſe Cauſes can be remov'd. Thus, when, by long lying, an Inflammation is produced about the Os Sacrum and Os Coccygis, if the Compreſſion of theſe Parts by the incumbent Body cannot be prevented, the Inflammation muſt neceſſarily degenerate into a Gangrene. That the ſame holds true, with reſpect to the other Cauſes of an Inflammation, is ſufficiently obvious.

Secondly, *By leſſening the Impetus of the arterial Blood, by means of the Veneſection and Purging.*

Two Things concur in an Inflammation, that is, a Stagnation of the arterial Blood in the ſmalleſt Canals, together with the Preſſure and Attrition made by the Motion of the Blood, by the Fever forcibly impel'd upon the obſtructed Part. Now, the Blood remaining ſtagnant in theſe Canals, produces an Obſtruction indeed; but there would by this means be no farther Injury done to the Veſſels of the obſtructed Part, unleſs the Impetus of the arterial Blood acted upon it. The principal Thing, therefore, required, in order to prevent the farther Injury of the inflam'd Veſſels, is ſo to diminiſh this Impetus, that the Veſſels may be neither ruptur'd nor more diſtended by this Cauſe. Tho' the Motion of the arterial Blood cannot be entirely taken away, whilſt Life remains, yet it may be render'd ſo moderate, as to prove no longer prejudicial; and this End is obtain'd

By Veneſection.

We have already obſerv'd, that the remaining Principle of Life, where ſuch a Stagnation is preſent, produces ſome Effects, which are the Signs of an Inflammation. By the Number and Violence of theſe the Malignity of the Inflammation is eſtimated, and its various Events prognoſticated. When, therefore, by whatever Cauſe, Life is weaken'd and render'd leſs powerful, thoſe Effects muſt, of courſe, be diminiſh'd, which depend upon the vital Motion of the Humours acting upon the obſtructed Parts. We may, therefore, by Veneſection at Pleaſure, leſſen the Motion of the Blood thro' the Veſſels till Death, that is, a perfect State of Reſt in the Blood is produced. We are, conſequently, capable of more or leſs repreſſing the Impetus of the Circulation, according to the various Degrees of this Evacuation. *Helmont*, and after him ſome others, have condemn'd this Evacuation of Blood as uſeleſs, and prejudicial in the Cure of inflammatory Diſeaſes; for this Author, as we find in *Capit. Pleura Furens*, fooliſhly imagin'd, that a Pleuriſy, for Inſtance, was produced by an hoſtile Acid ſticking like a Thorn in the intercoſtal Spaces. Hence he, and his equally abſurd Followers, tell us, *That Veneſection is, in this Caſe, vain and uſeleſs; that the pleuritic Thorn is to be drawn out; that a Blood-thirſty* Moloch *preſides over the Profeſſors of the Healing Art; that the Diſeaſe is to be conquer'd by Specific Remedies, but that the Strength is not to be impair'd by Veneſection.*

But from what has been ſaid, 'tis ſufficiently obvious, that this pleuritic Thorn is the ſtagnating Blood fix'd in the arterial Veſſels; that the Fluids, propel'd from the Heart, act upon this Thorn, and by the Diſtraction of the Fibres, produce the intolerable Pain. 'Tis true, a perfect Cure might be produced, if the ſtagnant Blood, there lodg'd, could be forthwith reſolv'd, and reduced to a State of Fluidity. But, ſurely, *Helmont* could never

never produce ſo ſurpriſing an Effect by all his Specifics. He, for this Purpoſe, extol'd the Blood which flow'd from a Goat immediately after Caſtration, when dry'd, and reduced to a Powder; the Penis of a Stag, and the Flowers of wild Poppies. But to any one who reads, in the Cloſe of this Article, what he ſays with reſpect to his own Diſeaſe, it will be ſufficiently obvious, that theſe boaſted Remedies were of but little Efficacy. Since, therefore, it is not as yet certain, that there are any Remedies, which, when either externally applied, or internally exhibited, have a ſpecific Virtue of ſuddenly reſolving this ſtagnating and obſtructing Blood; no more proper Method can be taken, than to prevent the farther Protruſion of this obſtructing Matter into narrower Parts of the Veſſels, and to guard againſt its greater Compaction and Conſolidation. But both thoſe Intentions may be obtained by leſſening the Impetus of the arterial Blood, which may be both commodiouſly and ſafely done by Veneſection: As alſo by

Purging; for this, after Veneſection, is a moſt efficacious Method of allaying the preternatural Impetus of the Blood. There are Purgatives, which, without increaſing the Motion of the Fluids, produce this Effect, and, at the ſame time, reſolve the Humours. *Sydenham*, after thirty Years Practice, and a careful Obſervation of the various Meaſures Nature took in Diſeaſes, recommends this Method in his *Schedula Monitoria de Novæ Febris Ingreſſu*, publiſhed towards the latter End of his Life. In an inflammatory Fever, accompanied with a Determination of the morbific Matter to the Brain, after Veneſection, this ſucceſsful Practitioner ordered a purgative Draught, prepared of Tamarinds, Rhubarb, Sena-leaves, and Manna. In the Evening, he allayed the Commotions excited by this gentle Purgative, by exhibiting a mild Paregoric. Every other Day, for three times, he preſcribed ſuch a Purgative; and this Method he found ſucceſsful during a Diſeaſe, otherwiſe of a very dangerous Nature. But he carefully inculcates, that ſuch Purgatives prove injurious, unleſs Veneſection is previouſly inſtituted.

But it is ſufficiently obvious, that all theſe Meaſures are not requiſite in every Inflammation, but only in Caſes where the Soundneſs of the Part abſolutely requiſite to Life, or Health, does not admit of other Terminations of the Inflammation; or when the Inflammation is in ſuch a Part of the Body, that, after Suppuration, the Pus cannot be commodiouſly diſcharged; from which Circumſtance the worſt of Diſorders might afterwards be expected.

ANTIPHLOGISTIC PURGATIVES are,

Cream of Tartar, ſix Drams. Cryſtals of Tartar, ſix Drams. Tartar itſelf, ſix Drams. Sal Polychreſton, five Scruples. The Pulps of Tamarinds, three Ounces. Tamarinds, four Ounces. Elder Rob, four Ounces. Rhubarb, a Dram and an half.

Take of the beſt Rhubarb, one Dram; of Sal Polychreſton, a Scruple and an half; of the Syrup of Succory with Rhubarb, one Ounce: Triturate all together, and mix with two Ounces of the diſtilled Water of Elder-flowers, and two Drams of Cinnamon-water, for a Draught.

Take of the Pulps of the beſt Tamarinds, two Ounces; of Cryſtals of Tartar, reduced to a fine Powder, two Drams: Mix all together, and let the Patient take one Dram every half Quarter of an Hour, till he is purged.

Take of the beſt Sena-leaves, without the Stalks, two Drams; of the beſt Agaric, one Dram; of the beſt Tamarinds, two Ounces: Boil for a Quarter of an Hour in a cloſe Veſſel, with the diſtilled Water of Elder-flowers. Then, with every five Ounces of the expreſs'd Decoction, mix of pure Nitre, one Dram; and of the ſolutive Syrup of Roſes with Sena, ſix Drams, for a Draught.

Take of Sena-leaves, three Drams; of Tamarinds, two Ounces; and of Agaric, three Drams: Boil for a Quarter of an Hour with Water, and with each Pint of the Decoction mix of the Syrup of Succory with Rhubarb, one Ounce: Of this let the Patient take an Ounce every half Hour, till he is purged.

Thirdly, *By leſſening the Quantity of the Humours by means of Veneſection and Purgatives*. We have already obſerved, that the moſt frequent Cauſe of an Inflammation is a preternatural Dilatation of the lymphatic and arterial Veſſels; in conſequence of which, they admit Parts of the Blood too groſs for paſſing thro' their Extremities. Now 'tis certain, that a Plethora is one of theſe Cauſes, by which the Beginnings of the Veſſels are dilated. Since, therefore, Veneſection and Purging leſſen the Quantity of the Humours, they muſt, of courſe, prove beneficial by this very means. Beſides, when the Quantity of the Humours is leſſen'd, the Preſſure and mutual Compaction of the Elements of the Blood are render'd leſs. But, from this Preſſure, an inflammatory Denſity of the Blood often draws its Origin; for, if the Blood forc'd from the Heart ruſh'd into the empty Arteries, there would be no Reſiſtance, and, conſequently, no Compreſſion; but, when the Heart expreſſes the Blood into full Arteries, theſe Arteries muſt either be dilated, or the Blood contained in their Cavities compreſs'd. Now the fuller the Arteries are, the more they reſiſt their Dilatation, and, conſequently, a Condenſation of the Blood muſt be produced. An Inflammation is, therefore, juſtly enumerated among the Effects of a Plethora; and, conſequently, a Diminution of the Quantity of the Fluids, circulating thro' the Veſſels, will ſo diſpoſe the Body, as to render it entirely free from an inflammatory State, and rather make it tend to the oppoſite Condition, that is, a Dropſy, which generally ſucceeds large Evacuations of the Humours.

Fourthly, *By derting the Impetus of the Blood to other Parts by Suction, Friction, Epiſpaſtics, Veſicatories, Fomentations, Baths, Fontanels, Setons, and ſtrong Purging*. Theſe were the Meaſures always employ'd by the ſagacious Antients for this Purpoſe, as appears from their Works. Thus *Hippocrates*, in the ſecond Chapter of his Treatiſe *de Locis in Homine*, when treating of a Quinſey, thus expreſſes himſelf: "Patients labouring under this Diſorder are to "be blooded in the Arm, and purged, that the Matter which "produces the Diſorder may, by this means, be carried off." *Galen*, alſo, in his *Method. Medend. ad Glaucon. Lib. 1. Cap. 16.* when treating of the Method of curing the Head-ach, tells us, that "an univerſal Revulſion is to be made by acrid Clyſters, "Ligatures, and frequent Frictions of the inferior Parts; as, "alſo, by Veneſection, if there is a Neceſſity for it. A Revulſion "is, alſo, made by ſprinkling on the Head Things of a repel-"ling Quality." In theſe Authors many more Paſſages occur, which ſufficiently teſtify, that, in ſeveral Diſeaſes, they repoſed the greateſt Confidence in Revulſions. *Helmont*, who, on all Occaſions, diſcovers himſelf an Enemy to the antient Phyſicians, laughs at Revulſions; and, ſince the Appearance of the incomparable *Harvey*, many have deſpiſed this Method as uſeleſs, and repugnant to the known Circulation of the Blood. But the Uſe of Revulſion, in various Diſeaſes, is confirmed both by Reaſon and Experience; for, as ſoon as the Reſiſtance to the Blood propel'd thro' the Veſſels in any Part of the Body is either leſſen'd, or entirely removed, the Blood is forthwith derived to that Part with greater Velocity. When an Artery of a conſiderable Size is cut, the whole Blood is diſcharged from the Part, becauſe its Reſiſtance is deſtroyed. When, after the Excluſion of the Fœtus, the Veſſels and Viſcera are freed from ſo conſiderable a Preſſure, unleſs the pendulous and flaccid Parts are ſupported by proper Bandages, the whole Blood is often derived thither with ſuch a violent Force, that a due Preſſure being wanting in the Veſſels of the Brain and Cerebellum, the Patient dies of a Syncope. The ſame happens in thoſe who labour under that Species of Dropſy called Aſcites, whilſt, after a ſudden Performance of the Paracenteſis, all the Water is eliminated, unleſs the Abdomen is carefully ſwath'd up. 'Tis, therefore, obvious, that, by diminiſhing the Reſiſtance in any Part of the Body, the Blood is more copiouſly, and, with a greater Force, deriv'd to it. But the Blood, propell'd from the Heart thro' the Veſſels, is reſiſted by their Plenitude, and the Firmneſs of their Sides, in conſequence of which they reſiſt their Dilatation. All Things, therefore, which empty the Veſſels of any Part of the Body, or render their Sides more capable of yielding to the diſtending Blood, derive the Humours more copiouſly, and with a greater Force, to that Part. Now, if we conſider, that the Blood forc'd from the Heart is partly diſtributed to the Head, and ſuperior Parts of the Trunk of the Body, and partly to thoſe which are inferior, it will be ſufficiently obvious, that by a Depletion of the inferior Veſſels, or a Diminution of their Reſiſtance, the Blood is more copiouſly, and, with a greater Impetus, derived thither, and diverted from the ſuperior Parts. 'Tis, therefore, poſſible to make a Revulſion of the Force of the arterial Blood, from the inflam'd, to any other Part; eſpecially if the Place, to which the Revulſion is made, receives its Blood from the ſame large arterial Trunks. Thus, in inflammatory Diſorders, Phyſicians foment the exterior Part of the Head, that, by increaſing the Impetus of the Blood thro' the Ramifications of the external Carotid, the Preſſure upon the internal Parts of the Head may be diminiſhed. When the Callus of a fractured Bone became luxuriant, *Celſus* informs us, that "it is of ſome "Advantage to apply Preparations of Muſtard and Figs to the "correſponding Member, till it is ſomewhat corroded, and the "offending Matter, by that means, eliminated." But all Revellents either relax or empty the Veſſels; for by Friction, or Stimulation, a more frequent Contraction of the Veſſels is produced in the Part, towards which the Revulſion ought to be made. Now a Revulſion is principally obtained by the following means:

By Suction. This is moſt advantageouſly done by means of Cupping-glaſſes, by which the Preſſure of the Atmoſphere is removed, or, at leaſt conſiderably diminiſhed on the Part to which they are applied, either when the Air is exhauſted, by means of an Embolus, or by Suction, or highly rarefied by raw Flax kindled in the Cavity of the Cupping-glaſs. As ſoon as in this Part the equable Preſſure of the Air on the Surface of the Body is leſſened, all the Veſſels are proportionably more diſtended; the Part becomes tumid and red; and, if the Cupping-glaſſes remain a conſiderable time applied, a genuine Inflammation, or even a Gangrene, may be produced. *Galen*, in the laſt

Chapter

Chapter of his twelfth Book *de Method. Medend.* obſerves, that Pains are ſurpriſingly mitigated, after making a Revulſion by Cupping-glaſſes. *Hippocrates, in Sect.* 5. *Aph.* 50. in order to repreſs an immoderate Diſcharge of the Menſes, orders the Application of large Cupping-glaſſes to the Breaſts. And *Van Sweiten* informs us, that he has frequently ſeen the moſt obſtinate Inflammations of the Eyes, which would yield to no other Remedies, removed by no other means than the Application of Cupping-glaſſes to the Nape of the Neck. How much Cupping-glaſſes were uſed by the *Egyptians*, in Diſeaſes of this Nature, we may ſee under the Article CUCURBITULÆ.

As for Frictions; the Veins, in conſequence of their being eaſily compreſſed, are emptied by Friction. Hence the Arteries correſponding to theſe Veins more eaſily evacuate their Contents into the empty Veins; the Reſiſtance, therefore, to the Blood, which afterwards is to flow into theſe Arteries, is leſſened: For which Reaſon, it muſt be more copiouſly, and with a greater Force, derived thither, as is obvious from what has been already ſaid. For this Reaſon, any Part of the Body may, by Friction alone, become hot, red, and inflamed; and if the Friction is continued, the Heat and increaſed Motion are communicated to the whole Body. For this Reaſon *Celſus*, in the 14th Chap. of his 2d Book, in acute Diſeaſes condemns long Friction in the following Words: "It is improper, in acute Diſeaſes to uſe "long Friction, as alſo in the Increaſe of Diſeaſes, except with "a View to procure Sleep to phrenitic Patients." And, a little after, he mentions the Uſe of Frictions, in order to make Revulſion, in the following Words: "Frictions alleviate long-pro-"tracted Pains of the Head, though not under the immediate "Paroxyſm; and a paralytic Member is ſtrengthened by Fri-"ction. But, when one Member is afflicted with Pain, its cor-"reſponding Member is far more frequently to be rub'd, eſpe-"cially when we intend to derive the Matter from the ſuperior, "or middle Parts of the Body. For this Purpoſe Friction of "the extreme Parts is uſed."

As for Epiſpaſtics; theſe Medicines are ſo called from their attractive Quality, becauſe they derive the Humours more copiouſly, and with a greater Force, to the Part to which they are applied. Now, tho' all thoſe things, which relax and debilitate the Veſſels in any Part of the Body, may be ſaid to be poſſeſſed of an attractive Quality, becauſe the Humours more eaſily enter the relaxed Veſſels; yet the Epithet attractive is commonly beſtow'd on theſe things, which, by their acrid Stimulus, irritate the Veſſels of the Part to which they are applied, to more frequent and ſtrong Contractions, that is, accelerate the Motion of the vital Humours through the Veſſels: Now theſe Subſtances of an attractive Quality, receive different Names, according to their greater or ſmaller Degree of Acrimony: Such as only excite a gentle Redneſs in the Part to which they are applied, are called *Phœnigmoi*: When they produce a greater Degree of Redneſs, Heat, Itching, and Tumor, they are generally called *Sinapiſms*; becauſe Muſtard-ſeed triturated, and applied to any Part of the Body, produces all theſe Effects: Subſtances ſtill more acrid, and capable of raiſing the Epidermis in ſmall Bladders, are called *Veſicatories*: But if, like Fire, they burn the Parts to which they are applied, they are called *Cauſtics*. All theſe things excite a true Inflammation in the Part to which they are applied; and, if they are highly acrid, may increaſe this Inflammation into a Gangrene. Of how great Efficacy theſe are, in deriving the Impetus of the Blood to other Parts, we are convinced from Inſtances which daily occur in Practice. If the Feet of a Patient, labouring under an acute Phrenitis, are cover'd with a Paſte, mix'd with triturated Muſtard-ſeed, Shavings of Horſe-radiſh, or other Subſtances of a like Nature, the Diſorder is often, in a few Hours, alleviated, by the Pain and Inflammation produced in theſe Parts; and the Patient begins to recover. When Nature endeavours to ſecrete the hurtful Parts from the common Maſs of Humours, and depoſite them in ſome particular Parts of the Body, Phyſicians, by means of Epiſpaſtics, generally, with great Succeſs, derive the peccant Matter to thoſe Parts, where it will, in all Probability, prove leaſt injurious: Thus, when, in the Beginning of the Small-pox, the Feet and Legs are fomented with emollient Decoctions, and Epiſpaſtics are applied to the Soles of the Feet, the Pocks appear very thick on the inferior Parts of the Body; whereas very few are found on the Face, and ſuperior Parts; as *Van Sweiten* informs us, he has often obſerv'd. From what has been ſaid, the Uſe of Subſtances of an attractive Quality is ſufficiently underſtood.

As for Veſicatories; theſe, as we have already obſerv'd, are ſtronger then Epiſpaſtics; and, when applied to a Part of the Body cover'd with Skin, ſeparate the Epidermis, and raiſe it into Bliſters, diſtended with Fluids; from which Circumſtance they receive their Name. Now all things capable of exciting a violent Inflammation are, alſo, Veſicatories; for, whilſt an Inflammation is degenerating into a Gangrene, theſe Bliſters of the Epidermis are the firſt Signs of the beginning Gangrene: Thus, alſo, live Fire raiſes the Epidermis into Bliſters: Hence all highly acrid Remedies, ſuch as Meadow Crow-foot, Water-pepper, or the leſſer acrid Houſleek, if applied in large Quantities, or for a conſiderable time, excite Bliſters. But, for this Purpoſe, Cantharides are moſt generally uſed, which are dry and juiceleſs Inſects, ſometimes capable, as *Van Sweiten* informs us, of being kept for thirty Years, in a Glaſs Veſſel but indifferently cloſed, without loſing their Virtues: Theſe Cantharides, groſly triturated, are mixed with adheſive Plaiſter, or Paſte, which, for eight or ten Hours, is to be applied to the Part to which the Revulſion is to be made, in which time the Bliſters generally appear. But if this Application is continued too long, by irritating the nervous Pulp lying under the Epidermis, it often excites intolerable Pains, and ſometimes an uneaſy Strangury, and a Diſcharge of bloody Urine.

As all theſe things are poſſeſſed of a conſiderable Acrimony, by irritating the Part to which they are applied, they often increaſe the Motion of the Blood through the whole Body. But as this Circumſtance is repugnant to the Intention to be purſued in this Caſe, as we have already ſhewn, Cantharides are, for that Reaſon, to be uſed with the greateſt Caution.

As for Fomentations and Baths; theſe are generally prepared of Water, with an Addition of ſuch things as are poſſeſſed of an emollient and relaxing Quality: But all the Preparations of this Kind act only as they relax the Solids, and leſſen the Reſiſtance made by the Sides of the Veſſels: Hence they are more eaſily dilated, tho' the ſame Cauſes continue to diſtend the Veſſels. The moſt efficacious of all theſe are Vapour-baths; for any Part of the Body, for a Quarter of an Hour, expoſed to the Steam of tepid Water, begins to ſwell. But, when the Revulſion is to be made, to ſuch Parts of the Body as cannot be commodiouſly immerſed in a Bath, Fomentations are, of all others, the beſt Succedaneum; provided they be kept warm.

As for Fontanels; the Skin is cut as deep as the Membrana Adipoſa; or, in thoſe who are afraid of the Knife, the deſired Effect is to be obtain'd by the potential Cautery. When a Wound is thus made, a Globe of Gold, Silver, Ivory, or any other Matter not ſoon ſubject to change, is to be put into it, and ſo ſecured by an adheſive Plaiſter, that it may not fall out: Thus, by the Interpoſition of the foreign Body, the Concretion of the Lips of the Wound is prevented, and a ſlight Contuſion is made, in all the Circumference of the Wound, by the Preſſure of this hard Body: Hence there is produced a continual ſlight Inflammation, and a gentle Irritation in the Part to which the Impetus of the arterial Blood is to be deriv'd. Fontanels are principally advantageous to thoſe Patients whoſe Solids are ſo flexible, that, by the leaſt Exceſs of the Force of the Blood, they may be eaſily dilated, and, by an *Error Loci*, admit the groſſer Parts of the Fluids: Thus, for Inſtance, Fontanels often prove highly advantageous to thoſe who, on the ſlighteſt Accounts, labour under an Ophthalmia. But, when a violent Inflammation ſuddenly ſeizes any Part, it is ſufficiently obvious, that Fontanels are of no Uſe; for the Part affected may be long corrupted by a Gangrene, before the Efficacy of the Fontanel can be reaſonably expected. The ſame holds true with reſpect to

Setons. Theſe are generally made in the Nape of the Neck; for which Purpoſe, the Surgeon raiſing the Skin, and Membrana Adipoſa, with a Forceps, with a large Needle made on purpoſe, paſſes a groſs Thread through the Part, and leaves it in the Wound, through which it is to be daily drawn: Hence there is produced an Irritation, and continual Inflammation, in the Part in which the Seton is. Setons are of the ſame Uſe with Fontanels, but generally produce a greater Pain and Irritation. *Van Sweiten* tells us, that he has ſeen obſtinate Head-achs, which would yield to no other Remedies, cured by the Revulſion made by Setons; and, in practical Authors, many Obſervations occur, which confirm this Truth.

As for ſtrong Purging; how beneficial it is, in inflammatory Diſeaſes, to leſſen the Impetus and Quantity of the Humours by Purging, as, alſo, what Purgatives are moſt proper for this Purpoſe, we have already obſerved. But we muſt, alſo, obſerve, that theſe are, likewiſe, beneficial for making a Revulſion of the Impetus from the inflamed Part; eſpecially if the Diſorder is lodged in the ſuperior Parts of the Body: For, by the meſeraic Veſſels, ſo large a Derivation may be made to the Cavity of the Inteſtines, that ſcarce any Preſſure ſhall remain on the Veſſels of the Brain: Hence it is, that draſtic Purgatives frequently produce Vertigos, and even Deliquiums. In Inflammations of the Eyes, when the whole Adnata is red, in conſequence of the Ingreſs of the groſſer Parts of the Blood into the ſmall Veſſels, by exhibiting a draſtic Purgative, the Eyes and Face become pale, and, the Blood being repelled into larger Veſſels, a Cure is often ſuddenly and ſucceſsfully perform'd. Clyſters, in like manner, frequently injected, produce this Effect; partly by relaxing, and partly by their gentle Stimulus, deriving the Impetus of the Humours to theſe Parts. *Hippocrates*, in his Treatiſe *de Locis in Homine*, when treating of the Method of curing Pains of the Ears, after ordering the Application of Cupping-glaſſes to the oppoſite Part, in order to prevent a Fluxion of the Humours to

the Part affected, uſes theſe Words: "If, *ſays he*, theſe Meaſures are of no Service, a Purge is to be exhibited; but "Vomiting is of no Advantage." And a little after, when treating of Inflammations of the Eyes, he ſubjoins theſe Words: "If the Eyes become ſuddenly inflamed, we are not to anoint "them with any thing; but the inferior Parts are to be ſtrongly "cauterized, or the Humours leſſen'd by ſome draſtic Purga"tive; taking care, at the ſame time, not to excite a Vomiting." Hence it is obvious, that the antient Phyſicians uſed Purgatives, in order to make a Revulſion from inflamed Parts, and theſe of a very ſtrong and draſtic Quality: For, in the Paſſage now quoted, *Hippocrates* uſes the Word ἀπισχνῦναι, which implies an Extenuation of the Body, and a collapſed State of the Veſſels, in conſequence of a violent Evacuation. But, in Caſes of this Nature, he carefully cautions againſt Vomiting; becauſe, during this time, the Impetus of the Blood to the Head is increaſed, as is ſufficiently obvious, when we only look at a vomiting Perſon; for the Eyes become red, and diſcharge Tears, whilſt the Lips, and whole Face, are diſtended and render'd turgid with Blood.

Fifthly, By a ſomewhat cold and dry Air; the total Extinction, or, at leaſt, great Moderation of the Paſſions; Reſt, either natural or artificial; a thin, liquid, and antiphlogiſtic Diet; Drink of the ſame Kind; together with diluting, and, at the ſame time, refrigerating Medicines.

We now come to conſider theſe things, by which the Motion of the Humours through the Veſſels may be render'd highly moderate, in order to prevent the farther Injury of the inflam'd Veſſels.

As for a ſomewhat cold and dry Air; this is beneficial, in ſo far as it is receiv'd into the Lungs, in Reſpiration: For it is certain from Phyſiology, that the Blood, forced from the Right Ventricle of the Heart, through the narrow Chanels of the Pulmonary Artery, ſoon becomes hot by its Attrition, and, conſequently, ſtands in need of the cooling Influence of the Air: But, if the external Air is too hot, this cooling Quality is not to be expected in it; for *Boerhaave*, in the firſt Volume of his Chymiſtry, has, by various beautiful Experiments, ſhewn, that, in live Animals, an highly acute Fever is excited, which, in a few Hours, proves mortal, when they are long pent up in a too hot Atmoſphere, and depriv'd of the grateful and refreſhing Influence of a cooler Air: It is, therefore, obvious, that a ſomewhat cold Air contributes greatly to the moderate Circulation of the Blood; and, all other Circumſtances being alike, a dry is always preferable to a moiſt Air. And, if a moiſt Air is, at the ſame time, cold, it may do Harm, by cooling too much; for it is obſervable, that, in the Autumn and Winter, Perſons are more affected with a Senſe of Cold, when the Air is moiſt, than when it is dry, though, at the ſame time, the Thermometers ſeem to retain the ſame Degree of Heat: This ſeems to happen, becauſe the Air ſurrounding our Bodies is ſooner render'd warm by their Heat, when it contains no Water, or, at leaſt, a very ſmall Quantity; for, as *Boerhaave* juſtly obſerves, in the firſt Volume of his Chymiſtry, "The more denſe any Bodies are, whether "fluid or ſolid, the more Time they require to become equally "warm by the ſame Fire."

As for a total Extinction, or, at leaſt, a great Moderation of the Paſſions; it is certain from daily and undeniable Experience, that the Circulation of the Humours may be very much accelerated by violent and exorbitant Paſſions of the Mind: Hence it is obvious, that theſe are carefully to be avoided; and, when, excited, forthwith check'd and allay'd.

As for Reſt, natural or artificial; it is certain, that Reſt is of the moſt happy Influence, in Diſorders attended with too violent a Circulation of the Juices. Now, when the Mind is ruffled by no Paſſions, and when nothing acts forcibly upon the Organs of Senſe, the Patient generally falls into a calm and profound Sleep: For this Reaſon, in acute inflammatory Diſeaſes, the antient Phyſicians order'd the Patients to be lodg'd in dark Rooms, remote from Noiſe. But if, by theſe means, Sleep cannot be procured, after taking the Meaſures before ſpecified, Anodynes may be ſafely uſed.

As for a thin, liquid, and antiphlogiſtic Diet; in order to reſtore what, by the neceſſary Effects of Life and Health, is daily loſt by the Body, Aliments are neceſſary, which, tho' of the beſt Kind, are ſtill of a foreign Quality, and muſt, by the Action of the Veſſels and Viſcera, be ſuited and adapted to the Nature of our Fluids. But, whilſt this Change of the Aliment taken is performing, if its Quantity is either too large, or if it produced, in the ſoundeſt and moſt robuſt Perſons, a ſlight Fever, by which the Matter exciting theſe Commotions is either corrected or expelled: And the ſoundeſt Perſons, almoſt every Day, perceive their Pulſes quicker for ſome Hours after Dinner. The weaker thoſe Powers are, which change the crude Aliments into laudable Blood, the more the Circulation will be accelerated, by the Aliments taken. If a tender Girl ſhould eat ſmoaked Fleſh, Bacon, or any other Aliments of difficult Digeſtion, ſhe will be feveriſh for ſome Hours after Dinner. Phthiſical Patients, alſo, gradually waſted by an hectic Fever, perceive their Diſorder increaſed by a copious Uſe of Milk: But, ſince the Aſſimilation of the Aliments to the Nature of ſound human Fluids principally depends upon the Action of the Solids upon the Fluids, and the large Quantity of the Humours already concocted, with which a little of the crude Chyle is gradually mix'd; as is ſhewn under the Article FIBRA; and ſince, by Veneſection and Purging, the concocted Humours are to be evacuated, and the Impetus of the Circulation leſſen'd, in order to cure an Inflammation by Reſolution it is ſufficiently obvious, that only ſuch Aliments ought to uſed, as are very eaſily digeſted. In Caſes of this Nature, all thoſe Subſtances are, alſo, proper, which, by the gentleſt Action of the Chylopoietic Viſcera, eſpecially of the Lungs and Arteries, eaſily farther elaborated into Blood: Hence Whey, and, eſpecially, the acidulated Serum of Butter-milk; Milk diluted with a double or triple Quantity of Water; Ptiſans, prepar'd of Barley and Oats; and the recent Juices of Summer-fruits, are ſo beneficial in Caſes of this Nature, eſpecially when uſed often, but in ſmall Quantities; for ſuch a Regimen will never overload the Body, but prove a grateful Cooler to it; a Circumſtance of no ſmall Importance, in acute inflammatory Diſorders: Hence, in intenſe Summer Heats, Perſons who are ſound, and Patients labouring under hot Diſeaſes, ſpontaneouſly deſire thin, liquid, and refrigerating Aliments, and are diſguſted at thoſe of a contrary Quality; whereas, in the Winter Seaſon, and in languid Diſeaſes, proceeding from a cold Cauſe, the oppoſite Regimen is beneficial. Thus *Hippocrates*, in his *Epidemics*, *Lib. 6. Text.* 18. tells us, that "Weak "Aliments are cooling, and ſuch as are ſtrong heating."

As for thin, liquid, and antiphlogiſtic Drink; the Juices of Lemons, Oranges, Cherries, Currants, or their inſpiſſated Syrups, or Robs, ſold in the Shops, when diluted with a large Quantity of Water, make a very grateful Drink; and, ſince there may be a great Variety of theſe, and ſince every thin and cooling Liquor is proper, the Patient may chooſe which is moſt agreeable to his Palate.

As for Medicines of a diluting, and, at the ſame time, of a refrigerating Quality. The arterial Blood remains ſtagnant in the minute Canals, and, by the Impetus of the Blood, propelled from the Heart, is preſſed, and put in a State of Attrition, as is obvious from the Definition of an Inflammation; and we have already ſhewn, that an intenſe Heat is produced by this Attrition. In order, therefore, to prevent the farther Injury of the inflam'd Veſſels, thoſe Medicines are proper, which, by their diluting Quality, are at once capable of reſolving the concreted and obſtructing Matter, and of removing the preternatural Heat. In theſe Caſes there is, properly ſpeaking, only one Diluter, which is Water; and all other Medicines only prove diluent, in conſequence of the Water they contain: But we have juſt now obſerved, that liquid Aliments, and thin, that is, aqueous Drinks, were proper in this Caſe; for which Reaſon they will concur with the Medicines, in order to promote the Dilution. Refrigerating Medicines are ſuch as either remove or leſſen the Cauſes of a preternatural and intenſe Heat: But we have already ſhewn, that the exceſſive Heat accompanying an Inflammation ariſes from an increaſed Circulation, and the violent Attrition of the Solids upon the Fluids, and of the Fluids on the Solids, in the inflam'd Veſſels, as, alſo, in the adjacent Veſſels, as yet pervious, but render'd narrower by the Tumor of the obſtructed Veſſels lying contiguous to them: Refrigerating Medicines, therefore, are all ſuch as are capable of removing the preternatural Denſity of the Fluids, relaxing the infarcted Veſſels, and diminiſhing the exceſſive Force of the Circulation. All aqueous Subſtances are, therefore, not only diluting, but, at the ſame time, refrigerating; for it is obſervable, that, the colder the Temperament of the Body is, the greater Quantity of Water is found in it; and, on the contrary, that the greater the Heat is, the leſs diluted the Blood appears to be: Hence all the Parts of dropſical Perſons are cold; whereas there is a great Degree of Heat in robuſt Perſons, and thoſe accuſtom'd to Exerciſe. Water is, alſo, beneficial, in as far as it relaxes the Solids of the Body, as is ſhewn under the Article FIBRA. Now, when the Blood is diluted by aqueous Subſtances, and the Veſſels relaxed, the Impetus of the Circulation is always diminiſh'd, as is ſufficiently obvious in thoſe tender Girls, who, by the Abuſe of tepid aqueous Liquors, render themſelves ſubject to ſo many Languors: When, therefore, there are any Hopes, that the Inflammation may be reſolved, the Baſis of all antiphlogiſtic Medicines is Water; to which are added, the moſt emollient farinaceous Subſtances, in order the more to relax the Veſſels; and highly reſolvent Medicines, in order to attenuate the inflammatory concreted Matter, and render it capable of circulating. There may be various Formulas of Medicines of this Kind, ſome Specimens of which we ſhall ſubjoin. But, before we proceed to this, we ſhall juſt obſerve, that Veneſection and Purging prove cooling in inflammatory Diſeaſes.

A MEDICINE *which is at once of a diluting and a refrigerating Quality.*

Take of the Roots of Sorrel, two Ounces; of the Roots of Graſs, and Vipers-graſs, each two Ounces; of the Leaves of Brooklime, Wood-ſorrel, and Agrimony, each one Handful: Boil in Water for half a Quarter of an Hour; then add, of the Flowers of Borrage, Bugloſs, Roſes, and Violets, each one Pugil. Let them ſtand in Digeſtion for half a Quarter of an Hour; and, when depurated, with every three Pints of the Liquor, mix of pure Nitre, two Drams; and of Elder-rob, three Ounces: Of this Preparation let the Patient drink three Ounces every Hour of the Day.

Or,

Take of the diſtilled Water of Elder-flowers, fifteen Ounces; of Elder-rob, two Ounces; and of pure Nitre, one Dram: Mix all together, and let the Patient drink an Ounce of the Liquor every Hour.

Or,

Take of the bruiſed Seeds of the Burdock, four Drams; of the Seeds of Parſley, ſix Drams; and of the Seeds of Succory, one Ounce: With diſtilled Parſley-water make into an Emulſion; with every twelve Ounces of which, mix of pure Nitre, one Dram; and of the Syrup of the Five aperient Roots, one Ounce: Of which Preparation let the Patient take an Ounce every Hour.

Or,

Take of unwaſhed diaphoretic Antimony, one Drath; of Sal Prunellæ, half a Dram; and of Zedoary-root, one Scruple: Make into a Powder, to be divided into ſix Doſes; one of which is to be taken every three Hours, in ſome proper Ptiſan.

6. By allaying the Impetus in the Part affected by the external Application of Refrigerants, Repellents, and Aſtringents, variouſly mix'd up with Anodynes and Aperients, as the Nature of the Caſe ſeems to require.

We have already conſider'd thoſe Remedies, which by changing other Parts, or the whole Body, prevented the farther Injury of the Veſſels; but we now come to treat of theſe, which, being externally apply'd to the Part affected, are capable of allaying the preternatural Impetus of the Humours. We have already obſerv'd, that by the Irritation of the Fibres, in the Part affected, the Motion of the Humours is accelerated not only in that, but, alſo, thro' all the reſt of the Body. Every thing, therefore, which, being apply'd to the inflam'd Part, is capable of removing this Irritation, will allay the Impetus of the Humours. But this Irritation was produced, becauſe the Blood, acting upon the obſtructed Veſſels, diſtracted their Sides. Every thing, therefore, capable of reſolving the Obſtruction, and procuring a free Paſſage to the Blood thro' pervious Veſſels, will remove this Irritation. But this End may be obtain'd in two Manners, either by ſo relaxing the obſtructed Veſſels, that they may tranſmit thro' their Extremities the obſtructing Molecules into the Veins; or by ſo conſtricting the Veſſels, by means of Refrigerants, Repellents, and Aſtringents, that the obſtructing Matter may be repel'd from the narrow to wider Parts of the Veſſels. This latter Method was frequently us'd by the Antients in the Cure of Inflammations, when, without any evident previous Cauſe, any Part of the Body was ſuddenly inflam'd, in which Caſe they deduced the Origin of the Diſorder from Fluxion. *Galen*, in his *Method. Medend. ad Glaucon. Lib.* 2. *Cap.* 2. when treating of this Subject, informs us, that ſome Phyſicians, attach'd to the Sect of the *Methodics*, affirm'd, that Inflammations requir'd relaxing Medicines, becauſe they thought they proceeded from Stricture; for the Phyſicians of this Sect deduced the Cauſes of all Diſeaſes from Stricture and Relaxation; and that, afterwards, many raſhly embraced this Opinion. But, a little after, he ſubjoins, that both Reaſon and Experience teach us, that, after due Evacuations, the inflam'd Part is to be anointed with ſuch Remedies as are capable of repelling the influent Humours, and at the ſame time of evacuating thoſe already contained in the Part affected, and reſtoring the Tone and Strength of the Parts. For theſe Purpoſes, he recommended Houſleek, Pomgranate-peel, and Sumach, which are manifeſtly poſſeſs'd of a refrigerating and aſtringent Quality. And, in the following Chapter of the ſame Book, he tells us, that Inflammations, ariſing from any other Cauſe than a ſudden Fluxion, may be moiſtened and rendered warm.

From what has been juſt now ſaid, as, alſo, from what was advanced concerning the Effects of actual and potential cold Subſtances apply'd to inflam'd Parts, 'tis obvious, that Refrigerants, Repellents, and Aſtringents, are only ſometimes, but not always, beneficial; and that great Caution is neceſſary in their Application, ſince they may prove very injurious, where they are not beneficial. In ſlight Inflammations, they are often highly ſerviceable, if apply'd in the Beginning. Thus *Van Sweiten* tells us, that he has frequently ſeen beginning Inflammations of the Eyes cured by the Application of cold Water alone. But when the Diſeaſe is of longer ſtanding, the inflammatory obſtructing Matter impacted in the Veſſels is not capable of being ſo eaſily repelled. Hence, the Veſſels being, by theſe Applications, conſtricted, and the Fluids coagulated, the Diſorder will be increas'd. In this Caſe, therefore, relaxing and aperient Medicines, which open the Veſſels, and reſolve the obſtructing Matter, are of all others moſt proper. The prudent Phyſician muſt, therefore, chuſe Remedies adapted to the particular State and Condition of the Diſorder.

With theſe, Anodynes, or ſuch Medicines as allay Pain, may, alſo, be mixed. Now thoſe Medicines which allay Pain, act in three Manners; for they either remove the Cauſe, or ſo diſpoſe the Part of the Body to which the dolorific Cauſe is apply'd, as to render it leſs affected by it. Or, laſtly, whilſt the Cauſe ſubſiſts, and without inducing any Change on the Part affected, they remove the Senſe of Pain. All the Things, therefore, now enumerated, are Anodynes, in ſo far as by opening and relaxing the obſtructed Veſſels, or repelling the obſtructing Matter, from narrower to wider Parts of the Veſſels, they either remove the Cauſes of the Pain, or ſo diſpoſe the Part, as to be leſs affected by theſe Cauſes. Beſides, ſuch Things may be us'd as ſooth the Senſe of Pain in the Parts to which they are apply'd, provided, at the ſame time, thoſe Medicines are not neglected, which are capable of removing or correcting the Cauſes of the Pain. Hence, the Leaves of Nightſhade, Henbane, and Hounds-tongue, may be mixed with the Fomentations to be apply'd to inflam'd Parts; for the Effects of violent Pain are a Fever, Heat, Thirſt, and Dryneſs, all which are injurious to inflam'd Parts; and, as moſt of theſe ariſe from the Senſe of Pain, 'tis obvious, that much Advantage is to be expected from ſuch Medicines as allay Pain.

The Injury done to the Veſſels is remov'd by the Uſe of the ſame Things mention'd in the preceding Aphoriſm; for the preternatural Diſtraction being remov'd, the proper Strength of the Fibre will reſtore it to its natural Form, and Nutrition will afford a freſh Supply of Strength.

The Injury done, is the Diſtention of the obſtructed Veſſel, by the Preſſure of the vital Fluids acting upon the Part obſtructed. Now, ſince all the things enumerated in the preceding Aphoriſm either leſſen or divert the Impetus of the Blood, 'tis obvious, that the Injury done muſt be remov'd by the ſame Remedies; for ſo long as there are any Hopes of a Reſolution left, the Coheſion of the Veſſels is not deſtroy'd, tho' they may have been violently diſtracted. Hence, as ſoon as the Obſtruction is reſolv'd, the diſtracted Fibres, by their proper Strength, gradually return to their former Dimenſions; for the whole Diſorder then remaining is a Weakneſs of the Fibres produced by too great a Diſtraction [ſee the Article FIBRA], which is cured when the diſtracting Cauſes are removed, and the Parts loſt reſtored by proper Aliments duly changed by the Force of the Viſcera and Veſſels. Now, the firmer and more elaſtic the Veſſels diſtended by the Inflammation are, the ſooner they return to their priſtine Form; and, on the contrary, the more tender the Veſſels are, in which the Inflammation is lodg'd, the longer Time is requiſite, before their due Strength can be reſtored. Perhaps, from this Circumſtance, we may account for ſome Phenomena, which, after inflammatory Diſorders of the Brain, cured by Reſolution, often continue for a long time afterwards. It, alſo, ſometimes happens, that after a Phrenitis, or violent Deliriums in acute Fevers, and the Small-pox, the Patients continue incredibly weak, or labour under a Perturbation of all, or only ſome of the Functions, which depend on the Brain. If, in Caſes of this Nature, the Cure is attempted by Veſicatories, Cathartics, Sudorifics, and other Evacuants of a like Nature, or ſuch Things as throw the Fluids into violent Commotions, the Patient is rendered worſe; but, if the Diſorder is committed to Time and Nature, it gradually diſappears. The incomparable *Sydenham*, who was both induſtrious and ſagacious in traceing and inveſtigating the true Natures of the moſt latent Diſeaſes, declares himſelf of this Opinion, in his *Schedula Monitoria de Novæ Febris Ingreſſu*; for he obſerv'd, that in a continual epidemical Fever, which, ſoon affecting the Head, generally produced a Phrenitis, after general Evacuations by Veneſection and Cathartics, a Coma remained for ſome time; which, however, after a conſiderable Number of Days, diſappeared, provided the Patient daily roſe out of Bed, and was not haraſs'd by draſtic Medicines; for, in Caſes of this kind, the equable Motion of the Humour thro' the Veſſels of the Brain ſeems to remain diſturbed, till the due and natural Strength is reſtored to the Veſſels weakened by the two great Diſtention.

The Fluidity of the obſtructing Matter is procured by attenuating, and diluting it:

1. By reſtoring the elaſtic Oſcillations of the Veſſels; by diminiſhing the diſtending Fluids, by means of Veneſection, and ſtrong Purging; as, alſo, by adding a Stimulus to the Fibres, by means of thin aromatic Liquors drank warm, Fomentations, Frictions, the Application of Cupping-glaſſes, and Scarifications.

The

The third Circumſtance, requiſite for the Cure of an Inflammation by Reſolution, was, to procure and preſerve a due Degree of Fluidity and Mildneſs to the obſtructing Matter, as we have already obſerved; ſo that we now come to treat of the Method and Remedies by which theſe Ends may be obtained. We ſhall, therefore, firſt, conſider thoſe things by which theFluidity of the obſtructing Matter is ſo effectually procur'd, that it may, without any Obſtacle, paſs through the narroweſt Extremities of the Veſſels. This Effect ſeems capable of being produced in two Manners; either by Dilution, when, for Inſtance, Water, by the Admixture and Interpoſition of its Parts, ſeparates the united Molecules of the Blood; or by an Attenuation, perform'd by the Attrition of the Veſſels, and Frictions; as, alſo, by ſuch Remedies as, by the Figure and Rigidity of their Parts, are capable of dividing the concreted Molecules. Diluent and attenuating Medicines may, therefore, be ſo mix'd, as, by their joint and concurring Virtues, to produce more conſiderable Effects, than either would do ſeparately.

The human Blood, if left in a State of Reſt, ſpontaneouſly tends to Concretion; and ſo much the more, the ſtronger the Perſon is. A continual Motion and Change of Situation are, therefore, requiſite in the Particles of the Blood, in order to prevent their Concretion; and, by this Motion and Change of Situation, thoſe Parts, which had already begun to be concreted, are again reſolved. When a Perſon falls into a Deliquium, the Blood ſtagnates in the large venous Receptacles about the Heart, and eſpecially a large Quantity of the Blood is collected between the Right Ventricle of the Heart and the Lungs, in the Auricle, and the venous Sinus, where it immediately tends to Concretion. When, by the Sprinkling of cold Water, ſuch a Patient begins to recover, a violent Palpitation of the Heart forthwith ariſes. The Blood, which is now viſcid, and, as it were, beginning to be converted into polypoſe Concretions, ſticks in the narrow Parts of the pulmonary Artery, by the Contraction of which theſe Concretions are forced back: Thus they are carried backwards and forwards, till, by their repeated Attrition on the Sides of the Veſſels, they are reſolv'd. Then all the Patient's Anxiety is remov'd, and a free Paſſage given to the Blood expelled from the Right Ventricle of the Heart, thro' the narroweſt Parts of the pulmonary Artery. The ſame Effect may be expected in an Inflammation, if the elaſtic Oſcillations, with which the Veſſels were before mov'd, are reſtor'd to them; for, if we conſider thoſe Cauſes, by which, in a State of Health, the human Veſſels are mov'd, it is obvious, that, in an inflam'd Veſſel, the oſcillatory Motion, by which it ought to be alternately diſtended and contracted, muſt be wanting; for, when the Heart contracts itſelf, it expels all the Blood contain'd in its Cavities into the full Arteries, which, as they are flexible, are by that means dilated. But, in a Moment after, when the Heart is in its Diaſtole, the Arteries, by their proper Elaſticity, and the Action of their muſcular Fibres, are again contracted; by which means the Blood, contain'd in their Cavities is carried forwards: And, ſince the Valves of the Aorta hinder the Blood from being preſs'd back to the Heart, that Fluid is, by this Force, convey'd from the Arteries to the Veins. Now, if we ſuppoſe any Obſtacle lodged in the Cavity of an Artery, capable of hindering the free Circulation of the Blood, the Blood, impel'd by the Force of the Heart, may dilate ſuch an Artery; but the Artery dilated cannot be next Moment contracted, becauſe the Blood contained in its Cavity cannot paſs through its obſtructed Extremity, and the Impetus of the ſucceeding Fluids will hinder its Regreſs: Such an Artery will, therefore, remain diſtended and full, but without Motion, ſince its Elaſticity and muſcular Force are not capable of ſurmounting the Reſiſtance of the obſtructing Fluid. Now the oſcillatory Motion of ſuch an Artery can only be reſtor'd by diminiſhing the Quantity of the diſtending Fluid; but its obſtructed Extremity prevents the Conveyance of this Fluid into the correſponding Vein. Hence nothing remains to be done, but ſo to diminiſh the Quantity and Force of the Fluids, that the natural and efficacious Contraction of the Artery may be reſtor'd, and, conſequently, the contain'd Blood forced back to the Baſe of the Artery. Then this obſtructing Matter, being no longer acted upon by the ſucceeding Fluid, will, by the Contraction of the Artery, be forced into its wider Parts, unleſs it remains firmly impacted, and totally immoveable in the narrow Parts; but, the Moment after, it is propel'd into the former narrow Chanels. Thus, by being carried backwards and forwards, there will be an Attrition of it on the Sides of the Veſſels, and the contiguous Molecules of the Blood. Hence an Attenuation and Diviſion of the concreted Molecules may be juſtly expected. But that the concreted Molecules may be again ſo diſſolv'd, as to become capable of paſſing through the narroweſt Parts of the Arteries, is, in ſome Caſes, obvious to the Senſes. Thus *Leewenhoeck*, in his *Experiment. & Contemplat.* ſupplies us with an Obſervation, which effectually demonſtrates the Efficacy of this alternate Motion of the Veſſels, in diſſolving concreted Blood. In a Bat, reduced to a languiſhing Condition by Cold and Hunger, but afterwards a little recover'd, he, with a Microſcope, view'd the thin Membrane us'd by that Animal as Wings; but he obſerv'd no Motion either in the Arteries or Veins. Six Hours afterwards, however, when the Animal became more vigorous, he ſaw an oblong Particle of concreted Blood filling the whole Artery, protruded, and immediately after repel'd, and in this manner continually carried backwards and forwards, till, being reſolv'd by the Attrition, the whole Maſs became capable of paſſing from the Artery to the Vein. How the Quantity and Impetus of the diſtending Fluid may be diminiſhed by Veneſection and Purging, we have already ſpecified. But how much the Diminution of the diſtending Fluids contributes to reſtore the oſcillatory Motion of the Veſſels, ſuffocated by too great Plenitude, is ſufficiently obvious in plethoric Patients, in whom, if the Diſorder riſes to a great Height, the Pulſe is hardly perceptible; but when, by copious Veneſection, the Quantity of the Blood is diminiſhed, the Pulſe beats ſenſibly, and all the Functions, before almoſt ſuppreſs'd, are reſtor'd.

By the Addition of a Stimulus to the Fibres, by means of thin aromatic Liquors, drank warm. The celebrated *Baglivi*, in his Treatiſe *de Fibra Motrice & Morboſa*, has demonſtrated, that the ſolid Parts of the Body are poſſeſſed of ſuch a ſurpriſing Property, that, when irritated by any Stimulus, they are often capable of exciting wonderful Commotions either by increaſing the natural Motion, which in a State of Health they ought to perform; or by entirely perverting and diſordering it. It is certain from Experience, that in the larger Parts any Stimulus produces this Effect. The Aliments taken, by the Motion of the Stomach and Inteſtines, are gradually carried through all their Gyrations and Meanders, to the Extremity of the Inteſtinum Rectum; and, during the Whole of this Paſſage, being deprived of all their diſſolvable Parts, are, at laſt, eliminated from the Body. But if the Inteſtines are irritated by a purgative Stimulus, the Aliments are, in a ſhort time, diſcharged by Stool; ſince they are propel'd by the accelerated periſtaltic Motion of the Inteſtines. Whilſt acrid Poiſons corrode the internal Surface of the Inteſtines, they often contract all the Parts they touch ſo violently, as entirely to cloſe them up. Hence, in conſequence of the intercepted elaſtic Air, enormous Tumors of the Abdomen are ſometimes produced. And this Irritability is ſo eſſential to ſome Parts of the Body, that it remains after Death, and when theſe Parts are ſeparated from the reſt. Thus we are inform'd by Lord *Bacon*, that the Heart of an embowel'd Man, when thrown on the Fire, jump'd pretty high, and continued to do ſo for ſeven or eight Minutes. *Peyer*, upon laying open the Breaſt and Abdomen of a Cat, who died after Abortion, and had been ſtiff for a conſiderable time, and inflating the Receptacle of the Chyle, was ſurpriſed to find, that as ſoon as the Air was conveyed to the Heart, firſt the Auricles, and then the whole Heart, vibrated for ſeveral Hours. By this caſual Diſcovery being induced to make the ſame Experiment on human Carcaſes, it was attended with the like Succeſs, though in ſome the Motion of the Heart was excited with more, and in others with leſs Difficulty: And ſometimes, alſo, beſides the Air blown in, which muſt be warm, he found a Neceſſity for an external Fomentation. But *Peyer*, in his *Parerg. Anatom.* informs us, that the Hearts of Perſons hanged are not only eaſily ſuſceptible of Motion, but, alſo, retain it for a long time. From all theſe Circumſtances it appears, that the Fibres of the Viſcera and Veſſels may, by the Application even of a gentle Stimulus, be irritated to greater Motions. When the ſoundeſt Perſon uſes too large a Quantity of Salt, Aromatics, or Wine, the Heart and Veſſels will, by theſe, be ſtimulated into a briſker Motion, and a Fever produced. When, therefore, the obſtructed Veſſels are long and violently diſtended by the Impetus of the ſucceeding Fluids, the Fibres, being often too much diſtracted, loſe their Force, and do not re-act with ſufficient Strength upon the contain'd Fluids. After, therefore, by Veneſection and Purgatives, the Quantity of the diſtending Fluids is leſſened, and the Impetus of the arterial Blood diminiſhed, it will be expedient to exhibit ſuch Medicines as, mixing with the Blood, and being conveyed through the arterial Veſſels, may, by their gentle Stimulus, irritate the Fibres of the Veſſels to a ſtronger Contraction, and, by that means, ſeparate and divide the obſtructing Molecules, ſo that they may, without any Difficulty, paſs through the narroweſt Parts of the Veſſels; and, in this Caſe, the Inflammation will be cured by Reſolution. This End is obtained by mild Aromatics infuſed in large Quantities of Water, to be drank by the Patient; or Infuſions, or weak Decoctions, of Sanders, Saſſafras, the Five aperient Roots, and other Subſtances of a like Nature, which can never prove injurious in Caſes of this Kind.

A thin AROMATIC LIQUOR, *to be drank warm.*

Take of white, yellow, and red Sanders, each one Ounce; of the Roots of the Carline-thiſtle, one Ounce; of Parſley, and Fennel-roots, each three Ounces: Boil for half an Hour, in Water; then add of the Shavings of Saſſafras, two Ounces; and of the Leaves of Betony, Rue, Scabious, and Colts-foot, each an Handful: Let them ſtand in a very hot Digeſtion, for half an Hour, in a cloſe Veſſel; and of the depurated Liquor let the Patient have five Pints, of which let him take two Ounces every Hour, warm.

But, whilſt large Quantities of ſuch Medicines are taken, in order to determine their Efficacy to the Part affected, Fomentations, Frictions, Cuppings, and Scarifications, are to be uſed. Frictions are, in this Caſe, highly beneficial, becauſe by the alternate Preſſure and Relaxation they, in a great meaſure, reſemble, and ſupply the Defect of, the Action of the Veſſels upon the Fluids. But it is ſufficiently obvious, that gentle Frictions are only requiſite in this Caſe, and that they ought never to be uſed in the inflamed Part, till the Tenſion and Pain are remov'd by Evacuants, and the Impetus of the Blood either entirely removed, or much diminiſhed, by ſuch Remedies as leſſen its Quantity.

2. By drinking other thin and aqueous Liquors warm, and diluting the impacted Matter.

When, by means of Evacuants, a great Part of the Fluids is eliminated, and the oſcillatory Motion of the Veſſels reſtor'd, nothing is more conducive to the Cure of an Inflammation by Reſolution, than to fill the Veſſels with a Fluid capable of paſſing through the ſmalleſt of them. Now Water is poſſeſs'd of ſuch a Quality; and the moſt ſubtle Part of the human Fluids, which comes under the Cognizance of the Senſes, almoſt, reſembles Water in all its Properties. Hence it follows, that Water is capable of paſſing through the moſt minute Veſſels of the Body. This Fluid, when drank warm, is the moſt efficacious Remedy in all inflammatory Diſorders; for, by the Laws of the Circulation, being convey'd to theſe Parts of the Body, where the obſtructing inflammatory Matter is compacted, it will act upon it, and, by the Concurrence of the Action of the Veſſels, attenuate it; and thus, gradually interpoſing itſelf betwixt the Molecules of the concreted Matter, it will ſeparate and dilute them. But we have already obſerved of how great Efficacy Water is in removing Obſtructions, by diluting and attenuating. Beſides, we muſt obſerve, that Water ſerves as an excellent Vehicle for all the other Remedies calculated for attenuating and reſolving inflammatory Concretions. All thin Liquors, therefore, in which Water is moſt predominant, are highly beneficial in theſe Caſes, ſuch as Whey, Milk and Water, ſmall Ale, Decoctions of Barley and Oats, together with Infuſions of Coffee and Tea.

3. By uſing Attenuants, Reſolvents, and things oppoſite to the Nature of the obſtructing Matter, both internally and externally, either in the Form of Decoctions, Baths, Fomentations, Steams, Cataplaſms, Plaiſters, or Ointments.

Tho' Water is capable of diſſolving a great many Concretions, ſuch as thoſe of the ſaline, ſaponaceous, mucous, and gelatinous Kinds; yet there are many which cannot be diſſolved by Water alone. For this Reaſon, together with the aqueous Subſtances, ſuch things are to be taken as are poſſeſſed of a reſolvent Quality: Of this Kind thoſe are to be choſen, which are moſt oppoſite to the Nature of the obſtructing Matter. But, in this Caſe, the obſtructing Matter is red Blood, or a thinner Fluid, remaining ſtagnant in its proper Veſſels, or, by an Error Loci, forced into Veſſels by Nature not deſtined for it. There are preſent, at the ſame time, an increaſed Motion and Heat, which give the Humours of the human Body a great Tendency to Putrefaction: Hence the Medicines intended to attenuate inflamtory Concretions ought, at the ſame time, greatly to reſiſt Putrefaction. But there are known Medicines, which are, at once, highly reſolvent and antiſeptic. Honey, by the antient Phyſicians ſo much uſed in inflammatory Diſorders, is remarkably poſſeſſed of theſe Qualities; for, by the immoderate or long-protracted Uſe of Honey, the Blood may be ſo reſolved, as to be diſcharged by Stool, like Water; whilſt, at the ſame time, all the Parts of Vegetables are excellently preſerved from Corruption in Honey. *Herodotus*, in *Lib.* 1. informs us, that ſome of the *Babylonians* were buried in Honey: Sugar, at preſent ſo much uſed, is poſſeſſed of the ſame Quality. The recent Juices of unripe Fruits, and the highly reſolvent Decoctions of Succory, Dandelion, Vipers-graſs, and Goats-beard, are of ſingular Efficacy, in Caſes of this Nature. Among the ſaline Attenuants, Nitre is preferable to the reſt; becauſe theſe are either alcaline, and, by that means, more diſpoſe our Humours to Putrefaction; or, by their Stimulus not to be ſo eaſily ſurmounted by the Force of the Veſſels, and Viſcera, too much increaſe the Impetus of the arterial Blood. Of theſe, various and ſufficiently grateful Remedies may be prepared for internal Uſe: But it will, at the ſame time, be beneficial to apply externally, to the inflam'd Part, Things of the ſame Nature, either in the Form of Baths, Fomentations, Steams, or Cataplaſms: But theſe external Medicines ſeem not only to act ſo far as the Water, impregnated with attenuating Medicines, inſinuating itſelf into the bibulous Veins of the external Skin, and being mix'd with the Blood, is, by the Laws of Circulation, convey'd through all the Parts of the Body; or ſo far as by Remedies of a deriving, attractive, or propellent Quality, it is more determin'd to the inflam'd Part; but, alſo, as theſe very Remedies, diluted with Water, penetrate directly the Arteries themſelves, and may, by this means, be convey'd with their entire Virtues to the obſtructed Parts. For that Portion of the Artery, which lies behind the obſtructed Part, is empty; there is now no Impetus of the Blood impelled from the Heart, and all the Ramifications ariſing from ſuch an Artery, beyond the obſtructed Part, will, in like manner, be empty: Hence the Fluids applied will enter thoſe Ramifications, with a Force equal to that with which highly minute Tubes attract contiguous Fluids: Whilſt, therefore, the internal and external Medicines thus conſpire, the ſtagnant Molecules, lodged in the obſtructing Veſſels, are, on both Hands, acted on by Attenuants; and if, at the ſame time, the oſcillatory Motions of the Veſſels are reſtor'd, it is ſufficiently obvious, that theſe Molecules are, as it were, triturated with thoſe Remedies, and may, by this means, be reſolved, if there are any Hopes of a benign Reſolution left. But the Plaiſters or Ointments, which, in order to obtain this End, are applied to the inflamed Part, ought not to be too tenacious, or acrimonious; becauſe they would then rather increaſe the Diſorder, as we have already obſerv'd: Hence ſuch Preparations are only uſed, as ſlightly adhere to the Skin, repel and confine the exhaling fine Dew, that thus the Part affected may be, as it were, in a Bath of its own Steam, and that the Virtues of the Medicines applied may more eaſily inſinuate themſelves into the relaxed bibulous Veins.

The Lenity of the Humours is procured by drinking aqueous Liquors; by a mild Diet; by Medicines gently diluting and obtunding; or ſuch as are in a ſingular and ſpecific manner oppoſite to the prevailing Acrimony.

We have already obſerved, that a mild Diſpoſition of the Humours is requiſite to the Reſolution of an Inflammation; for which Reaſon it is not ſufficient to procure a due Fluidity to the obſtructing Matter, unleſs, at the ſame time, its Lenity is preſerv'd, or its Acrimony, if any, corrected. Water, and all aqueous Subſtances, are principally ſubſervient to this Intention; for nothing is more mild than pure Water, by means of which, the moſt acrid Subſtances may be ſo diluted, as to prove no longer hurtful. The moſt concentrated Oil of Vitriol, which, like Fire, in a Moment deſtroys the Parts to which it is applied, may, by the Affuſion of a large Quantity of Water, be ſo weaken'd, that it may be ſafely uſed inwardly: Hence, as ſoon as any acrid Subſtances are mix'd with the Blood, Thirſt forthwith forces the Patient to uſe large Quantities, either of Water, or ſome other thin Liquor, till the peccant Matter is expelled, either by Urine, or Sweat. The ſoundeſt and moſt healthy Perſons experience this, if at Dinner they eat too large a Quantity of ſalt Fleſh, or any other thing of a like Nature. Beſides, thin aqueous Liquors anſwer all the Intentions of Cure, ſpecified above: A Diet, conſiſting of the ſofteſt frumentaceous Grains, ſuch as Barley, Oats, Buck-wheat, and Rice, as, alſo, of Milk, and the ſofteſt Pot-herbs, is here highly beneficial. *Hippocrates*, as appears from his Treatiſe *de Victu in Morbis acutis*, ſupported thoſe labouring under acute Diſeaſes, almoſt entirely with Barley-ptiſan alone. In Caſes of this Nature, the beſt Medicines are thoſe prepar'd of emollient and gently viſcid Subſtances; ſuch as the Decoctions of Marſhmallows, Mallows, Mullein, and other Subſtances of the like Qualities. Emulſions of farinaceous and ſomewhat oleous Subſtances, as, alſo, the ſofteſt expreſſed Oils, are, likewiſe, of ſingular Service in Diſorders of this Kind, becauſe they ſo obtund and ſheath up every Degree of Acrimony, as to render it inactive and languid. But becauſe theſe Oils very ſoon become rancid, eſpecially in a conſiderable Heat, Emulſions are generally preferable to them, which contain the obtunding Virtues of the Oils, and, at the ſame time, are not ſo ſubject to degenerate into a rancid Acrimony. But if, before or after the Inflammation, an acrimonious Cacochymy of the Humours is obſerved, in this Caſe thoſe things are proper, which are of a ſpecific Virtue againſt the known Acrimony: Thus an acid Acrimony is to be treated with Abſorbents, or Alcalines; whereas Acids are moſt proper for correcting a putrid Acrimony.

The obſtructing Matter is forced from narrow to wider Parts of the Veſſels;

1. By a large Evacuation of the arterial and venous Fluids, by means of Veneſection.
2. By a Relaxation of the Fibres.
3. By artificial Frictions.

We have already obſerved, when enumerating the general Intentions of Cure to be purſued in curing an Inflammation by Reſolution; that, if the obſtructing Matter cannot be render'd ſo fluid as to paſs thro' the narrow Parts of the Arteries, the only Method remaining is to repel it from theſe narrow Parts to larger Veſſels, where, being carried off by the Circulation of the Blood, it is ſo divided as afterwards to become capable of paſſing through thoſe Veſſels, in which it naturally ought to flow. This Method may be uſed in all Inflammations, but principally in thoſe ariſing from an *Error Loci*; when, for Inſtance, groſs Molecules of the Humours, having enter'd the dilated Orifices of the moſt minute Veſſels, cannot paſs through their Extremities;

for if, in such a Case, a red Globule, for Instance, which has enter'd an Artery destin'd for the Serum, can be repel'd, it will again return into the Arteries destin'd for the red Blood, thro' the narrowest Parts of which it is naturally capable of passing; in consequence of which the Inflammation will be resolv'd. But that this Retropulsion may be brought about, the Impetus of the Fluids on the obstructed Part must be removed, or at least very much diminish'd; the Fibres of the obstructed Vessel must be so relax'd as to permit the Regress of the impacted Molecule; and, lastly, this Molecule must be put in Motion, that it may return to larger Parts of the Vessel.

Whilst an Artery, distended by the Force of the Heart, contracts itself, it will, of course, force back its contain'd Liquor towards a wider Part, unless the Impetus of the succeeding Fluid prevents this Effect. When, therefore, the Quantity of this thin Fluid is lessen'd, and its Impetus diminish'd, the Fluid contain'd in the Arteries will move, as it were, from the Apex to the Base of these conical Vessels. Thus, with respect to the Determination of the Motion of the Fluids, the Arteries will, for a time, become Veins. Now Venesection answers both these Intentions; for it lessens the Quantity of the Fluids contain'd in the Vessels, and impairs the Strength of the Heart, by which they are impel'd; for by Venesection we may, at Pleasure, weaken the Strength of a Man, even to Death.

But that these Intentions may be successfully answered, the Evacuation of Blood must be both large and sudden; for, if it was small, the Quantity of Blood would not be sufficiently diminish'd; and, unless it is sudden, the Force of the Heart impelling the Blood is not so much weaken'd: For the strongest Man can hardly bear the free Discharge of two Pounds of Blood, in a full Stream, from a large Wound, without falling into a Deliquium; whereas he can bear the Loss of three times that Quantity, when the Blood is discharg'd, by Drops, from his Nose, or when, after the Drawing of a Tooth, any small Artery discharges Blood, Night and Day, as has often been observ'd to happen. But in neither of these Cases does the Patient fall into a Deliquium.

This is sufficiently confirm'd by what happens in acute inflammatory Disorders: Thus, whilst a Patient, labouring under an acute Pleurisy, cannot draw in the Air by reason of his intense Pain, and is, for that Reason, ready to be suffocated; if a large Orifice is made in one of the Veins of his Arm, the Pain often begins to be diminish'd, and sometimes totally ceases, whilst the Blood is flowing from the Vein, since, by this retrograde Motion of the Humours to larger Vessels, the obstructed Canals are set, as it were, at Liberty. When inflam'd Eyes are become entirely red, by the Blood impel'd into improper Vessels, by liberal Venesection even to a Deliquium, the Redness immediately disappears, since the Blood is repel'd into larger Vessels; for in this retrograde Motion 'tis not necessary the obstructing Molecules should pass through a large Space, before they enter larger Trunks; since, from anatomical Injections, we know, that in very small Interstices there are Anastomoses and Divarications of the Trunks into frequent and numerous Ramifications.

2. The obstructing Molecule remains strongly impacted in the narrow Part of the Vessel. Hence, if the Fibres of this Vessel are rigid, they will so compress this Molecule, as to render it immoveable. In such a Case, therefore, it will be expedient to relax the Fibres, after having previously, by Venesection, diminish'd the Impetus of the impel'd Blood; for otherwise the obstructing Molecules would be forced into narrower Parts, because the relax'd Fibres would more easily suffer themselves to be distended, a Circumstance repugnant to this Intention, which requires the Retropulsion, and not the Propulsion, of the obstructing Matter through the relax'd Vessels. But in what manner, and by what Medicines, the Fibres of the human Body may be relax'd, is shewn under the Article FIBRA.

3. When the Impetus of the Fluids, acting upon the obstructing Molecule, is removed, or, at least, much diminished, then the sole Contraction of the Vessel itself repels the obstructing Mass to a wider Part. Every thing, therefore, which increases the Contractility of the Vessels, or conspires to promote the same End, will assist this retrograde Motion. But Friction, by externally compressing the Sides of the Vessels, produces the same Effect which their own Contractility would have done, the Efficacy of which it, also, augments. Hence its Use is sufficiently obvious, especially if the Friction is made from the Extremities of the Vessels to their Bases. How beneficial this is, we learn from Experience. A Pleurisy is much more happily terminated by Venesection, if, at the very time the Blood is discharged, the Side affected is gently rub'd; or if the Patients, by a deep and often repeated Inspiration, or in consequence of a Cough, move the Part affected. For this Reason, by holding warm Wine or Vinegar to the Patient's Nose, we frequently force him to cough contrary to his Inclination, whilst he is afraid to do so for fear of the intense Pain he before felt. When, in Hunting, Animals are hotly pursued, upon taking off their Skin, the Tunica Adiposa, and even the muscular Flesh, are observed to be blackish, in consequence of the Blood being forc'd into improper Vessels. For this Reason, also, Grooms, after Horses have been hard run, rub them carefully over, in order to remove this Accident; for they have learn'd from Experience, that, without this Method, such Animals languish'd, and became good for nothing.

The Antients put Persons, fatigued by long Journeys, into a Bath, and rubbed them; and this Method is used in *Asia* to this very Day.

Hence in all inflammatory Diseases, whether internal or external, we understand what that Resolution is, which is always to be desired, if possible; what a perfect Cure of an Inflammation is; as, also, what a Cure without a Crisis is.

In whatever Part of the Body an Inflammation is, its Definition remains always the same, that is, an Obstruction of the arterial Canals, with a violent Impetus of the impel'd Fluids acting upon the Part obstructed. There will, therefore, be a Resolution of the Inflammation, when the Molecule obstructing the Artery is so attenuated and divided, or the obstructed Vessel so relax'd, that there may be a free Circulation of the Humours through the Vessel before impervious, or, also, when such a Molecule is repel'd to wider Vessels. 'Tis sufficiently obvious, that this Method of curing Inflammations is of all others the best and most safe; because, without any farther Injury of the Parts, it restores a perfect Soundness of the Functions. But it is not always in the Power of the Physician to cure an Inflammation by Resolution; the Measures, however, requisite for this End, we have already specify'd.

As for a perfect Cure; Resolution alone can properly be call'd a perfect Cure of an Inflammation, because it removes it without inducing any other Disorder; but the other Terminations of an Inflammation in a Suppuration, or a Scirrhus, are not perfect Cures, though they remove the Inflammation; for in these Cases the Inflammation terminates in another Disease, which again requires a fresh Cure before perfect Health is restor'd. But when an Inflammation terminates in a Gangrene, or a Sphacelus, it does not tend to the Cure, but to the Death of the Part.

As for a Cure without a Crisis; tho' the Word Crisis has had different Ideas affix'd to it, both by the Antients and Moderns, yet 'tis sufficient here to observe, that an Inflammation is then said to be cured, when the Matter of the Disease, that is, the stagnant Fluid, lodg'd in the arterial Vessels, by the remaining Principle of Life, and the Medicines exhibited, is so disposed as again to flow freely thro' the Vessels, entirely agreeably to the Laws of Health. When, therefore, this Matter of the Disease is so changed as to become moveable, and remains no longer impacted in the narrow Parts of the Vessels, and is, at the same time, destitute of those Conditions, which are requisite for its Circulation with the sound Humours through the Vessels, without any Hindrance of the Functions, 'tis then either eliminated from the Body, or deposited in some particular Parts of it. In this Case the Inflammation is said to be cured by a Crisis, and the Evacuation of the Matter, and its Deposition to other Parts, are said to be critical. When, for Instance, by an *Error Loci*, a red Globule has enter'd a Vessel destin'd for the Serum, and produc'd an Inflammation; if the red Globule is either forced back from this Vessel into the Artery destin'd for the red Blood, or divided into six serous Globules, of which Number, according to *Leewenhoeck*, it seems to be composed, this Inflammation will be cured without a Crisis; because the Matter of the Disease was so disposed as without any Impediment to be capable of passing through those Vessels, in which, during a State of Health, it ought to flow. But if the Extremity of the obstructed Vessel, together with the obstructing Molecule, are, by the Impetus of the succeeding mild and gentle Fluids, gradually separated, the Obstruction will be removed, but the Continuity of the Vessel being interrupted, the Humours will be discharged. The separated Extremity of the obstructed Vessel, together with its Molecule, can no longer obey the Laws requisite to a State of Heath, for which Reason it must be removed, since it is to be considered as an heterogeneous Body. Hence these highly tender Solids, when mix'd with the discharg'd Fluids, by the Heat of the Body, and the smallest Degree of beginning Putrefaction, are chang'd into Pus, which must be evacuated, since it can never acquire the same Nature with the human Fluids. An Inflammation, however, is cured in this manner, but not without a Crisis; because the Matter of the Disease is, by the remaining Principle of Life, separated and eliminated from the Body. Thus it evidently appears how the Resolution of an Inflammation differs from a critical Cure of it. This Doctrine seems to be beautifully confirm'd by a general Axiom of *Galen's*, with respect to the various Terminations of Diseases, delivered in the fourth Chapter of his third Book *de Crisibus*, in the following Words: "τὰ μὲν γὰρ "μεγάλα κρίνεται πάσης, ὅσα δὲ σμικρὰ λύεται μόνον. Violent "Diseases are all critically determined, whereas those which are "slight are only resolv'd." Thus a violent Inflammation terminates in a Suppuration, or a Gangrene, whereas one that is gentle, may be resolv'd.

INFLATIO. Inflation. An Emphyſema is ſometimes thus call'd.

INFRA-SCAPULARIS *Muſculus*. A Name for the SUBSCAPULARIS; which ſee.

INFRA-SPINATUS MUSCULUS.

This is a triangular, fleſhy, and pretty broad Muſcle, in ſome meaſure penniform, filling the whole Infra-ſpinal Cavity or Foſſa of the Scapula.

It is fixed in the poſterior Half of the Infra-ſpinal Cavity, or Foſſa, and to the correſponding Part of the Baſis of the Scapula.

From thence ariſe a great Number of ſhort fleſhy Fibres, which run more or leſs oblique, and end in a middle tendinous Plane, which terminates a little below the broadeſt Part of the Spine of the Scapula, under the Root of the Acromium.

Then the fleſhy Fibres, leaving the Bone, unite in one fleſhy Maſs, which, paſſing under the Acromium, over the Articulation of the Head of the Os Humeri, and adhering to the capſular Ligament, terminates there in a flat broad Tendon, which, adhering, alſo, to the Capſula, is afterwards inſerted in the greater middle Surface of the great Tuberoſity of the Head of the Os Humeri. At the Place where the Fibres leave the Infra-ſpinal Foſſa, under the Acromium, there is a great Quantity of fat or adipoſe Cells, between the Bone and the looſe Portion of the fleſhy Maſs.

This Muſcle appears double a little below the Spine, and toward the Baſis of the Scapula, becauſe of the middle tendinous Plane. It, alſo, ſeems confounded with the Teres Minor, to which it is very cloſely join'd. Its Tendon is united, on one Side, with that of the Teres Major; and on the other, with that of the Supra-ſpinatus; and it is cover'd by the poſterior Portion of the Deltoides.

The Infra-ſpinatus, being inſerted, by its Tendon, in the middle Surface of the great Tuberoſity of the Os Humeri, muſt perform different Motions, according to the different Situations of that Bone. If it acts, while the Arm hangs down parallel to the Trunk of the Body, it may move the Os Humeri round its Axis from before outward; and, conſequently, if the fore Arm be, at the ſame time, bent, it will turn the Hand from the Body.

If, while the Arm is kept rais'd by the Deltoides, the poſterior Portion of that Muſcle draws the Arm backward; the Infra-ſpinatus has the ſame Uſe with reſpect to the orbicular Ligament, as the Supra-ſpinatus: And, as theſe two Muſcles adhere cloſely by the Edges of their Tendons, they may, in ſome meaſure, co-operate in their Action on that Ligament.

When the Arm, raiſed in the manner already ſaid, is ſtrongly pull'd forward by the Pectoralis Major, a conſiderable Force is neceſſary to prevent the Head of the Os Humeri from being thrown backward out of the Glenoide Cavity. The Structure of the Infra-ſpinatus, and the Number of its Fibres, which is much greater than in the Supra-ſpinatus, fit it for anſwering this Purpoſe; in which it is, alſo, aſſiſted by the flat, broad, thin Ligament, as mentioned under the Article SCAPULA.

This Muſcle may, likewiſe, aſſiſt the Teres Major in great Efforts. *Winſlow's Anatomy*.

INFRIGIDANS *Ceratum Galeni*. The ſame as the CERATUM ROSATUM.

INFUNDIBULUM is a kind of ſmall Conduit, which pierces the Dura Mater upon the Baſis of the Skull, and ſinks into the Subſtance of the Glandula Pituitaria. See CEREBRUM. The Infundibulum of the Kidneys is the Pelvis.

INFUSIO. Infuſion either implies the Action of infuſing any Ingredient, or Ingredients, in a proper Fluid; or the Medicine prepared by this Action. The Method of making Infuſions is ſpecified under the Article DECOCTIO.

INFUSUM. An Infuſion. A Medicine prepared by Infuſion. Sometimes it imports a Clyſter or Injection.

INGA. *Ray* takes notice of four different Trees, which are call'd by this Name: The firſt is the

Arbor ſiliquoſa Braſilienſ. foliis pinnatis, coſta media membranulis utrinque extantibus alata. Ingæ Species, Belgis vulgo Lotus. Marcgr.

The ſecond is the

Arbor ſiliquoſa Braſiliana, ſiliqua biſpida ferruginea, Ceratoniæ facie. Brern. *Inga Opea Piiba Braſilianorum.* Marcgr.

The third is the

Inga alia Species. Marcgr. *Siliquoſa Braſilienſis, Inga dicta, ſiliquis longiſſimis contortis.*

The fourth is the

Arbor ſiliquoſa Braſilienſis, foliis pinnatis, coſta media ad ſingula Pinnarum poria appendicibus Aurentiarum æmulis elatis. Ingæ Braſilienſibus. Marcgr.

I find no medicinal Virtues aſcribed to theſe.

INGERENDA, or INGESTA. All Sorts of Aliment, whether ſolid or fluid; that is, whatever is taken into the Body for its Nouriſhment.

INGRAVIDATIO. The ſame as IMPRÆGNATIO.

INGREDIENTIA. Ingredients in a Compoſition.

INGRESSIO, or INGRESSUS. In Medicine it imports either the Ingreſs of a Phyſician into the Patient's Chamber; or the entering of one Part of the Inteſtine within another, in the Iliac Paſſion.

INGUEN. The Groin.

INGUINALIS FASCIA, or SPICA. A Sort of Bandage. See FASCIA,

INGUINALIS HERNIA. See BUBONOCELE, and HERNIA.

INGUINALIS HERBA. See ASTER ATTICUS.

INHAME. See CARA.

INHUMATIO, in Chymiſtry, is a Method of digeſting, by burying the Veſſel, containing the Ingredients to be digeſted, in Horſe-dung, or Earth.

INJACULATIO. A Term us'd by *Helmont*, to expreſs a Diſtemper which conſiſts in a violent ſpaſmodic Pain in the Stomach, and an Immobility of the Body.

INJECTIO. An Injection. There are various Sorts of Injections us'd in Medicine, either for the Mouth, Anus, Urethra, Vagina, or for Wounds, Ulcers, and Sinuſes, which are taken notice of under the reſpective Articles to which they belong.

The Moderns have very much improved Anatomy, by injecting certain fluid Subſtances into the Blood-veſſels, and thereby inveſtigating their Courſe more accurately than could be done without ſuch a Contrivance. *Ruyſch* was the moſt famous of all others for his artificial Injections, the Method of doing which he kept a very great Secret. But *Ringer* gives the following authentic Account of his Method.

RUYSCH's *Method of injecting and preparing Bodies for anatomical Purpoſes, from his own Manuſcript, purchaſed of him by* Peter *the Great, and now in the Library of the Univerſity of* Petersburgh.

1. The Hypogaſtrium is to be laid open; after which two Inciſions, about an Inch, or ſomewhat more, in Length, are to be made in the deſcending Trunks of the Aorta, and the Vena Cava, in ſuch a manner, that two Tubes may afterwards be introduced.

2. The Subject being placed in cold Water, the Blood is frequently to be expreſs'd from the above-mention'd Inciſions, for a Day or two.

3. After this, warm Water is to be poured upon the Subject for four, five, or ſix Hours, according as it is young, or an Adult.

4. In the mean time the ceraceous Matter, for the Injection, is to be melted in an Earthen Veſſel, placed in an Iron Veſſel, with ſome common Water in it.

5. When the Matter is melted, a ſufficient Quantity of factitious Cinnabar is to be added to it, ſtirring them till they are ſufficiently incorporated.

6. For the Matter, we are, in the Winter-time, to take ſimple Suet; but, in the Summer-time, we muſt add a little white Wax to it.

Some, for this Purpoſe, uſe Wax, Turpentine, Roſin, and Oil of Turpentine.

Others uſe Spirit of Wine ſaturated with Cinnabar; and, when the Veſſels are fill'd with this Preparation, cloſe them with melted Wax, leſt the injected Matter ſhould be again diſcharged.

But, when theſe Methods are taken, the injected Veſſels cannot be ſeparated from the Carcaſe, as in my Manner.

7. When the Carcaſe has been thus warm'd for four, five, or ſix Hours, it is to be taken out of the Veſſel in which it lay, and placed upon a Table; after which two Tubes are to be introduc'd into the Artery, in ſuch a Manner, that one of them ſhall be directed to the ſuperior, and the other to the inferior Parts of the Carcaſe. The Tubes are, alſo, to be firmly ſecured in theſe Veſſels; but we muſt obſerve, in fixing them, to comprehend the deſcending Trunk of the Vena Cava before opened; and, for this Purpoſe, we muſt not uſe a Cord, but a thick and ſtrong Thread.

8. After theſe Meaſures are carefully taken, the Carcaſe is again to be immerſed, for a Quarter of an Hour, in the warm Water from which it was taken.

9. As this Water, in the mean time, becomes cold, it is to be pour'd out, and a Supply of ſufficiently warm Water is to be added.

10. After this, a Syringe, heated by means of live Coals, is to be applied to the Tubes; and firſt to that which is ſuperior, and then to the inferior Tube, gently compreſſing the Matter with the *Embolus*, till a ſufficient Quantity ſeems to be injected; and, if there ſhould not be a ſufficient Quantity of Matter, the Syringe is again to be filled, and the Matter injected in the ſame manner.

11. When the Veſſels are full, their Mouths are to be clos'd; and the Subject, being plac'd in cold Water, is to be perpetually mov'd, till the Matter is cold, leſt, in conſequence of the Gravity of the Cinnabur, it ſhould be white on one Side, and red on the other.

12. When the Carcaſe is cold, my Liquor is to be poured upon it, in which it is to remain for ſome Days, frequently moving it, that the aqueous Parts may be the more perfectly extracted. Then the Liquor is to be renew'd, and the Carcaſe kept in an Earthen Veſſel.

13. When the Carcaſe is to be expos'd to View, it is to be take out of the Liquor, wiped gently, and dreſſed in Cloaths.

14. The

14. The Liquor is Spirit of Wine, or Malt Spirits, to which, in the Diſtillation, we may add a Handful of black Pepper, that it may the more powerfully penetrate the muſcular Parts.

15. The Malt Spirits, which I now perpetually uſe, ought not to be too ſubtile, ſince when they are ſo, they cannot be retain'd in Phials: I therefore take the rectified Spirit, and add a third Part of Water to it, which I find to be the beſt Mixture of all others.

16. For Birds, Fiſhes, Quadrupeds, and Animalcules, I uſe common Alcohol, mix'd with pure Water; but this is not to be uſed for the Preſervation of an human Carcaſe, ſince, by this means, it would ſoon loſe its Beauty. But the Spirit I uſe for this Purpoſe, I myſelf diſtil from a tinn'd Alembic, with the Aſſiſtance of a ſlow Fire.

17. The Carcaſe, when expos'd to View, is not to be long kept out of the Liquor, ſince by that means it would loſe its Beauty.

18. If we intend to dry the Parts of a Carcaſe, we are neither to expoſe them to the Fire, nor the Rays of the Sun, but to a dry Air; otherwiſe the Matter injected would make its Eſcape.

19. Nothing is more difficult, than to dry and indurate Subjects thus prepar'd, by reaſon of the Mouldineſs with which they are continually cover'd. A Pencil, therefore, dipt in the Liquor, or ſaturated with Alcohol, is to be uſed, by which the Mouldineſs is immediately remov'd; and this Method is to be perſiſted in, till the Diſcharge of the Mouldineſs ceaſes.

20. Dry'd Subjects are, with the greateſt Care, to be preſerv'd from ſuch Animals as prey upon fleſhy or membranous Subſtances.

21. Among Animalcules, the moſt offenſive are, a ſmall Species of Scarabæus, eſpecially in the Months of *May*, *June*, and *July*; but they are rarely to be found in the Winter-time. They, alſo, produce a kind of hairy Animalcule, which is no leſs offenſive.

22. If, by chance, a Subject ſhould be infeſted with theſe Inſects, I cover it over with Alcohol, which immediately kills them; after which, I again expoſe it to the Air, in order to dry it.

23. For the better Preſervation of Subjects, I ſometimes cover them over with a Verniſh prepared of Gum-copal, and Oil of Spike.

24. When we intend to render the moſt minute Veſſels viſible, the Carcaſe is firſt to be moiſten'd with Oil of Spike, or Turpentine; then, taking care that no Object intercept the full Acceſs of the Rays of the Sun, we are to uſe good Microſcopes.

INIMBAY. A Name for the BONDUCH; which ſee.

INION, *ἰνίον*. The Occiput; or, according to others, the poſterior Part of the Neck. *Blancard* ſays, it is the Beginning of the Spinal Marrow.

INNOMINATA OSSA.

The Pelvis is the third and loweſt Part of the Trunk, conſiſting principally of two large Pieces, called Oſſa Innominata, which, being united anteriorly by a cartilaginous Symphyſis, and poſteriorly to the two Sides of the Os Sacrum, repreſent a kind of Baſon. When conſidered ſeparately, they have no regular Figure, being of different Breadths in different Parts, unequally convex on the Outſide, and unequally concave on the Inſide. Each Bone is but one Piece in adult Subjects, but, in Children, it conſiſts of three Pieces joined together by a Cartilage, which afterwards perfectly oſſifies, leaving, commonly, no Veſtige of the firſt Diviſion. Anatomiſts, however, conſider in it, even in Adults, three different Portions, and diſtinguiſh them by different Names, as if they were three diſtinct Bones. The largeſt of the three is ſuperior and poſterior, called Os Ilium; the ſecond, inferior, called Os Iſchium; and the third and ſmalleſt, anterior, called Os Pubis.

It is neceſſary to obſerve, that, in the entire Bone, there are ſeveral common Parts, which belong to more Portions than one; as a deep cartilaginous cotyloide Cavity, called in *Latin*, *Acetabulum*; formed by all the three Portions: A large Opening, called Foramen Ovale, formed by the Os Iſchium, and Os Pubis: A large poſterior Notch or Sinus, called the Iſchiatic Notch, formed by the Os Ilium and Os Iſchium: An oblique Eminence, or Protuberance above the Acetabulum, towards the Foramen Ovale, made by the Os Ilium and Os Pubis. To theſe may be added, a Ridge on the Inſide of the Pelvis, which divides the upper wide Part from the Bottom, to which alone the Antients gave the Name of Pelvis.

The Os Ilium was ſo named by the Antients, becauſe it ſupports the Parts called by them Ilia. It is flat, very broad, unequally convex and concave, partly round, and partly of an irregular ſquare Figure. It is commodiouſly divided into the Criſta, Baſis, anterior and poſterior Edge, and two Sides, one external, and the other internal. The Criſta is the upper Part, being a pretty thick, arched Border, the Circumference of which is little more than the Quadrant of a Circle. The anterior and middle Part is convex outward; the poſterior Part a little convex inward. We diſtinguiſh in it two Labia, and a middle Space between them. It is originally an Epiphyſis, of which we ſometimes ſee plain Marks in a very advanced Age. The poſterior Portion of the Criſta, which is convex inward, is much thicker than the anterior; and, for that Reaſon, might be called the Tuberculum of the Criſta. The whole Criſta appears to be cruſted over with a Cartilage, which, in Reality, is no more than the dry'd tendinous Inſertions of the Muſcles.

The anterior Edge of the Os Ilium has two Eminences, or Tubercles, called the anterior Spines; one ſuperior, the other inferior; and likewiſe two Notches, one between the Spines, the other below the inferior Spine. The poſterior Edge is ſhorter and thicker than the anterior. It terminates, likewiſe, in two Eminences, or Spines, between which there is a conſiderable Notch. The Baſis, or inferior Part of this Bone, is the thickeſt and narroweſt. It forms, anteriorly, a Portion of the Acetabulum; and, poſteriorly, almoſt all the Iſchiatic Sinus. The Outſide is convex on the fore Part, and concave on the back Part. We obſerve on it the Remains of a long ſemicircular Line, which reaches from the upper anterior Spine to the great Iſchiatic Sinus, being a muſcular Mark. Above and behind this Semicircle, there are ſeveral other Impreſſions, and muſcular Marks. A little above the Edge of the Acetabulum, we ſee, likewiſe, many Inequalities, which ſurround Part of that Edge in a ſemicircular Form, being a Collection of muſcular and ligamentary Marks. The Inſide is unequally concave, and has ſeveral Inequalities toward the back Part, the principal of which is that large cartilaginous Surface of the Figure of an S, or of a Bird's Head, which anſwers to the lateral Surface of the Os Sacrum, with which it is connected by a cartilaginous Symphyſis. The other Inequalities are much of the ſame Kind with thoſe in the lateral Part of the Os Sacrum, with which they form ſeveral rough and irregular Cavities. From the upper Part of the cartilaginous Surface, or Symphyſis, all the Way to the oblique Eminence, runs a prominent Line, which bounds the Concavity of the Inſide of this Bone, and diſtinguiſhes the Margin of the Pelvis from the Bottom.

The Os Iſchium is the loweſt Portion of the Os Innominatum, as well as of the whole Trunk. It is divided into the Body, Tuberoſity, and Ramus, or Branch. The Body of the Os Iſchium forms the loweſt and greateſt Part of the Acetabulum, and ſends out an Apophyſis backward, called the Spine of the Iſchium. The Tuberoſity is very thick, unequal, and turned downward; and it is on this Part, that the whole Body reſts when we ſit. It appears cartilaginous, becauſe of the dry'd and hardened Remains of the Tendons. The whole convex Part of it is originally an Epiphyſis, of which the Marks are obliterated ſooner in ſome Subjects, than in others. Three muſcular Impreſſions may be diſtinguiſhed in it. The Branch of the Iſchium is a kind of ſmall, flat, thin Production, or Apophyſis, which aſcends forward from the Curvature of the Tuberoſity to the Os Pubis; and it is often cover'd, in Part, by a Continuation of the Epiphyſis of the Tuberoſity. Theſe three Parts of the Iſchium, taken together, form a large Opening, which makes the greateſt Part of the Foramen Ovale. Three other Notches are remarkable upon this Bone; one poſterior between the Tuberoſity and the Spine, for the Paſſage of the internal Obturator Muſcle, which is a little cartilaginous, and divided into three or four ſmall ſuperficial Chanels; one lateral between the Tuberoſity and the Acetabulum, for the Paſſage of the external Obturator Muſcle; and one anterior at the Edge of the Acetabulum, for Ligaments.

The Os Pubis is the leaſt of the three Portions of the Os Innominatum. The two together form the fore Part of the Pelvis; and in each we may diſtinguiſh the Body, Angle, and Branch. The Body of the Os Pubis is its upper Part, ſituated tranſverſely before the inferior Part of the Os Ilium. Its poſterior Extremity is very thick, and by its Union with the Os Ilium forms the oblique Eminence which diſtinguiſhes theſe two Portions of the Oſſa Innominata. It, likewiſe, contributes to the Formation of the Cotyloide Cavity. Its anterior Extremity ends in a ſmall Eminence, or Tuberoſity, called the Spine of the Os Pubis, which is ſometimes double. The upper Edge has on its inner Part an oblique Ridge, which may be called the Criſta of the Os Pubis, and is continuous with that Ridge which diſtinguiſhes the Margin, and the Bottom of the Pelvis. Before this Criſta is a broad, oblong, oblique Slope. The lower Edge is obliquely notch'd, and forms the upper Part of the Foramen Ovale. The Angle of the Os Pubis is its anterior Portion, and makes Part of that Connection, called the Symphyſis of the Oſſa Pubis. This Portion is flat, and not very thick; and, in ſome Subjects, toward the upper Part of the fore Side, near the angular Curvature, it has an Eminence which increaſes the Size and Extent of the Spine already mentioned. The two Oſſa Pubis, connected together by this Portion, form on the fore Side an unequal Convexity, but, on the back Side, a pretty even Concavity. The Branch of the Os Pubis is a flat thin Apophyſis, which, running downward, unites with the Branch of the Iſchium, by a cartilaginous Symphyſis, of which only ſome Marks remain in Adults. It completes the Formation of the Foramen Ovale. The Branches of the two Oſſa Pubis form, on the fore Side, a pointed Arch, which, in the natural State, is much more round.

Beſides what has been ſaid of the Acetabulum in general, ſee other Particulars, under the Article ACETABULUM.

The Subſtance of all the three Portions of the Oſſa Innominata is moſtly ſpongy, except in the Middle of the Os Ilium, where

where the two Tables, uniting, render the Bone tranſparent; and the ſame is to be ſaid of the Acetabulum.

The Oſſa Innominata are join'd to the Os Sacrum, and to each other, by a cartilaginous Symphyſis. They are articulated with the Os Femoris, by Enarthroſis.

The Oſſa Innominata, together with the Os Sacrum, form the Pelvis, which is Part of the Cavity of the Abdomen, and ſupports ſeveral Viſcera, eſpecially thoſe which are the common Sewers of the Urine, and groſs Excrements, and thoſe by which the two Sexes are diſtinguiſh'd. The Pelvis is larger in Women than in Men; the Oſſa Ilium and Iſchium are wider. The Arch form'd by the Branches of the Oſſa Pubis is alſo greateſt in Females.

Moreover, theſe Bones, together with the Os Sacrum, ſupport the whole Trunk, and all the Parts belonging to it, and, alſo, the lower Extremities. In a Word, they are the Baſis of the whole Body of Man, and the general Centre of all its Motions, when ſitting, ſtanding, or lying.

The Cartilages of the Oſſa Innominata are not ſo numerous as one might imagine on examining the Skeleton only. We are ſubject to think, we ſee the dry'd Remains of Cartilages on the Criſta of the Os Ilium, on the Tuberoſity of the Os Iſchium, and on the Grooves and Notches, which give Paſſage to the Tendons of Muſcles: But none of theſe Incruſtations are true Cartilages, being, for the moſt part, tendinous, aponeurotic, or ligamentary; which, being dry'd, look more like Cartilages, than the true Cartilages themſelves. The Cruſt, which covers the Criſta of the Os Ilium, is principally tendinous, and a ſmall Part of it aponeurotic in Adults; but in Children, and very aged Perſons, it appears cartilaginous. In Children, the Parts which are not completely oſſified, are eaſily taken for true Cartilages; and, in Old-age, the Tendons are often hardened to ſo great a Degree, as to have the very ſame Appearance. The Subſtance which covers the Tuberoſity of the Iſchium, is almoſt entirely tendinous; and that which lines the Grooves and Notches of the Tendons is principally ligamentary.

The true Cartilages of the Oſſa Innominata, in Adults, are five in Number, three common, and two proper. The firſt and principal common Cartilage is that which makes the Symphyſis of the Oſſa Pubis. It reaches from the Interval, between the Spines of theſe two Bones, all the Way to the Angle formed by the two Branches, where they begin to ſeparate. It is ſomething thicker or broader at its upper Part, than for a conſiderable Space lower down; but the inferior Part is much the broader. It fills the Angle already mentioned, and forms a kind of Arch, which is more conſiderable in Women, than in Men. The two other common Cartilages join the Os Ilium to the Os Sacrum, but are thinner than that of the Os Pubis.

The proper Cartilages are thoſe which line the Cotyloide Cavities. In the Edge of each of theſe Cartilages, there is a Notch, or Opening between the anterior and inferior Parts; and, in the Cavity itſelf, there is a broad unequal ſhallow Depreſſion reaching from the Notch beyond the Middle of the Cavity. All the reſt of the Surface of the Acetabulum is covered with a white, ſhining, ſmooth Cartilage, which terminates preciſely at the Edge of the Cavity. The Circumference of the Acetabulum has, beſides, a Border of a particular Kind, the Subſtance of which is neither wholly cartilaginous, nor wholly ligamentary; but I chuſe to place it among the Ligaments.

The Ligaments of the Oſſa Innominata are of two Kinds, common and proper. The common Ligaments go between theſe and the neighbouring Bones, which are numerous. One ſuperior Ligament, inſerted by one End in the internal Labium of the poſterior Part of the Criſta of the Os Ilium, about an Inch above the Angle of that Criſta. It is about an Inch in Breadth, and is faſtened by its other Extremity in the whole inferior Edge of the tranſverſe Apophyſis of the laſt Vertebra of the Loins.

One inferior and anterior, fixed by one End in the inner Side of the Angle of the Criſta of the Os Ilium, and by the other in the ſuperior and anterior Part of the firſt falſe tranſverſe Apophyſis of the Os Sacrum. In this Ligament there are tranſverſe Openings, which make it appear more or leſs complex.

Several inferior and poſterior, fixed by one End along the internal Labium of the Tuberoſity of the Criſta of the Os Ilium; and, by the other, in the firſt three falſe tranſverſe Apophyſes; and from thence, extending laterally over the Marks of the falſe oblique Apophyſis of the Os Sacrum.

To theſe muſt be added, the Ligaments by which the Os Femoris is joined to the Os Innominatum, which are deſcribed among the other Ligaments of the Thigh.

The principal proper Ligaments are four; two called Sacro-ſciatic, one broad and external, the other ſmall and internal, one Obturator, and one Inguinal.

The broad Sacro-ſciatic, or internal ſciatic Ligament, is ſlightly faſten'd to the Inſide of the Tuberoſity of the Criſta of the Os Ilium, covers exteriorly the two poſterior Spines of that Bone, and continues to be inſerted along the anterior and exterior Edges of the falſe tranſverſe Apophyſis of the Os Sacrum. From thence this Ligament, diminiſhing in Breadth, deſcends obliquely towards the Tuberoſity of the Iſchium, and is inſerted immediately below the Sinus, which is between the Tuberoſity and the ſciatic Spine. This Inſertion is afterwards continued over the whole internal Labium of the inferior Portion of the Os Iſchium, and of the Branches of the Bone, and the inferior Portion of the Branches of the neighbouring Os Pubis. Thro' all this latter Courſe of its Inſertion, that is, after its Arrival at the Tuberoſity of the Iſchium, it produces a kind of ligamentary Falx, one Edge of which is fixed to the Bones, the other lies looſe; and, by this Situation of the Falx, it forms, together with the Bones, a kind of deep Chanel, or Groove.

The ſmall Sacro-ſciatic, or internal ſciatic Ligament adheres cloſely to the Inſide of the poſterior Portion of the former. It is fixed interiorly to the Edge of the inferior Part of the fourth falſe tranſverſe Apophyſis of the Os Sacrum, and from thence all the Way to the upper Part of the Os Coccygis. From this Inſertion it runs up a little obliquely to the Spine of the Iſchium, and in the ſharp Point, and upper Part, in which it is fixed. During this Courſe, it croſſes the broad Ligament, being cloſely united to the Inſides thereof, and loſes but little of its Breadth. By theſe two Ligaments, two diſtinct Openings are form'd, a large one, with the ſuperior ſciatic Sinus; and a ſmall one, with the inferior ſciatic Notch.

The Obturator Ligament fills up all the great Foramen Ovale, except the oblique Notch, at its upper Part. It is faſtened, preciſely, to the Edge of the Circumference of that Hole, from the anterior Part of the oblique Notch, all the Way to the Symphyſis, between the Os Pubis and the Os Iſchium.

From thence, to the poſterior Part of the inferior Notch, it is fixed to the internal Labium of the Edge of the Circumference, forming a kind of ſmall Chanel with the external Labium; and afterwards it is fixed to the common Edge of the Foramen Ovale, and Cotyloide Notch, or Opening.

By this Diſpoſition, an Opening is left between this Ligament and the ſuperior oblique Notch; and, immediately below this common Opening, there are two ſmall Perforations in the Ligament alone.

On the Inſide of the upper and anterior Part of the Os Pubis, there is a tranſverſe Ligament, reſembling the Shape of a Penthouſe, fix'd by its upper Part to the Os Pubis, from the oblique Notch of the Foramen Ovale, all the Way to the lower Part of the Symphyſis, at a ſmall Diſtance from the Circumference of the laſt-mention'd Hole.

This tranſverſe Ligament is about half an Inch in Breadth in an adult Body; and poſteriorly, below the ſuperior oblique Notch of the Foramen Ovale, it joins the Obturator Ligament, by means of a particular Fold; and, by parting from it afterwards, a kind of deep narrow Groove is form'd between them, the tranſverſe Ligament being, at this Place, ſupported by ligamentary Frænа of different Sizes.

The inguinal Ligament, call'd, from the Diſcoverer, *Ligamentum Fallopii*, is an aponeurotic, or ligamentary Band, faſten'd by one End to the anterior and ſuperior Spine of the Os Ilium; and, by the other, to the Spine of the Os Pubis. The middle Portion of it is very narrow, but it expands conſiderably toward both Extremities. It is cloſely join'd to the Muſcles of the Abdomen, and to the aponeurotic Faſcia of the Thigh. It ſeems to be often wanting.

Beſides theſe Ligaments, peculiar to each Os Innominatum, there is another ſmall, flat, and very ſtrong Ligament, which runs tranſverſely between the two Angles of the Cotyloide Notch, and may be term'd the proper, or tranſverſe Ligament thereof.

The elaſtic Border of the Cotyloide Cavity may, alſo, be reckoned among the Ligaments. It is a ſort of additional Piece ſtrongly united to the Edge of the Cavity, but eaſily yields both Ways to any Preſſure. It may be ſtretched out by pulling, and recovers and contracts again, when that Force is removed. It is of a very ſingular Texture, being compoſed of elaſtic Fibres, interwoven together thro' its whole Circumference; and which, in ſeveral Places, are, by degrees, inclined toward the bony Edge of the Cavity. It makes an entire Circle, and where it paſſes over the Notch, the tranſverſe Ligament before-mention'd ſerves to ſupport it, as the bony Edge of the Cavity does thro' all the reſt of its Circumference.

One of the two Ligaments, by which the Os Femoris is connected to the Os Innominatum, ſurrounds the whole Articulation, the other is contained therein. The firſt is called the orbicular Ligament, the other, very improperly, the round Ligament.

The orbicular Ligament is very ſtrong, and unequally thick. It ſurrounds the whole convex Circumference of the Supercilium of the Cotyloide Cavity, to which it is ſtrongly fix'd for the Breadth of near a quarter of an Inch, from the ſharp Edge outward, and from thence ſeems to ſend off a ligamentary Aponeuroſis.

Its Inſertion at the ſharp Edge of the Cotyloide Cavity joins that of the elaſtic Border; the reſt of the Ligament is diſtinct from the Border, and only touches it quite round; and where is paſſes over the Notch, it is fix'd in the tranſverſe Ligament.

The Ligament which lies in the Joint is not round, as its common Name would make us believe. It is a flat Cord, broad at one End, and narrow at the other, and therefore, in ſome meaſure, of a triangular Shape. By its narrow End, it is inſerted at the two Angles of the Notch of the Cotyloide Cavity; and, by the other, in the Os Femoris: This broad End may be reckon'd the Baſis of the Ligament; and from thence ariſe ſome diſtinct ligamentary Filaments, which are inſerted at different Diſtances, in the Circumference of the rough Impreſſion of the Cotyloide Cavity.

There is nothing in the Perioſteum of this Bone different from that which has been ſaid above, except what relates to the Inſertion of ſeveral Muſcles.

The rough unequal Depreſſion, at the Bottom of the Cotyloide Cavity, is filled by a broad flat mucilaginous Gland, border'd with a fatty Subſtance, and covered by a fine Membrane, through which a mucilaginous Liquor paſſes, to moiſten the Joint, and facilitate its Motions. This Membrane riſes above the Gland, and gives a ſort of Covering or Coat to the Liquor contain'd in the Joint. The Blood-veſſels of this Gland paſs between the Bottom of the Cotyloide Notch, and the tranſverſe Ligament thereof.

As theſe Bones have no internal Cavity, and their Subſtance being cellulous or cavernous, they contain no medullary Maſs. The ſmall Cells of their cavernous Subſtance contain a medullary Juice, which diſtils inceſſantly through the Membrane with which they are all lined.

The Blood-veſſels paſs principally through the ſmall Holes, in both convex and concave Surfaces of the Bones; and, ramifying upon the bony Cells, they end in a great Number of ſmall capillary Tubes, which make the medullary Juice appear red. *Winſlow's Anatomy.*

INOCULATIO. See VARIOLÆ.

INOPINUS, παράλογος, ſudden, unforeſeen, is ſpoken of ſuch unexpected Accidents, or Events, as happen either naturally or preternaturally in Diſeaſes, and ſeem to indicate ſome Alteration. But when the Sick find themſelves, in any meaſure, relieved or depreſſed beyond Reaſon or Expectation, we are not much to fear the one, nor truſt the other, as we are taught by *Hippocrates*, 2 *Aph.* 27.

INOSCULATIO, ἀναστόμωσις. See ANASTOMOSIS.

INPINGUEDO *Porci.* The Herb *Coſtus.* *Caſtellus.*

INQUIETUDO, ἄλυσμὸς, Reſtleſſneſs. See ALYSMUS.

INSANIA. Madneſs. See DELIRIUM, and MANIA.

INSECTUM, ἔντομον, an Inſect, ſo called, from its being mark'd or diſtinguiſh'd by Variety of Parts ſeparated, as it were, by Inciſions. The ſeveral Species of Inſects, uſeful in Medicine, ſee under their proper Articles.

INSERTIO, Inſertion, in Anatomy, is the Inſinuation and cloſe Conjunction of the Veſſels, Fibres, Muſcles, or Membranes, with ſome other Part.

INSESSIO, ἱνίδρα, *Ionice*, ἱνίδρυσις, Inſeſſion; ſee ENEDRE. It ſignifies, alſo, the ſame as ENCATHISMA, or SEMICUPIUM; which ſee.

INSESSUS. The ſame as SEMICUPIUM; which ſee.

INSIDENTIA, ἐπίκασις. See EPISTASIS.

INSIDIANS, λοχῶν, inſidious, latent, is an Epithet of Diſeaſes, which betray no evident Symptom, but are ready, on any Provocation, to break forth, as it were, by Surprize, upon the Patient. *Caſtellus.*

INSIPIDUS, ἄγευστος. See APOEUM.

INSIPIENTIA. See DELIRIUM.

INSOLATIO. An Inſolation, or expoſing to the Rays of the Sun. BLANCARD.

INSOLATUS. The ſame as EILETHERES, which ſee.

INSOMNIA, *Inſomnitas*, *Inſomnietas*, Want of Sleep.

INSOMNIUM, ἐνύπνιον, a Dream.

Something may be learnt concerning the preſent State of the Body, and Prognoſtics may be drawn from Dreams; for if, theſe are different from what may be expected from the Buſineſs or Occupation of the Day, they aſſure us of ſome Diſorder in the Body. Dreams of Fire indicate a Redundance of yellow Bile. To ſee a Smoke, or a thick Fog, ſhews, that black Bile abounds in the Body. To dream you ſee a Fall of Rain, or Snow, or Hail, or a Repreſentation of Ice, there is a Redundance of Phlegm in the internal Parts. He who fanſies himſelf converſant among Stinks, may be aſſured, that he harbours ſome putrid Humour within his Body. To have red things repreſented in Sleep, or to fanſy yourſelf to have a Comb like a Cock, is a Sign, that Blood abounds within. The Moon, appearing in a Dream, ſignifies Affections of the Cavities in the middle Part of the Body; the Sun thoſe of the middle Parts, and the Stars thoſe which affect the Ambit, or exterior Surface. If any one, therefore, of theſe Luminaries be leſſen'd, or obſcured, or ſtopt in its Courſe, the Part ſignify'd by it labours under ſome Diſorder, which is but ſlight, if what diminiſhes the Light be only Air, or a Miſt; but more conſiderable, if Water; and if it appears to be overpower'd by the Interpoſition of the Elements, to ſuch a Degree as to ſeem quite extinguiſh'd, the Patient, it is to be feared, will ſink under the Diſtemper; but if, ſurmounting all Obſtacles, the Luminaries begin to ſhine out, and appear ſplendid, the Sick is to be judg'd in a hopeful State. If the Luminaries ſeem to hurry along with ſurpriſing Swiftneſs, they indicate Madneſs; if they appear to deſcend in the Weſt, or to be precipitated into the Sea, or to the Earth, it, alſo, ſignifies Diſeaſes. A troubled Sea indicates an Affection of the Belly; and to ſee the Earth overflown with Water, is not good; for it ſhews a humid Diſorder, and much more, if one fanſies himſelf immerg'd in a Pond or River. It is worſe to ſee the Earth dry'd and burnt up with the Sun; for it is an Indication of great Drineſs. If any one fanſies, in his Sleep, that he greedily longs after Meat or Drink, it ſignifies, that he wants Aliment, or Drinking. To fanſy that you drink pure Water, is good; to take other Liquors, is bad. The Appearance of Monſters, or armed Enemies, occaſioning a Fright in Sleep, ſhews Sickneſs, and Danger of Madneſs. To fanſy yourſelf precipated from ſome very high Place, threatens a Vertigo, Epilepſy, or Apoplexy, eſpecially if the Head, at the ſame time, be burden'd with Humours. *Lommii Med. Obſ.*

The foregoing Obſervations of *Lommius*, on Dreams, are all, or moſt of them, taken from *Hippocrates*, who has written a Book expreſly on the Subject.

INSPIRATIO. Inſpiration. That Part of Reſpiration, by which the Air is drawn into the Lungs.

INSPISSATIO. Inſpiſſation, or Condenſation.

INSTILLATIO imports, ſometimes, the ſame as EMBROCATIO.

INSTINCTUS. Inſtinct. That Principle, in brute Animals, which enables them to make their Option of what is moſt beneficial to them. This Inſtinct frequently directs them to Medicines well adapted to the Cure of their Diſeaſes.

INSTITA. A Fillet. It, alſo, ſignifies a flat Worm of the Inteſtines.

INSUFFLATIO. Inſufflation; the blowing into any Cavity, in order thereby to convey any thing medicinal to a Part affected.

INSULTUS. The firſt Invaſion, or Acceſs of a Paroxyſm, or Fit.

INTERGASTRUM. A Term uſed by *Paracelſus*, importing the Decuſſation of the optic Nerves.

INTEGUMENTA. The Integuments. The *Cuticula*, *Cutis*, and *Membrana Celluloſa*, are generally underſtood by the Integuments.

INTEMPERANTIA. Intemperance, with reſpect to Meat and Drink. But it, alſo, ſignifies the ſame as DYSCRASIA.

INTEMPERIES. The ſame as DYSCRASIA.

INTENTIO. Intention. This imports either Extenſion, or Indication.

INTERCEPTIO. The ſame as APOLEPSIS; which ſee.

INTERCIDENS Pulſus. A ſort of Pulſe is thus called, when betwixt two regular Pulſations, a third Stroke is perceiv'd. It ſeems to be much the ſame as the DICROTUS.

INTERCISIO. The ſame as DIACOPE; which ſee.

INTERCOSTALES MUSCULI.

The intercoſtal Muſcles are thin fleſhy Planes, lying in the Interſtices, between the Ribs, their Fibres running obliquely from one Rib to another. In each Interſtice lie two Planes, an external and an internal, cloſely joined together, nothing but a thin, fine, cellular, membranous Web coming between them.

According to this natural Diviſion, there muſt be forty-four intercoſtal Muſcles, in the twenty-two Interſtices left between the twenty-four Ribs; and of theſe there are eleven external, and eleven internal, on each Side. The Fibres of the external Intercoſtals run down from behind, forward; and thoſe of the internal Intercoſtals, from before, backward; ſo that the Fibres of theſe two Series of Muſcles croſs each other.

The external Intercoſtals extend commonly from the Vertebræ to the Extremity of the upper Labium of the bony Portion of each Rib, and go no further. The internal begin forward, near the Sternum; and end backward, at the Angle of each Rib.

Therefore, between theſe Angles and the Cartilages, theſe fleſhy Planes are double, the Fibres, by their oppoſite Directions, repreſenting this kind of Figure X. But from the Vertebræ to the bony Angles, and in the Interſtices between the cartilaginous Portions, the Plane is ſingle, being that of the external Muſcles, backward, and of the internal, forward.

The Fibres of the external Intercoſtals are very oblique, near the Vertebræ; but this Obliquity decreaſes inſenſibly towards the anterior Extremities of their Ribs. Their Inſertions begin at the Ligaments, by which the Ribs are faſtened to the tranſverſe Apophyſes. They are a little tendinous, and run a ſmall Space beyond the Edge, on the Outſide of each Rib.

The Fibres of the internal Intercoſtals are, in general, ſhorter and leſs oblique than the former. They fill almoſt intirely the Interſtices between the cartilaginous Portions, and they are covered on the Outſide by a ligamentary Membrane, the Fibres of which, running in an oppoſite Direction to thoſe of the Muſcles, have been miſtaken for Continuations of the external Intercoſtals, over which this Membrane is likewiſe ſpread, only a little diminiſhed in Thickneſs.

Any Portion of the Breaſt of an Animal may be boiled ſo much as that the Fleſh ſhall eaſily part from the Bones, and the Ribs may be drawn out, diſordering neither the Muſcles nor Membranes. But we are not from thence to conclude, that all the Intercoſtals on one Side of the Thorax make but one Muſcle; becauſe, by the ſame Way of reaſoning, it might be proved, that all the Muſcles which immediately ſurround the Os Femoris, are but one; ſince, by a like Experiment, they, together with the Perioſteum, may be entirely ſeparated from the Bone, without breaking their Fibres.

The poſterior Fibres of the external Intercoſtals are fixed, by their upper Extremities, ſo near the Articulation of the Ribs with the Vertebræ, that they cannot depreſs that Rib in which they are ſo inſerted; whereas the Inſertions of their lower Extremities in the following Rib being at a greater Diſtance from the Articulation, they may move that Rib upwards: And from thence it follows, that all the remaining Part of each external Intercoſtal, which terminates at the bony Extremity of each Rib, can only ſerve to raiſe the lower Rib toward the upper.

The anterior Fibres of the internal Intercoſtals are ſo near the Articulation of the Ribs with the Sternum, that they cannot depreſs that Cartilage in which each of them is inſerted; whereas the inferior Inſertions of theſe Fibres being at a greater Diſtance from the Articulation, they are in a Condition to raiſe the Cartilages in which they are ſo inſerted. From whence it follows, that all the internal intercoſtal Muſcles have the ſame Uſe with the external, and that they can have no other.

The Portions which lie between the two Extremities of the Ribs, ſerve to increaſe the Force of the ſame uniform Action. And the firſt Rib, being immoveable, ſerves for a fixed Point for the Motions of all the other Ribs; and each Rib in particular ſerves for a fixed Point for the Motion of that below it.

The Supra-coſtales are powerful Aſſiſtants to the Intercoſtals in their common Action, and are therefore very juſtly termed Levatores Coſtarum. *Winſlow's Anatomy.*

INTERCURRENS FEBRIS. An *Intercurrent Fever.*

Stationary Fevers are ſuch as ariſe from ſome particular Conſtitution of a particular Year, not yet ſufficiently known. Every one of theſe prevails in its Order, and rages with great Violence; having, as it were, the Aſcendant over all the reſt, during that continued Courſe of Years. But there are, alſo, other continued Fevers, which, tho' they ſometimes rage leſs, and, at other times, more ſeverely; yet, becauſe they are mixed with all kinds of ſtationary Fevers, and likewiſe with each other indifferently, in the ſame Year, I conceive they ſhould be called *Intercurrents:* Theſe are, the Scarlet Fever, Pleuriſy, Baſtard Peripneumony, Rheumatiſm, Eryſipelatous Fever, the Quinſey, and, perhaps, ſome others.

But as all theſe Diſeaſes are, during their State, or at leaſt were, accompanied with a Fever, till it went off, the febrile Matter being thrown upon ſome particular Part, according to the Nature of the Diſtemper, I queſtion not, that the Fever is to be accounted the primary Diſeaſe; and that the other Diſorders, whence the Names are derived, are Symptoms which principally regard either the peculiar Manner of the Criſis, or the Part moſt affected.

It muſt be obſerv'd, that, as the ſtationary Fevers prevailed more or leſs epidemically, according as they were favoured by the Conſtitution of Years, reſulting from a ſecret and inexplicable Temperature of the Air; ſo, likewiſe, did theſe Intercurrents ſometimes, but leſs frequently. For, tho' they generally ariſe from ſome particular Diſorder of particular Bodies, whereby the Blood and Juices are vitiated; yet ſometimes they proceed, mediately, from ſome general Cauſe in the Air, which, by its manifeſt Qualities, ſo diſpoſes the human Body, as to occaſion certain Faults of the Blood and Juices, which prove the immediate Cauſes of ſuch epidemic Intercurrents: Thus, when a ſharp Froſt of long Continuance, late in the Spring, is ſuddenly ſucceeded by warmer Weather, Pleuriſies, Quinſies, and the like Diſeaſes, uſually ariſe, whatever be the general Conſtitution of the Year. And becauſe theſe Diſeaſes, which happen indifferently in all Years, ſometimes rage as epidemically as thoſe which only happen in a certain ſucceſſive Courſe of Years, we chuſe to call them *Intercurrents*, in order to diſtinguiſh them.

Notwithſtanding the conſiderable Difference between theſe two Kinds of Fevers, with reſpect to the Cauſe proceeding from the Air; yet they frequently agree in other external and procatarctic Cauſes. For, not to mention Infection, which ſometimes communicates ſtationary Fevers; and Surfeits, which give Riſe to both ſtationary and intercurrent Fevers; the manifeſt external Cauſe of the greateſt Part of Fevers is to be aſcribed, either, 1. To leaving off Cloaths too early in the Spring; or, 2. To imprudently expoſing the Body to the Cold, after being heated with violent Exerciſe: Whence the Pores being ſuddenly cloſed, and the perſpirable Matter retain'd in the Body, ſuch a particular kind of Fever is raiſed in the Blood, as the then general Conſtitution, or the particular Depravity of the Juices, is moſt inclined to produce. And indeed I am of Opinion, that more have been deſtroy'd by this means, than by the Plague, Sword, or Famine together; for, if a Phyſician examines his Patient ſtrictly concerning the firſt Occaſion of the Diſeaſe, he will generally find it to proceed from one of theſe Cauſes; provided it is one of thoſe acute Diſeaſes we have treated of above.

But it muſt here be carefully remarked, that tho' the Diſeaſes I now treat of, under the Title of *Intercurrents*, were moſt, if not all of them, eſſential Diſeaſes; yet, frequently, certain Diſorders happen in ſtationary Fevers, reſembling theſe Intercurrents as to the Phenomena, and likewiſe characterized by the ſame Name, which, however, are manifeſt Symptoms of thoſe Fevers. In this Caſe, they are not to be treated by the Method which is to be uſed when they are eſſential Diſeaſes; but rather by that which the Fever requires, whereof they are now Symptoms, which Method is only to be ſlightly adapted to their particular Cure. Great Attention muſt be had to the Fever of the Year, and to find out the Method whereby it may be eaſieſt conquer'd, whether by Bleeding, Sweating, or any other Procedure. Should it be objected, that the Diſorders under Conſideration, which I term eſſential, are, in reality, only Symptoms. I reply, that perhaps they may be Symptoms, with reſpect to the Fever to which they properly belong; but they are at leaſt Symptoms of Fevers, which always neceſſarily produce them. Thus, in an eſſential Pleuriſy, the Fever is of ſuch a Nature as always to depoſite the morbific Matter upon the Pleura; in an eſſential Quinſey, of ſuch a Nature as to throw the morbific Matter upon the Throat; and ſo in the reſt. But, when any of the abovementioned Diſeaſes ſucceeds a Fever, which belongs to a particular Conſtitution of Years, and is dependent thereupon, it is then produced accidentally only, and no way neceſſarily; and, therefore, there is a remarkable Difference between them.

But, in order to diſtinguiſh rightly between eſſential and mere ſymptomatical Diſorders, it is of Moment to conſider, that the ſame Symptoms, which accompany any particular ſtationary Fever at the Beginning, will likewiſe happen at the ſame time, in a Pleuriſy or Quinſey, when theſe are only accidental Symptoms of ſuch a Fever. We had a Proof of this in the ſymptomatic Pleuriſy, ſucceeding the Fever, which prevailed in the Winter of 1675. For all that were ſeized with the Pleuriſy were afflicted, in the Beginning, with a Pain in the Head, Back, and Limbs; which were the moſt certain and common Symptoms of all thoſe Fevers which preceded the Pleuriſy, and continued after that Diſeaſe went off: Whereas, when either of theſe Intercurrents is the eſſential Diſeaſe, it attacks in the ſame manner in all Years indifferently, having nothing in common with the then prevailing ſtationary Fever. Beſides, the Symptoms, which afterwards ariſe, are more apparent, as not being concealed and perplexed, by a Mixture of other Phenomena of a different Nature, and belonging to another Fever. Again, the Time of the Year wherein the greater Part of eſſential Intercurrents uſually make their Appearance, frequently points out the Kind of Diſorders whereto they ſhould be refer'd: But, laſtly, he is beſt qualified to diſcover the diagnoſtic Signs, both of theſe, and all other Diſeaſes, who, by daily and diligent Obſervation, hath ſearched ſo intimately into their Phenomena, as, at firſt Sight, to be able to diſtinguiſh the Genus; though, perhaps, the characteriſtic Differences of ſome of them may be ſo very ſubtle, that he cannot expreſs them by Words to another.

But as theſe different Species of Fevers, ſo far as I can learn by carefully conſidering their Concomitants, and the Method of Cure, proceed from an Inflammation of the Blood peculiar to every Diſeaſe, I place the principal Part of the Cure in cooling the Blood. In the mean time, I endeavour univerſally to expel the morbific Matter, by a Method of Cure varied according to the Nature of the Diſeaſe, and which Experience ſhews to be readily curative of the particular Species thereof. And in reality, whoever is thoroughly acquainted with the Method of expelling the febrile Matter, whether by Bleeding, Sweating, Purging, or any other more proper Way, will have the beſt Succeſs in the Cure of all Fevers. *Sydenham.*

INTERCURRENS *Pulſus.* The ſame as PULSUS INTERCIDENS; which ſee.

INTERCUS. That Species of Dropſy, called *Anaſarca*, is ſometimes thus nam'd.

INTERDENTIUM. The Intervals betwixt the Teeth of the ſame Order.

INTERDIGITIUM. A Corn betwixt the Toes.

INTERFOEMINEUM. The PERINÆUM; which ſee.

INTERLUNIUS MORBUS. The Epilepſy.

INTERMISSIO. An Intermiſſion; that is, the Interval betwixt two Paroxyſms, or Fits of a Fever, or other Diſtemper.

INTERMITTENS *Febris.* An intermitting Fever. See PYRETOS.

INTERMITTENS *Pulſus.* An intermitting Pulſe. See PULSUS.

INTERNODIA. The Internodes, or Joints of the Fingers.

INTERNUNTII DIES. Critical Days.

INTERNUS. The Appellation of a Muſcle of the internal Ear. See AURIS.

INTEROSSEI MUSCULI.

Theſe are ſmall Muſcles lying between the Metacarpal Bones, and filling the three Interſtices left between them, both exteriorly, or towards the Back of the Hand; and interiorly, or towards the Palm of the Hand. From this Situation they have the Name

of *Interoſſei*, and have been divided into external and internal. They are commonly reckoned ſix in Number, three external, and three internal; Regard being had only to the fleſhy Maſſes in the Metacarpus, and to the ſix tendinous Inſertions in the Fingers: But, if we conſider the Compoſition of theſe Maſſes, their Number may be increaſed.

The external Interoſſei are ſtronger, more compound, and take up more Space between the Metacarpal Bones, than the internal: Each of them is made up of two Portions; one which appears almoſt on a Level with the Bones; the other hid, and which runs in upon the internal Muſcles.

The apparent Portion is, in ſome meaſure, penniform, being fixed along the Sides of two Bones, and, alſo, by a ſmall Extremity, to the neareſt Bone of the Carpus. The other Portion, which lies hid, appears more ſimple, and ſeems to be fixed only to the Baſes of the ſame two Bones.

Near the Heads of the Metacarpal Bones, theſe two Portions of each Muſcle end in broad flat Tendons, which, having reach'd the Side of the firſt Phalanx of one Finger, are afterwards united with the neareſt Portion of the Tendon of the Extenſor Communis. One Portion is likewiſe inſerted in the Phalanx itſelf, by ſmall ſhort Tendons. Theſe Muſcles may therefore be reckoned Bicipital; eſpecially when the Tendons of the two Portions unite.

The firſt two external Interoſſei are, for the moſt part, inſerted in the middle Finger: They fill the Interſtices between the three firſt Metacarpal Bones, and ſurround the middle Bone all the Way to the Hollow of the Hand: Their Tendons are fixed in both Sides of the firſt Phalanx, and in both Sides of the ſecond Tendon of the Extenſor Communis.

The third external Interoſſeus lies in the Interſtice between the two laſt Metacarpal Bones, and is moſt commonly inſerted in the ring Finger; its Tendon being fixed in that Side of the firſt Phalanx fartheſt from the Thumb, and in the correſponding Edge of the third Tendon of the Extenſor Communis. The fleſhy Body of this Muſcle runs in between the two Bones, toward the Hollow of the Hand.

The internal Interoſſei are more ſimple than the former, and do not lie ſo much between the Bones. The Tendon of the firſt is inſerted in the Side of the firſt Phalanx of the fore Finger, next the little Finger, and in the correſponding Edge of the Extenſor Communis. The Tendon of the ſecond goes in the ſame manner to the Side of the ring Finger, next the Thumb; and the third, to the ſame Side of the little Finger.

There are, therefore, two external Interoſſei for the middle Finger, one for the ring Finger, but none for the fore and little Finger. The middle Finger has no internal Interroſſeus; but the Index, ring Finger, and little Finger, have each of them one.

The external Interoſſei appear ſometimes to be really double, the two Muſcles being ſeparated by a pinguious Line; ſo that in ſome Subjects we have ſix internal Interoſſei. But the fleſhy Portions, on each Side of the ſecond Metacarpal Bone, belong to the two firſt external Muſcles; and the fleſhy Portion, on the Side of the fourth Metacarpal Bone, next the Thumb, belong to the third external Interoſſeus.

The Interoſſei may have two different Uſes, according to their different Inſertions, and the different Situations of the Fingers in which they are inſerted.

In general, they aſſiſt the Extenſor Communis by their Inſertions in the lateral Angles of the rhomboidal Fiſſures; for thereby they act like lateral Ropes, which, together with the Tendons of the Extenſor, ſerve to extend the third Phalanx of each Finger.

By the ſame lateral Inſertions they perform the lateral Motions of the Fingers, that is, they preſs them all cloſe againſt each other, but do not ſeparate them all, nor move each Finger in particular towards or from the Thumb. In a general Separation of all the Fingers, the Interoſſei move only the middle and ring Fngers; the Index and little Finger being ſeparated by other Muſcles. In the Motion of the Fingers toward the Thumb, which is termed Adduction, they act only on three Fingers, the middle, ring, and little Fingers. In the contrary Motion or Abduction of the Fingers, they move alſo three, which are, the Index, middle, and ring Fingers.

The Uſes of the Interoſſei in particular, whether external or internal, may be different in different Subjects, according to the Variety of their Inſertions; and, therefore, in living Bodies, nothing can be determined about them.

According to the Situation in which I have deſcribed them, the firſt and ſecond external Interoſſei perform alternately the Adduction and Abduction of the middle Finger; the third performs the Abduction of the ring Fnger, that is, moves it toward the little Finger.

The firſt internal Interoſſeus makes the Abduction of the Index, or moves it toward the middle Finger; the ſecond makes the Adduction of the ring Finger, by moving it, alſo, toward the middle Finger; and the third performs the Adduction of the little Finger, or moves it toward the middle Finger. *Winſlow's Anatomy.*

The Interossei of the Foot.

Theſe are ſeven ſmall Muſcles, which fill up the four Interſtices between the Metatarſal Bones, much after the ſame Manner as in the Hand. The four largeſt are ſuperior, the other three inferior. The common Diviſion of them into external and internal is very improper.

The firſt of the ſuperior Muſcles is fixed poſteriorly by fleſhy Fibres, in the Ligament which connects the Baſis of the two firſt Metatarſal Bones; in the Outſide of the firſt Bone, and in the upper Part of the Inſide of the ſecond. It ends in a ſmall Tendon, which is inſerted in the Inſide of the firſt Phalanx of the ſecond Toe.

The other three are fixed by fleſhy Fibres, in the inner and upper Parts of the laſt three Metatarſal Bones, and in the outer and upper Parts of the ſecond, third, and fourth Bones. They, alſo, end in Tendons, which are inſerted in the Outſides of the firſt Phalanges of the ſecond, third, and fourth Toes.

The three inferior Muſcles are fixed proportionably by fleſhy Fibres to the lower Parts of theſe Bones, principally to the third, fourth, and fifth, and to the Ligaments belonging to their Baſes. The firſt inferior Interoſſeus is likewiſe fixed by ſome Fibres to the Tendon of the Peronæus Maximus. The Tendons of theſe three Muſcles are inſerted in the Inſides of the Baſes of the firſt Phalanges of the laſt three Toes.

The Interoſſei of the Foot have the ſame Uſes as of the Hand. The firſt ſuperior Muſcle brings the ſecond Toe near the great Toe; the other three bring the ſecond, third, and fourth Toes, near the little Toe. The three inferior Muſcles move the laſt three Toes toward the other two. I here ſpeak according to the Situation which I have moſt frequently obſerved; but, as that Situation varies, the Uſes muſt likewiſe be different. *Winſlow's Anatomy.*

INTERPASSARE, in Medicine, is to quilt a Bag fill'd with medicinal Ingredients, in order to their equal Diſtribution.

INTERPELLATUS *Morbus*, in *Paracelſus*, is a Diſeaſe which is attended with irregular, or uncertain Paroxyſms.

INTERPOLATUS *Dies*, in *Paracelſus*, is a Day free from a febrile Paroxyſm; or a Day interpolated betwixt two Paroxyſms.

INTERSCAPULARIA. The Cavities betwixt the *Scapulæ* and *Vertebræ*. *Blancard.*

INTERSCAPULIUM. The Spine of the *Scapula*.

INTERSEPTUM. The Uvula, and the Septum Narium, are thus call'd.

INTERSPINALES COLLI, certain Muſcles of the Neck, call'd by *Winſlow*, *Spinales Colli Minores*.

Theſe Muſcles lie between the ſix ſpinal Apophyſes of the Neck, and between the laſt of the Neck and firſt of the Back; being inſerted in theſe Apophyſes by both Extremities on one Side of the poſterior cervical Ligament, which parts them from thoſe on the other Side.

The Inter-ſpinales are Aſſiſtants to the Semi-ſpinales in their mutual Action, and may, alſo, ſerve to bring back the Neck to its natural Situation, after ſmall Motions of Rotation. *Winſlow.*

INTERSTINCTUS. Diſtinct, relative to the Small-pox.

INTER-TRANSVERSALES *Muſculi*, called by *Winſlow* *Tranſverſales Colli Minores*.

Theſe are very ſmall ſhort Muſcles, found in the Interſtices of ſeveral tranſverſe Apophyſes, in which they are inſerted. *Winſlow.*

Their Uſe is to approximate theſe tranſverſe Apophyſes.

INTERTRIGO. A Galling. Gallings produced by the Wringing or Attrition of uneaſy Shoes are mollified and kept from Swelling by the Application of the Lungs of a Swine, or a Lamb, warm, to the grieved Part. Effectual to the ſame Purpoſe is the Powder of a burnt old Shoe, ſprinkled on the Place; or raw Wool, or the Flowers of the Garden Pomegranate, each of them burnt, and the Aſhes ſprinkled thereon; or *Acaſia* rubbed on the galled Part with Vinegar. To thoſe who have tender Fleſh apply the *Emplaſtrum ex Hordeo*. For Gallings, Burns, and Eruptions of Papulæ, a moſt excellent Plaiſter is prepared of three Ounces of Litharge, four Ounces of Wax, one Ounce of recent Swines Fat, and a Pound of Oil of Myrtle: To induce a Cicatrix, omit the Fat in the Preſcription. *Aetius, Tetrab. 4. Serm. Cap. 67.*

Balauſtines are much commended by *Oribaſius* for ſpeedily cicatrizing Gallings and old Ulcers: The Bark of the Pine-tree, alſo, is ſaid by the ſame Author to be excellent for Gallings, being applied to the Place.

Intertrigo takes its Name, according to *Varro de Lingua Latina, Lib. 4. ab eo quod duo inter ſe trita. Rhodii Lexicon Scriberianum.*

Children are ſubject to Inflammations and Excoriations, in ſeveral Parts of their Bodies, particularly behind the Ears, in the Neck and Thighs. Thoſe on the lower Parts uſually proceed from the Acrimony of the Urine, which ſometimes frets off the Epidermis, and leaves the Cutis bare. The Cure may be accompliſhed by waſhing the Parts gently with warm Water, twice or thrice a Day, which diſſolves and drinks up the acrimonious Salts

of

of the Urine lodged therein. Nurſes uſually diſſolve a little Fullers Earth in the Water, and apply it to the Part, after it has been well waſhed. Finely powdered Ceruſe, Chalk, or calcined Slate, will, alſo, ſerve for the ſame Purpoſe. But where the Inflammation and Excoriation are conſiderable, 'tis proper to uſe, by way of Fomentation, a Solution of Trochiſci albi Rhaſis in Plantain-water, twice or thrice a Day. In the mean time the Parts ſhould, by all means, be kept dry, or prevented from rubbing one againſt another by the Interpoſition of fine Linen Rags, or the Uſe of a little red deſiccative Ointment or Diapompholygos ſpread thin upon it.

INTERVALLUM. An Interval betwixt two Paroxyſms of a Diſtemper; or betwixt two Pulſations of the Artery.

INTERVERTEBRALES *Muſculi*.

They ariſe from the Body of one Vertebra laterally, and are inſerted, after an oblique Progreſs, into the back Part of the other Vertebra immediately above it.

Their Uſe is to draw the Bodies of the Vertebræ nearer one another, and a little to one Side. *Douglas*.

INTESTINA TERRÆ. Earth-worms.

INTESTINA. The Inteſtines. See COELIA.

As I have generally conſider'd the Stomach and Inteſtines together as one continued Canal, I ſhall, in this Place, give an Account of the Inflammations to which they are ſubject. And firſt of the Stomach.

This Organ, like all other Parts of the Body, may be ſeized with a true Inflammation, the Signs and Effects of which are generally theſe following: A burning, fix'd, and pungent Pain in the Stomach; an Exacerbation of this Pain, at the very time any thing is taken into the Stomach; a painful Vomiting immediately after Eating or Drinking, accompany'd with a tormenting Hiccup; a violent and perpetual Uneaſineſs about the Præcordia; and an acute continual Fever. The Cauſes of this Diſorder are either general Inflammations, the Contiguity of the Stomach to the other Parts inflam'd, or the taking acrid Subſtances into the Stomach.

An Inflammation of the Stomach generally ſoon proves mortal, unleſs expeditiouſly cured, in conſequence of the Injury done to the important Function of this Part, and the incredible Number of Nerves connected with it.

Like other Inflammations, it terminates either in Health, in ſuppuratory, ſcirrhous, cancerous, or gangrenous Diſorders, or in the ſudden Death of the Patient, accelerated by Convulſions.

As ſoon as this Diſorder is, from its Signs before enumerated, known to be preſent, we are forthwith, and with the greateſt Care, to uſe liberal Veneſection, which is to be repeated as Neceſſity requires, highly mild, nutritive, emollient and antiphlogiſtic Liquors, of a Quality oppoſite to the Cauſe of the Diſorder; as, alſo, Clyſters and Fomentations of a like Nature. But all acrid Subſtances, and eſpecially Vomits, are carefully to be abſtain'd from.

A mild and lenitive DRINK.

Take of the recent Leaves of Wood-ſorrel, three Ounces; of the Leaves of Mallows, an Handful and an half; of entire Oats, an Ounce; Boil with a ſufficient Quantity of Whey; to every twelve Ounces of which add two Yolks of Eggs, and one Ounce of the Rob of Currants.

A CLYSTER.

Take of the recent Leaves of Endive, Succory, Fumitory, Mallows, and Marſhmallows, each an Handful: Boil with Whey, and, after expreſſing the Decoction, uſe ten Ounces of it for a Clyſter, twice or thrice a Day.

If an Inflammation of the Stomach terminates in a Suppuration, many ſeemingly ſurpriſing Misfortunes enſue; but eſpecially a Nauſea, Vomiting, and Pain, which, when their Cauſe is unknown, are rarely cur'd; but when it is known, they are to be treated in the ſame manner with Abſceſſes.

When an Inflammation of the Stomach produces a Scirrhus, or a Cancer, it then excites exceſſive Vomitings, and intolerable Pains, which are heightened and protracted by taking the leaſt thing into the Stomach, of a fixed Nature, and augmented by all acrid Medicines.

By mild and lenient Medicines alone, this Species of the Diſorder may be alleviated, but rarely cured. Medicinal Waters are, however, in this Caſe, the moſt efficacious Means of Relief.

From what has been ſaid above, and under the Article HEPAR, the Origin, Nature, Effect, Knowledge, Prognoſtic, Cure, and palliative Cure of Inflammations, Suppurations, Gangrenes, Scirrhuſes, and Cancers, of the Spleen, Pancreas, and Omentum, may be deduced.

INFLAMMATIONS OF THE INTESTINES.

Not only the Stomach, but alſo the Inteſtines, eſpecially ſmall ones, are often ſubject to an acute Inflammation in their Membranes. This Misfortune is produced by the common Cauſes of an Inflammation, convey'd to the Inteſtines; either, for Inſtance, by the acrid Matter of Liquors drank, of Aliments, Spices and Pickles, Medicines, or Poiſons, taken into the Stomach, convey'd thence into the Inteſtines, and there retain'd in their valvulous Folds. This Misfortune may, alſo, be produced by an acrid, putrid, fetid, purulent, ichorous, gangrenous, bilious, or atrabilious Matter convey'd from the Oeſophagus, Stomach, Liver, Spleen, Pancreas, and Omentum, to the Inteſtines, where it remains and corrodes them. And, laſtly, an Inflammation of the Inteſtines may be produced by violent previous Convulſions, which create Flatulences, ſtop the Motion of the Fluids, and by that means produce an Inflammation.

This Diſorder contracts the Inteſtines, cloſes up their Cavities, prevents the Paſſage of what is convey'd to them, produces highly acute, burning, and fixed Pains; excites violent Convulſions, when the inflam'd Part is irritated by the Things convey'd to it; renders the Patient coſtive; excites a Vomiting of the Aliments, and of Things convey'd to the affected Part, ſooner or later, according as the Inflammation is near the ſuperior, or inferior Parts of the Inteſtines; produces painful Flatulences, acute Gripes accompanied with Rumblings, the Iliac Paſſion, that Diſorder call'd Volvulus, an Abſceſs, a Gangrene, a Scirrhus, a Cancer, a highly acute Fever, exceſſive Weakneſs, in conſequence of the intenſe Pain, and ſudden Death.

So long as the Diſorder continues in its inflammatory State, it is, by the Ignorant and Unſkilful, taken for a Twiſting of the Inteſtines; and being, through a dangerous Miſtake, aſcribed to Cold, Flatulences, and Wind, is for that Reaſon treated with hot Medicines, a Practice which proves fatal to the Patient.

But a genuine Inflammation of the Inteſtines is known from its concomitant continual acute Fever, intenſe Thirſt, exceſſive Heat, a hard Pulſe, a burning Pain, high-coloured Urine, and the Induction of a ſudden Weakneſs.

When an Inflammation ſeizes the Flexure of the Colon, the Diſorder reſembles the Colic; but, if it ſeizes the Extremity of the *Inteſtinum Rectum*, it is generally taken for the blind Hæmorrhoids; in which Caſe, its moſt happy Termination is by a mild, bloody, and bilious Dyſentery.

As ſoon as an Inflammation of the Inteſtines is known to be preſent, from the Signs before enumerated, we are, in its firſt Stage, with the greateſt Expedition, to attempt its Cure; which is to be obtain'd, firſt, by liberal and repeated Veneſection, as in a Pleuriſy; ſecondly, by the careful Injection of laxative, diluting and antiphlogiſtic Clyſters, repeated three, four, or more times a Day; thirdly, by the frequent drinking of Liquors of a laxative, diluting, and antiphlogiſtic Nature, with a prudent Addition of Opium, and ſuch Things as are oppoſite to the particular known Cauſe of the Diſorder; fourthly, by Fomentations prepared of Subſtances of like Qualities apply'd to the whole Abdomen, and eſpecially Fomentations conſiſting of young, vigorous, and ſound Animals; fifthly, by carefully abſtaining from all kinds of Drink, Aliments, or Medicines which are of an acrid, hot Nature, or capable of increaſing the Impetus of the Fluids; as, alſo, by avoiding Exerciſe, and the Exorbitancies of the Paſſions; and, ſixthly, by perſiſting in the Uſe of theſe Things, till the entire Diſorder is remov'd, and does not return in three Days.

If this Diſeaſe is not cured by proper Remedies, and continues to rage with Violence longer than three Days, the Pain, Heat, and Diſtraction, are ſucceeded by a Shivering thro' the whole Body, without any apparent Cauſe, and by an obtuſe Pain, with a Senſation of Weight in the Part affected; theſe are Signs, that an Abſceſs is forming in it: Within fourteen Days after, the Abſceſs breaking, the Pus will be diſcharg'd: If this Pus is diſcharg'd into the Cavities of the Abdomen, it produces many Diſorders ſimilar to thoſe ariſing from a Diſcharge of Pus from the Liver, and mention'd under the Article HEPAR: But, if this Pus is diſcharg'd into the Cavities of the Inteſtines, it produces a purulent Dyſentery, ſmall or great, ſhort or long, according to the Nature of the Ulcer form'd. In this Caſe, entire Membranes of the Inteſtines are frequently diſcharg'd, and a Conſumption is often brought on.

As ſoon as an Inflammation of the Inteſtines is known to be preſent, all ſuch Aliments are carefully to be abſtain'd from, as are capable of generating a large Quantity of hard and thick Fæces: The Patient is only to be nouriſh'd with Broths boiled with gently detergent Roots; balſamic detergent Decoctions are to be copiouſly drank, and injected by way of Clyſters; or Medicinal Waters are to be copiouſly drank, and their Uſe perſiſted in till a perfect Cure is brought about.

The ALIMENT *to be uſed in this Diſorder.*

Take of the Roots of Viper's-graſs, Goat's-beard, Skirret, Parſley, and Succory, each two Ounces: Boil in Fleſh-broth, and, with every thirty Ounces of the Broth, mix two Yolks of Eggs, and a ſufficient Quantity of Salt.

A DECOCTION.

Take of the Roots of Garden Valerian, two Ounces; of the Leaves of Lovage, two Handfuls; of the Flowers of Saint John's-wort, one Handful; and of the Flowers of Agrimony, two Ounces: Boil with two Pints of Water; of which let the Patient drink two Ounces every Hour. This Decoction is alſo to be uſed as a Clyſter.

If the Diſeaſe proceeds from highly violent Cauſes, and ſuch as are productive of terrible Symptoms in the inflam'd Part, a Gangrene may be eaſily produced, which will at laſt prove mortal.

From the Violence of the Cauſes, and the terrible Nature of the Symptoms, we may eaſily foreſee, that a Gangrene will happen, if the Signs of a benign Reſolution and Cure do not, at the ſame time, appear.

That a Gangrene is forming, may be known, not only from the Circumſtances mentioned in the preceding Paragraph, but, alſo, from the ſudden Remiſſion of the intenſe Pain, without any apparent Cauſe; a weak and intermittent Pulſe; a Dyſentery, in which the Matter diſcharg'd is fetid, cineritious, ichorous, livid, or black; an inſenſible Evacuation of the Fæces; and, ſoon after, a calm and gentle Death.

The Diſorder, when attended with the laſt-mentioned Train of Symptoms, is rarely to be cured; but ought to have been ſo before theſe appeared: But the only beneficial Meaſures which can be taken, are, that the Patient ſhould abſtain from all Aliments capable of producing a large Quantity of hard, acrid, and thick Fæces; that he ſhould be nouriſh'd with Broths, in which gently detergent Roots are boil'd, drink large Quantities of balſamic and detergent Decoctions, have the ſame injected by way of Clyſter, and uſe large Quantities of Medicinal Waters.

But if the Part inflam'd is glandular, the Heat intenſe, the impacted Matter thick, the Emunctories of the Glands obſtructed, and their Follicules and Sides diſtended, a Scirrhus ariſes, which is a very different Diſorder from the preceding; and muſt be clearly and certainly known and diſtinguiſh'd.

If, therefore, an Inflammation in the ſmall Inteſtines, with the Conditions mentioned under the Article INFLAMMATIO, as neceſſary to form a Scirrhus, is of long ſtanding, but does not riſe to the greateſt Height; and, being neither cured by Reſolution, proper Medicines, nor Suppuration, leaves in the Part affected, a Stupor, a Senſe of Weight, and a conſtant Diſtraction, we have juſt Ground to ſuſpect, that a Scirrhus is forming there.

If this Scirrhus follows its general Nature, and produces its ordinary Effects already mentioned, in this Part, many violent and obſtinate Diſorders enſue, ſuch as Stupor, Weight, and Increaſe of Bulk, all which are daily augmented: Hence proceeds a Leſſening of the Cavity of the Inteſtines; a Stagnation of the Fæces and Chyle in them, and their Action on the reſiſting Parts; the Matter, in the mean time, becoming highly putrid by its Continuance. Hence ariſe an Obſtruction and Intortion of the Inteſtines, and the conſequent Detention of the Fæces; the Iliac Paſſion; that Diſorder called Volvulus, or a Dyſentery of a drier Species, produced by an acrid irritating Matter; Convulſions; Hiccup; Vomiting; continual Pain; a Fever; Extenuation; an Atrophy; and, at laſt, Death.

Medicines of whatever Kind are of little Efficacy in this Species of the Diſorder: Let the Patient, however, abſtain from all ſuch Aliments as generate large Quantities of thick and hard Fæces, and feed only upon Broths, in which detergent Roots are boil'd: He muſt, alſo, drink large Quantities of balſamic and detergent Decoctions; which are, alſo, to be injected by way of Clyſters. Medicinal Waters are, alſo, to be liberally uſed. By theſe means the Diſorder may be long protracted without any great Degree of Inconvenience.

But if the Scirrhus, generated in this Part, is join'd with the Cauſes capable of producing a Cancer, and is known by the Signs enumerated under the Article CARCINOMA, then the State of the Patient is highly miſerable, and incurable; and may be underſtood from what is ſaid under that Article, compared with the Nature, Function, and nervous Texture, of the Inteſtines. And the Patient is, in a particular manner, afflicted with an highly acrid, continual, and obſtinate Dyſentery, which burns, corrodes, and conſumes all the Parts it touches; and is attended with violent Convulſions, and intolerable Pains of a fixed and laſting Nature, till, at laſt, Death puts an End to the Patient's Misfortune.

When the Preſence of a Scirrhus is known by the Signs enumerated under that Article, great Caution is requiſite, and it is to be treated in the manner already directed. But if, in order to remove it, acrid Subſtances are us'd, eſpecially draſtic Purgatives, a Cancer is produced, and rages with uncommon Violence. In this Caſe the Drink is to conſiſt only of recent Whey; and the Patient is to be nouriſh'd only with Broths prepar'd of farinaceous Subſtances alone, or Fleſh, together with the Yolks of Eggs. Mild Clyſters, conſiſting only of a Decoction of Linſeed, Leaves of Nightſhade, or white Poppy-heads, are to be injected. Then Medicines highly demulcent, anodyne, gently narcotic, and not eaſily convertible into an acrid Nature, are to be exhibited.

From what has been ſaid, it is ſufficiently obvious, why, in Practice, ſo violent, fixed, obſtinate, intolerable, and inſurmountable Pains are perceiv'd in the Oeſophagus, the Mouth of the Stomach, the Liver, the Spleen, the Pancreas, the Ilium, and the Colon; as, alſo, how various and ſurpriſing a Diſorder a Dyſentery is in every reſpect; how improperly and unjuſtly, in Diſorders of this kind, a certain hectic Acrimony of the Humours is accus'd, and prejudicial Medicines exhibited, in order to remove this ſuppoſed Acrimony; how great Caution is requiſite in exhibiting Purgatives, in exceſſive Pains of theſe Parts; what is the Nature of that incurable Hypercatharſis, which, in ſome Patients, frequently ſucceeds the Exhibition of Purgatives; how various Remedies and Meaſures are requiſite to the Cure of Dyſenteries; how vain, fallacious, and deſtructive it is, to preſcribe one Medicine, as proper in all their various Conditions and Natures; or, in general, one univerſal Method of Cure.

INTORTUS. Writhed, twiſted. *Scribonius Largus*, *N.* 43. directs Vaporation of the Parotides, with fervent Sea-water, by means of recent Sponges dipt therein, and expreſs'd *per Linteum intortum*, through a twiſted Linen Cloth, for the greater Force. *Celſus*, *Lib.* 5. *Cap.* 28. for a Callus in a Fiſtula, directs us to introduce *Papyrum intortum*, a twiſted Piece of Papyrus, anointed over with ſome Cauſtic. *Intortæ Venæ & conglomeratæ*, in the ſame Author, *Lib.* 7. *Cap.* 18. are Veins twiſted or ſhriv'el'd up, and conglomerated in a Cirſocele.

INTOXICATIO, from *Toxicum*, τοξικὸν, Poiſon, Venom, is properly the ſame as INFECTIO. *Paracelſus*, *Lib.* 1. *de Peſte*, reſtrains *Intoxicatio* to the external Poiſoning of Wounds and Abſceſſes. It is generally now us'd in a topical Senſe for *Inebriatio*, Inebriation. See ALCOHOL.

INTRICATUS. An Epithet of a Muſcle. See BICAUDALIS.

INTRITUM, τρῖμμα, τρῖμμα, ὑπότριμμα, a culinary Word, ſignifying a ſort of minced Meat, ſo call'd *ab interendo*, from rubbing or grating. *Intrita*, according to *Pliny*, is Food prepar'd by rubbing or grating. *Donatus* ſays, it is properly *Mortarium alliatum*. *Intrita* and *Intritum*, in *Martial*, ſignifies Meats prepared by pounding in a Mortar; for which the Moderns uſe *contuſum*. *Celſus* uſes *Intrita* in the ſame Senſe; as do *Varro*, alſo, and *Columella*. *Rhodii Lexicon Scribonianum*.

INTROSUSCEPTIO, INTUSSUSCEPTIO. Introſuſception is a preternatural Ingreſs of one Portion of an Inteſtine into another, or a Reduplication of the Inteſtine. See ILIACA PASSIO.

INTSIA. The Name of a very large evergreen Tree, which grows in *Malabar*, call'd, alſo, *Acacia Malabarica Globoſa*. The Juice of the Leaves, and of the Bark, taken with a little Salt, mitigates Pains of the Belly: And the Bark, pulverized, and ſprinkled upon Ulcers, is ſaid to eaſe the Pains thereof. *Raii Hiſt. Plant.*

INTYBUS. A Name for the *Cichoreum*; *latifolium*: *ſive Endivia vulgaris*: For the *Hedypnois*; *annua*: For the *Hyoſeris*; *anguſtifolia*: And for the *Lampſana*.

INVERECUNDUM OS. The Os Frontis.

INVIDIA. Envy. This is eſteem'd a Cauſe of Diſeaſes by ſome Phyſicians, particularly of an Atrophy; and produces its Effect like all other Species of Sorrow.

INUNCTIO. Inunction. This imports either the Action of anointing, or the Materials with which a Part is anointed.

INVOLVULUS. The Name of a Worm found upon Vine-leaves.

INUSTORIA are Cauteries.

IOBOLOS. An Epithet for thoſe kinds of venomous Animals, which dart out their Poiſons.

IODES, ἰώδης, from ἰὸς, Ærugo, Verdegriſe. Æruginous, or of the Colour of Verdegriſe. It is frequently us'd as an Epithet for the Matter diſcharg'd by Vomit, in *Hippocrates*.

JOHUALXOCHITL. See COLCAQUAHUITL.

JOLLÆ COMPOSITIO. The Name of an Eſcharotic deſcrib'd by *Celſus*, *Lib.* 5. *Cap.* 22.

ION, ἰον. The Violet.

JONDRABA. A Name for the *Thlaſpidium*; *apalum*; *ſpicatum*.

IONIA. The *Athenian* Name for the Chamæpitys, according to *Paulus Ægineta*, *Lib.* 5. *Cap.* 45.

IONTHLASPI.

The Characters are;

It hath a Flower, conſiſting of four Leaves, which are placed in form of a Croſs; out of whoſe Flower-cup riſes the Pointal, which afterwards becomes a Fruit, which is flat, round, and ſhap'd like a Buckler, having but one Cell, in which is contain'd a flat round Seed.

Boerhaave mentions two Species of this Plant; which are,

1. Ionthlaſpi; minimum; ſpicatum; lunatum. *Col. p.* 1. 284.

2. Ionthlaſpi; luteo flore; incanum, montanum; *Prodromus*. *Col. p.* 1. 280.

Beſides the two foregoing Species of Ionthlaſpi, *Miller* mentions a third; which is,

Ionthlaſpi orientale, fructu echinato. *Tourn. Cor.*

The firſt Sort is found in Plenty upon the Mountains near the *Tiber*. The ſecond Sort grows wild about *Montpelier*; as alſo in the Fields near *Niſmes*, and other Places in the South of *France*; alſo in *Spain* and *Italy*. But the third Sort was diſcovered by Dr. *Tournefort* in the *Levant*, from whence he ſent the Seeds to the Royal Garden at *Paris*. *Miller's Dict. Vol.* 2.

The

The two firſt are eſteem'd deterſive, aperitive, and vulnerary.

IONTHOS, ἰωνθος. An hard and ſmall Pimple in the Face, call'd by the *Latins Varus*. See EPHELIS, FURUNCULUS, and VARUS.

IOS, ἰὸς. Ærugo, Verdegriſe.

IOSACCAR, ἰοσάκχαρ. Sugar of Violets.

IOTACISMUS. A Defect in the Tongue, or Organs of Speech, which renders a Perſon incapable of pronouncing certain Letters.

IOUI. This is an alimentary and reſtorative Liquor, prepar'd in *Japan*, and capable of being preſerv'd ten or a dozen Years. It is fluid like Broth, aqueous, black, of an agreeable Smell, and good Taſte, ſalt, and ſavoury. With reſpect to the Manner of preparing it, no more is known, than that it is made of the Gravy of Beef, expreſs'd when half-roaſted: The *Japoneſe* keep the reſt a Secret, and ſell it very dear. This Liquor is very rare in *Europe*: Some, however, is imported either on account of Curioſity or Luxury. It is thought to be a Reſtorative after Diſeaſes, and, on this Account, is eſteem'd greatly all over the Eaſt.

JOVIS BARBA, or BARBA JOVIS.

The Characters, according to *Miller*, are;

It hath pennated or wing'd Leaves; the Flowers are papilionaceous, and are ſucceeded by ſhort oval Pods, in which is, for the moſt part, contain'd one roundiſh Seed.

Boerhaave mentions five Species of this Plant; which are,

1. Barba Jovis. *C. B.* 397. *Barba Jovis pulchre lucens.* J. B. 1. 11.

2. Barba Jovis; Africana; foliis viridibus pinnatis; flore cœruleo.

3. Barba Jovis; Hiſpanica; incana; flore luteo. *T.* 651.

4. Barba Jovis; Lagopoides; Cretica; fruteſcens; incana; flore ſpicato, purpureo, amplo. *Breyn. Prodr.* 2.

This Plant is of ſome kin to the *Herba Paris*, but differs from it, in that it has more Leaves, ſix, ſeven, and ſometimes eight, which are of a dark Green above, and lighter underneath, full of tranſverſe Veins; from among theſe riſes one Stalk, bearing on the Top ſeveral five-leav'd white Flowers, growing together in a Cluſter, each of which is ſucceeded by a dark-brown Berry, as big as a ſmall Cherry. The Root, when dry, is about as thick as a Gooſe-quill, appearing wrinkled, and as it were geniculated and knotty, of a brown Colour on the Outſide, conſiſting, principally, of what we may call the cortical Part of the Root, and having but a ſmall whitiſh Pith; it is of a bitteriſh Taſte, and ſomewhat earthy Smell. It grows in *Baſil*, in moiſt, ſhady Woods. *Miller's Bot. Off.*

We have three Kinds of Ipecacuanha, the Grey, or Aſh-colour'd, the Brown, and the White; which laſt, called alſo *Pſeudipecacuanha*, M. *Tournefort* diſcovered to have no Virtue, and is, perhaps, that Kind mentioned by *Piſo*; ſo that, properly ſpeaking, we have only two Kinds of Ipecacuanha, that of *Braſil*, and that of *Peru*, called *Bexuguillo*. The Plant which produces this latter ſort is unknown; and the Root itſelf was not known in *France* till the Year 1672. One M. *Le Gras*, who was not a Phyſician, brought it firſt over, and gave it to M. *Craquenel*, an Apothecary; but it ſucceeded very ill in his Hands, he having given it in the Quantity of two Drams for a Doſe, which was too great. In 1687. Mr. *Garnier* attempted to re-eſtabliſh its Credit; in order to which he applied to the elder *Helvetius*, who made ſeveral ſucceſsful Trials of it. After which the King purchaſed, of *Helvetius*, the Secret, and Manner of giving it, and made it known to all the World; and it was afterwards of great Service in the Armies and Hoſpitals. *Geoffroy.*

Dr. *James Douglas* in the *Philoſophical Tranſactions*, takes notice of the following ſorts of *Ipecacuanha.*

The firſt general Diviſion of theſe Roots, ſays he, muſt be into true and falſe; and each of theſe may be again ſubdivided into ſeveral Species, the diſtinctive Note of which is principally taken from their Colour.

Of the true Ipecacuanha I have four Kinds, Black, Brown, Grey, and White; but I cannot pretend to determine whether they belong to different Plants, or are only Varieties of the ſame Plant, owing to the Soil in which they grow, as is affirmed by Sir *Hans Sloane*. And as theſe Roots are never imported to us entire, it is impoſſible to give any certain Deſcription of them in that State.

However, by comparing the ſeveral dried Pieces, as we have them, we may very probably conjecture, that a ſhort radical Trunk deſcends from a *Caulis*, and is afterwards divided into ſeveral large Branches; and theſe again into ſmaller ones, in different Series with minute Filaments, or Fibrillæ, going out from them.

Each Piece is made up of an outer or cortical Part, and an inner or fibrous one, which, like a white Nerve, or ſmooth compact Faſciculus of woody Filaments, runs through the Centre or Axis, of the Roots; and, perhaps, incloſes within it a ſmall Pith, which, however, is hardly diſcernible by the naked Eye.

The cortical Part is corrugated by two ſorts of Wrinkles, one ſuperficial, conſiſting either of circular Rings, or little Knots, which do not go quite round; the other penetrating into its Subſtance, being deep Inciſures, or Fiſſures, reaching all the Way to the Nerve.

What Lengths theſe Roots are of, when taken out of the Ground, cannot be determined: I have met with ſome Pieces above nine Inches, many above ſix, but the greateſt Number is ſtill ſhorter.

We find them bent, writhed, and contorted into all manner of Figures; and, indeed, few Pieces are altogether ſtraight for any conſiderable Length.

What has been hitherto ſaid, agrees to all the true Ipecacuanha-roots; but ſever. l other things are ſtill to be taken notice of, in which they differ.

The Black Sort is the ſmalleſt of the four, very hard, and the Fiſſures wide and numerous. The outward Colour of the Cortex is not equally black, in all the Pieces of this Kind; and its inner Subſtance, as well as the Nerve, is moſtly white, tho' not always in the ſame Degree,

The Brown Sort is larger than the Black, the Fiſſures at larger Diſtances, the inner Subſtance of the Cortex darker, and the external Colour has ſeveral Degrees of Redneſs in the ſeveral Pieces. The third, or Grey Sort, is ſometimes found of a darker, ſometimes of a lighter Colour; and the inner Subſtance of the Cortex is Brown, ſtreaked with White. It is much larger than the Black Sort, many Pieces being above one-fourth of an Inch in Diameter, but the Nerve is ſmall in proportion to the cortical Part. I have met with few Pieces of this Species above five Inches in Length; but, as I have already obſerved, nothing can be concluded from thence as to the Length of the whole Roots. The Fiſſures are here ſtill fewer than in the Brown Sort, and in ſome Pieces ſcarce any are to be met with. The ſuperficial Corrugations are various in different Roots, ſome being almoſt wholly ſmooth, and in others the Wrinkles rather longitudinal than circular.

The White Kind, as far as I can judge, by the ſmall Sample which I have of it, is of very different Sizes, ſome Pieces of it being larger than any of the Grey Sort, and the reſt much leſs. The whitiſh Colour of the Cortex has a yelloviſh Caſt, and the nervous Part is very large, in proportion to the reſt. Very few Fiſſures are to be obſerved therein, and hardly any reach ſo deep as the Nerve. The other Corrugations are, likewiſe, very ſhallow, and moſt of them longitudinal; but it ſeems to be more knotty than the other Kinds, and theſe Knots I take to be owing principally to the Fibrillæ, which go out from the larger Branches of the Roots.

The Places of Growth of theſe different Species of Ipecacuanha have not, as yet, been fully ſettled. The Black Sort is hitherto known to come only from *Braſil*, by the Way of *Lisbon*, and ſome of our Druggiſts, for that Reaſon, diſtinguiſh it by the Name of the *Braſil* Root.

About the Brown Sort I am informed, by Dr. *James Houſtoun*, who reſided ſeveral Years in *New Spain*, that it grows plentifully at ſome Diſtance from the City of *Cartagena*, in the Kingdom of *New Granada*; from whence it is frequently ſent in Saroons, or Skins, containing an hundred Weight, to *Jamaica*, and ſo to *England*; where it is certain we have had it, of late Years, in great Abundance.

The Grey Ipecacuanha is, with us, preferred to all the reſt, and by far the moſt generally uſed, when it can be had. It is ſaid, by Authors, to grow in *Peru*, from whence it is brought to *Portobello*, and from thence into *Europe*, by the *Spaniſh* Galleons. Some Parcels of it are, likewiſe, probably, ſent from *Portobello* to *Jamaica*; for we are certain, that it has, ſometimes, been imported hither from that Iſland. By ſome Specimens brought me from *St. Thomé*, a *Portugueſe* Iſland, under the Equator, whither they were ſent directly from *Braſil*, it is evident, that this Species is, likewiſe, a Native of that Country; and there-

fore

fore muſt either have been included by *Piſo*, under one of the two Species mentioned by him, or elſe diſcovered ſince his Time. According to Father *La Bat*, in his late Voyage to the Iſlands of *America*, this Species grows, alſo, plentifully in *Martinico*, where, for many Years paſt, it has been uſed by the Inhabitants.

The White Sort, called, by the *Portugueſe*, *Ipecacuanha Blanca*, is ſaid, by *Piſo*, to grow in *Braſil*; and, if we may believe Father *La Bat*, it is likewiſe found in *Martinico*.

Theſe are the four Kinds of true Ipecacuanha, which have hitherto come to my Knowledge; but I have met with two other Roots, to which that Name has been falſly aſcribed, which from their outward Colour I ſhall call White and Rediſh-brown.

The White Sort agrees nearly, both in Colour and Surface, with the true White, but it is not near ſo knotty. It is, likewiſe, conſiderably larger in Size, ſtraighter, and ſofter to the Touch.

The Brown Sort is of a deeper Colour than the true Brown, and many Pieces have ſome Mixture of Red, (from whence it has been, ſometimes, called Red Ipecacuanha) and the inner Subſtance of the Cortex inclines to a rediſh Yellow. The Pieces of it are much longer than any of the former Sorts, ſome of them meaſuring ſixteen Inches, and they are of a Size between the Black and the Grey. The Fiſſures are at greater Diſtances from one another, than in the true Brown, and the Spaces between them much ſmoother. In a Word, though this Root, when mixed with the true Brown, to which it bears the greateſt Reſemblance, may eaſily be confounded with it; yet, when they are attentively compared, the whole Appearance ſufficiently diſtinguiſhes them.

Both theſe falſe Kinds were brought me from *Maryland*, in 1725. by a Surgeon, who informed me, that they grow there in great Plenty, being called Ipecacuanha by the Inhabitants, and uſed as a Vomit by thoſe of inferior Rank. I have, ſince that Time, received a Sample of the Brown Sort, taken from a Parcel which lay in the Cuſtom-houſe, above twelve Years ago, and called by the Name of wild Ipecacuanha.

Sir HANS SLOANE informed me, that this falſe Brown Kind was the ſame which was formerly ſent to him from *Virginia* for the true Ipecacuanha, and which he afterwards diſcovered to be the Root of a poiſonous *Apocynum*, deſcribed by him in his *Natural Hiſtory* of *Jamaica*; in which Iſland it is very common, and likewiſe in *New Spain*, as appeared by the Specimens ſent him by Dr. *Burnet*. See APOCYNON.

M. BOULDUC's *Analyſis of* IPECACUANHA.

There are, ſays this Author, two Species of *Ipecacuanha*, known at preſent, one Grey, the other Brown, inclining on the Outſide to Black. The Grey is leſs violent in its Effects, and leſs certain in its Succeſs, than the Brown, as appears from Experiments made by myſelf and others: However, as we generally prefer mild before violent Remedies, the Grey Ipecacuanha is more frequently uſed than the Brown.

Since theſe two Roots came in Requeſt, we have been preſented with a third, which though of a white Colour, and little reſembling the others, they have been very ſolicitous to have it paſs for another Ipecacuanha; and, in Fact, it is now called *The White Ipecacuanha*, and is uſed in ſome Diſtempers, as the other, for Infants, and Women with Child, becauſe generally it has very little Effect.

I went firſt to work upon the Grey Sort. with a Deſign to carry on the Operation to the other two. I made an Analyſis of it, by two different Methods; one, by the common Way of Diſtillation by the Retort, in a cloſe and gradual reverberatory Heat; the other, by way of Extraction, with proper and convenient Diſſolvents.

By Diſtillation I obtain'd no more, at firſt, than a Phlegm, and an acid Spirit, with a little Oil: And from the black Maſs which remain'd in the Retort, and was calcin'd by a very violent Fire, I obtained a very ſmall Quantity of fixed Salt.

I gain'd ſo little Knowledge by this Analyſis, that I might be excuſed from entering into a tedious and particular Account of the Proportions and Effects of all the Parts produced from it: And I might juſtify myſelf for omitting it, from a Perſuaſion that it would be of no great Service for acquainting us with the true Nature of the mixed Bodies, and that it only preſents us with the common Subſtance deſtroyed. And yet I thought myſelf obliged to give it, not only becauſe it has been the Cuſtom for a long time, but becauſe it cannot fail to diſcover and demonſtrate to us the Proportions of the ſeparated Parts.

In order, therefore, to make the more ſucceſsful Inquiry into the Conſtitution of this Root, I thought it beſt to proceed by way of Extraction; which might afford me an Abſtract, or, at leaſt, ſome eſſential Part, of the Compound; by which its principal Character, and ſpecific Virtues, might be determin'd.

I began the Extraction with highly rectified Spirit of Wine, and, by that means, obtain'd, from eight Ounces of the Root, ten Drams of ſulphureous or reſinous Parts; the Reſiduum, being entirely depriv'd of its reſinous Parts, and well dried, weigh'd no more than ſix Ounces; from which, however, by the Help of diſtil'd Rain-water, I obtain'd two Ounces of pretty ſolid Extract; which was nothing but the ſaline Parts of the Root, mix'd with ſome earthy Parts, which were inſeparable from them. This Extract had its Parts not very cloſely united, becauſe it had been ſeparated from its reſinous Parts in the preceding Operation.

I thought myſelf oblig'd to uſe this double Extraction, one with Spirit of Wine, and the other with Water, becauſe I was very well aſſur'd, that the Virtue of this Root did not conſiſt in its Reſin only, but alſo in its ſaline Parts, on which the Spirit of Wine could not faſten, and of which Water was the only proper Diſſolvent.

The laſt Reſiduum, or Caput mortuum, being deprived of both its reſinous and ſaline Parts, weigh'd no more than four Ounces.

From theſe two different Extractions it appears, that this Root contains a much greater Quantity of ſaline than reſinous Parts, beſides ſome earthy Parts: Whence I infer, that, without the Help of Spirit of Wine, I could, by Water alone, extract both the ſaline and reſinous Parts of that Root; becauſe the ſaline Parts being predominant over the reſinous, the former are capable of attenuating, diſengaging, fuſing, and diſſolving the others, in order to appropriate them to themſelves, and ſo make of both but one Body, conſiſting of ſaline and reſinous Parts.

This agrees with Experience; for it is the known Property of Salts to diſſolve Sulphur: And the Trial which I made of them on this Occaſion confirms my Inference; ſince, with bare Rain-water, and the like Quantity of the ſame Root, I obtain'd three Ounces and an half of pretty ſolid Extract, with its Parts much more cloſely united than in the preceding Experiment; and from the Reſiduum, which, when well dried, weighed but five Ounces, and would afford no more Extract by Water, by Spirit of Wine I obtain'd no more than one Dram of a kind of Reſin.

All this Labour, and all theſe Obſervations, would deſerve but little Regard, if they were not ſucceeded by ſome Experiments made on the particular Effects of theſe ſeveral Parts. My Deſign is not to ſpeak of thoſe Effects which proceed from the Diſtillation: We have Proofs enough to convince us, that not one of thoſe kinds of Parts which are abuſively call'd *Principles*, retain any of the Virtues of the compound Body from which it was ſeparated. But we are not to paſs the ſame Judgment on thoſe Parts which are afforded by different Extractions; as for theſe, we know, that they contain, as it were, in Abſtract, all the active Principles of the Compound. *Memoires de l'Acad. des Scien.* 1700. *p.* 8.

In another Diſſertation, publiſh'd the ſame Year, M. *Boulduc* gives his Obſervations upon the Brown Ipecacuanha. By Diſtillation, he remarks, that it yielded leſs Oil than the Grey; and that the laſt Portion of Spirit which comes away with its Oil upon the greateſt Violence of Fire, although conſiderably acid, appear'd to him to have more volatile Parts than the ſame Portion of Spirit in the former. He ſays, that, by Trial with Salt of Tartar, the Particles of the Brown eſcap'd with the greater Briskneſs, and ſtruck the Senſe of Smelling more powerfully. Hence he concluded beforehand, that as the Brown contains leſs oily Parts than the Grey, ſo i contains fewer reſinous; And, in the ſecond Place, that this laſt Portion of Spirit ſeems to contain more volatile Parts, which is the Reaſon it is more violent in its Effects. This Obſervation may countenance the Opinion of ſuch as believe the purgative Virtues of Medicines to be exalted by means of a certain volatile Salt contain'd in them. By Extraction, both by Spirit of Wine, and by Water, that of the Brown weigh'd leſs than that of the Grey. The Proportions are theſe: From eight Ounces of the Grey he had, by Spirit of Wine, ten Drams of a reſinous Extract; but, from the ſame Quantity of the Brown, but ſix Drams. From the Remainder, thus freed of its reſinous Parts, by an aqueous Menſtruum he drew, from the Grey, two Ounces of a ſaline Extract; but, from the Brown, only between five and ſix Drams. The Remainder of the Grey, after it had been thus deprived of its reſinous Parts by the Spirit of Wine, and of its ſaline ones by the Water, weigh'd four Ounces, but that of the Brown weigh'd near ſix Ounces; which ſhews, that the active Principles abound more in the Grey than in the Brown; which is farther confirm'd by the following Way of Extraction. In the former he began with Spirit of Wine, and then us'd Water: But here he extracted firſt with Water, and then with Spirit of Wine; and obſerv'd, that eight Ounces of the Brown yielded, by a watry Menſtruum, one Ounce three Drams of an Extract very ſolid and compact; and the Remainder, well dried, yielded, by means of Spirit of Wine, but twenty-four Grains of a reſinous Extract; whereas the like Quantity of Grey afforded, by an aqueous Menſtruum, three Ounces and an half of Extract; and its Remainder, by Spirit of Wine, thirty-ſix Grains of a reſinous Extract. Whence M. *Boulduc* thinks it eaſy to conclude, that the Brown contains leſs of principal Parts, and more of terreſtrial ones, than the Grey. It is, however, certain, that the Brown is more efficacious, which ſeems a ſort of a Paradox: The Reaſon of which is conjectur'd to be, that active Virtues are not to be eſteem'd according to the Meaſure or Weight of their Bodies. Thoſe of

leſs

leſs Bulk have often more Force and Energy: *Vis maxima in minima mole*, is a Maxim which holds good in many Inſtances. It has been taken notice, that the Spirits drawn from the Brown were more piquant, and ſtruck the Senſes more briskly, than thoſe of the Grey: Why then may they not have the ſame Activity in our Bodies, to irritate the interior Parts, and agitate the Humours more violently? The Extracts of the Brown are, indeed, leſs in Quantity, but their Virtues may be more concentrated, and, by Conſequence, more active.

This curious Inquirer, in another Diſcourſe, in the Memoirs for 1701. ſays, he has found means to deprive this Root of its emetic Quality, the Difference between this and other violent Purgatives having encourag'd him in this Search; the other violent Cathartics, as Scammony, and Colocynth, however prepar'd and corrected, leaving too often fatal Marks of their Action; but Ipecacuanha, though it may appear very brisk in its Operation, leaves generally behind it but an Aſtriction of the Part it had before open'd and fatigued. He made a reſinous Extract with Spirit of Wine, and then drew out the ſaline Particles with Rain-water, and found by Experience, that its Violence, as in moſt other Purgatives, was owing to its Reſin. For the Effects of the Reſin were more violent than the Root itſelf, leaving little or no Aſtriction afterwards; but the ſaline Extract was diuretic, purg'd gently without any, or little, Nauſeouſneſs, and, in ſhort, had the ſpecific Quality of the Root, that is, to cure Dyſenteries.

This Root is given from fifteen Grains to half a Dram, and we ought never to exceed a Dram. It never fatigues the Stomach, and is the beſt Succedaneum for the emetic Tartar. It is the beſt Specific in Dyſenteries hitherto known, acting, in ſuch Caſes, not only as an Emetic, but alſo deterging Ulcers in the Inteſtines, by a Mucilage contain'd in it, like that of Marſhmallows, by which it, in ſome meaſure, ſupplies the villous Coat of the Inteſtines, when corroded and deſtroy'd by the Diſeaſe. It, alſo, powerfully ſhakes and evacuates the Glands of theſe Parts. Its beſt Effects are in old Dyſenteries, after many other Medicines have been tried, and the Body has, by theſe, been ſufficiently prepar'd; then the firſt or ſecond Doſe generally produces viſible good Effects; or, if they ſhould happen to miſs, it ought to be continued every Day, in the Quantity of three or four Grains, acting, in that Caſe, as an Alterative.

This Root has an emplaſtic and deterſive Quality join'd together; and, though it does not appear ſenſibly acrid, it produces, in thoſe who powder it, an Oppreſſion in the Thorax, Difficulty of Breathing, and Spitting of Blood. It is, likewiſe, offenſive to the Eyes, increaſes the Diſcharge of the lachrymal Glands, and, when the Tears do not find a ready Vent, the Eyes ſwell. Theſe Effects are probably owing to the mucilaginous Quality of the Root. The ſame Cautions ought to be obſerv'd in giving Ipecacuanha, as in giving emetic Tartar. It is taken in Subſtance, finely powder'd, either mix'd with a Liquid, or incorporated with a proper Syrup, into an Opiate: It may, likewiſe, be given in Infuſion, or Decoction. *Geoffroy.*

However effectual Ipecacuanha Vomits may be in Dyſenteries, I much queſtion whether they are ſo conducive to the Cure of Fevers as Antimonials.

IPNITES, ἰπνίτης. A Species of Bread. See ARTOS.

IPS, ἶψ. A Species of Worm. The ſame as INVOLVULUS; which ſee.

IRA. Anger.

Anger is of ſuch a Nature, that it quickly throws the whole nervous Syſtem into preternatural Commotions, by a violent Stricture of the nervous and muſcular Parts; and ſurpriſingly augments not only the Syſtole of the Heart, and its contiguous Veſſels, but alſo the Tone of the fibrous Parts in the whole Body. This impetuous Motion of the Blood and nervous Fluid, in Perſons highly enraged, appears evidently from the Increaſe of the Pulſe, the Quickneſs of Reſpiration, Thirſt, Heat, Inflation and Redneſs of the Face, the greater Pulſation and Swelling of the Arteries of the Head, eſpecially about the Temples, Fierceneſs of the Eyes, Tremor of the external Parts, and a kind of Precipitancy obſervable in the Functions of the Mind. Beſides, we are aſſured, from practical Obſervations, that nothing ſo ſoon excites acute, bilious, intermitting, and inflammatory Fevers, as violent Anger. It is alſo certain, that this Paſſion, by the ſpaſmodic Stricture it produces in the Parts, exerts its Power principally on the Stomach and Inteſtines, which are highly nervous and membranous Parts; whence the Symptoms are more dangerous, in proportion to the greater Conſent of the Stomach and Inteſtines with the other nervous Parts, and almoſt with the whole Body.

The unhappy Influence of Anger, likewiſe, on the biliary and hepatic Ducts, is highly ſurpriſing, ſince, by an intenſe Conſtriction of theſe, the Liver is not only render'd ſcirrhous, but, alſo, Stones are often generated in the Gall-bladder, and biliary Ducts: Theſe Accidents have ſcarce any other Origin, than an Obſtruction of the free Motion and Efflux of the Bile, by means of this violent Stricture. But this generally happens from a Suppreſſion of the lawleſs Paſſion, when, for Inſtance, there is no Opportunity of ſatiating the latent Principle of Revenge; or when Sorrow is joined with Fear.

From ſuch a Stricture of theſe Ducts, likewiſe, proceeds the Jaundice, which, in Proceſs of Time, lays a favourable Foundation for calculous Concretions in the Gall-bladder: When the Bile, alſo, is put into a violent Commotion by Anger, and copiouſly diſcharged from the biliary and cyſtic Ducts into the Duodenum and Stomach, it frequently happens, that from its Stagnation, and the Acrimony it has contracted by this long Continuance, there ariſe Nauſeas, Vomitings, Diarrhœas, Choleras, Cephalalgias, Anxieties, bilious, continual, and intermitting Fevers: Hence ariſes that Symptom peculiar to paſſionate Perſons, which is, that, under the immediate Influence of Anger, they are ſenſible of a certain conſtrictive Pain in the Right Side, below the Pit of the Stomach, and a certain Bitterneſs in the Mouth: Theſe two Symptoms derive their Origin from no other Cauſe than the impetuous Motion of the Bile, and its Effuſion into the Inteſtines, while the biliary Ducts, which are formed of nervous and muſculous Coats, being too much compreſſed with the quick Influx of the ſpirituous Liquid contained in the Nerves, diſcharge a large Quantity of Bile, and pour it into the Duodenum; whence proceed an Inclination to vomit, and a Diarrhœa, which *Hildanus*, *Cent.* 7. *Obſ.* 18. remarks, when he affirms, that the Body has been render'd as ſoluble by the Influence of Anger, as if Phyſic had been taken. But, if the Bile offends by its Acrimony, and is too copiouſly diſcharged, during a Sally of Anger, Eroſions of the Inteſtines and Stomach, with a ſubſequent ſlow Fever, have been frequently obſerved to be produced by it: And the more acrid the Bile, or the further it recedes from its natural Condition, the more prejudicial is Anger, and attended with the more dangerous Symptoms.

Laſtly, By increaſing the Motion of the Fluid, or the Spaſms of the fibrous Parts, by means of Anger, a larger Quantity of Blood is propelled with an Impetus to certain Parts; whence it happens, that they are too much diſtended, and the Orifices of the Veins diſtributed there opened. It is evident from Experience, that Anger has a great Tendency to excite enormous Hæmorrhages, either from the Noſe, the Aperture of the Pulmonary Artery, the Veins of the Anus, or, in Women, from the Uterus, eſpecially in thoſe previouſly accuſtomed and diſpoſed to ſuch Evacuations. Thus, if any one in his Youth has been ſubject to Hæmorrhages of the Noſe, a violent Sally of Anger ſoon makes his Diſorder recur; for it is well known, that, upon the Approach of this Paſſion, the Countenance immediately becomes red, the Veins of the Head, eſpecially thoſe of the Forehead, are preternaturally tumefied, and the Blood is often, in an Inſtant, diſcharged in great Plenty from the Noſe. I have likewiſe ſeen Women, who, in conſequence of a Sally of Paſſion, have been ſeized with Hæmorrhages of the Uterus, or of the Noſe: And this too is the Reaſon why, in old and plethoric Perſons, a violent Paſſion often produces a ſanguine Apoplexy, which ariſes from a Rupture of the ſmall Arteries of the Plexus Choroides in the Head. But there never readily happens an extraordinary Collection of Blood, and an unbounded Effuſion of it, unleſs from a ſpaſmodic, and that, too, a violent Stricture of the nervous and muſcular Parts.

Having thus conſider'd the Effects of Anger, with the Manner of its operating, we come now to the principal Point propoſed; which was to ſhew, why Cathartics and Emetics are ſo prejudicial in the Paſſion of Anger, that they may, with the ſtricteſt Juſtice, be termed Poiſons. But, before we determine this, our Deſign obliges us to ſay ſomewhat of the Nature of Poiſon, and the Method of its operating, leſt, by a Neglect of this kind, a Foundation ſhould be laid for various Errors and Miſtakes.

By Poiſon, then, in this Place, we mean a cauſtic Matter, furniſhed with a very fine, volatile, and acrid Salt, which, in a ſmall Quantity, by exciting enormous Spaſms in the Stomach and Inteſtines, quickly induces a Train of dreadful Symptoms, perverts and deſtroys the whole Oeconomy of the vital Motions, leaving Signs of a fatal Mortification in the Carcaſe of the Patient. True Poiſons, therefore, have, for the Foundation of their Activity, a certain fine, acrid, and highly cauſtic Salt, which, inſinuating itſelf deeply into the membranous and nervous Fibres of the Stomach and Inteſtines, lacerates, corrodes, inflames, and ſpaſmodically conſtricts them: But Poiſon, when exhibited in a ſmall Quantity, quickly proves mortal; which muſt undoubtedly proceed from the violent and ſpaſmodic Strictures of the nervous and membranous Syſtems in the whole Body, by which the Influx of the nervous Fluid, and thinner Blood, into the Organs of Motion and Senſation, upon the Ceſſation of which all Strength, Tone, and Motion of the Parts, are loſt, is partly intercepted, and partly forced in a greater Quantity to other Places.

The Symptoms excited by Poiſon are highly violent, and entirely owing to the Spaſms, which not only affect the Stomach and Inteſtines, but are, alſo, propagated to other Parts endued with more delicate Senſation and Motion: Hence, from ſwallowing Poiſon, are produced Cephalalgias, Nauſeas, Vomitings, violent Gripes, Diarrhœas, or an obſtinate Coſtiveneſs, Hiccups, violent Strictures of the Thorax, Difficulty of Breathing, and the

the utmoſt Uneaſineſs of the Præcordia, a Loſs of Strength, a Syncope, accompanied with Coldneſs of the Extremities, and a cold Sweat; a weak, quick, and plainly intermitting Pulſe, Convulſions, Epilepſies, Inquietudes, and Deliriums: Theſe are the moſt general and uſual Symptoms produced by Poiſons. Upon opening the Bodies of Perſons cut off by Poiſon, there immediately appears a Swelling of the whole Abdomen; and Spots of a purple or blackiſh Colour are diſcover'd in the Stomach, which is corroded, and ſometimes perforated; together with ſome other Phenomena. This much ſhall ſuffice, with reſpect to Poiſon properly ſo called: For a more explicit Account, the Reader may conſult *Hoffman's Pathologia Rationalis, Tom.* 2. *Part.* 2. *Cap.* 2. where the Doctrine of Poiſons is expreſly handled.

If, therefore, we duly weigh and conſider the Effects of Emetics taken after a Tranſport of Anger, it will appear very evident, that they exert on the human Body no other Influence than that of real Poiſon; ſince all Emetics, eſpecially thoſe prepared of Antimony, operate by a ſubtile, acrid, cauſtic, inflaming Salt, which, adhering to the membranous and nervous Coats of the Stomach and Duodenum, corrodes and ſpaſmodically conſtricts them. Beſides, when exhibited in a ſomewhat larger Quantity, they quickly prove mortal, when the Stomach is diſorder'd: Inſtances of which frequently occur, in the Writings of practical Phyſicians.

If we examine accurately into the various Symptoms produced by the Exhibition of Emetics, they are found not to be unlike thoſe excited by Poiſon, properly ſo called: For there immediately appear Anxieties, and violent Strictures of the Præcordia, an exquiſite Heat about the Region of the Stomach, vain Efforts to vomit; the extreme Parts grow cold, begin to tremble, and be convulſed; a cold Sweat ſeizes the Head or Breaſt; Reſpiration is perform'd with Difficulty; the Patient is deprived of Sleep, toſſes about, and is very reſtleſs: To theſe Symptoms is added, an uncommon Loſs of Strength; and the Patient is either afflicted with an obſtinate Coſtiveneſs, or an uncommon Flux; the Pulſe is either quick, weak, or plainly intermitting; the Mind becomes deſultory and unhing'd; Convulſions, and other Symptoms of a like Nature, happen. It is certain, that theſe mortal Symptoms proceed from violent Spaſms, which throw almoſt the whole Syſtem of the membranous Parts into violent Exagitations and Convulſions; whence the poiſonous Quality of Emetics, after Anger, is ſufficiently obvious: Beſides, upon opening the Bodies of thoſe cut off by Poiſon, there appear undoubted Marks of a Violence done by ſome Subſtance of a virulent Quality, as is evident from the Diſſection of ſuch Perſons, ſince the Duodenum, and Bottom of the Stomach, are obſerved very much inflam'd, and full of Spots, partly of a rediſh, and partly of a blackiſh Colour.

Violent and ſtrong Cathartics, after the Tranſports of Anger, are equally dangerous; ſince they prove mortal in the ſame manner with Emetics, or even with Poiſon properly ſo called, as they are, in like manner, furniſhed with a ſubtile, cauſtic, and penetrating Salt, and, by exciting Spaſms, create Inflammations in the Stomach and Inteſtines, produce violent Symptoms, quickly deſtroy the Patient, and, after Death, leave Signs of a fatal Mortification in the Stomach and Inteſtines. Since, therefore, Emetics and Cathartics, exhibited after the violent Tranſports of Anger, produce Spaſms, and not only excite, but increaſe the Inflammation; ſince they, alſo, bring on other Symptoms uſually induced by Poiſon; very ſoon put an End to Life; and, after Death, leave in the Body Marks like thoſe common to Perſons cut off by Poiſon; hence we may reaſonably conclude, that both emetic and purgative Medicines may be eſteem'd poiſonous, when given to Perſons after the Tranſports of Anger.

Emetics therefore, and draſtic Purges, after Anger, are highly detrimental, and, for the moſt part, kill the Patient: For, if we recollect from the preceding Obſervations, that Anger throws the Stomach, Duodenum, and hepatic Ducts, into Spaſms, we may hence, without the leaſt Heſitation, infer, that Vomits, in ſuch a Caſe, are by no means proper, ſince they irritate the tender Fibres of the Stomach, but lately diſorder'd by the Influence of Anger, to more terrible Spaſms, and excite a more violent Inflammation, which is hardly curable by the utmoſt Skill and Judgment of the Phyſician. Let Phyſicians then conſider, how improperly, prepoſterouſly, and imprudently, they act, when they diſturb and exaſperate the Stomach, already too much diſorder'd with Anger, by Emetics: For theſe Remedies are, in ſuch a Caſe, ſo far from being ſerviceable, that they rather add to the Acuteneſs of the Pain, and increaſe the Diſeaſe. Let us ſuppoſe, that Nature herſelf ſeems diſpoſed and inclined to Vomiting, and is in a manner urged and ſtimulated to it by a ſtrong Contraction of the Pylorus: Let us, alſo, ſuppoſe, that the Patients very earneſtly deſire this dubious Kind of Remedy, and place great Confidence in it, perſuading themſelves, that, by ejecting and diſcharging this heavy Burden out of the Stomach, they ſhall immediately grow better: Yet theſe very things, which might encourage an unwary Phyſician to give a Vomit, ought rather to convince the prudent, ſagacious, underſtanding Practitioner, that he ſhould, in ſuch a Caſe, by all means reject Emetics, and abſtain from them, as he would from Poiſon.

Anger, by means of the ſubſequent Uſe of Emetics and Cathartics, is moſt of all prejudicial to thoſe who are ſubject to hypochondriac and hyſteric Spaſms, or thoſe who are afflicted with a Cardialgia. The Reaſon of this ſeems very plain, ſince ſuch Patients are weaken'd by the ſpaſmodic Stricture, with which the interior nervous Parts are affected, or have the Stomach, with the annexed Inteſtines, diſpoſed to an Inflammation: If, therefore, ſuch Perſons are ſeized with a Fit of Anger, which makes its Havock by Spaſms, the ſpaſmodic Conſtrictions of the Stomach muſt neceſſarily be increaſed; and their Violence is ſo far from being appeaſed by the Addition of an Emetic or Cathartic, that, by this Method, the Way is rather paved to an invincible Diſorder, and total Deſtruction of the Body. The utmoſt Care then muſt be taken, not to preſcribe ſuch Medicines to Perſons thus debilitated, unleſs we wiſh for a fatal Event.

For the ſame Reaſon Emetics, and other ſtrong Evacuants, are very detrimental, if given about the Paroxyſms of intermitting Fevers, eſpecially when preceded by Anger, becauſe, at that time, the Stomach and Primæ Viæ being agitated by Spaſms, the Patient is ſeized with a Nauſea, and Inclination to vomit. Beſides, Anger, and Medicines of a purgative and cathartic Quality, are noxious to all weak Perſons. Thus have I obſerved, that thoſe, who had before thoroughly purged their Bodies with Laxatives, Purgatives, Baths, and medicinal Waters, and, by that means, contracted a very great Weakneſs of the Stomach, have become very bad by taking Emetics or Cathartics after a Fit of Anger, and, in a very ſhort time, expired under a moſt terrible Train of Symptoms. The Caſe is the ſame in Women after Delivery: For I knew a Woman, who, on the third Day after her Delivery, being in a violent Paſſion, took a Purge of the draſtic Kind; and within two Days, notwithſtanding the Application of all the beſt Remedies, ſhe miſerably periſh'd.

Beſides, Anger, and Emetics, or Cathartics, are extremely prejudicial to Women, about the time of their menſtrual Diſcharge; and likewiſe to Men, who are accuſtomed to hæmorrhoidal Diſcharges, and wait for their Approaches: For, ſince theſe uſual and ſalutary Diſcharges from the Uterus, and hæmorrhoidal Veins, are always accompanied with Spaſms, it is evident, that Emetics and Cathartics are, at that time, very detrimental, eſpecially if given after a Fit of Anger. I have ſeen dreadful Symptoms produced by Emetics, tho' not of a very draſtic Nature, given about the time of the Menſes. In Perſons afflicted with the Hæmorrhoids, a ſtrong Vomit has excited Abſceſſes with a ſlow Fever. When an Accumulation of Blood tends to the Breaſt, a dangerous Hæmoptyſis is often produced by a ſtrong Vomit. Anger, and ſtrong Evacuants, are likewiſe very hurtful to thoſe, who, after drinking plentifully of Wine, have endeavoured to extinguiſh the Heat of their Body by large Draughts of any cold Liquor; for they eaſily produce Spaſms in the Stomach, and its Right Part the Pylorus. In ſuch Caſes Emetics immediately produce intolerable Anxieties, and continual Watchings. Theſe are ſucceeded by an intolerable Loſs of Strength, accompanied with Inquietudes, Toſſings of the Body, and a Coldneſs of the Extremities.

I ſhall now ſubjoin ſome Cautions for preventing the Misfortunes generally ſubſequent to Anger, eſpecially when of the violent Kind. For this Purpoſe, then, the prudent Phyſician ſhould, by all means, aſſwage and ſooth the Spaſms excited in the Stomach and Duodenum, reduce the Blood and Humours to an equable Motion, and correct their Acrimony, if they have any.

For this Purpoſe I recommend, beſides Infuſions of the Herbs *Paul's* Betony, Daiſies, common and *Roman* Chamomile, and Fennel-ſeeds, the bezoardic Powders, and thoſe of the nitrous and cinnabarine Kind, or Nitre mixed with a ſmall Quantity of Camphire, or the following Mixture.

> Take of the Spiritus Nitri dulcis, or the Spiritus Vitrioli dulcis, and of the Eſſence of Caſtor, each one Dram; and of Camphire, three Grains: Of this Mixture, twenty or thirty Drops may be exhibited.

Theſe two Remedies are great Preſervatives againſt Inflammations, from whatever Cauſe they proceed. If, in conſequence of a Fit of Anger, the Bile is convey'd in too large a Quantity to the Inteſtines, then Powder of Rhubarb, mixt with Nitre and Crabs-eyes, is highly beneficial: For by this means the Acrimony of the Bile is not only corrected, but, alſo, gently eliminated. To this may be added the Magneſia alba, which not only greatly corrects, but, alſo, mildly eliminates the acrimonious Humours. To theſe may be added the Eſſence of Orange-peel duly prepared, the Stomachic Elixir of *Michaeli*, or my Stomachic Elixir, mixed with the anodyne mineral Liquor. *Hoffman*.

IRAIBA. The Name of a Species of Palm, which grows in *Braſil. Raii Hiſt. Plant.*

IRINON. See IRIS.

IRIO. A Name for the *Eryſimum, vulgare.*

IRIPA. The Name of a tall Tree, which grows about *Repolyn*, and in other Parts of *Malabar*; call'd *Malus Indica, pomo cucurbitæformi, monopyreno.*

The Roots of this Tree have a cathartic Virtue. Of the Leaves boiled in Cow's Urine, with an Addition of Honey, is prepared a Potion, which is ſaid to cure the Itch, Leproſy, and other cutaneous Affections. Of the ſame boiled in ſweet Milk, with the Leaves of *Mangos*, they prepare an Apozem, which cures the Jaundice, Aſthma, and the vitiated Fermentation of the Aliments in the Stomach, with the Pain of the Head cauſed thereby: Of the Fruit is prepared an Oil for the Itch, and other cutaneous Affections. *Raii H. P.*

IRIS.

The Characters are;

Under the Flowers are two membranaceous Calyces, ſurrounding one another like Sheaths. The Flower is hexapetalous; three of the Petals are bifid and erect, the other three are reflexed downwards. Upon the under Part of the lower Petals is placed a large Congeries of little Tubes, reſembling a Beard. From the very Bottom ariſes a Male Stamen, carefully defended by an hollow petaloidal Caſe. This Flower grows on the Apex of the Ovary, which produces thoſe Beards and Tube-like Caſes: Thence the Flower ſeems enneapetalous, or conſiſting of nine Petals. The Ovary grows at the End of the Pedicle, and becomes an oblong Fruit, full of Seeds. The Root is fleſhy, oblong, and creeping.

Boerhaave mentions twenty-four Species of this Plant; which are,

1. Iris; hortenſis; latifolia; petalis pendulis purpuro-violaceis, erectis cœruleis.

2. Iris; hortenſis; latifolia; præcox purpurea.

3. Iris; hortenſis; latifolia. *Boerh. Ind. A.* 2. 124. *Iris vulgaris noſtras, hortenſis.* Offic. *Iris vulgaris.* Ger. 46. Emac. 50. Raii Hiſt. 2. 1280. *Iris purpurea ſive vulgaris.* Park. Parad. 181. *Iris vulgaris Germanica ſive ſylveſtris.* C. B. P. 30. Tourn. Inſt. 358. *Iris vulgaris violacea ſive purpurea, hortenſis & ſylveſtris.* J. B. 2. 709. COMMON FLOWER-DE-LUCE.

The Roots of this common Flower-de-luce ſpread themſelves pretty much on the Surface of the Earth, being of a reddiſh-brown Colour on the Outſide, and whitiſh within, round, an Inch and more in Thickneſs, and ſhooting out long Fibres. The Leaves are nervous, broad and flat, thickeſt in the middle, with thin Edges, like a Sword; they grow in thick Clumps together; the Flowers are made of nine Leaves, of a purpliſh-blue Colour. The Seed grows in large triangular Pods, full of flat angular Seed. It grows with us only in Gardens, and flowers in *May* and *June*.

The Juice of the Root, which is the only Part uſed, is a ſtrong Errhine: Being ſnuff'd up the Noſtrils, it purges the Head, and clears the Brain of thin, ſerous, phlegmatic Humours. The ſame, likewiſe, or a ſtrong Decoction of the Root, given inwardly, is a ſtrong Vomit, and accounted good for the Dropſy, Jaundice, and Agues; but, becauſe it very much vellicates or offends the Stomach, it is rarely uſed. *Miller's Bot.*

Externally applied, it cures impetiginous Diſorders, and other Stains of the Skin. *Dale.*

Lemery ſays, the Doſe of the Juice of the Root is from two Drams to an Ounce and an half.

4. Iris; hortenſis; latifolia; petalis repandis ex atro purpureo & albo ſtriatim variis, erectis vero fuſcis obſoletis.

5. Iris; Dalmatia; major. *C. B. P.* 31.

6. Iris, alba; Florentina. *C. B. P.* 31. *Park. Parad.* 180. *Tourn. Inſt.* 358. *Boerh. Ind. A.* 2. 124. *Iris Florentina, Iris Illyrica.* Offic. *Iris Florentina.* Ger. 47. Emac. 52. *Iris flore albo.* J. B. 2. 719. Raii Hiſt. 2. 1180. FLORENTINE ORRIS. *Dale, p.* 247.

This *Iris* has a thick, tuberous, knobbed Root, of a white Colour in the Inſide, ſhooting out Fibres on all Sides; which, when they are pared off, make the dry Root appear full of round Spots. The Leaves are long and flat, like other Flower-de-luces, bearing at the Top of the round, ſmooth Stalks, two or three white Flowers, which are incloſed, before their opening, in thin green Husks. The Flowers are pretty large, and are made of nine Leaves, like the former. They have the like Seed-veſſels. It is found wild about *Florence* in *Italy*; but with us is only nurſed up in Gardens, and flowers in *June*.

The Root only is uſed, being brought dry from *Leghorn*, of a firm Texture, and a pure white Colour, having a pleaſant, ſoft, ſweet Scent, ſomewhat like Raſpberries.

It is attenuant, emollient, and pectoral, good for Diſorders of the Lungs cauſed by ſharp Humours falling on the tender Veſiculæ; it helps Coughs, Hoarſeneſs, and Soreneſs at the Stomach; it is likewiſe commended againſt the Gripes in Children, and to bring down the obſtructed *Menſes*; outwardly it is uſed in Perfumes, ſweet Bags, and Hair Powder: It is an Ingredient in the *Theriaca Andromachi* and Mithridate. *Miller's Bot. Off.*

It is reckoned proper to attenuate the Lympha, which ſtuffs the Bronchia and Glands of the Inteſtines. It is often joined with Hydragogues in beginning Dropſies, to ſcour the Glands of the Meſentery; and a kind of Ratafia is likewiſe made of it for the ſame Purpoſe. *Geoffroy.*

Externally applied, it is good for Freckles, and Spots of the Skin; and it is eſteemed good for a fetid Breath. *Schroder.*

7. Iris; Suſiana; flore maximo, ex albo nigricante. *C. B. P.* 31.

8. Iris; latifolia; petalis repandis atropurpureis vietis, erectis obſolete purpuraſcentibus fere fuſcis.

9. Iris; folio lato; rugoſo; florum petalis repandis ex purpureo ſordido, pallido, & luteo variis; erectis vero obſolete & ſqualide luteſcentibus.

10. Iris; latifolia; Germanica; odore Sambuci. *C. B. P.* 31.

11. Iris; latifolia; Pannonica; colore multiplici. *C. B. P.* 31.

12. Iris; folio lato; rugoſo; florum petalis repandis obſolete luteis, pallidis; purpureis, ſtriatis, petalis, erectis obſolete luteis.

13. Iris; ſativa; lutea. *C. B. P.* 32.

14. Iris; latifolia; candida; purpureis venis diſtincta. *C. B. P.* 32.

15. Iris; folio lato; rugoſo; petalis repandis purpureis, erectis candidis.

16. Iris; pratenſis; anguſtifolia; non fœtida; altior. *C. B. P.* 32.

17. Iris; anguſtifolia; bicolor. *C. B. P.* 33.

18. Iris; anguſtifolia; flore cœruleo, ſtriato.

19. Iris; anguſtifolia; floſculi petalis repandis ex luteo & purpureo utrimque variis, erectis purpureis.

20. Iris; humilis; flore atropurpureo. *H. L.*

21. Iris; humilis; minor; flore purpureo. *T.* 361.

22. Iris; humilis; minor; flore purpureo flaveſcente. *T.* 362.

23. Iris; humilis; ſegmentis tribus inferioribus ex ochroleuco, albo & viete purpureo variis, ſuperioribus albis.

24. Iris; humilis; ſegmentis tribus inferioribus ex viridi & pallido variis, ſuperioribus albis. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 123.

According to *Dioſcorides*, the beſt Iris grows in *Illyria* and *Macedonia*; and of this the choiceſt is what has a thick Root, appearing as if it were imperfect, difficult to be broken, of a reddiſh Colour, extremely fragrant, of a pretty bitter Taſte, of a freſh Smell, without the leaſt Scent of Mouldineſs, and what excites Sneezing, when bruiſed. The next in Goodneſs and Virtues, is the *African* Iris, which is white, and of a bitter Taſte; the Roots, when old, are ſubject to be Worm-eaten, though, at the ſame time, they are more fragrant.

All the Species of Iris are of an heating and attenuating Quality, and effectual in Coughs, on account of attenuating thoſe Humidities which are difficult to be expectorated. Seven Drams of the Root, taken in Hydromel, are a Purge for groſs and bilious Humours. The Iris has, alſo, an hypnotic Virtue, excites Tears, and cures the Gripes; taken in Vinegar, it cures the Bites of venomous Animals, and is a Remedy for Diſorders of the Spleen, Convulſions, extreme Coldneſs, Rigors, and an involuntary Efflux of the Semen; taken in Wine, it provokes the Menſes. A Decoction of the Roots makes a proper Fomentation in Diſorders incident to Women, as mollifying and opening the Parts about the Region of the Uterus. A Clyſter of the ſame relieves under the Sciatica. The Iris is, alſo, incarning; and fills up Fiſtulas, and other ſinuous Ulcers, with Fleſh. The Roots apply'd with Honey, by way of a Collyrium, or Peſſary, extract the Fœtus; boiled, and apply'd to the Place, they mollify ſtrumous and old ſcirrhous Swellings; being dry'd, and uſed with Honey, they cleanſe and incarn them, and cover bare Bones with Fleſh; made into a Cataplaſm with Vinegar, and Oil of Roſes, they cure the Cephalalgia; apply'd with Hellebore, and double the Quantity of Honey, they abſterge Freckles and Sunburns: They are Ingredients in Peſſaries, Malagmas, and Acopa; and, in ſhort, are uſeful on many Accounts, *Dioſcorides, Lib.* 1. *Cap.* 1.

In *Dioſcorides, Lib.* 1. *Cap.* 66. we have a Deſcription of what he calls a *Stypſis*, [στύψις, *Spiſſamentum*, an Inſpiſſation] of Irinum, or the Oil of Iris; as follows.

> Take of Spatha, [σπάθη, the Involucrum, or Cover of the Fruit of the Palm-tree, while yet in Flower, *Dioſc. Lib.* 1. *Cap.* 150. See PALMA] very well bruiſed, ſix Pounds eight Ounces; and put them into ſeventy-three Pounds five Ounces of Oil, mix'd with five Pints of Water; and boil them together in a Copper-veſſel, till they ſmell of the Spatha; after which, ſtrain them into a Veſſel, whoſe Inſide is rubbed over with Honey. With this Oil, thus impregnated with an Aromatic, is the firſt Irinum tempered, or prepared, the Iris being macerated in the inſpiſſated Oil, in the Manner deſcribed below.

Another Way of preparing the Stypſis of the Irinum is, to boil five Pounds two Ounces of Xylobalſamum, bruiſed as was directed for the Spatha in ſeventy Pounds five Ounces of Oil; after which take out the Xylobalſamum, and put in of Calamus bruiſed, nine Pounds ten Ounces, with a Lump [χόνδρος] of Myrrh, waſhed over with old ſweet-ſcented Wine. This done, take of this inſpiſſated and aromatized Oil, fourteen Pounds, with an equal Weight of bruiſed Iris, to be macerated for two Days and two Nights in the Oil, and then very ſtrongly expreſſed. If you would have it made ſtronger, add the ſame Weight of Iris a ſecond or third time, and macerate and ſtrain as before. Much the beſt of this kind of Preparation is, what ſmells of nothing but

but the Iris; and ſuch is made at *Perga* in *Pamphylia*, and in *Elis* in *Achaia*.

This Scypſis of Irinum is heating and emollient, and cleanſes cruſty, putrid, and foul Ulcers. It is adapted, alſo, to uterine Affections, ſuch as Inflammations and Stoppages; it expels the Fœtus, opens the Orifices of the Hæmorrhoids, and with Vinegar, Rue, and bitter Almonds, cures the Ringing of the Ears; it is effectual againſt inveterate Diſtillations, and the Ozœna, the Noſtrils being anointed therewith; the Quantity of a Cyathus, taken inwardly, ſerves for a Purge; it gives Relief, alſo, under the Iliac Paſſion, and provokes Urine. It facilitates Vomiting, being rub'd on the Fingers, or any other Emetery [ἐμετήριον, ſomething thruſt into the Mouth to promote Vomiting]. It is uſed, alſo, as a Litus for the Quinſey, and, with Hydromel, as a Gargariſm for the Roughneſs of the Aſpera Arteria; and it ſerves as an Antidote for thoſe who have eaten Hemlock, poiſonous Muſhrooms, or Coriander. *Dioſcorides, Lib.* 1. *Cap.* 66.

Aetius, Tetrabib. 1. *Serm.* 1. deſcribes another Oil of *Orris*.

Beſides the foregoing Species of Iris, *Dale* mentions the two following; which are,

1. *Iris lutea paluſtris*. See *Acorus adulterinus*.

2. *Chamæiris*. Offic. *Chamæiris tenuifolia*. Ger. 52. Emac. 56. *Chamæiris anguſtifolia major & minor*. Park. Parad. 187. *Iris anguſtifolia Prunum redolens, major & minor*. C. B. Pin. 33. Tourn. Inſt. 361. *Iris graminea, cui quotannis pereunt folia*. J. B. 2. 727. Raii Hiſt. 2. 1189. GRASS-LEAV'D FLOWER-DE-LUCE. It is cultivated in Gardens, and flowers in *May*; the Herb is in Uſe. It agrees in Virtues with the *Iris*; *hortenſis*; *latifolia*; or common *Flower-de-luce*.

Iris bulboſa. A Name for ſeveral Sorts of *Xiphium*.

Iris Perſica. A Name for the *Xiphium*; *Perſicum*; *præcox*; *flore variegato*.

Iris tuberoſa. A Name for the *Hermodactylus*; *folio quadrangulo*.

Iris fœtida. See XYRIS.

IRIS is, alſo, according to *Gorræus*, the Name of a Paſtil, conſiſting of Saffron, Myrrh, and Alum.

IRIS is, moreover, the Name of a Species of Cryſtal.

IRIS, in Anatomy, is a Membrane of the Eye. See OCULUS.

Mr. *Sharp* gives the following Account of an Operation upon this Membrane, which he calls, *Cutting the* IRIS.

There are two Caſes, ſays he, where this Operation may be of ſome Service, one when the Cataract is from its Adheſion immoveable; and the other when the Pupil of the Eye is totally cloſed up by a Diſorder of the muſcular Fibres of the Iris, which, gradually contracting the Orifice, at laſt leaves the Membrane quite imperforate. This laſt Diſtemper has hitherto been deem'd incurable. The Adheſion of the Cataract I have conſidered as a Species of Blindneſs not to be relieved: But Mr. *Cheſelden* has invented a Method of making an artificial Pupil, by ſlitting the Iris, which may relieve in both the Inſtances here ſtated.

In performing this Operation, the Patient muſt be placed as for Couching, and the Eye kept open, and fixed by the Speculum Oculi, which is abſolutely neceſſary here, for the very Reaſon I would diſcard it in the other, ſince the Flaccidity of the Membrane from the Iſſue of the aqueous Humour would take away its proper Reſiſtance to the Knife, and make it, inſtead of being cut through, tear from the Ligamentum Ciliare; then, introducing the Knife in the ſame Part of the Conjunctiva you wound in Couching, inſinuate it with its Blade held horizontally, and the Back of it towards you, between the Ligamentum Ciliare, and Circumference of the Iris into the anterior Chamber of the Eye; and, after it is advanced into the farther Side of it, make your Inciſion quite through the Membrane; and, if the Operation ſucceeds, it will, upon wounding, fly open, and appear a large Orifice, tho' not ſo wide as it becomes afterwards.

The Place to be opened in the Iris, will be according to the Nature of the Diſeaſe: If the Membrane itſelf be only affected with a Contraction, the middle Part of it, which is the natural Situation of the Pupil, muſt be cut; but, if there be a Cataract, the Inciſion muſt be made above or below the Cataract, though I think it more eligible to make it above.

The contracted Iris, from a paralytic Diſorder, is ſo often complicated with an Affection of the Retina, that the Succeſs is very precarious in this Caſe. This Operation, by what I have ſeen, has anſwered beſt in Adheſions of the cryſtalline Humour, though, to ſpeak truly, but very ſeldom even there. As I would not miſlead any one in an Operation not yet much known in the World, I do confeſs, that either the Danger of the Iris ſeparating from the Ligamentum Ciliare, or of the Wound not enlarging ſufficiently, do, upon the Whole, make the Event very doubtful. I once perform'd it with tolerable Succeſs, and, a few Months after, the very Orifice I had made contracted, and brought on Blindneſs again.

I have not here once uſed the Word Uvea, but have made mention of the Ligamentum Ciliare; both which Parts are but little underſtood, for want of proper Explanation; but which muſt be rightly conceived of, in order to underſtand what has been ſaid.

The generality of Anatomiſts call that Membrane, which I have ſpoke of under the Name of Iris, the Uvea, and its anterior Lamina, the Iris: Others, again, call the Membrane, Uvea; and the Colour of it, Iris: But both one and the other Diſtinction confound Learners exceedingly, and take their Riſe from a Want of proper Attention to the Hiſtory of Anatomy. The Antients, who have given moſt of the Names we now employ in the Deſcription of the Eye, were vers'd principally, if not altogether, in the Diſſection of Brutes; among which, thoſe of the graminivorous Kind have a party-coloured Choroides, one half of it being dark, and the other of a light ſhining Green: This laſt, from its Reſemblance to an unripe Grape, was call'd the Uvea; but the ſucceeding Writers, among the Moderns, applying themſelves to human Diſſections only, and not duly conſidering the Difference of the human Choroides, which is nearly of an uniform Colour, and of that above deſcribed, have retained the Appellation, tho' we have not the Thing. Hence has aroſe the great Variety of Miſapplication of this Word, which ought no more to be ſpoke of in the Anatomy of the human Eye, than the Tunica Nictitans, which is proper to certain Beaſts and Birds.

The Ligamentum Ciliare is that circular Line on the Globe of the Eye, where the Sclerotis, Choroides, Retina, Cornea, Proceſſus Ciliares, and Iris, terminate and unite together, forming a whitiſh Ring ſomewhat denſer than any other Part of the Coats; but, ſince the Inſtitution of this Term, the Deſcription of the Part it implies has been very much neglected, and the Term itſelf confounded with the Proceſſus Ciliares: Wherefore it was neceſſary to define it, that the Proceſs of the Operation of the Iris might be better underſtood. *Sharp*.

IRREPTIO. See EISBOLE.

IRUCAHA. The Name of a large Tree, which grows in the Iſland of *Maragnan*. It bears a Fruit ſhaped like a Pear, with a yelloviſh Rind, and Pulp within of a good Taſte, and eſteemed very nutritive.

IS, *is*. A Fibre, the Plural of which is *ives*, by which, it is pretended that *Hippocrates* meant equally a Fibre and a Nerve. "Some (ſays *Erotian*) thinks that this Word ſignifies a Nerve; "others explain it only of the Fibres of which the Nerves are "compoſed." The *Greek* Authors who have wrote on Plants, have called by this Name the Nerves, or ſmall Threads, which appear on the Back of the Leaves, and the Filaments at the Extremities of the Roots. Thoſe who have treated of the Structure and Compoſition of animal Bodies, have given the ſame to the ſmall Threads of the Fleſh, and other Parts, which the *Latins* have rendered by the Word *Fibra*. No one can deny that *Hippocrates* hath uſed the ſame Word in this Senſe; as, for Inſtance, when he obſerves, that the Spleen is full of Fibres. He has, alſo, obſerved "the Fibres which are in the Blood:" But it is pretended, that by thoſe, alſo, he meant the Nerves; for which Purpoſe there is a Paſſage quoted from *Hippocrates*, in which it is ſaid, (*Lib. de Oſſium Natura*) that "The Heart "has Nerves, or Fibres," which "come from every Part of "the Body." In this Paſſage he makes uſe of the Word ἰνίας, which is not read elſewhere; but *Foeſius* is for having it read ἴνας, which laſt Word may be as properly tranſlated *Fibre*, as *Nerve*. What might incline one to the ſecond Signification is, what is added as a Proof, or Confirmation, of what is ſaid concerning the Heart, that "the Seat of Senſation is rather "about the Thorax, than any other Part of the Body;" becauſe this has ſome Relation to the Opinion of thoſe who make the Nerves to come from the Heart. But the Conſequence is not juſt; for they who own the Heart as the Origin of the Nerves, do not, on that Account, look upon the Nerves as the Organs of Senſation. Beſides, it is poſſible, that neither the common Reading, nor that of *Foeſius*, may be good, and that we ought rather to read it *ἰνίας*, *habenas*, changing a Letter, which alters nothing in the antient Pronunciation. The laſt-nam'd Author tranſlates this Paſſage thus; "The Heart is "ſituated, as it were, in the Straights of a Paſſage, in order to "take hold of the Reins, for the Conduct and Management "of the whole Body. For this Reaſon the Seat of Senſation is "lodged about the Thorax or Breaſt, rather than in any other "Part. The Changes of Colour are, alſo, produced in the "Countenance, according as the Heart conſtricts or relaxes the "Veins; when it relaxes them, one becomes red, and aſſumes a "freſh lively Colour; when, on the contrary, it conſtricts them, "one becomes pale and livid."

ISADA. A Name by which the *Spaniards* and *Portugueſe* call the Lapis Nephriticus.

ISALE. The ſame as IXALE; which ſee.

ISAROS, ἴσαρος. A Name for the ARUM. *Oribaſii Collect. Medicin. Lib.* 11.

ISATIS.

The Characters are;

The Fruit is ſhap'd like a Tongue, broad, compreſs'd at the Edges, unicapſular, gaping two Ways, and containing a Seed, which is generally of an oblong Figure.

Boerhaave mentions three Species of this Plant; which are,

1. Iſatis; ſativa; ſive latifolia. *C. B. P.* 113. *Tourn. Inſt.* 211. *Boerh. Ind. A.* 2. 3. *Iſatis, Glaſtum*. Offic. *Iſatis, ſive Glaſtum*

ſum ſativum. J. B. 2. 909. *Glaſtum ſativum*. Ger. 394. Emac. 491. Park. Theat. 600. Raii Hiſt. 1. 842. Synop. 3. 307. WOAD. *Dale*.

The lower Leaves of Woad are large, long, and ſmooth, broadeſt and round-pointed toward the End, of a blueiſh-green Colour; the Stalks grow to be about a Yard high, thickly beſet with narrow ſharp-pointed Leaves, ſet on without Foot-ſtalks, and, as it were, encompaſſing them with two ſlender Auricles. The Flowers are numerous, growing on the Tops of the Stalks Umbel-faſhion, conſiſting of four ſmall yellow Leaves apiece; the Seed is long, ſlender, and flat, in Shape like the Seed of the Aſh-keys. The Root is thick and woody, ſinking deep in the Earth. It is found wild in divers Places, but is frequently ſown in the Fields for the Uſe of the Dyers, being the principal Ingredient they dye their Blues with. The antient *Britons* us'd to ſtain their Bodies with it, to make themſelves appear terrible.

Woad is reſtringent and drying, and ſometimes us'd to ſtop both inward and outward Bleedings: It is, alſo, applied, with good Succeſs, for Ruptures and Strains, and to ſtrengthen the Joints. It is an Ingredient in the *Emplaſtrum ad Heruiam*. *Miller's Bot. Off*.

Hippocrates, *Lib. de Ulceribus*, adviſes the Application of the bruis'd Leaves of Woad, together with Linſeed, by way of Cataplaſm, to Ulcers, when there is any Danger of an Eryſipelas; or a Cataplaſm of Linſeed, moiſten'd with the Juice of Woad.

It is eſteem'd an excellent Vulnerary.

2. Iſatis; ſylveſtris; vel anguſtifolia. C. B. P. 113.

Dr. *Wedel*, Profeſſor of Phyſic in the Univerſity of *Jena*, has obtain'd true volatile Salt from this Plant, only by Fermentation, without the Aſſiſtance of Fire. *Martyn's Tournefort*.

3. Iſatis; Dalmatica. *Bobart*. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 3.

ISATODES, ἰσατώδης. Of the Colour of Woad. This is us'd by *Hippocrates*, as an Epithet for Bile, and for Stools; and this Colour is a Sign of an extreme Malignity of the Bile.

ISCA, ἴσκα. A ſort of fungous Excreſcence, which adheres to the Oak and Hazel, and was employ'd as a Cautery by the Antients, as the Moderns uſe the Moxa.

ISCHÆMON, from ἴσχω, to reſtrain, and αἷμα, Blood. A Name for any Medicine which reſtrains or ſtops Bleeding.

ISCHAS. A dry'd Fig.

ISCHIAS, ISCHIADICUS, ἰσχιὰς, ἰσχιαδικὸς, have a phyſiological and pathological Signification: In the former Senſe the two crural Veins are call'd the Greater and Leſſer Iſchias. See VENA. Pathologically, *Iſchias*, and *Morbus Iſchiadicus*, ſignify a Diſeaſe, or Pain of the Hip, being a Species of Arthritis, ſeated in the Joint of the Hip. See SCIATICA.

Hence φθίσις ἰσχιαδικὴ, *Tabes Coxaria*, in *Hippocrates*, *Coac. Prænot.* is a Conſumption, or Waſting, of the Thigh, and Leg, from an Abſceſs, or Flux of Humours, fixed on the Hip.

ISCHIAS, in Botany, is a Name for the *Tithymalus*; *tuberoſa*; *pyriformi radice*.

ISCHIUM, ἰσχίον. The Name of a Bone, deſcrib'd under the Article INNOMINATA OSSA. But the Ligament which retains the Neck of the Femur in the Acetabulum, was, likewiſe, called *Iſchion*, by the Antients, according to *Heſychius*. And *Hippocrates*, in his Treatiſe *de Articulis*, ſeems to call the entire Articulation at the Hip, or, perhaps, the Head of the Femur, *Iſchion*.

ISCHNOPHONIA, ἰσχνοφωνία, from ἰσχνὸς, ſlender, and φωνὴ, the Voice. An Exility or Shrillneſs of Voice: But more frequently ſignifies a Heſitation of the Speech, or Stammering.

ISCHURETICA, according to *Blancard*, are Medicines which cure a Suppreſſion of Urine.

ISCHURIA, ἰσχυρία, from ἴσχω, to retain, and οὖρον, Urine. An Iſchury, or Suppreſſion of Urine. See the Articles CALCULUS, CATHETERISMUS, and URINA.

Women with Child are often troubled with an entire Suppreſſion of Urine, the moſt general Cauſes of which are Gravel and Stone; an Inflammation of the Neck of the Bladder, owing to violent Pains occaſioned by the Piles, or a Strangulation of the Neck of the Bladder betwixt the Os Pubis and Head of the Child, when it is ſunk down very low.

In the two firſt Caſes, general Remedies, as Bleeding, emollient Clyſters, and gentle Purges with ſoftening Decoctions, are of great Uſe; but nothing gives ſo ſpeedy a Relief as a Catheter. But when the Head of the Child is ſunk very low, and preſſed ſtrongly againſt the Os Pubis, the Catheter will not paſs; and then the Remedy is, to put back the Child's Head, which immediately gives Liberty to the Urine to come away without uſing the Catheter.

La Motte gives an Inſtance of a Woman's being greatly reliev'd in a Suppreſſion of Urine, caus'd by the Piles, by a Semicupium made of Marſhmallows, Mallows, Violet-leaves, and Chamomile, with an Addition of a ſmall Quantity of new Milk: In this the Woman ſat an Hour, Night and Morning, for two or three Days, in a Veſſel, contriv'd in ſuch a manner as her Legs were out of the Bath, whilſt ſhe was immerſed in it, above the lower Part of the Belly: But this was not done till after Bleeding, and ſome emollient Clyſters.

La Motte ſays, that ſuch a Bath hath ſucceeded ſeveral times in the ſame Caſe, and that there is no Danger of a Miſcarriage from its Uſe.

La Motte makes a Diſtinction betwixt a Suppreſſion and Retention of Urine. In a Retention of Urine the Patient has frequent Motions to make Water, without being able to do it. But in a total Suppreſſion of Urine the Patient has ſeldom or never any Inclination to make Water; but, if ſhe has any, does it in a Moment: And this laſt is much the moſt dangerous.

La Motte gives an Inſtance of a Woman, though not in Child-bed, who was ſeventeen Days without making a ſingle Drop of Water, or having any Inclination to it. On the 18th Day in the Morning ſhe diſcharged a great Quantity of Blood by the urinary Paſſages, which became more and more ſerous, till, at laſt, the Diſcharge was of Urine only, which continued three Hours; and after this ſhe ſoon recovered.

The METHOD *of diſcharging the* URINE, *by a* PUNCTURE *of the* BLADDER.

Heiſter ſays, that, by a Puncture of the Peritoneum, we mean a Paracenteſis of the Urethra and Bladder, for the Diſcharge of the Urine when it is ſuppreſſed. But, as this Perforation is made both in the Hypogaſtrium and Perinæum, it might, with more Propriety, be termed, *a Puncture of the Bladder*. An Operation of ſuch Conſequence, that if not ſeaſonably and dextrouſly performed, the Patient muſt inevitably periſh; but it is never undertaken, when Relief can be had from internal Medicines, or the Introduction of the Catheter. Now the Catheter cannot be introduced, 1. When the Neck of the Bladder is greatly inflamed; for that ſometimes contracts the Urethra ſo cloſely, that this Inſtrument cannot poſſibly be paſſed through it; and Violence not only increaſes the Inflammation and Pain, but ſometimes bruiſes the Part, and induces a Sphacelus, with conſequent Death. 2. A Caruncle, Cicatrix, or hard Tubercle, may obſtruct the Paſſage. 3. The Introduction of the Catheter in old Men is ſometimes impracticable, from the Stricture, Shrinking, or Wrinkles of the Urethra. 4. From the Diſtention of its ſpongy Subſtance with Blood. 5. From a Scirrhoſity, or preternatural Tumor of the Proſtate Gland, which Caſe occurred to *Morgagni*, *Colot*, and once to myſelf, ſays *Heiſter*, in a Man at *Helmſtadt*. Laſtly, From a Stone lodged in the Neck of the Bladder. Upon theſe, and other ſuch Occaſions, immediate recourſe muſt be had to this Operation, or the Patient will certainly periſh.

We will now give a ſuccinct Account of the ſeveral Methods of this Operation. *Launay* adviſes to place the Patient as for Lithotomy; then to introduce a grooved Catheter into the Bladder; and, next, to make an Inciſion in the Perinæum, cutting through the Urethra into the Groove; after which, he paſſes a Gorget through the Groove of the ſame Catheter; and then, he ſays, the Urine will diſcharge itſelf. But *Launay* immediately forgets, that this Paracenteſis is only neceſſary when the Catheter cannot be conveyed into the Bladder.

We will proceed, therefore, to others. The firſt and moſt common Practice, both among the Antients and the Moderns, is to place the Patient on a Bed, or Table, and ſecure him by Aſſiſtants, as in cutting for the Stone; then the Operator makes an Inciſion on the Left Side of the Suture of the Perinæum, into the Bladder, with a ſmall double-edged Knife (ſee *Tab.* XXII. *Let.* I). An Efflux of the Urine will convince him, that he has entered that Receptacle; but he ſhould not draw out his Knife, before he has introduced a Probe by the Side of it; then, extracting his Knife by the Side of that Probe, he muſt convey a Silver Tube, about four Inches long, (ſee *Tab.* XXIII. *Let.* P; or *Tab.* XLV. *Fig.* 3. or *Tab.* LIII. *Fig.* 4.) into the Bladder, which muſt be there ſecured by a flat Bandage carried round the Hips; and, after the Urine is diſcharged, be ſtopt with a Tent, to prevent a continual Efflux. This Tent muſt be taken out when the Patient would make Water, and then inſerted again. This muſt be continued, till the Inflammation, or other Diſorders, are removed. But, indeed, the Method ſeems dangerous and cruel, becauſe by thus unneceſſarily wounding the Neck of the Bladder, and the Urethra, the Inflammation is generally increaſed, and the ſeminal Ducts in the Proſtatæ very much injured.

I would, therefore, recommend an Inciſion in the ſame Part of the Perinæum, and with the ſame Inſtruments as in the Apparatus minor, or the lateral Method, cutting into the Body of the Bladder, without injuring its Neck; after which, a Silver Tube may be introduced. For this neither injures the Sphincter of the Bladder, nor Urethra, nor increaſes the Inflammation, and the Wound heals with more Eaſe and Expedition.

But there is a third Method, preferable to either of the preceding, where the Perforation is made in the ſame Part, as in the ſecond, but with the Trochar and Cannula (*Tab.* L. *Fig.* 3.) inſtead of the Inciſion-knife. When this Inſtrument has been

Paſſed into the Bladder, the Perforator is extracted, but the *Cannula* remains there, for the more ready Diſcharge of the Urine; by which means both the Operation and Cure are greatly facilitated. Nor is it improper to paſs one or two Fingers into the Anus, for the better Direction of the Inſtrument into the Bladder, and the Preſervation of the Rectum. *Garengeot* affirms, that nobody has wrote any thing concerning this Method; whereas *Riolanus* has propoſed a *Paracenteſis* either in the *Hypogaſtrium*, or *Perinæum*, when the Knife ſhould be forced laterally into the Bladder, till the Urine flowed: By this, he ſays, he has freed many from the moſt imminent Danger. *Thevenin*, likewiſe, propoſed the ſame Puncture, though with a Knife, till the Urine followed. And I myſelf, ſays *Heiſter*, *Dionis*, and *Tolet*, have recommended this Practice; and *Morand*, in the Memoirs of the *Royal Academy of Sciences*, informs us, that *Chirac* preferred this to the ordinary Method.

Denys, a Lithotomiſt of *Leyden*, obſerving, that the Surgeon might thruſt the Perforator too far, and incautiouſly wound the oppoſite Side of the Bladder, for want of knowing exactly when it was perforated, has contrived a Needle of another ſort, (ſee *Tab.* LIII. *Fig.* 3, 4, 5.) incloſed in a ſilver Tube (*Fig.* 3, 4.). In the upper Part A A, are three Apertures, one of which is not ſeen in that Poſition; there are as many too in the lower B B, which are conceal'd (in *Fig.* 3.) by the Plate C C; but in *Fig.* 5. which repreſents the *Perforator* out of its *Cannula*, we may obſerve, that it is made like other Perforators, round below the triangular Point; but from D D, to the Beginning of its Handle E E, it is triangular, with three excavated Sides, which Sides of the Triangle D E ſhould correſpond with the Apertures of the Cannula, when the Perforator is thruſt into it. Thus, as ſoon as the Inſtrument enters the Bladder, the Urine flows through the upper Apertures A A, into the lower ones, and gives ſpeedy Intelligence of the Perforation; after which the Perforator is extracted, and the Urine diſcharged through the Tube ſtill remaining there.

Some Authors, as *Tolet* and *Colot*, propoſe another Method of perforating the Bladder, much like that in the *Apparatus major*. Having diſpoſed the Patient properly, they paſs a grooved *Catheter* into the *Urethra*, till it meets with the Obſtacle, which is generally near the Neck of the Bladder; then they make an Inciſion into the *Urethra* through the ſame Part of the *Perinæum*, as in the *Apparatus major*, till the Point of the Knife reaches the Grove of the *Catheter*, but the Wound is not ſo large, as in Lithotomy: Thus of a Male they make a kind of Female Urethra; after which they paſs a Conductor thro' this ſhort Paſſage into the Bladder, and the Urine flows out. When the Urine is diſcharged, they convey a Tube through the Groove of the Conductor, and proceed as before. Both theſe Authors affirm, that this Diviſion of the Urethra ſo near the Sphincter, relaxes that, and the *Proſtatæ*, to ſuch a Degree, that not only a Catheter, but a grooved Conductor, may be introduced; and *Colot* mentions many Patients, whom he has cured by this Practice, of Ulcers and Excreſcencies of the Bladder, as well as a Suppreſſion of Urine. I muſt, however, think the Methods propoſed above more ſafe and eaſy, for the Cure of a ſimple *Iſchury*, becauſe, paſſing Inſtruments through the contracted Neck of the Bladder, muſt occaſion greater Pain, than a Perforation of the Receptacle itſelf.

But, in my Opinion, the moſt ready Method is, to proceed as in the high Operation for the Stone. The Perforator and Cannula is paſſed into the anterior Part of the Bladder, immediately above the Juncture of the Oſſa Pubis; then the former is extracted, and the latter remains, for the Diſcharge of the Urine, ſecured by a Bandage round the Body, that the Patient may, at Pleaſure, retain or diſcharge his Urine, till the Cauſe is removed; then the Tube may be extracted, and the Wound healed by the Application of Balſam of *Capivi*, and over this Lint, and a proper Plaiſter. Though this is ſeldom practiſed, I muſt, when nothing extraordinary forbids it, with *Roſſet*, *Riolanus*, and *Tolet*, recommend it as very neceſſary, ſince it appears from anatomical Experiments, that the Bladder, diſtended with Wind or Water, may be thus ſafely perforated, and that it has been done by *Turbier*, *Meri*, *Douglas*, and *Middleton*.

When the Cauſe cannot be removed, in a Perſon advanced in Years, or when it proceeds from a *Callus* of the Bladder or Urethra, a Scirrhus of the Proſtate, a large Stone, a paralytic Bladder, or ſome other obſtinate Diſorder, the Patient ſhould always wear this Pipe, made to cloſe with a Screw, that the Urine may not come away from him inceſſantly. But when it ariſes only from a Caruncle, or ſmall Cicatrix, after the Operation, the Obſtacle ſhould be removed, and the Wound healed, as in Lithotomy. When it is cauſed by a *Fungus*, or putrid Excreſcences, in the Bladder, they are often removed by ſuppurating and deterging Injections. Laſtly, if the Neck of the Bladder is ſo violently inflamed, as to obſtruct the natural Paſſage of the Urine, it will be proper, after the Operation, to bleed the Patient, and then adminiſter Clyſters, and to apply diſcutient Cataplaſms to the Region of the Bladder, with cooling, internal Medicines, in order to diſperſe the Inflammation and Tumor; and, unleſs this is effected before the third Day, the Patient is ſeldom cured.

A Suppreſſion of Urine is ſometimes accompanied with a violent Inflammation of the *Scrotum*, which frequently turns to a large Abſceſs or Gangrene, as *Colot* obſerves. In theſe Caſes, he practiſes the Puncture of the *Perinæum*, and then a Diviſion of the *Scrotum*, down to the Teſticles, where the Gangrene is, that no Blood may be left there, which may excite a farther Putrefaction; after that, the injured Parts muſt be treated with Digeſtives and Balſamics. During the Cure, he retains a ſilver Cannula in the Urethra, to prevent any Urine from eſcaping, which would increaſe the Diſorder. But where the Urethra is callous, and very much contracted, ſo that a Catheter cannot be introduced, he makes an Inciſion through the *Perinæum*, without it; then paſſes a Probe through the Neck into the Body of the Bladder, lacerates the Callus, forms a large Suppuration, which ſeparates the Callus, and reſtores the Parts to their former State. If any *Fiſtula* remains in the *Perinæum*, he applies the actual Cautery. But if this Method is not proſecuted in time, the Patient will be too weak to leave any Hopes of Succeſs.

ISICOS, ἰσικός. A ſort of Sauſage, deſcribed by *Apicius*, L. 2. C. 1. It is called ἰσίκιον by *Athenæus*, and ἰσυκὸν by *Trallian*. It is ſaid to have been invented by *Heliogabalus*.

ISIR, or IXIR. An *Elixir*.

ISIS. A Goddeſs of the antient *Egyptians*, reported by *Diodorus Siculus*, to have invented many excellent Medicines; and hence, he ſays, after ſhe was received among the Number of the Deities, ſhe was applied to for the Cure of Diſtempers; and frequently indicated Remedies by Dreams. *Galen*, *de Comp. Medic. p. g.* L. 2. C. 18. and L. 5. *Cap.* 2. and 3. takes notice of ſome Plaiſters, which bear her Name. See, alſo, *Scribonius Largus*, *Num.* 26. and *Paulus Ægineta*. L. 7. C. 17.

ISOCHRYSON, ἰσόχρυσον. A pompous Title of a Collyrium, in *Galen*, *Lib. de Comp. Medic.* 1. L. 4. C. 7. It imports, worth its Weight in Gold. *Iſochryſon* is, alſo, the Name of a chymical Compoſition mentioned by *Libavius*, conſiſting of equal Parts of Martial Regulus of Antimony, and Quick-ſilver.

ISOCRATES, ἰσοκρατὲς, from ἴσος, equal, and κεράννυμι, to mix. An Epithet of Wine, importing its being mixed with an equal Quantity of Water. *Hippocrates*, L. 2. *de Morbis*.

ISOMOERIA, ἰσομοιρὴν, in *Hippocrates*, *de Aere*, *Locis*, & *Aquis*, ſeems to import an Equability of the Seaſons.

ISOPYRON, according to *Gerard*, is the *Trifolium Paludoſum*; according to *Blancard*, the *Aquilegia*, or the *Flos Conſtantinopolitanus*.

ISORA-MUNE. H. M. The Name of a Tree which grows in *Malabar*. The Juice of the Root is eſteem'd excellent in an *Empyema*, and Diſorders of the Breaſt, even applied externally; and it is accounted good for Eruptions and Whitloes.

ISORRHOPOS, ἰσόῤῥοπος. Equiponderated, or equilibrated; ſpoken when one Part is equal in Weight to another.

ISOSTATHMOS, ἰσόσταθμος. The Name of a Bechic Medicine in *Aetius*, *Tetrabib.* 2. *Serm.* 4.

ISOTHEOS, ἰσόθεος. Divine. A pompous Epithet for many Medicines deſcribed by *Galen*, *Aetius*, and *Paulus Ægineta*.

ISPIDA. The ALCEDO.

ISTHMION, ἰσθμιον. This is defin'd, the narrow Paſſage betwixt the Mouth and Gullet. The Fauces.

ISTHMOS, ἰσθμός. The ſame as ISTHMION.

ITALICUM *Emplaſtrum*. A Plaiſter deſcribed by *Paulus Ægineta*, L. 7. C. 17. *Italicus* is, alſo, an Epithet for a nervous Balſam, deſcribed by *La Mort. Pharm. Med. Phyſ.* C. 29.

ITEA. The *Salix*, Willow. *Aetius*, *Tetrab.* 1. *Serm.* 1.

ITHAGENES, ἰθαγενὴς, from ἰθὺς, for ἐυθὺς, right, and γένος, Kind. Legitimate, true, or genuine. It is uſed by *Hippocrates*, relative to a Conception, by way of Diſtinction from a falſe Conception, or *Mola*.

ITHYCYPHOS, ἰθύκυφος, from ἰθὺς, for ἐυθὺς, right, ſtrait, and κύφος, gibbous, imports a Perverſion from Straitneſs to Gibboſity. Thus ἰθυκύφη ῥάχις, *Hippocr. de Artic.* is the Spine of the Back, elevated from its natural Rectitude into a gibbous Form. *Foeſius*.

ITHYLORDOS, ἰθύλορδος, from ἰθὺς, ſtrait, direct, and λορδὸς, incurvated, inflected, or bent inward, ſignifies perverted in a ſtrait Courſe or Proceſs, and depreſſed inwards to a Figure oppoſite to the gibbous one, expreſſed by the preceding Word. To this Purpoſe *Galen*, *Com. in Lib. de Articulis*, ſays, that, if the Parts deviate backwards, it is called CYPHOSIS; if forwards, LORDOSIS; if ſideways or obliquely, SCHOLIOSIS. See thoſe three Articles. *Foeſius*.

ITHYORIA, ἰθυωρία, *Ionice* ἰθυωρίη, from ἰθύω, to go ſtrait forwards, is a Proceſs or Direction in a ſtrait Line, and applied, *Lib. de Fract.* to the Bones.

ITHYSCOLIOS, ἰθυσκόλιος, from ἰθὺς, ſtrait, and σκολιὸς, oblique, imports a Deviation from a ſtrait to an oblique or ſideway Courſe or Proceſs. Thus ἰθυσκόλιος ἡ ῥάχις, in *Hippocrates*, is an oblique and incurvated Spine, that is, as *Galen. Com.* 3. in *Lib. de Artic.* explains it, διαστροφὴ εἰς τοὐπίσω καὶ πρόσω, "a Perverſion to the anterior and poſterior Parts." *Foeſius*.

ITHYTRICHES, ἰθύτριχες, from ἰθύς for ἰυθύς, ſtrait, and θρὶξ, Hair, in *6 Epid. Sect.* 7. *Aph.* 1. are thoſe who have ſtrait Hair, and are oppoſed to the ἀλύτριχες, or *Iuli*, or thoſe with criſped or curled Hair, in *Ariſtot. Probl.* It, alſo, ſometimes imports black Hair.

ITINERARIUM. A Staff, uſed in cutting for the Stone, is thus called by *Hildanus*, in his Treatiſe *de Lithotomia, C.* 14, 15.

ITRION, ἴτριον. A ſort of ſweet Cake.

IVA ARTHRITICA. See CHAMÆPITYS.

IVA MOSCHATA. See CHAMÆPITYS.

IVABEBA, Piſon. The Name of an *American* Shrub, call'd, alſo, *Iva Braſilienſibus*. Margrav. *Solanum pomiferum Americanum non ſpinoſum lacteo flore*. The Root is eſteemed a great Deobſtruent, and particularly ſerviceable for abſterging the Kidnies; but, on account of its Bitterneſs, Decoctions of this Root have generally the *American* Liquorice added to them. *Raii Hiſt. Plant.*

IVA-PECANGA. A Name for the *Sarſaparilla*.

IVA-UMBU *Braſilienſibus* Marcgr. called alſo *Prunus Braſilienſis, fructu flavo, nucleo Amygdalæ ſapore*.

A Sort of *American* Plum-tree; the Fruit of which is eatable. *Raii Hiſt. Plant.*

JUBA, in Botany, is a Panicle, ſo called from its Reſemblance to a Horſe's Mane.

JUCAIA ARBOR. Niremberg. The Name of a Tree ſomewhat like the Pomegranate-tree. *Raii Hiſt. Plant.*

JUDÆI *Compoſitio*. The Name of an Eſcharotic deſcrib'd by *Celſus, L.* 5. *C.* 22.

JUDÆI *Emplaſtrum*. The Name of a Plaiſter deſcribed by *Celſus, L.* 5. *C.* 19. and of another deſcribed by *Aetius, Tetrab.* 4 *Serm.* 3. *C.* 14.

JUDAICA ARBOR. See SILIQUASTRUM.

JUDAICUM BITUMEN. See ASPHALTUS.

JUDAICUS LAPIS.

Lapis Judaicus. Offic. Schrod. 352. Calc. Muſ. 298. Kentm. 28. Boet. 408. De Laet. 136. Aldrov. Muſ. Metall. 711. Matth. 1386. Geſn. de Lap. 128. Charlt. Foſſ. 29. *Judaicus Lapis*. Worm. 69. Schw. 382. *Spinos Echini*. Woodw. Att. Tom. 2. P. II. page 19. JEWS STONE.

This is an oblong, roundiſh Stone, of the Figure of an Olive, marked with Streaks and Furrows, running from the Baſis to the Apex, according to its Length, at equal Diſtances from each other. It is of a whitiſh or aſh-colour, and ſhining within. It parts obliquely into thin Laminæ, and is given in Powder to the Quantity of a Dram, in any proper Vehicle. It was called *Lapis Judaicus*, or *Syriacus*, from the Countries where it is found. By others it is named *Euroius*, as being of a diuretic Virtue. This laſt Virtue I very much queſtion; but it is plain from Experience, that this Stone, the *Lapis Lyncis*, Crab's-eyes, and ſeveral other Things ſaid to have a Power of diſſolving the Stone, are really diuretic. But it cannot be concluded, that, becauſe oftentimes Gravel comes away with the Urine, therefore they have any lithontriptic Quality; for the fixed earthy Parts of theſe Stones, being mixed and incorporated with the Salts of the Fluids in the Body, become thereby more fixed, and more unfit to paſs off thro' the Pores of the Skin, but find their Way more eaſily thro' the Strainers of the Kidneys. Therefore the Secretion, by inſenſible Perſpiration, being leſſened, they are excreted in greater Quantities by Urine; and thereby whatever Saburra they find there, they waſh away; and hence the Urine becomes turbid, and is ſometimes mixed with Gravel, ſome Particles of which may be of a conſiderable Size, when the Paſſage is wide enough to tranſmit them. In this manner the diuretic Quality of theſe Stones may be accounted for; but neither Experience nor Reaſon give any Ground for attributing to them a lithontriptic Quality. *Geoffroy*.

Paulus Ægineta, Lib. 7. *Cap.* 11. calls this Stone *Tecolithos*; and hence an Antidote is named, deſcribed by the ſame Author, in the ſame Chapter. See ECHINUS OVARIUS.

JUDICATIO. The ſame as CRISIS; which ſee.

JUGALE OS, or *Zygoma*. The Name of a Bone in the Head. See CAPUT.

JUGALIS SUTURA. The ſagittal Suture is ſometimes thus called. The Suture, alſo, by which the *Os Jugale* is articulated to the Bone of the ſuperior Jaw, is ſo named.

JUGAMENTUM. The ſame as JUGALE Os.

JUGLANS. The Walnut. See NUX.

JUGULARIS *Vena*. The Jugular Vein. See VENA.

JUGULUM. The Throat, or anterior Part of the Neck. In *Celſus, L.* 8. *C.* 8. it ſignifies the Clavicle.

JUJUBA. See ZIZYPHUS.

From this Tree the Gum *Lacca* of the Shops is produced. The Leaves of this Tree are like thoſe of the Apple-tree, but hoary and woolly underneath, having Fruit like a Jujube, growing in Cluſters.

There are three kinds of Gum lac; Seed-lac, which is in ſmall, bright, reddiſh Grains; of this melted is made the Shell-lac, which is in flat, thin, tranſparent Pieces, of a reddiſh-brown Colour, and is the beſt Sort; the Stick-lac is what comes upon ſhort Sticks, which are covered over by it, and it is in its native State. *Garzias ab Horto*, and *Bontius*, believed, that Gum-lac was prepared by great winged Ants, which ſuck'd out the Materials from the Branches of this Tree, which they worked as the Bees do Honey; but others, to whom Mr. *Ray* aſſents, rather think, that it is an Exudation of the Sap of the Tree, inſpiſſated by the Sun; and to which the Ants, by their gnawing the Bark, may give the freer Vent.

Geoffroy calls it a kind of Gum Reſin, gather'd by Ants in the *Eaſt Indies* from Flowers, which they afterwards carry to the Branches of Trees to make their Neſts, in which they probably lay their Eggs; becauſe theſe Neſts are diſpoſed in Cells, in ſome of which a ſmall Grain is found, which is red when bruiſed, being the Worm out of which theſe winged Ants are afterwards formed. It is brought chiefly from the *Moluccas* Iſlands, and, alſo, from *Madagaſcar*.

Gum-lacca is accounted opening and attenuating, removing Obſtructions of the Liver and Spleen, and good for the Dropſy and Jaundice; it provokes Urine, cauſes Sweat, and purifies the Blood; but it is not much uſed in Medicines, greateſt Part being ſpent in making ſealing Wax, the fineſt of which is made of it.

TINCTURE OF GUM-LAC.

The Chymiſts obſerve, that certain Vegetables diſſolve with Difficulty in Alcohol; yet, being diſſolved therein, ſometimes afford great medicinal Virtues. Such Medicines are Dragon's-blood, Gum-juniper, Gum-lac, and Myrrh, which are found of a very tenacious Hardneſs, that will not eaſily admit a Diſſolution of their Parts; which have, therefore, been attempted various Ways, the moſt commodious of which is the following.

Gum-lac is brought to us from *Aſia*, and is a kind of Roſin, collected from the Trees by the Ants, in great Quantities, in the Iſland of *Ceylon*, whence the beſt is brought, with which they build their Neſts.

Take of this pure Gum, reduce it to fine Powder, and moiſten it with the Oil of Tartar *per Deliquium*, ſo as to make it into a ſoft Paſte, which, being put into a round urinal Glaſs, is to be ſet in a Furnace, with Heat ſufficient to dry the Maſs gradually. Then take out the Urinal, and leave it in the open Air, without Fire, where the alcaline Oil will again reſolve; after which it is to be dried a ſecond time in the Furnace; and thus, by repeating the Liquefaction, and the drying alternately, the glaſſy Tenacity of the Gum will be broke, and reſolved into a Liquor of an elegant purple Colour. Now let it again be gently dried, and carefully taken out of the Glaſs, as being thus prepared for affording a Tincture with *Alcohol*. Put the Matter into a tall chymical Glaſs, and pour upon it pure *Alcohol*, enough to float three or four Inches above it; ſtop the Glaſs with Paper, and ſet it in the ſame Furnace, that it may ſimmer two or three Hours, which may be done without Danger of loſing the *Alcohol*, by reaſon of the long and ſlender Neck of the Glaſs. Let the Liquor cool, and pour off the clear Tincture, by a gentle Inclination of the Veſſel, into another Glaſs, which is to be well ſtopped. The Remainder may be treated in the ſame manner with more *Alcohol*, and the Tincture poured to the former, till the Matter, by boiling, will no longer tinge the *Alcohol*; and then the Matter is exhauſted. The ſeveral Tinctures, being put together, and purified from their Fæces by ſtanding, are to be diſtilled by a very gentle Fire, in a glaſs Body, till one half of the *Alcohol* is come over: The Remainder, being thus thickened, is to be kept for Uſe, under the Title of Tincture of Gum-lac.

REMARKS.

Hence we ſee, that an Alcali, with the Air, and a digeſting Heat, opens a denſe Body, ſo as to make it give out its Virtue to Alcohol; and the Reciprocation of drying by the Fire, and moiſtening by the Air, penetrates to the uttermoſt Parts, though there always remain ſome fixed Parts in theſe Subſtances, incapable of being diſſolved by the Repetition of this Action: Whence the Menſtruum extracts the more active Virtue of ſuch Subſtances, leaving the groſſer, leſs active Matter behind. And hence we have an effectual, expeditious, commodious, and almoſt an univerſal Method, of preparing excellent

excellent Tinctures; the general Virtues of which depend upon the preſiding Spirit, ſecretly lodged in theſe Subſtances, and that often wonderfully contains their peculiar Virtues; again, upon a rich balſamic Part preſiding in the ſame; and, laſtly, upon a corroborating reſinous Part, which they generally hold; and theſe are added to the Virtue of the Menſtruum, or Alcohol. Hence, in general, all theſe Tinctures may be pronounced heating and exciting to the Nerves and Spirits; drying, preſervative, ſtrengthening, and conſtringent to the Veſſels. But the preſent particular Tincture of Gum-lac is of great Virtue in curing the Diſorders of the Gums, Mouth, and Teeth; in the Scurvy, being frequently uſed, by rubbing it on the Parts; and, taken internally, it has the ſame Virtue, and ſafely cures that Diſorder, if not attended with too much Heat: It is, alſo, of great Uſe in the Gout, the Rheumatiſm, and the Scurvy from a ſluggiſh Cauſe, as, alſo, a Leucophlegmatia, Dropſy, or the like: It may be taken, thrice a Day, in *Spaniſh* or *Canary* Wine, after the Stomach has been firſt cleanſed and emptied: It has a grateful Odour and Bitterneſs, with an agreeable Aſtringency, that ſhews its ſtrengthening Virtue, and is therefore highly commended in the Cure of the Fluor albus. *Boerh. Chem.*

JUJUBA SILVESTRIS. See PALIURUS.

JULAP, JULAPIUM, JULEB, and JULEPUS, all ſignify what is now called, in the Shops, a *Julap*. This is an alterative Medicine, unknown to the antient *Greeks*, and invented by the *Arabians*: It was ſo called becauſe uſually prepared of delicate and ſweet Ingredients, or at leaſt with Sugar, the Word *Julep*, or *Juleb*, in the *Perſian* Language, ſignifying *a ſweet Potion*. In Imitation of the *Arabians*, the *Greeks* of the latter Ages called this Form of Medicine ζυλάπιον, *Zulapium*, others ἰολάβιον, *iolabium*, which Names are ſtill uſed by Phyſicians. We meet with two Sorts of *Julap* in Authors, one aſcribed to the Antients, the other in Uſe among the Moderns.

The Julap of the Antients was very different from that of the Moderns; it was a ſimple Syrup, conſiſting properly of the Juice, diſtilled Water, Infuſion, or Decoction of one Thing only, ſweeten'd with Sugar, and only prepared, for the moſt part, when there was inſtant Occaſion for it: Of this Kind was the *Julap Roſatus*, otherwiſe called *Alexandrinus*, and *Regius*, formerly in great Requeſt, and a very elegant and proper Medicine for allaying Heat and Thirſt.

But *Julap* is, alſo, a Name for what the moſt modern Writers have called *Syrupus*, and *Serapium*, as is uſual among the modern *Italians*; perhaps, becauſe a Syrup is the Baſis of a Julap: At *Montpelier* they ſtill keep to the old Name *Julepus*.

A Julap then is a liquid Medicine, compoſed of ſome proper Liquor, and a Syrup, or ſometimes Sugar, of extemporaneous Preparation, without Decoction, divided into three or four Doſes, and deſigned for the Concoction or Alteration of the Humours, or reſtoring the Strength.

Hence this alterative Medicine may be diſtinguiſhed into two Sorts: The firſt of theſe prepares the Humours, or concocts them, in order to their Evacuation; and this was what the antient *Greeks* called προποτισμὸς, [*Propotiſmus*] a precurſory or preparatory Potion, in order to an univerſal Purgation; and therefore properly called, alſo, a concoctive or digeſtive Potion. The other Sort of *Julap* is deſigned for producing an Alteration in the Humours, Spirits, and other Parts of the Body, without ſerving any cathartic Purpoſe; ſuch are thoſe we call ſtrengthening and cordial Julaps, and the like. *Morelli Formulæ Remediorum.*

JULIA. The ſame as IULIS.

JULIANI ANTIDOTUS. The Name for an Antidote, deſcribed by *Aetius*, *Tetr.* 3. *Serm.* 3. *Cap.* 22.

IULIS. Offic. Salv. de Aquat. 219. Rondel. de Piſc. 1. 180. Aldrov. de Piſc. 37. Geſn. de Aquat. 464. Bellon. de Aquat. 254. Jonſ. de Piſc. 28. Charlt. Piſc. 14. Raii Icht. 324. Ejuſd. Synop. Piſc. 138. THE RAINBOW-FISH.

This Fiſh is frequently found about *Genoa*. The Broth thereof looſens the Belly, and is diuretic. *Pliny*. *Oribaſius*, *Medic. Collect. Lib.* 2. *Cap.* 49. eſteems this Fiſh as good Food.

JULIUS BASSUS. The Name of an antient Phyſician, from whom two Medicines for the Colic are quoted by *Marcellus Empiricus*, *Cap.* 29.

IULUS. Offic. Mouff. Inſect. 201. Charlt. Exer. 51. Jonſ. de Inſect. 128. Aldrov. de Inſect. 633. Mer. Pin. 205. *Iulus quartus*, *glaber*. Raii Inſect. 46. THE GALLY-WORM.

This is a terreſtrial Inſect, furniſh'd with many Annuli, or Rings, and creeping on many Legs, and rolling itſelf up, when touched. It is common in Gardens. *Charlton* recommends it, taken in Wine, againſt the Jaundice and Difficulty of Urine. *Dale*.

IULUS, in Botany, is a Katkin: It is an Aggregate of Summits, hanging down in Form of a Rope, or Cat's Tail; as in the Sallow, Haſel, Birch, and others.

JUMNISUM. Ferment. *Rulandus*.

JUNCAGO. See JUNCUS.

JUNCARIA, J. B. *Juncaria Salmaticenſis*. Cluſ. Hiſp. *Juncaria*. Tab. *Rubia latifolia aſpera*. C. B. *Sinanchicæ Species*. Lugd. ITALIAN RUSHY HORSE-TAIL.

It is eſteem'd vulnerary, deterſive, and aperitive; but is ſeldom uſed in Medicine. *Lemery des Drogues.*

JUNCTURA. A Joint, or Articulation.

JUNCUS. The Ruſh.

There are a great many Species of the Ruſh in Botanical Authors, none of which are uſed in Medicine, except the four following; which are,

1. Juncus; lævis; paniculâ ſparſâ; major. *C. B. P.* 12. *Theat.* 182. *Park. Theat.* 1191. *Boerh. Ind. alt.* 2. 163. *Tourn. Inſt.* 246. *Juncus vulgaris*. Offic. *Juncus lævis*. Ger. Emac. 39. *Juncus lævis vulgaris*, *paniculâ ſparſâ noſtras*. Raii Hiſt. 2. 1304. Synop. 3. 432. *Juncus paniculâ arundinaceâ*. J. B. 2. 520. COMMON SOFT RUSH.

2. Juncus; acutus capitulis Sorghi. *C. B. P.* 11. *Theat.* 173. *Raii Hiſt. Plant.* 2. 1302. *Synop.* 3. 431. *Tourn. Inſt.* 247. *Boerh. Ind. A.* 2. 163. *Oxyſchœnos*. Offic. *Juncus pungens*, *ſive Juncus acutus capitulis Sorghi*. J. B. 2. 520. *Juncus maritimus capitulis Sorghi*. Park. Theat. 1192. PRICKING LARGE SEA RUSH. It grows in maritime Places. The whole Herb and Seed are uſed, and agrees in Virtues with the *Juncus aquaticus maximus*.

3. Juncus; aquaticus; maximus. *Ger.* 31. *Emac.* 35. *Raii Hiſt. Plant.* 2. 1304. *Boerh. Ind. A.* 2. 64. *Holoſchœnos*. Offic. *Juncus lævis maximus*. Park. Theat. 1191. *Juncus maximus*, *Holoſchœnos*. J. B. 2. 525. *Juncus maximus*, *ſive Scirpus*. C. B. P. 12. Theat. 178. *Scirpus paluſtris altiſſimus*. Tourn. Inſt. 528. BULRUSH.

The Seeds of this and the two preceding, roaſted, ſtop a Diarrhœa, and Floodings in Women. *Dioſcorides* recommends the young Shoots, as a good Topic for rubbing the Wounds made by venomous Spiders.

4. Gramen; junceum; ſpicatum; ſeu Triglochin. *C. B. P.* 6. *Theat.* 85. *Gramen Triglochin*. J. B. 2. 508.

It is deterſive, and operates by Urine; but binds the Belly. *Lemery des Drogues.*

JUNCUS ODORATUS. See SCHOENANTHUS.

JUNIPAPPEEYWA. A Name for the JANIPABA.

JUNIPERINUM VINUM. Wine impregnated with Juniper-berries. *Dioſcoridet*, *Lib.* 5. *Cap.* 46.

JUNIPERUS.

The Characters, according to *Miller*, are;

The Leaves are long, narrow, and prickly. The Male Flowers are, in ſome Species, produced at remote Diſtances from the Fruit on the ſame Tree; but, in other Species, they are produc'd on different Trees from the Fruit. The Fruit is a ſoft, pulpy Berry, containing three Seeds in each.

Boerhaave mentions ſix Species of this Plant; which are,

1. Juniperus; vulgaris; fruticoſa. *C. B. P.* 488. *Tourn. Inſt.* 388. *Boerh. Ind. A.* 2. 108. *Juniperus*. Offic. Ger. 1189. Emac. 1372. *Juniperus vulgaris*. Park. Theat. 1028. *Juniperus vulgaris baccis parvis purpureis*. J. B. 1. 203. Raii Hiſt. 2. 1411. Synop. 3. 444. THE JUNIPER-TREE, or BUSH.

This ſeldom grows, with us, to be bigger than a Buſh, or Shrub, though, in ſome foreign Countries, as *Norway* particularly, it grows to a pretty large Tree; the Branches are thick ſet, with narrow, ſtiff Leaves, of a blueiſh-green Colour, ſharp and prickly at the Ends. The Flowers are ſmall, moſſy, and ſtaminous. The Berries are round, green for the firſt Year, and afterwards of a dark-purple, or black Colour, each Berry containing three corner'd Seeds. It grows upon Heaths, in ſeveral Counties in *England*; the Fruit is ripe about *Michaelmas*. The Wood, the Berries, and the Gum, are uſed.

The Wood is hot, dry, and cephalic, good to burn in Times of Peſtilence, and contagious Diſtempers. The Berries are carminative and diuretic, expel Wind, help the Colic, and are very uſeful againſt the Stone, Gravel, and Stoppage of Urine; and are commended, by ſome, in all contagious, peſtilential Fevers, and the Plague itſelf. The Gum, which is the *Sandaracha* of the *Arabians*, is yellowiſh, clear, almoſt pellucid, like Maſtich, but yellower, and in larger Drops, of a leſs grateful Smell; it is uſed to be burnt upon Coals, and the Fume to be received by thoſe who are troubled with Catarrhs, and ſerous Defluxions upon the Noſe and Eyes.

Officinal Preparations are only the diſtil'd Oil. See OLEUM. *Miller's Bot. Off.*

Its Salt has ſome Reſemblance to that called by *Angelus Sala*, *Oxyſal Diaphoreticum*, being a fix'd Salt, loaded with a great deal more Acid than is neceſſary to ſaturate it.

Thus, by the chymical Analyſis, we obtain from Juniper ſeveral acid Liquors, and a fix'd, but no volatile Salt. We muſt obſerve, that the Salt of this Plant is involved in a great Quantity of Sulphur, and ſome terreſtrial Parts: Juniper-wood yields, beſides the ethereal Oil, a great deal of Oil, thicken'd to the Conſiſtence of Syrup: Its Berries yield a great deal more, and its Top a little leſs: To extract all theſe Subſtances from the Juniper, they muſt be carefully ſeparated in the *Analyſis*; otherwiſe

wiſe their Mixture produces, at firſt, an ardent and urinous Spirit; after which the Oil forſakes the Fæces: It is no hard Matter to perceive, that all theſe Principles ſhould render the Juniper good to reſtore the Functions of the Stomach, to diſſipate Wind, and Matters which cauſe acute Pains, to clear the Lungs, and evacuate that groſs Lymph which often occaſions Difficulty of Breathing. This Plant is, alſo, ſudorific, cephalic, and antihyſteric; it provokes the Menſes, takes away Obſtructions of the Bowels, reſtores their Elaſticity, and gives a free Paſſage to the Urine. They make uſe of the Wood, the Tops, and the Berries. The Decoction of the Wood volatilizes the Blood, and purifies it by inſenſible Tranſpiration, much after the manner of Guaiacum. A *Semicupium*, prepar'd with this Wood, gives great Eaſe to thoſe who are troubled with the Gout; the Wine, in which the Tops of Juniper have been boiled, is very diuretic. *Tragus*, *Matthiolus*, *Hartman*, and *Simon Paulli*, affirm, that they have cured ſome Perſons of the Dropſy by the Uſe of this Wine. I have ſeen ſome very much eaſed by Pills made with two Parts of Aloes, and one Part of Juniper-berries. They draw from theſe Berries an ardent Spirit, a Tincture, an Elixir, and an Extract; they prepare with it, alſo, a Ratifia, and a ſort of Honey: The Tincture is made by the Infuſion of theſe Berries in their ardent Spirit: The Infuſion of the ſame Berries in their Spirit, or common Water, and evaporated to the Conſiſtence of Honey, is called the Elixir or Extract of Juniper. The Honey of Juniper is only the Berries boil'd with Honey. It is good in Clyſters, for the Dyſentery and Teneſmus. The Ratifia is only an Infuſion of the Juniper-berries in Brandy or Champaign, with the Addition of a little Sugar, and ſome Cinnamon. The Pulp of theſe Berries, cleared from the Seeds, and work'd up with ſome Sugar, makes a Conſerve not inferior to the Preparations juſt now mentioned. Laſtly, they burn the Fruit of this Plant to remove a peſtilent Air. It is infuſed in Vinegar in time of the Plague, to waſh Letters, Linen, and the very Utenſils, with it. We have no Plant, in *Europe*, that is of greater Uſe: It is uſed in the *Elixir Vitæ* of *Fioraventi*, in the *Elixir de Tribus*, in the peſtilential Elixir of *Sennertus*, and in that which *Zwelfer* calls the *Aſthmatic Elixir*. *Martyn's Tournefort.*

The Whole of the Juniper-tree is poſſeſſed of a medicinal Quality, becauſe the Whole of it is balſamic. Its Wood is ſo far from being inferior to the exotic Woods, *Guaiacum* and *Saſſafras*, that it may not only be commodiouſly uſed as a Succedaneum to them, but is, in my Opinion, ſays F. *Hoffman*, preferable to them, in all Diſorders ariſing from an impure State of the Humours. Its Berries, in conſequence of the large Quantity of balſamic Oil which they contain, whether uſed in Subſtance, reduced to a Rob, or toaſted, and uſed with Water, by way of Coffee, are highly efficacious againſt all thoſe Diſeaſes which ariſe from Obſtructions of the Viſcera, or a thick and viſcid Condition of the Blood; for which Reaſon they are of great Service in Aſthmas, Cachexies, the Jaundice, the Colic, the Stone of the Bladder and Kidneys, as, alſo, in Crudities of the Stomach. Some Phyſicians, of no inconſiderable Characters, inform us, that large Numbers of dropſical Patients have been cured by a *Lixivium* of the Aſhes of this Tree, exhibited in Wine. *Hoffman de Præſtantia Remed. Domeſt.*

2. Juniperus; vulgaris; Arbor. *C. B. P.* 488.

3. Juniperus; Bermudiana. *H. L.* 345.

4. Juniperus; Virginiana. *H. L.* 345.

5. Juniperus; Virginiana; foliis inferioribus Juniperinis, ſuperioribus Sabinam, vel Cypreſſum, referentibus.

6. Juniperus; Virginiana; Ramis intortis, pendulis, expanſis; folio toto Juniperino. *Boerh. Ind. alt. Plant. Vol. 2. p.* 208.

Beſides the foregoing Species of *Juniperus*, *Dale* mentions the two following; which are,

1. *Juniperus major.* Offic. *Juniperus major baccâ cæruleâ.* C. B. P. 498. Tourn. Inſt. 389. Raii Hiſt. 2. 1416. *Juniperus maxima.* Ger. 1189. Emac. 1372. *Juniperus maxima Illyrica.* Park. Theat. 1029. J. B. 1. 300. THE BLACK JUNIPER.

It grows in *Greece*; the Wood and Berries are uſed, and agree in Virtues with the *Juniperus*; *vulgaris*; *fruticoſa*. *Dale.*

2. *Juniperus Alpina.* J. B. 1. 301. Raii Hiſt. 2. 1413. Synop. 444. Park. Theat. 1028. *Juniperus Alpina minor.* Ger. Emac. 1372. *Juniperus minor montana, folio latiore, fructuque longiore.* C. B. P. 489. Tourn. Inſt. 389. DWARF JUNIPER, WILD SAVINE.

It grows upon Mountains: The Herb is uſed: A Decoction of its Tops, or its expreſſed Juice, are ſaid to be good for deſtroying that Species of Vermin called *Bots*, which are ſometimes lodged in the Stomach and Inteſtines of Horſes. *Dale.*

Miller, beſides the foregoing Species of *Juniper*, enumerates ſix more.

JUNIUS CRISPUS. The Name of a Phyſician quoted by *Marcellus Empiricus*, *Cap.* 23. as the Author of a Medicine, which he calls *Ambroſia.*

JUNO. The Air.

JUNONIS ROSA. The Lily. *Blancard.*

JUPICAI *Braſilienſibus.* A Species of Graſs, which grows in *Braſil.* *Piſo* relates, that the Plant, rub'd upon the Part affected, does much Service in an *Impetigo*, and eaſes the troubleſome Itching.

JUPICANGA. A Name for the *China Occidentalis.*

JUPITER.

Stannum. Offic. Mer. Pin. 208. Aldrov. Muſ. Metall. 181. Schrod. 394. *Stannum, ſeu Plumbum candidum.* Calc. Muſ. 458. 466. *Stannum Jupiter.* Mont. Exot. 13. *Plumbum candidum, quod & Stannum alias vocatur.* Worm. 124. *Plumbum candidum.* Schw. 387. Kentm. 85. Fabr. 16. TIN. *Dale.*

JUPITER. Tin. The Characters of Tin are;

Firſt, It is the lighteſt of all Metals.

Secondly, It is the leaſt ſimple of Metals; being brought by a ſmall Degree of Fire, to emit ſulphurous Flames, which are eaſily ſeparable from the metalline Part, and almoſt combuſtible.

Thirdly, It is hence leſs fixed in the Fire than any of the other Metals.

As it is, of all Metals, the leaſt fixed in the Fire, and affords the greateſt Quantity of ſulphurous Fumes, it conſequently loſes moſt Weight in the Fire. The Fume, thus emitted, ſeems to be the Sulphur of the Metal, which is pernicious to the Lungs, as appears by thoſe who are employ'd in melting Tin, it uſually giving them a pale ghaſtly Complexion, and throwing them into a *Phthiſis.*

Fourthly, It is ſoft, flexible, malleable, and may be drawn into Wire, but not ſo well as Iron; neither is it very ſonorous or elaſtic.

But though it be very little ſonorous, or the leaſt of any Metals, except Lead, yet, when mixed with other Bodies, it may augment their Sound; as in the Compoſition of Bell-metal. So, though it be but very little elaſtic in itſelf, yet, when mixed with other elaſtic Bodies, it may increaſe their Elaſticity.

A Body, Mr. *Boyle* obſerves, by being aſſociated with another, may have new Properties and Uſes, and ſome of them quite different from what it had alone: Thus two or more Materials, being conjoined, may be qualified into a third, by virtue of freſh Properties thence accruing to the Compoſition. As Tin is flexible, and yields but a dead Sound, who would dream, that one conſiderable Uſe of it ſhould be, to make a leſs yielding and better ſounding Metal more ſtrong and ſonorous? Yet Bell-metal is principally compoſed of Tin and Copper.

Fifthly, It melts more eaſily than any of the other Metals, long before it ignites, and with a Degree of Heat little greater than that of boiling Water: It readily hardens again in the Cold.

Sixthly, When crude, or accompanied with its adhering Sulphur, it diſſolves only in *Aqua Regia*; but, when purified of its Sulphur by Calcination, it diſſolves even in Vinegar, and requires only a ſmall Proportion of that Solvent.

Acids do not diſſolve it without great Difficulty, eſpecially the more powerful ones. The Reaſon hereof is, apparently, its abounding with Sulphur, which Acids do not touch. It diſſolves in *Aqua Regia*, ſcarcely in *Aqua-fortis*; which is a remarkable Circumſtance, conſidering the near Alliance it has with Silver. The weaker the acid Menſtruum is, the ſooner and the eaſier it works its End; and the ſtronger, the more ſlowly: Thus ſour Apples, and other unripe Fruits, being boiled in Tin Veſſels, will grow ſweetiſh; but the ſtrongeſt Acids, boiled in the ſame Veſſels, make no Solutions at all. But Tin, freed by Calcination from its Sulphur, diſſolves in all Acids, and is reducible thereby to vitriolic Cryſtals. This Solution is little practiſed, by reaſon of the Difficulty attending it; for the Tin muſt be firſt thoroughly calcin'd, and the Calcination requires a continual Fire for three Days.

Seventhly, It ſo far endures Lead and Antimony in the Refiner's Teſt, as hardly to be ſeparable from them, without the Aſſiſtance of Copper.

Eighthly, In many of its Properties it approaches to Silver.

If the Sulphur could be perfectly purged out of Tin, 'tis likely it might approach to Silver; for, as it is, the two Metals have ſeveral Properties in common. Thus, when diſſolved in ſtrong Acids, Tin grows bitter, as well as Silver; and, when it is fuſed along with Silver, it adheres ſo obſtinately to it, that they can ſcarcely be ſeparated; and in ſuch Circumſtances it reſiſts Lead, almoſt as much as Silver does. Hence many account it an imperfect Species of Silver.

It may admit of ſome Doubt, whether Tin bears theſe Reſemblances to Silver, in virtue of its being Tin, or only in virtue of the Particles of Silver mixed with it. 'Tis certain more of theſe Reſemblances, and thoſe in a greater Degree, are found in ſome Species of Tin than in others. Mr. *Boyle* mentions a Gentleman, who, having procured a good Quantity of the nobler Metals, from ſome Tin-ore, long digeſted in lixiviate Liquors, deſired Mr. *Boyle* to purchaſe him a large Quantity of it, in full Expectation of raiſing an Eſtate. But, ſays Mr. *Boyle*, after his firſt Stock of Ore was ſpent, the next that he procured, though managed with the ſame Care as the former, proved wholly unprofitable.

He, in the ſame Place, relates, that having diſſolved ſome Block-tin (that is, pure and unwrought) in a particular Menſtruum, which held it ſuſpended; and, having afterwards evaporated the Solution, and ſet it to ſhoot, he found, to his Surprize, that the Cryſtals it afforded, were not all like its own kind of Vitriol, but broad, flat, and thin, like thoſe of Silver: Upon examining them by the Tongue, they had nothing of the Taſte of Calx of Tin made in Spirit of Vinegar, but that exceſſive Bitterneſs we meet with in the Cryſtals of Silver made with Aqua-fortis; and both of them preſently tinged the Nails and Skin with a Black that would not eaſily waſh off: Whence he might have ſuſpected, that the Menſtruum had exalted the Metal into an Affinity with Silver, had he not afterwards proſecuted the ſame Trial with the ſame Menſtruum, and another Parcel of Block-tin, and found, that though this Metal was bought at the ſame Place, and very ſoon after the other, yet the former Succeſs proceeded from his having procured a Lump of Tin of a peculiar Nature.

Some Authors ſpeak much of the Analogy between Tin and Lead, and will have Tin to be Lead, only under a leſs Degree of Coction: But, if in ſome Circumſtances they correſpond, they differ in others. Lead, for Inſtance, is eaſily reduced to a Calx, and Tin more eaſily ſtill; but the Calx of Lead readily melts, and runs into a browniſh Glaſs, whereas Tin does not vitrify without much Difficulty. Tin and Lead readily mix and unite with each other by a gentle Fire; but, if the Heat be intenſe, there ariſes a Colluctation between them, the Effect of which is, that both fall into a Calx, and that the Lead becomes exceedingly difficult, afterwards, to fuſe and vitrify. The Tin is eaſy to be revivified, but the Lead not without Difficulty; nor is the Reſtoration at all complete, or the new Body in all reſpects like the old.

Tin is found in a very heavy Ore, though itſelf be light; uſually in a brown deep Glebe, inclining to yellow; or in a black ſmooth, ſhining one, which is the richeſt Kind; ſometimes like Iron-ſtone; and ſometimes it is, alſo, in a heavy porous Stone.

The Ore is principally found in *Cornwall* and *Devonſhire*, whence all the reſt of *Europe* is ſupplied with this Metal. It is ſo much the peculiar Product of this Country, that *Camden* ſuppoſes it to have given the Denomination *Britain* to the Iſland. And *Bochart* derives the Name *Britannia* from the *Syriac Barat Anac*, that is, *Fields of Tin*.

The Metal is procured by roaſting, grinding, waſhing, then melting the Ore, and thus ſeparating the Scoria from it.

The Stones from which Tin is wrought, Dr. *Merret* tells us, are uſually found betwixt the two Walls of Iron-coloured Rocks, of little or no Affinity with the Tin, in a Vein, from four to eighteen Inches broad: Though, inſtead of Stones, they ſometimes, alſo, find it mixed with a ſmall gravelly Earth, generally of a red Colour, but ſometimes white. From the Earth the Tin is eaſily ſeparated, by bare Waſhing, which is called *Prian Tin*, and is ſcarcely half the Value of the former.

In the Tin-ore is frequently found an hard, glittering, ſulphurous Subſtance, called *Mundic*, or *Maxy*, which is commonly ſuppoſed to feed the Metal; yet, where the Mundic abounds, they rarely find much Tin. The Mundic is to be carefully ſeparated; for, if the leaſt of it be left, in melting the Tin, it makes it brittle and cruddy, and diminiſhes much of its Ductility.

There alſo occurs a ſort of Spar, of a ſhining whitiſh Subſtance, ſoft and flattiſh at firſt, but ſoon after it becomes harder. It ſeldom grows, but only ſticks to the Metal. Some of the Miners account this the Mother or Nouriſher of the Metal. The beſt Ore is that in Sparks; and next to this, that which has bright Spar in it.

The Ore being dug, they break the greater Stones, and thus carry it to the Stamping or Knocking-mill, where it is pounded with large Lifters, of thirty or forty Pounds apiece; and thus reduced to a ſmall Sand, to be waſhed out by a Stream of Water, diſcharged into it through a Braſs Grate, into a Launder, or Trench dug in the Floor, out of which the Water eſcapes, carrying with it the Parts not metalline, which they call the *Cauſalty*, and leaving the other at the Bottom.

To clear away the Mundic, they dry or burn the Ore, thus ſeparated, in a Kiln, upon Iron Plates, keeping the Matter conſtantly ſtirring, that all the Mundic may, by degrees, get uppermoſt, and ſo be burnt away; which they diſcover by the Flames growing yellow, and the Stench diminiſhing. Then they proceed to grind it again, very fine, in a Crazing-mill; after which they waſh it, then dry it a little, and, at laſt, carry it, thus prepared, to the Furnace, which they call a Blowing-houſe, and there melt, and caſt it.

When it runs out of the Furnace, there ſwims on it a Droſs, or Scum, like that of Iron; which, being melted down with freſh Ore, runs into Metal. The Cauſalty they throw on Heaps upon Banks, which, in ſix or ſeven Years, they fetch over again.

The Ore of Tin is commonly a black, ponderous, ſtony Subſtance, appearing like black Stones; but ſome Tin-ſtones are yellow, and others white; ſome are brittle, and others extremely hard, ſo as to require being broke before Calcination.

Tin is ſeldom uſed in Medicine internally, though its Virtues are highly extolled by ſome, but we fear upon no juſt Grounds; particularly in Diſeaſes of the Head, the Lungs and Uterus, the Falling-ſickneſs, and the Bite of a mad Dog. It has been taken in crude Filings, to the Quantity of twenty Grains, or more, for ſome time, without Harm.

Beſides the Utenſils and Veſſels made of this Metal, it ſerves to preſerve Iron and Copper; being extremely eaſy to melt, and, by means of any unctuous Matter, adhering cloſely to them: It likewiſe ſerves in Solders; amalgamated with Mercury, it ſerves for the Foiling of Looking-glaſſes: By Calcination it makes Putty; which is of great Uſe in the Poliſhing of Gems, and the making of Enamels: It is a principal Ingredient in Pewter, as well as Bell-metal: It mixes well with Zink and Regulus of Antimony, and thus becomes whiter and harder; but too much Regulus makes it brittle.

Being expoſed on a Tile to the Focus of a Burning glaſs, it ſends off a copious thick groſs Fume, leaving a fine, light, white Calx behind, which, being continued longer in the Focus, turns to thin, tranſparent, glaſſy Strings; which melt no more, without the Addition of an unctuous Subſtance or Charcoal; by this means it returns to Tin. It deflagrates with Nitre: Hence, perhaps, this Metal conſiſts of a copious Sulphur, or particular Bitumen, and a fine vitrifiable Earth, mixed, on account of its poiſonous Quality, with a minute Proportion of an arſenical Salt.

Tin is ſoluble only in Aqua Regia; and a Solution of it tinges a Solution of Gold with a beautiful purple Colour. A Liquor which will perpetually ſmoke, or, as is commonly ſaid, a Spirit fermenting in the Air, may be made from Tin, in this manner.

Take of pure Tin, one Part; of Quickſilver, three Parts: Mix them, and make an Amalgama; to which add four Parts of corroſive Sublimate, and, having mixed them well together in as ſmall a Time as can be, throw them into a Glaſs Retort, to the Neck of which a Receiver is to be fitted, and a Diſh ſet under the Receiver full of cold Water: Then, diſtilling with a Sand-heat, a pellucid Liquor riſes firſt; next, the Spirit, with great Impetuoſity; and, laſt of all, white Flowers ſtick in the Neck, and upper Part of the Retort. Then, removing the Fire, ſeparate the turbid Liquor, and keep it cloſe ſtopt in Glaſs Phials; and, whenever it is expoſed to the open Air, it will break out in thick Fumes.

Tin may be reduced into a Powder by this Method.

Melt half a Pound of Tin in a Crucible, and pour it into a round wooden Box; cover it cloſe, and ſhake it about, till it is cold; ſome part of it will be in a grey Powder: That Part which remains in ſolid Metal, melt again; and, putting it in the Box, ſhake it, as before: Repeat the ſame Operation, till there is as much pulverized as is required.

This, with ſome, is a Secret againſt Worms, and is particularly deſtructive to them: They give half a Dram of it in Conſerve of *Roman* Wormwood, made into a Bolus, after the Uſe of Mercurials, againſt the Joint-worm.

Tin is thus calcin'd.

Put what Quantity you pleaſe of Tin into an Iron Dripping-pan; place it in a reverberating Oven, and make ſuch a Fire as to keep it melting red-hot; every now-and-then ſtirring of it with an Iron Spatula, full of Holes, the better to break the Tin, and forward its Calcination: This you may continue, till you have a ſufficient Quantity for your Uſe.

The principal chymical Preparations of Tin are, *Sal Jovis*, *Antihecticum Poterii*, *Arcanum Joviale*, and *Aurum Moſaicum*.

The *Sal Jovis*, or Salt of Tin, is thus prepared.

Take any Quantity of calcin'd Tin, and put it into a Matraſs, with as much diſtilled Vinegar as will riſe four Fingers-breadth above it: Let it digeſt three or four Days, and ſtir it in that Time often; then pour off the Liquor, and put on more, three or four times. All the Liquors filtrate together, and evaporate about two Thirds: Then let it ſtand in a cool Place, and it will ſhoot into Salt on the Sides of the Veſſel. Evaporate the Liquor again, and continue to repeat the ſame Operation, until all be obtain'd.

This is commended principally as a Coſmetic, in Pomatums; but it is often given inwardly in nervous Caſes, and particularly Convulſions and Epilepſies, from two Grains to eight. *Quincy* affirms, that he has known two or three extraordinary Inſtances, where the Succeſs could be aſcribed to nothing beſides this Medicine.

dicine. In young Children it is ready to occaſion a Puke; but it is never the leſs efficacious: It is not agreeable in Liquids, but is beſt taken in a Bolus.

For the *Antihecticum Poterii*, ſee ANTIHECTICUM.

For *Arcanum Joviale*, ſee ARCANUM.

For the *Aurum Moſaicum*,

Take of pure Tin, an Ounce; of Mercury, revivified from Cinnabar, ten Drams: Make an Amalgama, which being mixed with ten Drams of common Sulphur, and an Ounce of Sal Ammoniac, let the Whole be well rubbed and mixed together: Then ſublime them with a common Fire for four Hours: A kind of cinnabarine Subſtance will riſe to the upper Part of the Veſſel, and a ſpongy Subſtance of a Gold Colour will remain at the Bottom; which, being waſhed in many Waters, is termed *Aurum Moſaicum*, and uſed both by Painters and Phyſicians.

It is believed to be diaphoretic, and is given from ten to thirty Grains, in hyſteric and hypochondriacal Affections, and in malignant Fevers.

Boerhaave gives us the following Proceſs upon Tin.

Mix with Aqua-fortis, or Spirit of Nitre, a ſixth Part of Sea-ſalt; and thus an *Aqua Regia* is obtained, which diſſolves Gold, and not Silver. If Aqua-fortis, alſo, be drawn off from Sea-ſalt, or Spirit of Salt from Nitre, by Diſtillation; thus, alſo, an *Aqua Regia* is obtain'd. Again, if two Parts of Nitre, three of Vitriol, and five of Sea-ſalt, be diſtil'd together, as in making Aqua-fortis, an excellent *Aqua Regia* is produced; which, therefore, we ſee conſiſts of a Mixture of Nitre and common Salt.

To a Quantity of this Aqua Regia, contained in an Urinal-glaſs, add a little Tin, and a violent Diſſolution ariſes: Continue, till as much Tin is diſſolved as poſſible; and the Solution will appear thick or oily. If the Solution be diluted with twenty times its Quantity of Water, or more, the Tin will be precipitated; which, being perfectly waſhed in Water, and then dried, affords a white Powder or Magiſtery of Tin.

Tin, put into Aqua-fortis, makes a violent Effervеſcence; when the Tin, diſſolving and ſwelling, appears in the Form of a thick Soap, or the White of Eggs.

This is a peculiar Manner of Solution; the Liquor is in ſome meaſure bitter, and therein approaches to Silver. The Calx, thus prepared, is given by many Phyſicians, as a particular Remedy in hypochondriacal and hyſterical Diſeaſes; but I do not admire it, as there are ſafer for the ſame Purpoſe. When duly mixed with Pomatum, it affords a famous Coſmetic for an ulcerated Skin. It is difficult, with the utmoſt Violence of Fire, to reduce it to Tin again. It appears by this Experiment, that Tin, of all the Metals, diſſolves with the leaſt Proportion of Acid. It is ſurpriſing, that Tin, diſſolved in *Aqua Regia*, ſhould not fume: Yet, if mixed with twice its Weight of Mercury ſublimate, and diſtilled in a Retort, it affords a Liquor at firſt that will ſmoke perpetually, and exhale all away. *Boerhaave*.

JURACATIA *Braſilienſibus*. Marcgrav. Piſo. *Arbor peponifera Braſilienſis ſpinoſa, fructu Mamao ſimili, ramoſa*.

The Name of a Tree which grows in *Braſil*, to which I find no medicinal Virtues aſcribed.

JUREPEBA *Braſilienſibus*. Marggrav. *Solanum ſpinoſum Indicum Borraginis flore*. Ico. Roberti Hort. Pariſ. *Solanum foliis & caule ſpinoſis*. Moriſ. Præl. *Solanum ſpinoſum, maxime tomentoſum*. Bocc.

The Name of a *Braſilian* Tree, deſcrib'd by Mr. *Ray* in his *Hiſtoria Plantarum*, but without any medicinal Virtues.

JURUMU, called, alſo, *Pepo Braſilienſis*, *Luſitanis Bobora*. Marggr.

The Name of a *Braſilian* Pumpion, ſaid to be agreeable Food, either boil'd, or roaſted under the Embers.

JUS, Broth. We have already deſcrib'd the *Jus Album*, from *Oribaſius*, who took it from *Galen*, *de Aliment. Facultat. L.* 3. *C.* 30. under the Article ALBUM JUS. See, alſo, *Dioſcorides*, *L.* 2. *C.* 35. And, under the Article FIBRA, we have conſider'd Broth as a Reſtorative, and directed the Methods of uſing it. I ſhall, in this Caſe, only farther remark, that it is a very great Error to exhibit ſtrong Jelly-broths, by way of Nouriſhment, in weak and worn-out Conſtitutions; becauſe theſe are likely to prove too ſtrong for the Powers of Digeſtion. And the great Secret of reſtoring loſt Strength and Fleſh conſiſts in proportioning juſtly the Aliment, to the Strength of the digeſtive Organs.

JUSQUIAMUS. A barbarous Word, made *Latin* from the *French*, importing Henbane.

JUSSA is explain'd by *Rulandus*, *Lapis Gypſeus*, Plaiſter of *Paris*.

JUSTICIA.

This Plant was ſo named by the late Dr. *Houſtoun*, in Honour of *James Juſtice*, Eſq; a great Lover and Encourager of Gardening and Botany.

Of this Plant *Miller* mentions two Species; which are,

1. Juſticia annua, hexangulari caule, foliis Circeæ conjugatis, flore miniato. *Houſt*.

2. Juſticia fruteſcens, floribus ſpicatis majoribus, uno verſu diſpoſitis. *Houſt*.

There are no medicinal Virtues attributed to either of theſe Plants at preſent, that I know of.

JUSTUS. The Name of an Oculiſt, mentioned by *Paulus Ægineta*, *L.* 6. *C.* 20.

JUVANTIA. A Term introduc'd into Medicine, importing whatever relieves under a Diſtemper, whether Aliment, Medicine, or any of the Non-naturals.

JUVENCUS. A Steer. See Bos.

JUWB *Amazonum*. Cluſ. *Arbor exotica foliis alatis*. C. B.

The Name of an exotic Tree, deſcrib'd by *Ray*, but without any medicinal Virtues.

JUXTANGINA. The Name of a Species of Quinſey, the ſame as *Cynance*, or rather *Paraſynance*. *Caſtellus*. See ANGINA.

IXALE, ἰξάλη, in *Hippocrates*. *Libr. de Fract.* ſignifies an entire Goat-skin, according to *Galen*; or the Skin of any other Animal.

IXIA. A VARIX; which ſee.

IXIA, in Botany, according to the Moderns, is the *Carlina*, or *Chamæleon Albus*.

But the *Ixia*, or *Ixias*, mentioned by *Aetius*, *Actuarius*, *Scribonius Largus*, and others, does not ſeem to be the ſame Plant as what we now call by that Name; for it is repreſented as a Poiſon.

Ixias is a Name for the Herb *Chamæleon*, as appears from *Scribonius Largus*, where he treats of Poiſons; and, alſo, from *Heſychius*. It does not, however, mean all Species of *Chamæleon*, but only what yields a viſcous Gum, as does that which grows in *Crete*; and, as *Theophraſtus* writes, produces a Tear: We are told, alſo, by *Dioſcorides*, that the ſame Plant, which he calls the *white Chamæleon*, in ſome Places diſcharges a *Viſcum* at its Roots, which the Women uſe inſtead of Maſtich. This Diſtinction of the *Chamæleon* was obſerv'd by *Nicander*, in his *Alexipharmaca*, where, mentioning the *Ulophonus* [οὐλοφόνῳ] a poiſonous Plant, which is unanimouſly agreed to be the *Chamæleon*, he adds the Characteriſtic Epithet ἰξίου, viſcous. But, ſince the Antients have diſtinguiſh'd the *Chamæleon* into two Sorts, and *Dioſcorides* ſeems to make the *Ixias* a Species of the *White*, whereas it is certain, that the *White* may be taken inwardly, but the *Ixias* is a very pernicious Poiſon, it appears, however, from what they ſay of them, that the *Ixias* is of a very different Nature from the *Chamæleon*, which produces no *Viſcus*; for this latter, if of the white Sort, is not poiſonous, but preſcribed by *Dioſcorides*, *Galen*, and *Pliny*, againſt Worms of the Inteſtines, the Dropſy and Dyſury; but the black *Chamæleon* has a poiſonous and deadly Root, as we are aſſured by *Galen*, who, therefore, adviſes it to be uſed outwardly for the *Scabies*, *Impetigo*, and *Vitiligo*. But the Poiſon of the *Ixias* has very different Effects from that of the *black Chamæleon*, and requires as different Remedies; as appears from *P. Ægineta*, who treats ſeparately of the *Ixias* and *Chamæleon*, and of the Remedies againſt them. *Dioſcorides*, alſo, in the Preface to his ſixth Book, having divided Poiſons into their proper Claſſes, ranges the *Chamæleon* and *Ixias* ſeparately among the Roots.

This Plant is called *Ixias*, ἀπὸ τῦ ἰξῦ, from *Ixos*, [*Viſcum*;] for it abounds with ſo tenacious and pernicious a viſcid Juice, that it ſeems to be mortal only on account of its conglutinating the Inteſtines, agreeably to the Deſcription of its Effects by *Nicander*; in the *Latin* Verſion of which we have ἰξίας render'd by *Viſcum*, from the Example of *Pliny*, who calls it by this Name in many Places; and, tranſlating almoſt every thing from *Greek* Authors, gives us the ſame Remedies for the *Viſcum*, which the *Greeks* had preſcribed againſt the *Ixias*. For, by the Term *Viſcum*, we are not to underſtand what Fowlers uſe in taking of Birds, ſince that was never accounted Poiſon; whereas the *Ixias* has that Character from all who have written of it: But the great Similitude they bear to one another in Effects, was the Cauſe why *Pliny* render'd ἰξίας by *Viſcum*; for, as *Viſcum* is extremely tenacious of whatever it adheres to, ſo the *Ixias*, taken inwardly, glutinates all the Inteſtines, contracting and ſtopping up all the Orifices, thro' which the Excrement ſhould be diſcharged. It is to be wonder'd, however, that *Pliny*, who ſeems to have no Averſion to *Greek* Words, ſhould chuſe to ſay *Viſcum* before *Ixias*; and the more, becauſe *Scribonius Largus*, who writ before him, makes no Scruple to call it *Ixias*.

Some call the *Chamæleon*, *Ixias*. The white Species, in ſome Places, generates a white *Viſcum* under the *Alæ* of the Leaves, principally about the Riſe of the Dog-ſtar, in the ſame manner as Frankincenſe is ſaid to be produced: Whence it takes the Name of *Ixias*. *Pliny*, *Lib.* 22. *Cap.* 18.

The

The *Ixias*, which ſome call *Chamæleon*, ſmells, when taken, like *Ocymum*. Taken inwardly, it cauſes a Swelling of the Tongue, a Delirium, and a Stoppage of all the natural Paſſages. Remedies are Wormwood drank in Wine; or two Drams of Caſtor taken in four Cyathi of Wine. *Scribonius Largus*, N° 192.

The *Ixias*, which is, alſo, called *Ulophonon*, in Taſte and Smell reſembles Ocymum. When taken, it cauſes a violent Inflammation of the Tongue, with Madneſs; obſtructs all the Paſſages for the Diſcharge of the Excrements; excites a great Rumbling in the Inteſtines, and a Fainting attended with an Incapacity of Evacuation. The Cure begins with ſtrong Emetics and Clyſters, after which muſt be exhibited the Cremor of Wormwood in Mulſum, or Vinegar, or Oxymel, or the Seed of wild Rue, or the Root of Silphium, or the Decoction of Tragoriganum in ſome of the before-mentioned, or in Milk; or take of Nard, and Silphium, each half a Scruple, in Wine; or take of Caſtor, Rue, and Turpentine, each one Dram. *Aetius*, *Tetrab.* 4. *Serm.* 1. *C.* 71.

IXINE. The ſame as Ixias.

IXION, ἰξίον, in *Galen's Exegeſis*, is expounded φύλλον τῆς λευκῆς χαμαιλέοντος, "the Leaf of the white Chamæleon."

IXIR. See Xir.

IXIS, ἴξις, in *Hippocrates*, *Lib. de Rat. Vict. in Morb. acut.* ſignifies a ſtrait or direct Way, or Courſe; as in that Paſſage, where, ſpeaking of Ptiſana duly lubricous, he ſays, ὐδαμοῦ γὰρ περισίσχει, ὐδὲ μένει κατὰ τὴν τοῦ στόμαχου ἴξιν· "It no-where "adheres nor ſtops in the ſtrait or direct Paſſage of the Tho-"rax" (the Oeſophagus). *Galen*, commenting ſon this Place, ſays, ἴσμεν δ' ὅτι τὴν ἴξιν ὡς τὸ πολὺ μὲν τὴν εὐθυωρίαν, ἐνίοτε δὲ καὶ αὐτὴν λέγει τὴν φορὰν, &c. "We know, that (*Hippocrates*) by "*Ixis* generally means *Eythyoria* (a ſtrait or direct Courſe), "and ſometimes the Conveyance itſelf. Now it is plain, that "Ptiſana paſſes in a ſtrait Courſe down through the Thorax, "and is, alſo, conveyed into the Ventricle through the Oeſo-"phagus; ſo that the Meaning of *Hippocrates*, in the Expreſſion, "is, that nothing ſticks by the Way, as is uſual in many Af-"fections of the Thorax and Lungs, where what adheres be-"comes dry, and cauſes pertinacious and almoſt inſuperable "Obſtructions." By στόμαχου ἴξις, then, is here meant the Gullet or Oeſophagus, the ſtrait or direct Paſſage, by which the Ptiſana paſſes to the Ventricle or Stomach. *Galen*, in his *Exegeſis*, expounds ἴξις by εὐθυωρία, a ſtrait or direct Way, or by ἄφιξις, an Advent or Acceſs. The ſame Author explains κατ' ἴξιν, in *Hippocrates*, by κατ' εὐθὺ, or κατ' εὐθυωρίαν, that is, directly, or in a direct Line; as when, *Lib.* 1. περὶ γυναικ. it is ſaid, that if the Semen proceeding from the Man concur κατ' ἴξιν, directly, ſo as to make one Line with that from the Woman, ſhe will the ſooner conceive. And ἴξις ἕλκους, he expounds by εὐθυωρία, "the ſtrait Courſe or Situation of an Ulcer." *Ixis* is ſometimes uſed with reſpect to the Breadth of the Body, ſometimes to its Length, *Lib. de Fract.* Again, *Hippocrates*, in the ſame Book, adviſes us to be very cautious of applying Splints, κατὰ τῶν σφυρῶν τὴν ἴξιν, "to the Part lying in a direct Line "with the Malleoli." The ſame Author, for reſtoring a Cylloſis, (ſee Cyllos) directs the Bone of the Tibia, on the Outſide, near the Malleolus, to be forced inwardly; but the Os Calcis, τὸ κατ' αὐτὴν ἴξιν, "directly anſwering to it," to be protruded outwards: Where *Galen* expounds ἴξις by εὐθυωρία· that is, a Direction in which the Os Calcis anſwers to the Tibia, when placed on it in its natural Situation. And, in the ſame Book, he ſays, that the inward Part of the Os Femoris is thicker than the outward, as that Part of the Cubit, τὸ κατὰ τὴν τοῦ μικροῦ δακτύλου ἴξιν, "which anſwers directly to the little Finger," is longer, and more ſlender, than the reſt. *Foeſius.*

Κατ' ἴξιν (*Kat' ixin*) is explain'd, in *Galen*, *Com. ad Aph.* 20. *Lib.* 1. by κατ' εὐθυωρίαν, "according to the Direction of a right "Line, or directly forward." And, *Com. ad Aph.* 21. by κατ' εὐθὺ τοῦ πεπονθότος μορίου, "in a direct Line with the Part affected." He gives the ſame Expoſitions of the Phraſe in ſeveral other Places; but, *Lib.* 2. *de Cur. ad Glauc.* he ſays, that by κατ' ἴξιν *Hippocrates* means the very ſame as κατ' ἰσότητα, "according to "Equality." This Expreſſion, κατ' ἴξιν, is often uſed by *Hippocrates*, particularly 6 *Epid. Sect.* 2. *Aph.* 10. and 2 *Epid.* where, in Diſeaſes, and the Motions of Nature, we are adviſed always to regard their Direction, and whether they proceed κατ' ἴξιν, in a direct Courſe. And, 6 *Epid. Sect.* 1. *Aph.* 5. he mentions, among other Symptoms which relieve under a Pain of the Kidneys, attended with Vomitings, and a Numbneſs of the Thigh, τὸ κατ' ἴξιν, which directly anſwered, or was on the ſame Side with the Part affected. Again, 1 *Epid. Ægr.* we are told, that the Patient, on the eighth Day, was afflicted with a Pain in the Groin, and that a Tumor aroſe in the ſame Place, σπληνὸς κατ' ἴξιν, "directly anſwering to the Spleen. And, 3 *Epid. Ægr.* 3. the Spleen, he ſays, was tumefied, and the Thigh, κατ' ἴξιν, "anſwering it on a direct Line," was ſeized with a Pain. And, 4 *Epid.* he ſays, that the Ear, κατ' ἴξιν τῆς σπληνὸς καὶ τῆς πλευρῆς, "anſwering to, or on the ſame Parts with the Spleen, "and the Side," was ſeized with a Pain. And a little after, in another Caſe, he ſays, a ſmall Quantity of Blood was diſcharged ἐκ τοῦ κατ' ἴξιν, that is, "from the (Noſtril) anſwering "in direct Poſition to the diſeaſed Spleen."

Ἴξις is a Word peculiar to *Hippocrates*, and moſt commonly imports Rectitude, or a direct Way and Progreſs. But this Rectitude, ſays *Galen*, *Com.* 3. *in Lib. de Fract.* is to be underſtood not only proceeding with the Length of the Body, but, alſo, with its Breadth, as being no other than the direct and neareſt Courſe of the Ducts, or Paſſages, appointed for the commodious Derivation of the Humours: And theſe Paſſages are not all of one Kind, but various, ſome diſpoſed according to the Length of the Body, others according to its Breadth, and others tending from the anterior to the poſterior Parts.

Beſides the before-mentioned Significations, κατ' ἴξιν imports "perpendicularly," as *Lib. de Fract.* βάλλεσθαι μὲν οὖν χρὴ τὸ ὀθόνιον κατὰ τὴν ἴξιν τοῦ ἕλκεος, "A Bandage muſt, therefore, be ap-"plied directly, or in a perpendicular Direction, upon the Ul-"cer." In which Place *Hippocrates* blames the Surgeons of his Time, for applying a Bandage ἔνθεν καὶ ἔνθεν, "on this Side "and that Side;" which was a proper Expreſſion, as *Galen* underſtood it, to hint a Reaſon for applying a thin Piece of Lead, not on this or that Side of the Tumor, but κατ' ἴξιν, directly or perpendicularly upon it. *Hippocrates* is always pleaſed when Things take their Courſe κατ' ἴξιν· for then Nature is their Guide, and they are carried τῆς ἐυκρίσιος λόγῳ, "with a "rational View to Excretion;" which is a well-known Maxim, eſtabliſhed by long Obſervation, and approved by *Hippocrates*, who has given it, as it were, the Sanction of a Law, when he talks of Pains of the Sides, Tenſions of the Hypochondria, Tumors of the Spleen, and Hæmorrhages from the Noſtrils, and the like, κατ' ἴξιν. Thus, 2 & 6 *Epid.* for a Pleuriſy, he directs a Vein to be opened κατ' ἴξιν; an Abſceſs ariſes in the Skin κατ' ἴξιν; in a Phlegmon of the Liver, an Hæmorrhage is excited κατ' ἴξιν; an Abſceſs ariſes and breaks κατ' ἴξιν. In 6 *Epid. Herophon* had a Swelling of the Spleen; after that, was afflicted with an Abſceſs of the Groin, and, ſoon after, with another in the Leg, both κατ' ἴξιν· the Event of which was the Recovery of the Patient beyond all Expectation. And *Heropythus*, 3 *Epid. Ægr.* 9. had a frequent Viciſſitude of Deafneſs and Pain in the Right Iſchion; and ſuch was the Nature of the Diſorder, that whenever the Pain in the Iſchion ceaſed, the Fever was exaſperated, and the Deafneſs increaſed, but were both mitigated while the Pain of the Iſchion continued. From the Premiſes we may rationally conclude, that all morbific Matters, which take their Courſe from the lower Parts upwards, or the contrary, κατ' ἴξιν, ſeek a Place, where they may ſettle, or be diſcharged, ſince they are under the Direction of Nature, tend to Excretion, and are not hurried by an Orgaſmus. Hence, alſo, we are taught to act in Imitation of Nature; for, ſays our great Maſter, ἀκλίνα ἢ ῥέπει· the Senſe of which is, "that we "are to lead, where Nature ſhews the Way." And as we have Reaſon to expect a good Event when Things take their Courſe κατ' ἴξιν, ſo the contrary is to be feared from a Direction or Tendency ἀνάπαλιν, "prepoſterouſly," that is, contrary to the other. See Anapalin. Thus, in *Coac.* it is ſaid τὸ ἀνάπαλιν αἱμορῤῥαγίαι πονηρὸν, "an Hæmorrhage which happens prepo-"ſterouſly is pernicious;" for Example, if in a Tumor of the Spleen the Hæmorrhage falls on the Right Side; for Right with Right, and Left with Left, are ὁμόφυλα καὶ ἐυπρόσφυλα, "con-"ſocial and connatural," ſays *Hippocrates*. Whence Nature contends with more Strength and Vigour againſt Diſeaſes, when Things tend κατ' ἴξιν, which is more to be regarded than the Courſe and Situations of the Veins.

IXODES, ἰξώδης. Viſcous. From ἶξος, Bird-lime, or Gum.

IXOS, ἶξος, is properly the viſcid tenacious Juice, which tranſudes through the Barks of many Trees, and adheres to the Surface. It is tranſlated *Viſcum*, Birdlime. See Viscum.

IXYS, ἰξὺς, or ἰξύη. *Galen* ſays, that the ἰξύαι are underſtood by ſome to mean the Oſſa Ilia; ſome the Part immediately above them; but he thinks, from a Paſſage in *Homer*, *Odyſſ.* 5. *ver.* 231. it means thoſe Parts of the Body which are, on each Side, interpoſed betwixt the Bones of the Breaſt and Oſſa Ilia. I ſuppoſe he means the ſpurious Ribs, and the Oſſa Ilia. By ſome it is underſtood of the Loins; by others, of the Flanks.

IYNX. The Name of a Bird, called, in *Latin*, *Torquilla*; in *Engliſh*, the Wry-neck.

K.

K. For the Signification of this Letter in the Chymical Alphabet, ſee ALPHABETUM CHYMICUM.

KAATH. See the fifth Species of ACACIA; where I find the Word printed *Raath*, by Miſtake, inſtead of *Kaath*.

KAAWY. A Sort of Drink uſed by the *Indians*, made of Mays.

KABNOS. A barbarous Word for CAPNOS, Smoke.

KACHIMIA, or KAKIMIA. A barbarous Word for CACOCHYMIA.

KADALI. *Ray*, in *Hiſt. Plant*, takes notice of four Shrubs called by this Name.

The firſt is the

Kadali. H. M. *Baccifera Indica fructu umbilicato quinquecapſulari polyſpermo.*

It grows in the *Eaſt Indies*. The Fruit, when ripe, is eaten by the Inhabitants, and it is uſed for dying Calicoes. Of the tender Leaves, boil'd in Oil, an Ointment is made, which is good for Aphthæ, and Exulcerations of the Mouth and Gums. The Juice of the Leaves, taken in an Infuſion of Rice, is good for the Colic.

The ſecond is the

Ben-Kadali, H. M. *flore albicante, fructu viridi, pulpa albicante.*

The Fruit of this is eaten by the Inhabitants, but is of no Uſe in Medicine.

The third is the

Katou-Kadali, H. M. P. 4. T. 43. p. 91. *floribus minoribus, fructus cortice aſpero.*

The Leaves powder'd, together with the Leaves of Pepper, and taken with Sugar, eaſe a Cough, and cauſe Expectoration.

The fourth is the

Tsjeron-Kadali foliis, floribus & fructibus minoribus.

From the Leaves, Bark, Flowers, and Fruit, boil'd in Oil of Seſamum, an Oil is made, which is a powerful Remedy againſt Aphthæ, Fiſſures of the Tongue, and Puſtules of the Palate and Tongue. It is farther ſaid to cure an Epilepſy, and Cynic Spaſms, if the Head is anointed therewith. *Raii Hiſt. Plant.*

KAIB. *Rulandus* explains this, *Lac Acidum, coagulatum.* Acid and coagulated Milk.

KAIDA. *Ray*, in his *Hiſtoria Plantarum*, takes notice of four Shrubs, which are called by this Name, differing only with reſpect to their Fruits. The firſt is the

Kaida. H. M. The Juice of the Leaves and Roots are uſed by way of Bath for Manias. The Flowers, which are very fragrant, taken internally with Saunders and Cumin, and, at the ſame time, bruiſed and applied to the Hypogaſtrium, are ſaid to increaſe Venereal Vigour. Apozems are prepared of the Root, which are ſaid to be effectual in a Dyſury. Of the Juice of the Root, alſo, by boiling, an Oil is prepared, which is ſaid to be good in the Gout.

The ſecond is the *Kaida Taddi*. H. M.

The Juice of the tender Leaves, taken with Sugar, cures a Dyſentery.

The Juice of the ripe Fruit, mix'd with Sugar, is recommended againſt Aphthæ.

The third is the *Perin-Kaida-Taddi.*

The fourth is the *Kaida-Tsjerria.*

The Fruits of all theſe are extremely large, and are eaten by Elephants, and ſome of the Inhabitants.

KAIGANG. A Name for the *Ficus*; *Malabarenſis*; *folio cuſpidato*; *Fructu rotundo, parvo, gemino.*

KAKA-MOULLON, or *Kaka-Mullu*. H. M. Call'd, alſo, *Siliquoſa Indica, flore papilionaceo, decapetalo, Siliquis latis monoſpermis.* The Name of a ſiliquoſe Tree, which grows in the *Eaſt Indies*, about *Chenotti, Parou*, and *Warapoli.*

The Bark, boil'd in Milk, is ſaid to cure a Diabetes and Gonorrhœa. *Raii Hiſt. Plant.*

KAKA-NIARA. *H. M.* Call'd, alſo, *Baccifera Indica, fructu oblongo, Calyce inſidente, monopyreno, oſſiculo compreſſo.* An *Eaſt Indian* Tree, which grows in *Porea* and *Montan.*

The Juice expreſs'd from the Leaves, and taken with the milky Liquor of the Cocoa-nut, kills Worms; and expels them, if taken with Brine. *Raii Hiſt. Plant.*

KAKA-TODDALI, otherwiſe call'd, *Frutex baccifer Indicus ſpinoſus, trifolius, floribus ſpicatis, fructu plano, rotundo tricocco.*

A low Shrub, which grows in all Parts of *Malabar*.

An Ointment is prepared of the Root, and green Fruit, fry'd in Oil, which ſome recommend againſt the Gout. Baths are made of the Leaves boil'd in Water, which are ſaid to be ſerviceable in an Anaſarca, Cachexy, œdematous Tumors of the Legs, and other Diſorders of the like Kind, proceeding from a Redundance of Serum.

KAL is explain'd by *Rulandus*, and *Johnſon, Sal de Torrente*, but I don't know what they mean.

KALD. Vinegar. *Rulandus.*

KALED. In *Senior Zadith's Tabula Chymica*, this Term occurs, which imports, flying, or volatile.

KALI.

The Characters are;

The Plant reſembles the Aizoon, and is ſucculent: The Flower is roſaceous, according to *Tournefort*; but apetalous, according to others: The Fruit is globous, and membranaceous, containing one Seed, intorted like the Shell of a Periwinkle, in the Centre of the Calyx.

Boerhaave mentions three Species of this Plant; which are,

1. Kali, majus; cochleato ſemine. *C. B. P.* 289. *Raii Hiſt.* 1. 212. *Ger. Emac.* 535. *Tourn. Inſt.* 247. *Boerh. Ind. A.* 2. 93. *Kali.* Offic. *Kali cochleatum majus.* Park. Theat. 279. *Cali vulgare.* J. B. 3. 702. *Salicarnia altera.* Ger. 428. GLASSWORT.

This Kali, which is only to be found in the warmer Countries, grows to be a Foot or two high, with thick, fat, brittle Stalks like Purſlane, bearing long, roundiſh, fleſhy Leaves, having here-and-there ſmall, yellow, ſtamineous Flowers, which are ſucceeded by Seed-veſſels, twiſted up Snail-faſhion. It grows upon the Coaſts of *Spain, Italy*, and the Southern Parts of *France.*

Of this Plant is made the Sal Alkali, or the Soda, or the true Cineres Clavellati, of which the fineſt Glaſs is made: They burn it in great Heaps, which, by the Vehemence of the Fire, melt, and run into blackiſh Lumps of hard Salt.

The Juice of this Plant is cathartic and diuretic, accounted good to purge phlegmatic watery Humours, and ſerviceable againſt the Dropſy and Jaundice, and Obſtructions of the Liver and Spleen; but it is ſeldom, or never, uſed in *England.* Becauſe a great Quantity of fixed Salt is drawn from the Aſhes of this Plant, the Name of *Alkali* has been given to the fixed Salt of all others. The beſt *Venice* and *Caſtile* Soap is made of the Lixivium of theſe Aſhes. *Miller's Bot. Off.* See ALCALI.

2. Kali; ſpinoſum; foliis longioribus & anguſtioribus. *T.* 247.

3. Kali; Ægyptium; villoſum; flore ſtellato. *Lippii. Boerh. Ind. alt. Plant. Vol.* 2. *p.* 93.

Kali minus. A Name for the *Chenopodium*; *ſedi folio minimo*; *folio Kali ſemine ſplendente*; *annuum.*

Kali fruticoſum. A Name for the *Chenopodium*; *ſedi folio minimo*; *fruteſcens*; *perenne.*

Kali geniculatum. A Name for the *Salicarnia.*

Beſides the foregoing Species of *Kali*, *Dale* mentions the following; which is,

Kali Hiſpanicum, Cod. Med. 63. *Kali Hiſpanicum ſupinum annuum, ſedi foliis brevibus.* Act. Reg. Par. Ann. 1719. p. 93. Fig. p. 98. ALICANT GLASSWORT.

There are ſeveral Species of *Kali* found in many Places about the Sea-coaſt. *Miller* takes notice of eighteen.

KAL-TODDAVADDI, H. M. otherwiſe call'd, *Mimoſa Malabarica, flore pentapetalo, ſiliquis lanuginoſis.*

An Evergreen which grows in *Malabar*, to which I find no medicinal Virtues aſcribed.

KAMAR, or *Camar*. Silver. *Rulandus.*

KAMIR. Ferment. *Rulandus.*

KANDEL. *Ray*, in his *Hiſt. Plant.* takes notice of ſix Shrubs, which are called by this Name. The firſt is the

Kandel, H. M. or *Frutex Indicus ramis demiſſis radices agentibus ſe multiplicans, fructu oblongo, terete corticoſo.*

The Roots are uſed in ſtaining Linen; and the Leaves ſerve for Manure. An Ointment is made of the Bark rub'd with Oil, which is recommended againſt Laſſitude.

The ſecond is the

Karil-Kandel, H. M. or *Kanil-Kandel. Candela arbor floribus in eodem pediculo ternis, fructu anguſtiore.*

The Bark, boil'd in Whey, cures Gripes of the Belly, and removes Pains and Flatulences.

The third is the

Pee-Kandel, H. M. or *Candela Indica fructu longiore & craſſiore, flore tetrapetalo.*

It agrees in Virtues with the *Tsjerou-Kandel.*

The fourth is the

Tsjerou-Kandel, H. M. or *Candela Indica humilior flore exalbido pentapetalo, fructu majore.*

The Bark, together with dry'd Ginger, or long Pepper, is call'd *Tripali*, by the Inhabitants of the Country where it grows, which, bruiſed with Roſe-water, is ſaid to cure a Diabetes.

The fifth is the

Pon-Kandel, H. M. or *Candela Indica floribus pentapetalis odoratis. fructu minore incurvo.*

The ſixth is the

Kada-Kandel, H. M.

The two laſt have no medicinal Virtues aſcrib'd to them.

KANDEN-KARA, H. M. or *Baccifera Indica, floribus racemoſis, fructu plano, rotundo, dipyreno.*

The Name of a Tree, which grows in *Malabar*, to which I find no medicinal Virtues aſcrib'd. *Raii Hiſt. Plant.*

KANFOR. Tin. *Rulandus.*

KANELLI. The Name of two *Eaſt-Indian* Trees. The firſt is the

Pelluta-Kanelli, H. M. or *Baccifera Indica, Fructu umbilicato, racemoſo, candido, monopyreno, rotundo.*

This is an evergreen Tree, of a moderate Size, which always flowers, and bears Fruit. The Leaves dry'd, reduc'd to Powder, and exhibited in Milk, cure a Diarrhœa. Baths are prepar'd of Decoctions of the Leaves, which are ſaid to be ſerviceable in Pains of the Limbs of all kinds.

The ſecond is the

Tsjerou Kanuelli, which reſembles the preceding. *Raii Hiſt. Plant.*

KAPA-MARA, H. M. The ſame as ACAJAIBA; which ſee.

KAPRILI. Sulphur. *Rulandus.*

KAR. *Rulandus* explains this, *Gemma lucens ſicut Ignis.*

KARA-ANGOLAM, H. M. or *Arbor Indica, Pruniferа, Fructu umbilicato, corticoſo, Perſici ſimile.*

A very large, tall Tree, which grows in many Parts of *Malabar*, always bearing Leaves, Flowers, and Fruit.

A very good vulnerary Ointment is made of the Leaves boil'd in Oil. The Root is cathartic, and purges off ſerous and pituitous Humours. The Fruit is extremely heating, and therefore ſeldom eaten. *Raii Hiſt. Plant.*

KARABE. The ſame as *Carabe*. See AMBRA.

KARABITUS. An *Arabic* Term, importing a *Phrenitis*, or *Delirium.*

KARA-KANDEL. See KANDEL.

KARATAS. *The Penguin, or wild Ananas.*

The Characters are;

It hath a tubulous Bell-ſhap'd Flower, which is divided into three Parts, at the Mouth; from whoſe Calyx ariſes the Pointal, fixed like a Nail in the hinder Part of the Flower; which afterwards becomes a fleſhy, almoſt conical Fruit, which is divided by Membranes into three Cells, which are full of oblong Seeds.

There is but one ſort of this Plant at preſent known; which is,

Karatas foliis altiſſimis, anguſtiſſimis & aculeatis. *Plum. Nov. Gen.*

Father *Plumier* has made a great Miſtake in the Figure and Deſcription of the Characters of this Plant, and the *Caraguata*; for he has joined the Flower of the *Caraguata* to the Fruit of the *Karatas*, and *vice verſa.*

This Plant is very common in the *Weſt-Indies*, where the Juice of its Fruit is often put into Punch, being of a ſharp acid Flavour. There is, alſo, a Wine made of this Fruit, which is very ſtrong; but it will not keep good very long, ſo is only for preſent Uſe. This Wine is very intoxicating, and heats the Blood; therefore ſhould be drank very ſparingly.

In *England* this Plant is preſerved as a Curioſity; for the Fruit ſeldom arrives to any Degree of Perfection in this Country; and if it were to ripen as throughly here, as in its native Country, it would be little valued, on account of its great Auſterity; which will often take the Skin off from the Mouths and Throats of thoſe People who eat it incautiouſly. *Miller's Dictionary, Vol.* 2.

KARENA, in *Paracelſus*, is the twenty-fourth Part of the ſmalleſt Drop.

KARIIL, H. M. or *Prunus Pentaphyllos Malabarica, fructu Calyci inſidente.*

A very large pruniferous Tree, which grows in *Malabar*. Of the Roots, Leaves, Fruits, and other Parts of which, boil'd in Water, Baths are prepar'd, which are eſteem'd excellent againſt all manner of Pains in the Joints.

KARIN-TAGERA, H. M. A ſmall Tree of *Malabar*, ſomewhat reſembling the Hazel, but of the evergreen Kind.

An Oil is prepar'd of the Root, which is ſaid to prevent the Hair from falling off. *Raii Hiſt. Plant.*

KARI-VETTI, H. M. or *Arbor baccifera Indica, racemoſa, Acinis oblongis monopyrenis, Flore tetrapetaloide.* A Tree of a moderate Size, which grows in *Malabar*.

The expreſſed Juice of the Leaves, exhibited with Whey, is an excellent Emetic, and brings away pituitous and ſerous Humours. *Raii Hiſt. Plant.*

KASAM. Iron. *Rulandus.*

KASJAVA-MARAM, H. M. or *Arbor baccifera Indica racemoſa, tetrapetalo flore, Fructu rotundo monopyreno.*

A Tree which grows in *Malabar*, of a moderate Size. Of the Leaves, boil'd in Oil, together with freſh Turmeric, a Liniment is made, which is recommended againſt watery Puſtules. The Juice of the Leaves, applied behind the Ears, in Linen, cures Lippitude. An Ointment is, alſo, prepar'd of the Root, boil'd in Oil, which is good againſt the Gout and Head-ach.

KATIMIA. A Name for *Cadmia*, *Lapis Calaminaris*, or Tutty. *Rulandus.*

KATK N. See JULUS.

KATMER-BOUHOUR, *Turcarum.* Cornut. The Name of an oriental Species of *Cyclamen*. *Raii Hiſt. Plant.*

KATOU-CONNA, H. M. or *Arbor Indica ſiliquoſa, flore pentapetalo, ſiliquis in Spiram contortis, lanuginoſis.*

A tall Tree, which grows in *Malabar*, which is perpetually green, and always bears Flowers and Fruit.

A Decoction of the Leaves preſerves the Hair from growing white, and cures the Leproſy; and the Bark, made into a Paſte, with Sugar, has the ſame Virtues. *Raii Hiſt. Plant.*

KATOU-INDEL, H. M. or *Palma ſylveſtris Malabarica, folio acuto, fructu Pruni facie*, D. Commelin.

A Sort of Palm, which grows in *Malabar*.

The poor People of the Country chew the Fruit of this Tree, like that of the *Faufel*, or *Areca*, with *Betel*, and calcin'd Oyſter-ſhells. The Leaves, Fruit, and other Parts of this Tree are very powerful Aſtringents, and, therefore, proper for ſtoping any ſort of Fluxes. The Inhabitants make Caps of the Leaves.

KATOU-KALESIAM, H. M. or *Sorbus ſpuria Malabarica Katou-Kaleſiam dicta.*

A ſort of Service-tree, which grows in *Malabar*. *Raii Hiſt. Plant.*

KATOU-KARVA, H. M. or *Canella ſylveſtris Malabarica.* THE GREAT WILD CINNAMON-TREE OF THE MOUNTAINS.

This is not much unlike the Cinnamon-tree of *Ceylon*. Baths are made of the Leaves of this Tree, boil'd in Water, which are in Eſteem againſt any ſorts of Pains of the Joints. A Drink is prepared of the Bark of the Root, boil'd in Water, together with Cardamoms, and Nutmeg, which is ſaid to be effectual in Gripings of the Belly. *Raii Hiſt. Plant.*

KATOU-NAREGAM, H. M. or *Malus Limonia Malabarica fructu umbilicato.*

A tall Tree of *Malabar*, which bears a ſmall ſort of Lemon. The Juice of the Leaves is eſteem'd an excellent Errhine, for purging the Head. Taken with Pepper, Ginger, and Sugar, it cures Coughs, and other Diſorders of the Lungs excited by a cold Cauſe. Of the Leaves, boil'd in Water, Baths are prepared, which are in Eſteem againſt Laſſitude, and Pains in the Limbs. *Raii Hiſt. Plant.*

KATOU-PATSJOTTI, H. M. or *Frutex baccifer Malabaricus fructu calyce excepto, ſulcato, tripyreno.*

A ſmall Shrub, which grows in *Malabar*, of no Uſe in Medicine. *Raii Hiſt. Plant.*

KATOU-PULCOLLI, H. M. or *Frutex Indicus flore dipetalo, capſula oblonga, binis cellulis bina ſemina continente.*

A Shrub which grows in ſandy and open Places in *Malabar*.

The medicinal Uſes of the Seeds are, in Pains of the Stomach, and internal Inflammations; the external Uſe is in the Itch and Herpes. *Raii Hiſt. Plant.*

KATOU-THEKA, H. M. or *Prunifera Indica fructu umbilicato racemoſo Avellanæ magnitudine.*

It grows in *Malabar*, and the Fruit is uſed inſtead of that of the *Areca*, to chew with *Betel*. The Bark dried, and reduc'd to Powder, reſtrains the exorbitant Heat of the Bile. *Raii Hiſt. Plant.*

KATOU-TSJACA, H. M. or *Arbor Indica fructu aggregato globoſo, Katu Isjaka dicta.*

A tall Tree, which grows in *Malabar*, flowering and bearing Fruit, all the Year round. The Juice, expreſſed from the Fruit, cures Pains of the Belly.

KAUKI, *floribus odoratis. Breyn.* A Tree, which grows in *Java*, bearing very fragrant ſmall Flowers, from which a Water is diſtil'd, poſſeſſed of much the ſame Virtues as Roſe-water.

KAYE-BAKA. The Species of *Nerium*, or *Oleander*, mentioned by *Ray*, in his *Hiſt. Plant.*

KAYL. *Lac Acetoſum*, ſour Milk. *Rulandus.*

KAYSIR. *Spuma Maris.* The Foam of the Sea; properly the Pumice-ſtone. *Rulandus.*

KAZDIR. KASDIR, or KASIR. Tin. *Rulandus.*

KEDANGU, H. M. or *Siliquoſa Malabarica, ſiliquis ſpithameis, anguſtiſſimis, contortis.*

A Shrub which grows in *Malabar*. Baths prepared of a Decoction of the Leaves are ſaid to diſcuſs all Sorts of Tumors. The Juice of the Flowers is an excellent Remedy for the Epilepſies and *Aphthæ* of Children. *Raii Hiſt. Plant.*

KEIRI. A Name for the *Leucoium*; *luteum*; *vulgare.*

KELP is a fixed Salt, or particular Species of Pot-aſh, procured by burning the Weed called *Kali*, which grows frequent on ſome Shores; and thus reducing it to ſolid Lumps, or Cakes, of Aſhes, that run into a Liquor ſomewhat like Oil of Tartar, *per Deliquium*, by the Moiſture of the Air.

KEMP-

KEMPFERA.

This Plant was ſo named by the late Dr. *Houſtoun*, in Honour of the Memory of Dr. *Kempfer*, a learned Botaniſt.

The Characters are;

It hath an anomalous Flower, conſiſting of one Leaf, and divided at the Brim into five Parts: After the Flower is paſſed, the Pointal becomes a hard Fruit, which is divided into four Cells, which are full of ſmall Seeds.

We know of but one Sort of this Plant; which is,

Kempfera fruteſcens, Chamædryos folio, floribus ſpicatis cæruleis. *Houſt.*

This Plant is figured and deſcribed in the *Paradiſus Batavus*, under the Title of *Veronicæ ſimilis fruticoſa Curaſſavica, Teucrii foliis, flore galericulato.*

It is very common in *Jamaica*, and ſeveral other Iſlands in the *Weſt Indies*, where it grows to the Height of three or four Feet, and becomes woody. The Flowers are produced in Spikes, at the Extremity of the Branches, which are of a fine blue Colour.

KENKEL. The Name of an Animal, mentioned in the *Turba Philoſophorum, Theatr. Chym. Vol. 5. p.* 12. whoſe entire Juice is there ſaid to be of a Tyrian, or Purple-colour.

KENNE. A Name of the Stone generated in the Eye of a Stag.

KERATOPHYTON. The Name of a ſubmarine Plant.

The Characters are;

It is of a viſcid or glewiſh Conſiſtence, pellucid like Horn, and frequently covered with a cretaceous Cruſt; ſometimes of elegant and various Colours. *Boerhaave, Index Plant.*

Boerhaave mentions ſixteen Species of this Plant, none of which have any medicinal Virtues attributed to them at preſent, that I know of, except the ſeventh; for which ſee CORALLIUM NIGRUM.

KERMES. See CHERMES.

KERSYDROS. See CHERSYDROS.

KETMIA.

The Characters are;

The Leaves reſemble thoſe of the Mallows, or Vervain Mallows; the Flower is like that of the Mallow; the Fruit is divided into many Partitions, the Top of which opens when ripe, and diſcloſes a great many Seeds.

Boerhaave mentions twenty-two Species of this Plant; which are,

1. Ketmia; Syrorum quibuſdam. *C. B. P.* 316.
2. Ketmia; Syrorum; flore purpuro-violaceo. *T.* 99.
3. Ketmia; Syrorum; flore albo.
4. Ketmia; Syrorum; floribus ex albo & rubro variis. *T.* 99.
5. Ketmia; Sinenſis; fructu ſubrotundo; flore ſimplici. *T.* 100.
6. Ketmia; Sinenſis; fructu ſubrotundo; flore pleno. *T.* 100.
7. Ketmia; Africana; populi folio. *T.* 100.
8. Ketmia; Africana; populi folio ſubtus incano; & caule vireſcente. *T.* 100.
9. Ketmia; Ægyptiaca; ſemine moſchato. *T.* 100, See ALCEA INDICA.
10. Ketmia; Indica; vitis folio; parvo flore. *T.* 100.
11. Ketmia; Indica; vitis folio; ampliore. *T.* 100.
12. Ketmia; Americana; folio Papayæ; flore magno, flaveſcente, fundo purpureo; fructu erecto, pyramidali, hexagono; ſemine rotundulo; ſapore fatuo. *Prægn.*
13. Ketmia; Indica; Goſſypii folio; Acetoſæ ſapore. *T.* 100.
14. Ketmia; quæ Althæa; magna; folio aceris; cortice cannabino; floribus parvis; ſemina rotatim in ſummitate caulium, ſingula ſingulis cuticulis cooperta ferens. *Baniſter.*
15. Ketmia; Americana; paludoſa; folio ſcabro ulmi acutiore.
16. Ketmia; Braſilienſis; folio Ficus; fructu pyramidato, ſulcato. *T.* 100.
17. Ketmia; veſicaria; vulgaris. *T.* 101.
18. Ketmia; veſicaria; Africana. *T.* 101.
19. Ketmia; Afra; veſicaria; foliis profundius inciſis, vix crenatis.
20. Ketmia; Indica; aculeata; foliis digitatis. *T.* 101.
21. Ketmia; Virginienſis; folio inferiori Ulmi, ſuperiori Aceris.
22. Ketmia; Indica; folio Goſſypii; ſapore fatuo. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 271.

The *Hiſtoria Plantarum*, aſcribed to *Boerhaave*, informs us, that all the Species of this Plant, except thoſe which taſte like Sorrel, agree in Virtues with Mallows. And that the Flowers are poſſeſſed of the ſame Virtues as thoſe of Mallows.

KEYRI. A Name for the *Leucoium; luteum; vulgare.*

KIBRIC. *Rulandus* defines this, the Parent, and Firſt Matter, of Mercury, and all fuſible and liquifiable Subſtances. The Philoſophers Stone is, alſo, thus called.

KIBRITH. Sulphur. *Rulandus.*

KIBRIUS, or KEBRIC. Arſenic. *Johnſon.*

KIDIBENGI. A Name by which thoſe are call'd who take *Bangue*, as an Exciter to Venery.

KIKI, *xlus.* The Name by which *Dioſcorides* calls the *Ricinus.*

KINA-KINA. A Name for the *Peruvian* Bark. See QUINA-QUINA.

KIRATH. A Weight, equal to four Grains. *Blancard.*

KISES. *Rulandus* explains this, *Sal è Rivo, vel Fluvio.*

KISMESEN. See ACACALIS.

KIST. Fourteen Grains. *Paracelſus.*

KNAWEL.

The Characters are;

The Calyx is quinquefid, and expanded in five acute Segments like a Star; the Flowers are ſtamineous, reſting on the Calyx; placed on the Summits, and at the Divarications, of the Branches; each Calyx contains one Seed.

Boerhaave mentions two Species of this Plant; which are,

1. Knawel. *Offic. Boerh. Ind. A.* 2. 93. *Knawel folio & flore viridi.* Buxb. 174. *Polygonum Seleuoides ſive Knawel.* Ger. 453. *Emac.* 567. *Polygonum Germanicum ſive Knawel Germanorum*, Park. 447. Raii Hiſt. 1. 213. Synop. 68. *Polygonum III. Dodonæi ſive tenuifolium.* J. B. 377. *Polygonum anguſtiſſimo & acuto vel gramineo folio, minus repens.* C. B. 281. *Alchimilla ſupina gramineo folio, minore flore.* Tourn. Inſt. 508. GERMAN KNOT-GRASS.

It grows in ſandy Fields. The Herb is in Uſe, which agrees in Virtues with the *Polygonum Latifolium*, being drying, aſtringent, and vulnerary; and is eſteem'd lithontriptic by ſome.

2. Knawel; folio Alſines, glabro; floſculis plurimis. *Polygoni, vel Linifolia, per terram ſparſa, flore ſcorpioides.* J. B. 3. 379. *Boerh. Ind. alt. Plant. Vol.* 2.

Beſides the foregoing Species of *Knawel*, *Dale* mentions the following; which is the

Polygonum coccifernm. Offic. C. B. P. 281. *Polygonum Polonicum coccifernm.* J. B. 3. 378. *Knawel incanum, flore majore perenne.* Raii Hiſt. 1. 213. Synop. 3. 160. *Alchimilla gramineo folio, majore flore.* Tourn. Inſt. 508. POLONIAN KNAWEL. See Coccos.

It is eſteemed drying, aſtringent, and vulnerary.

KOBALTUM. See COBALTUM.

KOLERUS. A dry Ulcer. *Paracelſus.*

KOLTO. A Name for the PLICA POLONICA.

KOPHI. The ſame as CYPHI; which ſee.

KREUPELBOOM. A Name for the *Conocarpodendron; folio craſſo, nervoſo, lanuginoſo, ſupra crenato, ibique limbo rubro; flore aureo; lono facile deciduo.*

KRISSIA BOOM. A Name for the *Palma; Guineenſis; vinifera.*

KUHUL. Lead-ore, or the Lead of the Philoſophers. *Rulandus.*

KUMEN. *Caſtellus* explains this by *Coadunatio.*

KURIA, KYMIA, or KYMUS. A Maſs. *Rulandus.*

KUTUBUTH is properly the *Arabian* Name for a Water Spider, an Inſect perpetually in Motion. Hence the Name has been transferred to a Species of Melancholy, called by *Sennertus*, *Melancholia Errabunda.* See MELANCHOLIA.

KYMENNA is explained by *Rulandus, Ampulla.*

KYMIA. See KURIA. A chymical Cucurbit is, alſo, thus call'd. *Rulandus.*

KYMIT *elevatum.* White ſublim'd Cinnabar. *Rulandus.*

KYMOLEA. The Slime, or Mud, gather'd under a Grinding ſtone, call'd, alſo, *Chymolea. Rulandus.*

KYNA. Opopanax. *Rulandus.*

KYRAM. Snow. *Rulandus.*

L.

FOR the Signification of L in the Chymical Alphabet, ſee ALPHABETUM CHYMICUM.

LABDANUM. See LADANUM.

LABE, λαβὴ, from λαμβάνω, to ſeize. The firſt Acceſs of a Fever; but particularly of a febrile Paroxyſm, in periodical Fevers.

LABELLA LEPORINA. The ſame as LABIA LEPORINA.

LABEO. The ſame as BROCHUS.

LABIA. The Lips.

The Cheeks and Lips form the Sides and Entry of the Cavity of the Mouth. They are formed in general by the Connection of ſeveral fleſhy Portions, of different Breadths, fixed round the convex Sides of the two Jaws, cover'd on the Outſide with the Skin and Fat, and lined on the Inſide by a glandulous Membrane. Beſides this, the Lips ſeem, likewiſe, to have a ſoft ſpongy Subſtance in their Compoſition, which ſwells and ſubſides on certain Occaſions, independently of the Action of the Muſcles belonging to them; and is mixed with Fat.

The Subſtance which forms the red Border of the Lips, is very different from the reſt of the Skin, being a Collection of very fine, long, villous Papillæ, cloſely connected together, and cover'd by a fine Membrane; which ſeems to be both a Continuation of the Epidermis, and of that Pellicle which covers the glandulous Membrane of the Cavity of the Mouth: This Subſtance is extremely ſenſible, and very painful, when the outer Membrane is by any Accident deſtroy'd. The internal Membrane of the upper Lip forms a ſmall middle Frænum above the firſt Dentes Inciſorii.

The Gums are that rediſh Subſtance, like Leather, which covers the two Sides of the whole alveolary Border of both Jaws, inſinuates itſelf between all the Teeth, ſurrounds what I call the Collar of each Tooth in particular, and adheres very ſtrongly to them. Therefore the outer and inner Gums are continuous, and, both together, form juſt as many Openings as there are Teeth.

The Subſtance of the Gums is of a very ſingular Structure, very compact and elaſtic. It is not immediately fixed to the Bones of the Jaws, but by the Intervention of the Perioſteum, with which it is perfectly united; and it is cover'd with a fine, ſtrong, even Membrane, which ſticks very cloſe to the Subſtance of the Gums, and ſeems to be a Continuation of that thin Membrane which goes to the Lips and Cheeks, and of that which goes to the Tongue.

The Arteries which go to the Lips, Cheeks, and Gums, are Ramifications of the external Carotid, and, principally, of the external and internal maxillary Branches. See ARTERIA. The Veins are Ramifications of the external anterior Jugular. See VENA.

The Nerves of theſe Parts come from the Maxillaris ſuperior, and inferior, which are Branches of the Fifth Pair; and, alſo, from the Portio Dura of the Auditory Nerve, or Sympatheticus minimus, the Ramifications of which are ſpread in great Numbers on all theſe Parts, and communicate, in a pretty ſingular manner, with the Nerves of the Fifth Pair in ſeveral Places.

There is ſo much Variety in the Muſcles of the Lips, in different Subjects, that it is not at all ſurpriſing to find Anatomiſts diſagree in the Deſcription of them. In ſome Subjects, Portions of theſe Muſcles are wanting; in ſome they can ſcarcely be diſtinguiſhed, becauſe of the Paleneſs and Attenuation of the Fibres; and in others there are really ſome particular Faſciculi, which are not generally to be found. About fifteen Years ago, I, ſays *Winſlow*, diſſected an old Woman; in which Subject alone I obſerved a great many ſingular Things, which I have not met with in great Numbers of other Subjects more proper for Diſſection: In this Subject the Muſcles of the Face in general were very much multiplied, and very diſtinct.

I have already mentioned the Muſcles of the Lips, under the Article CAPUT; but, as *Winſlow* takes notice of ſeveral Things relative to theſe, which are there omitted, I ſhall inſert his Account of them.

The Muſcles of the Lips are uſually divided into common and proper: The common Muſcles are thoſe which end at the Angles or Commiſſures of the two Lips; and thoſe are proper, which are fixed in one Lip only, which are again ſubdivided into proper Muſcles of the upper Lip, and proper Muſcles of the under Lip. All theſe Muſcles have particular Names; ſome of which are taken from ſomething in the Conformation of the Muſcles; ſome from the Inſertions, or Situation, and ſome from the Uſes attributed to them.

I ſhall here deſcribe thoſe which I am able to ſhew, without mentioning thoſe which I have not hitherto found, though I am in no Doubt about the Accuracy of theſe great Anatomiſts, who have publiſhed Accounts of them, and who have, beſides, given unqueſtionable Proofs of their being faithful and judicious Obſervers. I ſhall lay aſide the Names taken from the ſuppoſed Uſes; becauſe I am ſtill uncertain about ſome of the Uſes attributed to them; and, alſo, to encourage young Anatomiſts, and even Beginners, to endeavour at gueſſing, at which they may, perhaps, ſucceed better than I have done.

The Muſcles, to which I confine myſelf, may be enumerated in the following Order.

Muſculi Communes. Semi-orbiculares, Supra-ſemi-orbiculares, Buccinatores, Zygomatici Majores.

Muſculi proprii Labii ſuperioris. Zygomatici Minores, Canini, Inciſorii Laterales, Inciſorii medii.

Muſculi proprii Labii inferioris. Triangulares, Triangularium Collaterales, Quadratus, Inciſorii inferiores, Cutanei.

The upper Lip is ſometimes moved by the Action of the Muſcles of the Noſe, eſpecially of the Pyramidales; and both Lips, either jointly or ſeparately, are moved by Suction, without the Aſſiſtance of the Muſcles belonging to them.

The *Semi-orbiculares* are commonly looked upon as one Muſcle, ſurrounding both Lips, from whence it is called *Orbicularis*; but, when we examine carefully the Angles of the Lips, we find that the Fibres of the upper Lip interſect thoſe of the under Lip, and we eaſily diſtinguiſh the muſcular Arch of one Lip from that of the other; and for this Reaſon I divide this Muſcle into two, and I call them either by the common Name of *Semi-orbicularis*, or I call one *Semi-orbicularis ſuperior*, and the other *Semi-orbicularis inferior*; but the Name of *Semi-ovales* would be ſtill more proper.

The ſuperior Semi-orbicular Muſcle is oftentimes broader than the inferior; and it has this Peculiarity, alſo, that all its Fibres do not go to the Corner of the Mouth, but terminate by degrees, between the Middle and Extremities of this Arch, nearly like the Semi-oval Fibres of the upper Palpebra. The inferior Semi-orbicular Muſcle is commonly more uniform in the Diſpoſition of its Fibres.

The *Supra-ſemi-orbiculares* are Fibres which increaſe the Breadth of the two lateral Portions of the ſuperior Semi-orbiculares upward; and they appear at firſt Sight to be one continued Arch, like the Muſcle laſt named; but, being narrowly examin'd, they will be found to be ſeparated by a ſmall Interſtice, lying betwixt their contiguous Extremities, which are fixed in the Gums, oppoſite to the Edges of that cutaneous Foſſula that runs down from the Septum Narium to the middle of the Edge of the upper Lip. Their other Extremities are confounded with thoſe of the Semi-orbicularis ſuperior.

The *Buccinatores* are two in Number, each of them ſituated tranſverſely between the poſterior Part of the two Jaws, and the Corner of the Mouth: They are broad backward, and narrower forward, in the Shape of a Triangle, or Trapezium; and they form a conſiderable Portion of the Cheeks. To have a juſt Idea of theſe Muſcles, we muſt be made acquainted with a Ligament on each Side of the Face, which I call the *Ligamentum inter-maxillare*; becauſe it connects the two Jaws, and, alſo, gives Inſertion to the poſterior Fibres of the Buccinator.

This Ligament is ſtrong, and pretty broad: It is fixed by one End to the Outſide of the upper Jaw, above the laſt Dens Molaris, and at the Side of the Apophyſis Pterygoides, where it adheres very cloſely to the Muſculus Pterygoidæus internus. By the other End it is fixed in the poſterior or ſuperior Extremity of the oblique prominent Line, on the Outſide of the lower Jaw, below the laſt Dens Molaris: It ſerves, likewiſe, as a Frænum, to check and limit the Depreſſion of the lower Jaw, in opening the Mouth; and we may feel it ourſelves, with the End of the Finger in the Mouth, eſpecially when it is wide open.

The Buccinator is inſerted poſteriorly in three different Places: The middle Fibres are fixed tranſverſely in the Ligamentum Intermaxillare, and run directly to the Corner of the Mouth: The ſuperior Fibres run down in an oblique graduated manner, from the Alveoli of the upper Jaw to the Corner of the Mouth; and the inferior Fibres run up from the lower Jaw in the ſame manner. All theſe Fibres contract, by degrees, as they approach the Commiſſure of the Lips, where they run in behind the Extremities, and Union of the Semi-orbicularis, by which they are covered, and to which they adhere cloſely. There is a large Hollow between this Muſcle and the Maſſeter, filled with Fat.

The

The *Zygomatici Majores* are two Muſcles ſituated, one on each Side, between the Zygoma, and the Corner of the Mouth: Each Muſcle is thin, long, oblique, and fixed by one Extremity to the lower Edge of that Portion of the Os Malæ, which is connected with the Zygomatic Apophyſis of the Os Temporis: From thence it runs down obliquely, from behind forward; being, in its Paſſage, commonly involved in Fat: It ends at the Commiſſure of the two Lips, adhering ſtrongly to the Buccinator which covers it. This Muſcle is very often complex.

The *Zygomatici Minores* are two ſmall ſlender Muſcles, lying above the great Zygomatici, and almoſt parallel to them: Their ſuperior Extremity ſeems to be a Detachment from the lower Fibres of the Orbicularis Palpebrarum; but they may be always diſtinguiſh'd: Their lower Extremity unites with the neighbouring Inciſorius. Theſe Muſcles are quite buried in Fat, and, for that Reaſon, often diſappear.

Each of the two *Canini* is fixed by a broad Inſertion in the upper Jaw, above the Socket of the Dens Caninus, in a Depreſſion, below the inferior Edge of the Orbit, near the Os Malæ; from thence it runs down obliquely, croſſing the lower Extremity of the Zygomaticus Major, which covers it at this Place; afterwards it terminates at the Extremity of the Arch of the Semi-orbicularis ſuperior, and communicates, by ſome Fibres, with the Triangularis. I formerly looked upon this as a neutral Muſcle, that is, as being neither a proper Muſcle of the upper Lip, nor common to both.

Each of the two Inciſorii Laterales is a ſort of Biceps, its upper Part being divided into two Portions, which unite below. One of theſe ſuperior Portions is larger than the other, and is fix'd in the Os Maxillare, below the middle Tendon of the Orbicularis Palpebrarum, ſeeming to communicate by ſome Fibres with the contiguous Fibres of that Muſcle. From thence it runs down a little obliquely toward the Cheek, along the Apophyſis Naſalis, mixing with the Pyramidalis Naſi, and ſending ſome Fibres to the Nares. Afterwards it paſſes over, and adheres to the Myrtiformis, or Tranſverſales Naſi, and unites with the other Portion.

This other Portion is fixed by a broad Inſertion, immediately below the Edge of the Orbit, in the Os Maxillare, near the Union of this Bone with the Os Malæ; and, likewiſe, a little in the laſt-named Bone, being at this Place covered by the inferior Portion of the Orbicularis Palpebrarum, with which it has ſometimes a kind of Communication. From thence it runs down obliquely towards the Noſe, and unites with the firſt Portion.

The two Portions, thus united, and contracting in Breadth, run behind the Semi-orbicularis ſuperior, and are fixed in it oppoſite to the lateral Dens Inciſorius. Sometimes it ſends a ſmall Faſciculus of Fibres to the Muſculus Caninus, which may be reckoned an Aſſiſtant to that Muſcle, and named Caninus minor.

The Inciſorii Medii are commonly call'd Inciſorii minores Cowperi, or Inciſorii minores ſuperiores. They are two ſmall ſhort Muſcles ſituated near each other, below the Septum Narium. They are fixed by one Extremity in the Os Maxillare, on the Alveoli of the firſt Inciſores, behind the Semi-orbicularis ſuperior, and by their other Extremity in the middle and ſuperior Part of the Subſtance of the upper Lip, near the Nares, in which they likewiſe have an Inſertion; and they ſometimes ſend lateral Fibres to the Semi-orbicularis.

Each of the two Triangulares is fixed by a broad Extremity in the Outſide of the Baſis of the lower Jaw, from the Maſſeter to the Hole near the Chin. From thence it aſcends, contracting in Breadth in a bent triangular Form, runs in between the Extremities of the Buccinator and Zygomaticus major, to both which it adheres very cloſely, and terminates at the Commiſſure of the Lip, partly in the Semi-orbicularis ſuperior, and partly, though not always equally, in the Semi-orbicularis inferior. This Muſcle ſeems ſometimes to be a Continuation of the Caninus major.

The Quadratus forms the thick Part of the Chin below the under Lip. It is a very complex Muſcle, and very difficult to be prepared, becauſe its Fibres are interwoven with a great Quantity of Fat, or a pellicular Texture of the Membrana Adipoſa. It is firſt inſerted in the fore Side of the lower Jaw, where it partly fills the broad Foſſula on each Side of the Symphyſis. Thence it runs up, interſecting, along the Symphyſis, the contiguous Fibres of the Skin, and terminates by a broad Inſertion in the Semi-orbicularis inferior. The Direction of the other Fibres, of which it is compoſed, varies in different Subjects, and it communicates by ſome Fibres with the Cutanei.

The Inciſorii inferiores are two ſmall Muſcles, commonly mentioned with the Addition of M. *Cowper*'s Name. Each of them is fixed by the ſuperior Extremity, on the Alveoli of the lateral Inciſores of the lower Jaw. Thence they run down, approaching each other, and are inſerted together in the lower Part of the Middle of the Semi-orbicularis inferior.

On the Outſide of the ſuperior Inſertion of each of theſe Muſcles, we meet with a Faſciculus of Fibres, which ſeem to be detached from it near the Inciſors. This Faſciculus goes off laterally in form of an Arch, and unites with the Fibres of the Semi-orbicularis inferior, with which it may be eaſily confounded. It may be looked upon as a Muſculus acceſſorius to the Semi-orbicularis inferior, or as a Collateralis to the Inciſorius minor.

The two Muſculi Cutanei form a kind of fleſhy Membrane, which covers the whole fore Side of the Throat and Neck, from the Cheek and Chin, all the Way down below the Clavicula, and adheres very ſtrongly to the membranous or aponeurotic Expanſion. This Expanſion has a particular Adheſion to the anterior Portion of the Baſis of the lower Jaw, of the ſame Kind with that at the lower Part of the Zygoma; and it is ſpread over all the Muſcles that lie round the Neck, and over the upper Portion of the Pectorales majores, Deltoides, and Trapezii.

The Fibres of each cutaneous Muſcle run obliquely upward and forward, and meet, and ſeem to interſect thoſe of the other Muſcle at acute Angles, from the Sternum all the Way to the Chin. They adhere very cloſely to the Skin, by the Intervention of the cellular Subſtance. From the Clavicles, to the upper Part of the Neck, theſe Muſcles are very thin, and from thence increaſe a little in Thickneſs, as they approach the Baſis of the lower Jaw, and eſpecially from the Maſſeter to the Chin.

They adhere ſtrongly to the lower Portion of the Maſſeter, Triangularis, and Quadratus, and on the Maſſeter and Buccinator, their fleſhy Fibres become aponeurotic, but continue longer on the Triangularis, being mixed with the Fibres of that Muſcle all the Way to the Commiſſure of the Lips. They likewiſe advance a little on the neighbouring Portion of the Quadratus.

The Portion of theſe Muſcles, which anſwers to the Baſis of the Triangularis, is in a manner divided into two fleſhy Laminæ, the outermoſt of which is what advances over the Triangularis and Quadratus, the other being inſerted ſeparately in the lower Jaw. I have ſometimes obſerved a Part of the fleſhy Extremity of the Right Side to paſs before the Symphyſis of the Chin over a like Part from the Left Side, the one covering the other.

The common Muſcles of the Lips either draw both Corners of the Mouth at once, or only one at a time, according to the different Direction of their Fibres. The proper Muſcles pull the different Parts of the Lips, in which they are inſerted. The Buccinators, in particular, may ſerve to move the Food in Maſtication. An entire Treatiſe might be written on the almoſt innumerable Combinations of the different Motions of all theſe Muſcles, according to the different Paſſions and Poſtures in which a Man may put his Face. None are more affecting, than thoſe produced by the Cutanei alone, eſpecially in Weeping, which they do by their Adheſions to the Triangulares, *&c.* But, by their Inſertions in the Bone of the lower Jaw, they draw up the lower Part of the Integuments of the Neck, and thoſe of the Breaſt next to theſe; for they cannot move the Jaw. In old People, and in thoſe who are much emaciated, theſe Muſcles may be perceived by the Eye, under the Chin, and on the Neck.

LABIA LEPORINA. Hare-Lips.

In ſome Perſons, the upper Lip is ſo divided or ſlit, as to reſemble the upper Lip of a Hare (ſee *Tab.* XLI. *Fig.* 1.); whence it is called a Hare-Lip. This Diviſion is ſometimes ſmall, and ſometimes ſo large, that a Part ſeems wanting; at other times it is double, like the Letter M, and then is termed the double Hare-Lip. Beſides the Deformity cauſed by this Diſorder, it is attended with an Inconvenience, which hinders Infants from ſucking, and Adults from ſpeaking diſtinctly. Sometimes this Accident happens to the lower Lip, from the ill Treatment of a Wound, and this we call the ſpurious Hare-Lip. In the true Species, which is born with the Infant, the Palate is often divided either in Part, or entirely to the Noſe and Uvula; and ſometimes I have obſerved the Uvula wanting. It is no Wonder, therefore, if, after a complete Cure of the external Diſorder, the internal remains incurable, and renders the Speech ungrateful and difficult, on account of the Fiſſure of the Palate and Noſe. The leſs and more equal the external Fiſſure, the eaſier the Cure; and the more difficult, when it is larger, and more unequal. Sometimes the Lip is ſo mutilated as to admit of no Cure, particularly in Infants, though, in ſome more advanc'd in Years, it may be attempted with greater Hopes of Succeſs. So the double Hare-Lip is often difficult to be remedied from the Largeneſs of the Hiatus, or ſome other Cauſe. Sometimes Part of the Jaw, or a Tooth, projects forwards into the Slit; and, unleſs theſe are removed, the Cure can never be perfected.

When the Hare-Lip is recent, or proceeds from a Wound, it is cured by the knotted Suture; but, when a Part is loſt, the Needles muſt be uſed, as in the true Kind: In this, as Art cannot ſupply what is naturally deficient, it can only unite what is divided; and this is done by cutting and taking off the Edges of the Wound, with great Circumſpection. We ſhall therefore give a ſuccinct, but very plain Account of the Method. A temperate Seaſon, as Spring, Summer, or Autumn, but particularly the firſt, is to be choſen for this Operation; the Patient ſhould be free from any other Diſeaſe, vigorous, and in good Health; but, if he has any Diſorder, let that be firſt removed. Next, he ſhould be prepared by lenient Purges, with a continued Regularity of Diet. The Operation is to be performed in a light Room, and requires the ſubſequent Apparatus; a Pair of Sciſſars, (*Tab.* XXII. *Lett.* C.) ſome Needles (*Tab.* XXV. *Fig.* 21. and 22. or *Tab.* XLI. *Fig.* 2, 3, 4, 5.) made of the ſtiffeſt Sort of Gold, of Silver, or Braſs, with ſharp triangular Points, (*Fig.* 2.) or flat,

(*Fig.* 3, 4, 5.) that they may more eaſily enter the Lip. Steel Needles are not ſo commodious, becauſe they are ſubject to Ruſt; and hence, in extracting, excite Pains, and cauſe Lacerations. Beſides theſe, let there be provided ſome ſtrong Silk Threads, a Veſſel full of warm Water, with a Sponge, Lint, vulnerary Balſam, and a long, narrow Fillet; and, if ſharp Needles are to be left in the Wound, or the Jaw or a Tooth projects into the Diviſion, a Forceps proper for the Removal of them will be convenient. Laſtly, Some *Hungary* Water, or ſomething of the like kind, to revive the Patient, by applying it to his Noſe. When the Operator is provided with theſe Neceſſaries, he muſt ſeat his Patient, if he is an Adult, againſt the Light, and ſecure his Head by an Aſſiſtant: If he is an Infant, which is generally the Caſe, he muſt be laid in a ſtrong Man's Lap, and his Head and Legs muſt be held faſt by two Aſſiſtants, while the Perſon, whoſe Lap he is in, ſecures his Hands; or, if he be very young, they may be tied with a ſtrong Roller. When the Fiſſure is large, and the two Parts cannot be eaſily united, it is proper to divide the *Frænulum* of the upper Lip from the Gums, with a Pair of Sciſſars, but without wounding the Gums, or uncovering the Jaw; then the Surgeon cuts off the Edges of the Fiſſure with his Sciſſars, that they may be every-where bloody, and particularly in the upper Part, which ſometimes requires a peculiar Inciſion; but he carefully avoids taking off too much, or too little; for both Extremes will prevent an Union. He next cleanſes the Lips with a Sponge, and an Aſſiſtant holds them cloſe together, whilſt the Operator paſſes thro' them two or three Needles, according to the Size of the Wound, and Age of the Patient, at about the Diſtance of the Breadth of a Gooſe-quill from the Fiſſure; for, if they were nearer, they would tear out, eſpecially in Infants, who are very ſubject to cry. The Needles are to be entered from the Left towards the Right, beginning at the ſuperior Angle of the Fiſſure, and inſerting them at about a Straw's Breadth from each other; for this will produce an Agglutination. In performing this Operation upon Adults, an Acutenaculum or Handle (*Tab.* 27. *fig.* 2. or 3.) may be found convenient to ſuſtain and depreſs the Needles, tho' it may be done by the Fingers, which is my conſtant Practice.

When the Needles are thus paſſed, and the Lips again cleanſed with a Sponge, let an Aſſiſtant hold them cloſe together, whilſt the Operator faſtens a Piece of ſtrong waxed Thread or Silk about one End of the Needle, and proceeds with it either like the Figure 8, laid ſideways, thus ∞, (as *Tab.* 25. *fig.* 21, 22.) or circularly, (as *Tab.* 41. *fig.* 5.) beginning either at the upper or lower Part; and, having, by this means, drawn the Margins of the Lips together, he faſtens the Thread with a Knot. It is cuſtomary to cut off the Points of the Needles with a ſtrong Pair of Forceps, that they may not project above the Breadth of a Gooſe-quill beyond the Ligature, that they may not prick the Lip, and excite Pain and Inflammation; but, when the Needles are ſhort, or ſecured with Linen or Sponge laid under them, this is not neceſſary; on the contrary, the Cure ſucceeds better without it, there being then no Danger of an Irritation of the Wound.

It is the Practice to dreſs with ſoft Lint, dipt in Honey of Roſes, which is applied between the Gums and Lip, to heal the Wound internally: This, indeed, may be done to Adults; but many Inconveniencies attend it, if the Patient is an Infant; for they, by crying, will eaſily divide the Wound, beſides the Danger of coughing, or being ſuffocated, if the Lint ſhould ſlip down. The external Part of the Wound is dreſſed with Balſam of *Peru*, or ſome other vulnerary Balſam, covered with Lint, and a Compreſs; adding, if it is thought proper, a ſticking Plaiſter, with four Heads, cut in the Form of a Roller, repreſented *Tab.* 23. *d*, two of which are faſtened on the Right Side of the Lip, and two on the Left, the Whole being ſecured with a four-headed Bandage, an Inch broad, or a ſimple two-headed one, whoſe Ends may be faſtened about the Occiput, either by a Knot, or Pins. Some, when the Fiſſure is very large, apply a narrow uniting Bandage (ſee *Tab.* 23. *fig. f*) over the Plaiſter; but this does more Prejudice than Service, by preſſing the Needles too forcibly; and as the only thing requiſite to keep the Dreſſings on the Wound, the firſt-mentioned Bandage is to be preferred. And, in Infants, if I am not miſtaken, the ſticking Plaiſter is very inconvenient; for, during the whole Application of it, they will cry, and, by that means, injure the Lip, but juſt ſown up. *Garengeot* adviſes Bleeding two or three times after the Operation: But this is ſuperfluous, and I have cured many without it.

The Antients thought it unſafe to attempt this Cure upon Infants under two Years of Age; and *Garengeot* would defer it till they are four or five; but Experience teaches us, that many have been freed from this Diſorder at five or ſix, and even at three Months old, when they were well in other reſpects, and the Operation was rightly performed. Beſides, Parents are unwilling to defer it ſo long; and, therefore, when the Fiſſure is but ſmall, there is no neceſſity for the leaſt Delay. Before this Operation, Infants ſhould be kept awake a conſiderable time; and an Anodyne may be given them, that they may ſleep the longer afterwards, and not divide the Lip by crying, but rather let the Wound heal. Further, the Infant, during the Operation, ſhould have his Head rather bent forwards than backwards, to prevent coughing, or the Blood from running down his Throat. And though this is generally attended with a profuſe Hæmorrhage, there is no Danger; for that prevents an Inflammation, and it ceaſes upon the Application of the Suture and Bandage before recommended.

Some Surgeons, for Prevention of the Hæmorrhage, and Convenience of the Operation, provide certain Tenacula, contriv'd on purpoſe, repreſented *Tab.* 41. *fig.* 6, 7. to hold the Lip on each Side of the Fiſſure, before they remove the Skin with the Inciſion-knife, or Sciſſars, which, tho' they ſeem very properly adapted to make a neater Wound and Cicatrix, are very ſeldom uſed. In Infants, as well as Adults, when there is a Fiſſure in the Palate, Part of the upper Jaw, or a Tooth, generally projects forwards, which muſt, therefore, be removed, or extracted, before the Operation is begun.

The Dreſſings ought not to be removed before the third Day, unleſs ſome Accident renders it neceſſary, and then with Caution, that the Parts may not be ſeparated; to prevent which, it may be proper to moiſten the Bandage and Plaiſter with warm Wine; and, if the Thread is relaxed, ſo as not to retain the Lips of the Wound, a new Thread muſt be faſtened round the Needles, and the Wound bound tighter. This ſeldom happens. But, when every thing appears in due Order, the Surgeon ought to anoint the Wound with a Feather, dipt in a vulnerary Balſam, lay freſh Lint between the Gums and Lip of an Adult, and proceed as we directed before. If the Lips of the Wound appear conjoined in three or four Days, he may take out the middle Needle, if there are three, or the upper one, if there are but two, with his Fingers, or a Forceps; but this muſt be done very cautiouſly, firſt applying his Fingers on each Side, to compreſs the Edges of the Wound. The Wound may be thus opened every Day, or every other Day, by which means the Threads will ſeparate ſpontaneouſly, and the Cure be perfected by dreſſing with a vulnerary Balſam, or Honey of Roſes, or Syrup of Violets, with a ſticking Plaiſter, and uniting Bandage. Laſtly, it will contribute greatly to the Cure, if the Patient, being an Adult, is, for ſome time, dieted upon Broths, Emulſions, Milk, Jellies, and Food, which requires no Maſtication; and is forbid talking. In Infants, the lower Part of the Lip ſhould be often moiſten'd with a Feather, dipt in Honey of Roſes, or Syrup of Violets, which will not only heal, but excite the Child to lick that Part, and, by that means, promote the Cure.

Many *German* Quacks and Mountebanks paſs a ſtrong Thread, with a common Needle, thro' the Lips, at the Diſtance obſerved by regular Surgeons, and then tie the Ends of the Thread, as in the knotted Suture. They obſerve the ſame Order in tying the Threads, as others in making the Ligature about the Needles; nor do they vary in their other Dreſſings, and the Remainder of the Cure. At laſt they cut the middle Thread on the third or fourth Day, the uppermoſt on the fifth, and the loweſt on the ſixth or ſeventh, and ſometimes all of them on the fourth or fifth Day; and thus they frequently ſucceed, tho' in an aukward Manner, and with very indifferent Inſtruments, when the Fiſſure is ſmall; for, when it is large, this Method can never be effectual.

We ſhall now ſubjoin ſome neceſſary Cautions and Obſervations relating to this Diſorder. Firſt, When the Skin, in the upper Angle of the Fiſſure, is not taken clean off, that Part will not unite, tho' the lower may; but there will remain an *Hiatus*, to avoid which, none of the Skin ſhould be left behind. Secondly, If, thro' Neglect, ſuch an Aperture is left above, and the inferior Parts are healed, the only Method is to take off the whole Cicatrix by a double Inciſion, and cloſe the Wound afterwards with Needles and Ligature: In this Manner I cured two Girls of ſuch a Foramen, which had been left by Mountebanks. Thirdly, When the Palate is divided, and the Hiatus of the Lip extends to the Noſe, as is repreſented in *Tab.* 41. *fig.* 1. A, the beforementioned Cautions are ſuperfluous, becauſe the Angle is wanting in the upper Part, though a modern Writer has inſiſted on them without Diſtinction; which proves that he either never met with this Sort, or did not underſtand it. Fourthly, In a double Hare-Lip, the four Sides of the Fiſſure muſt be cut off, and then united by long Needles, and a Ligature, beginning on the Left Side, then proceeding to the middle, and from thence to the Right Side. *Roonhuyſen*, *Palfin*, and others, adviſe to looſen the Threads on the ſecond or third Day, and propoſe many Advantages from it: But, as the Threads generally adhere to each other, and the Wound or Needles, by means of the Blood or Balſam, without any Pain or Injury, and this Removal would make Infants cry, I cannot ſee any Reaſon for ſuch a Procedure; unleſs an Inflammation, or ſome other Accident, require it, eſpecially as they will ſeparate after extracting the Needles. Sixthly, I uſe a kind of Ribband or Fillet, with two or three Hooks, like thoſe repreſented *Tab.* 25. *fig.* 9. which I fix to the Patient's Head, in ſuch a manner, that the Angles may be placed on each Cheek, near the Lips. Next, having encompaſſed the Needles with the Thread, I faſten a ſtrong Lace to one of the Hooks, which I paſs to one of the Hooks on the other Side over the Needles, and

ſo back again, till the whole Lace is taken up, to the other Hooks, which is the beſt Method of ſecuring the Lips of the Wound. Seventhly, Some direct to extend and ſupport the Left Side with the Left Hand, and take off the Skin by Sciſſars, with the Right; then, changing Hands, the Right Side is to be ſupported by the Right Hand, and the Left to perform the Operation; but as this will render the lower Part of the Lip more tenſe than the ſuperior, however cautiouſly it be done, hence, in the Section, more will be taken from the inferior than the ſuperior Part, and, in conſequence of this, the Wound will be too large and unequal; which Inconvenience is ſtill greater in Children, from the Smallneſs of their Lips, to ſay nothing of the changing Hands, and making an Inciſion with the Left; I think it, therefore, better not to touch the Lip with the Fingers, during the Section, but only to take the Margin with the Sciſſars. Eighthly, *Petit* has invented, for this Purpoſe, a Needle, almoſt like the Larding-pin, (ſee *Tab.* XLI. *Fig.* 8.) by whoſe obtuſe End A, which is hollow and ſlit, when he has paſſed it through the Lips of the Wound, he introduces the *Fibula* (*Fig.* 9.) made of Silver, with two Heads; and after extracting the Needle, leaves it in the Wound: Then he involves the Thread round the *Fibula*, to unite the Wound, and this indeed ſeems a very proper Method. But, if I was to uſe theſe *Fibulæ*, they ſhould be made of Silver, either without a Head, or with one only (as *Fig.* 10.); for then the Head need not be cut off, and they might then be extracted with much more Eaſe. Beſides, I think this Needle too thick and large, and would prefer that (*Tab.* XL. *Fig.* 8.) which I recommended for perforating the Ear. Ninthly, If this Operation ſhould be attended with an Inflammation, Fever, or Convulſions, which never occur'd to me, I agree with *Garengeot*, in removing the Suture. Tenthly, If a large Part of the Lip, or any Teeth, are wanting in Adults, ſo that the *Fibulæ* cannot be ſupported, a Leaden Plate ſhould be fixed under the Lip. Laſtly, It is ſurpriſing, that *Hildanus*, out of 600 chirurgical Obſervations, ſhould have nothing upon the Hare-Lip. *Heiſter. Chirurg.*

Sharp ſays, that the callous Edges of the Fiſſure muſt be cut with a thin Pair of ſtrait Sciſſars, the whole Length of it, obſerving the Rule of making the new Wound in ſtrait Lines, becauſe the Sides of it can never be made to correſpond without this Caution. For inſtance, if one Side of the Hare-Lip was indented, the Inciſion of the Edges muſt be continued in direct Lines.

The Pins I employ, ſays he, are made three-fourths of their Lengths of Silver, and the other Part, towards the Point, of Steel; the Silver Pin is not quite ſo offenſive to a Wound, as a Braſs or Steel one; but a Steel Point is neceſſary for its eaſier Perforation, which makes them paſs ſo readily, that there is no need of any Inſtrument to aſſiſt in puſhing them through. *Sharp.*

Beſides the preceding Signification of *Labia*, the Edges, or Lips, of Wounds or Ulcers are thus called. And there is another Part of the Body, which has acquir'd this Appellation, which is the moſt external Part of the *Pudendum Muliebre*.

The LABIA PUDENDORUM are more prominent and thicker above than below, which lie nearer each other below than above. They are principally compoſed of the Skin, cellular Subſtance and Fat. The exterior Skin is a Continuation of that of the *Pubes* and *Inguina*. It is more or leſs even, and furniſhed with a greater Number of glandular Corpuſcles, from which a whitiſh ceruminous Matter may be expreſſed; and after a certain Age it is likewiſe covered in the ſame manner with the *Pubes*.

The inner Sides of the *Labia* are ſomething like the red Portion of the Lips of the Mouth; and it is diſtinguiſhed everywhere, from the external Side, by a kind of Line, in the ſame manner as the red Portion of the Lips from the reſt of the Skin; being likewiſe thinner and ſmoother than the outward Skin. A great Number of Pores are obſervable in it, and, alſo, numerous glandular Corpuſcles, which furniſh a Liquor more or leſs ſebaceous; and the Corpuſcles are larger near the Edges, than in the other Parts. The Places where the *Labia* are joined above and below, are termed Commiſſures; and may likewiſe be called the Extremities or Angles of the Sinus. *Winſlow.*

LABIATE FLOWERS are ſuch as have Lips; or, more properly, a labiated Flower is an irregular monopetalous Flower, divided into two Lips; the upper is called the Creſt, the under the Beard. Sometimes the Creſt is wanting, and then the Style and Chives ſupply its Place; as in the Ground-pine, *Scordium*, *Bugula*, and the like; but the greateſt Part have two Lips: In ſome Species the upper Lip is turned upwards, as in Ground-ivy; but moſt uſually the upper Lip is convex above, and turns the hollow Part down to the lower Lip, and ſo repreſents a kind of Helmet, or Monk's Hood, from whence theſe are call'd Galeate, Cucullate, and Galericulate Flowers, in which Form are moſt of the verticillate Plants. *Miller's Dict.*

LABIS, λαβὶς, from λαμβάνω, to take. A *Forceps.*

LABLAB. A Name for the *Phaſeolus*; *Ægyptiacus*; *nigro Semine.*

LABOR imports either Labour, conſidered as an Exerciſe of the Body, or a Diſeaſe.

LABORATORIUM. A Laboratory.

LABRAX, λάβραξ. The Name of a Fiſh. See LUPUS.

LABRISULCIUM. A Chap in the Lip; or the ſame as CHEILOCACE. This is a ſcrophulous Symptom. See SCROPHULA.

The *Labriſulcium*, or chapt upper Lip, as it is an Attendant on the Strumæ, is beſt cured by the ſame internal Remedies uſually preſcribed to alter and rectify this particular Diſcraſy of the Blood, and its ſecreted Juices, which, together with mercurial Purgation, oftentimes takes down the Swelling, at leaſt for a time, till by getting of a freſh Cold, or ſome other Treſpaſs in the Non-naturals, a new Fluxion ariſes, and the Part ſwells up again.

The Chap, or Cleft, itſelf, may be anointed with Oil of Almonds, Sperma-ceti, Ointment of Tutty, or *Turner's* Cerate of *Lapis Calaminaris*. Dr. *Bate* has two Remedies, in his Diſpenſatory, the one he calls his *Unguentum ad Fiſſuras*, the other *Oleum Tritici*, being an Oil, ſtrongly expreſſed from Wheat bruis'd, and put between hot iron Plates; which, however they may happen to ſucceed in common Chaps or Clefts in the Skin, from the cold Air, to which many People are ſubject, yet I muſt ſuſpect their Efficacy in our preſent Caſe.

Arnoldus Boot has treated of this Symptom more particularly in his tenth Chapter, under the Title of *Cheilocace*; where, in the firſt Place, he tells you, that, as Children are the uſual Subjects of this Diſeaſe, it is neceſſary the Remedies ſhould be made as palatable as can be. He begins the Cure, therefore, with an opening Apozem of the Decoction of Fumitory, Betony-root, Dock, Succory, and Polypody, rendering the ſame purgative with Sena, Agaric, and Tamarinds, of which the Patient is to take a Draught two or three times in a Day, rendered pleaſant with a little Syrup of Violets, or Succory: Having made a general Evacuation by the Lancet, he bleeds with Leeches behind the Ears, by way of Revulſion, and directs, alſo, Fontanels, or Iſſues.

His Topics for the Lip are Epithems, by way of Fotus, prepared of a Decoction of Chervil, Cinquefoil, Myrrhis, red Roſes, and Sage, in which a little Salt of Vitriol, or white Vitriol, depurated by repeated Solutions and Coagulations, has been diſſolved, whilſt the Chap or Cleft on the Inſide is touch'd frequently with a Mixture of Plantain-water, Sugar of Lead, and Honey of Roſes. *Turner's Surgery.*

The *Unguentum ad Fiſſuras* of *Bates* is made of Myrrh, and Litharge of Silver, each one Ounce; Honey, four Ounces; Wax, two Ounces; Oil of Roſes, ſix Ounces; *Oleum Rhodii*, twelve Drops.

Or, Take of *Armenian* Bole, Myrrh, and Ceruſs, each two Drams; and make into an Ointment, with Duck's Fat.

LABRUM. A Lip. See LABIA.

LABRUM VENERIS. A Name for the *Dipſacus, Sylveſtris*, or *Virga Paſtoris major.*

LABRUSCA. A Name for the *Vitis Sylveſtris.*

LABURNUM. A Name for the *Cytiſus Alpinus*; *latifolius*; *flore racemoſo, pendulo.*

LABYRINTHUS. The Labyrinth of the Ear. See AURIS.

LAC. Milk.

Milk is a Liquor prepared from the Aliment chewed in the Mouth, digeſted in the Stomach, perfected by the Force and Juices of the Inteſtines, and elaborated by means of the Meſentery, and its Glands, and Juices, and the Juices of the thoracic Duct: It has undergone ſome Actions of the Veins, Arteries, Heart, Lungs and Juices, and began to be aſſimilated; yet may ſtill be had ſeparate, and diſcharged out of the Body.

And thus by their own Milk, prepared from the proper Matter of the Chyle, all the known lactiferous Animals are nouriſhed, both Male and Female: For Milk is always prepared from the Chyle, as well in Men as in Women, in Virgins, and barren Women, in Mothers, and Nurſes. Whence every ſuch Animal conſiſts, is nouriſhed, and lives, on its own proper Milk; and from this alone prepares all the other Parts, both the ſolid and fluid, by means of the vital Actions. It is, alſo, certain, that Men may live for Years, by feeding upon Milk alone, and perform all the Actions of Life, and have all the ſolid and fluid Parts of their Bodies perfectly elaborated. The Serum, therefore, the Blood, the Lymph, the Spirits, Bones, Cartilages, Membranes, and Veſſels, proceed from Milk; and if a Man may live, for many Years, upon Milk alone, Milk muſt contain in itſelf the Matter of all the Parts of the human Body. Milk approaches nearer to an animal Nature than Chyle; the Chyle of the Inteſtines is nearer to a vegetable Nature, and that of the Stomach neareſt. And hence we find the Phenomena of Fermentation and Putrefaction in the Stomach and Inteſtines; ſuch as acid Eructations, fetid Smells, and the like; for this Chyle is a true Emulſion, prepared by the grinding of the Teeth, the Tongue, the Stomach, and the Inteſtines, along with the Saliva, the Liquor of the Stomach, the pancreatic Juice and Bile, in the Inteſtines; and hence proceeds Milk.

If this Milk be good, and ſuffered to reſt in a clean Veſſel, it firſt appears uniformly white, then throws up a white, thick, unctuous Cream to its Surface, and remains ſomewhat bluiſh below. If the Cream be carefully taken off, the remaining Milk

produces

produces more. The ſame thing happens in Emulſions. The Milks of all the known Animals have this Property alike, as likewiſe the Property of Whiteneſs. The human Milk is very ſweet and thin, the next is that of Aſſes, then that of Mares, then of Goats; and, laſtly, of Cows. Whence it is preſcribed, in this Order, to conſumptive Perſons of weak Viſcera. But though Milk reſembles vegetable Emulſions in ſeveral reſpects, yet they differ in others. The Rennet, prepared of the Juice in the Stomach of ſuch Creatures as chew the Cud, being mixed with Milk, coagulates into an uniform Maſs, which may be cut with a Knife, and it thus ſpontaneouſly ſeparates into Whey and Curd; but this does not happen in Emulſions. If long boiled over the Fire, it loſes its more fluid Parts, and condenſes into a butyraceous and cheeſy Maſs; but not into an uniform one, that will cut like the dried Serum of the Blood, or White of Egg. It has a pleaſant Taſte, and no unpleaſant Smell; it is extremely mild, and of a middle Nature between the Blood and the Chyle; and hence proves different according to the Aliment, and the Creature that prepares it.

Neither the Smell, nor Taſte, nor the dropping of new Milk into the Eye, manifeſts any acid, alcaline, or ſaline Matter to be contained in it. If Milk be heated, and ſucceſſively mixed with pure, volatile, and fixed Alcali, there ariſes no Effervеſcence which ſhews any Acidity; but the Milk grows ſomewhat thick and turbid. To other Parcels of the ſame Milk add the acid Spirit of Vinegar, of Nitre, of Salt, and of Vitriol; and theſe make no Effervеſcence, ſo as to manifeſt the Milk to be alcaline, but thicken and coagulate it. But, upon mixing Milk, to which Oil of Tartar *per Deliquium* was poured, with ſome Oil of Vitriol, there immediately ariſes a violent Effervеſcence, and much greater than if the ſame Quantity of Alcali was added to pure Oil of Vitriol. If new Milk be digeſted in a Glaſs Alembic, with a Fire about 160 Degrees, there comes over an aqueous Liquor, without any Signs of an inflammable Spirit; nor does this Liquor give any chymical Sign of being either acid or alcaline, upon mixing with either acid or alcaline Salts. It, alſo, appears not to contain any ſaline Matter, being inodorous, and perfectly inſipid, and cauſing no Pain, if dropt into the Eye. There remains behind a yellow, thick, unctuous Maſs of a ſweet and grateful Taſte, which Maſs gives not the leaſt Appearance of containing any thing acid, alcaline, or ſaline, upon all the Trials made to diſcover it.

REMARKS.

This is the true Nature of Milk, thus variouſly examined: Whence we here find no Signs of a perfect Fermentation, either of the acetous, or vinous Kind; nor of Putrefaction, which produces an alcaline Salt, or fetid Oil; and this though a great Quantity of animal Juices be mixed with the vegetable Matter of the Milk: Whence we muſt form a very different Notion of the Action performed in the making of Chyle and Milk, than Chymiſts uſually ſuppoſe and deliver. And, as Cattle are milked twice a Day, this whole Operation muſt be performed in the Body in the Space of twelve Hours; and, if detained longer, it begins to degenerate, and to corrupt. This Experiment was made upon Cows Milk, becauſe they feed wholly upon Graſs, Hay, and Water. There is ſometimes a Difference found in Womens Milk from the Difference of the Aliment; but, when freſh, there is little Difference to be obſerved. Some have ſuppoſed, that there was here a latent Acid, though it did not appear upon the preceding Experiment; but, if Acids are denominated with reſpect to our Senſes, or their ſenſible Effects, there is no Acid contained in the recent Milk.

Let new Milk boil in ſeveral different Veſſels, with the Addition of a little Water, to prevent its growing too thick in the boiling; pour into one of them a little Vinegar, and one Part of the Milk will preſently coagulate, and leave the other fluid. Into a ſecond pour the Spirit of Nitre; to a third, Spirit of Salt; and to a fourth, the Oil of Vitriol, and the ſame Effect immediately enſues; nor can this Coagulation be prevented by a Heat of 212 Degrees. The ſame Coagulation is made with any other Acid, as the Juice of Sorrel, Barberries, Citron, Currants, Verjuice, Tamarinds, and Tartar; ſo that the Thing which of itſelf was ſo liquid as to paſs through the fineſt Arteries, now has one Part ſeparated into a groſs curdy Matter, and another into a much thinner than the Milk itſelf, called *Whey*. If the Curd be ſtrongly preſſed betwixt thick Linen, it makes Cheeſe, which conſiſts of the Cream of the Milk, and the Curd. This Cheeſe, with Age, becomes ſharp and acrid, not acid, but rather ſomewhat alcaline, of a particular Smell, and ſo penetrating a Taſte, as often to inflame the Mouth. But when the Milk is firſt deprived of its Cream, and afterwards coagulated with Acids, or with Rennet, the Cheeſe thence made proves very dry, and hard like a Horn; and, when applied to the Fire, grows tough, ſcorches, fries, burns, and ſmells perfectly like Horn. This is a ſtrange Change of ſo fluid a Matter as Milk; but is, perhaps, the Origin of all the Solids in the Body.

REMARKS.

The Nature of Milk, thus diſcovered, is the ſame in the Receptacles of the Breaſts, where it is lodged; and, therefore, may be there coagulated by a like ſaline or acid Matter; at which time the thin Serum comes out at the Nipples, and the thick Curd remains in the Veſſels, ſo as there to produce Hardneſs, Swellings, Inflammations, Suppurations, Scirrhoſities, and Cancers; and, perhaps, the ſame may happen in the chylous Glands of the Meſentery. But, in all theſe Coagulations with Acids, the Milk retains its white Colour; and hence appears the Reaſon why weak Bodies generate a white Chyle and Milk, but with Difficulty convert it into a red Blood; whence ſuch Conſtitutions as abound with Acid, are troubled with acid Corruptions, their Sweat and Smell being alſo acid, and the whole Body pale: Which Particulars, being conſidered, may lead Phyſicians into a due underſtanding of many Diſeaſes.

Dilute new Cows Milk with a little Water, and boil it in a clean Veſſel, and, by degrees, drop Oil of Tartar *per Deliquium* into it: It will thus begin to turn yellow; the more ſo, as more Alcali is added, and the Boiling the longer continued, ſo as to paſs from a faint yellow into a red Colour. At the ſame time it coagulutes more and more, and ſeparates into curdy Maſſes, though not ſo large and firm, nor ſo eaſily hardening, as thoſe produced by Acids. At length, by boiling the Whole long enough, it become a thick, red, coagulated Maſs.

REMARKS.

Milk, therefore, which, mixed with Acid, or its own Rennet, retains its white Colour, even in the Heat, immediately turns yellow with Alcalis in a ſtrong Heat, and, if the Heat be ſufficiently intenſe, almoſt red. When a Woman, that gives Suck, becomes highly feveriſh, the Milk in the Breaſts is corrupted, and, in this Caſe, it becomes yellow, ſaline, thin, and ſanious; the coagulated thick Part, remaining in the Breaſt, now grows ſomewhat fetid, and is abhorred and loathed by the Child. When, therefore, the Milk coagulates in the Body, and grows yellow under a Fever, the Phyſician muſt not ſuppoſe it coagulated by an Acid, but by too much Heat, and rather by an alcaline Tendency: And, perhaps, Phyſicians find the Milk thus coagulated by a Fever an huudred times for once that it is coagulated by an Acid. And in the laſt Contagion among the Cows, while their Meat remain'd in the Stomach, and was neither diſcharged upwards by ruminating, nor expelled downwards, and therefore truly putrefied by the violent Degree of Heat, ſo that the Stomach was almoſt ſcorched, then the Milk grew ſharp, yellow, ſomewhat fetid, and thin in the Dug; and in this Form was either milked out, or dropt ſpontaneouſly. Thus, if, when Milk is coagulated, either by chymical Acids, or by Rennet, and heated, and an Alcali be put to it, we ſhall find this Aſſertion falſe, that Alcalis diſſolve the Coagulation, and recover the former Fluidity. And hence we may underſtand, how Milk will long remain white in the weakeſt and coldeſt Conſtitutions, and not be brought to the natural Redneſs of Blood. Such Perſons are, therefore, continually pale, and their Blood thin, pale, and watry; but, upon the Removal of the Diſorder, the Whiteneſs vaniſhes, and the red Colour returns. So, when the vital Faculties are but moderately ſtrong, they are only able to convert ſome Part of the Milk into Blood, but not to perfect the Whole; then there ariſes a ſomewhat pale yelloviſh, or greeniſh Colour, whence the Green-ſickneſs in Virgins. But where the vital Faculties are robuſt and ſtrong, ſo that they briskly circulate, and heat the Milk, the white Colour is ſoon ſubdued, and converted into a florid Red; whence the Blood will be often ſo intenſely red, as to appear almoſt black. Laſtly, it is manifeſt, that the white Colour of the Milk may remain in the Body, that abounds with Acids; but, if Alcalis preſide in it, it will gradually acquire, firſt, the Colour of Bile, afterwards grow more intenſely yellow, and tend to Redneſs. Dr. *Lower* has ſhewn, that the white Colour diſappears twelve Hours after feeding. *Boerhaave's Chymiſtry*.

The medicinal Virtues of Milk, and the Manner of uſing it, is ſpecified under the Article FIBRA.

A MILK-DIET.

I have given, ſays Dr. *Cheyne*, the Preference in a low Diet, both from Obſervation and Experience, to Milks; ſuch as Aſſes, Mares, Cows, Goats, and Womens; all of them excellent in their Kind, and preferable in this Order: Milk is a Medium be-

tween

tween young animal Food and mere Vegetables: Milk is white Blood already made, adjuſted to all the Meanders of Circulation, and prepar'd by the Hand of Nature, and intended and ſignatured by its Author, for the curing, nouriſhing, and fortifying of weak, tender, and diſeaſed Animals. Aſſes-milk needs no Concomitant but in extremely bilious Stomachs; and I queſtion whether teſtaceous Powders, joined with it, do not hurt inſtead of benefiting the Patient; if it purges, or even curdles, that is of no great Diſadvantage to the Patient, if he is not quite gone; for that Curdling ſhews great Redundancy of Gall, and an inflammatory State in the chyliferous Tube, which requires vomiting, purging, and cooling, which the Aſſes-milk will do moſt gently and ſafely in ſome; and in a ſhort time theſe Effects will ceaſe, or may be eaſily removed by a little Decoctum Fracaſtorii at Night, or *Spa* or *Pyrmont* Water, or *Briſtol*, or any chalky Water, for common Drink, when theſe Symptoms exceed. But, to be uſeful in very tender Caſes, Aſſes-milk ought to be eſteem'd Food rather than Phyſic, and taken accordingly; and tender Perſons, eſpecially in inflammatory Caſes or Diſeaſes, with acute Pains, ought to live on it, and take it in ſuch Quantities as they can bear. All cacochymic, conſumptive, thin, atrophous Perſons, ought to enter upon it directly, and continue it twice or three times a Day, till they are quite recover'd: For I know nothing in Nature that will ſo ſoon recover and plump up the muſcular Fleſh and Habit, as Aſſes-milk long continued; for all Chyle that nouriſhes muſt firſt be reduced to the Nature and Conſiſtence of Aſſes-milk, elſe it will never kindly paſs into the Lacteals. I ſay nothing of Mares-milk, becauſe it is not much in Uſe in *England*, though much admired in *Eaſtern* Countries.

Some Perſons have a natural Averſion to Cows-milk; with others it curdles, and either binds too much, or purges, or ſo inflates and comes off in Phlegm, that they cannot take it without abundance of Pain and Suffering, which is an infinite Loſs to them, it being the ſafeſt, gentleſt, and moſt certain and univerſal Antidote in all chronical Diſtempers, without Exception of one. The only certain Way to make it agree, is firſt to cleanſe the Primæ Viæ by Vomits, or an aloetic Pill now-and-then, mixing the Milk, at firſt, with *Briſtol*, or any ſoft, but chalky Water, making it into a Gruel or Pudding, with Seeds, as Barley, Oats, Wheat, Sago, Rice, and the like; putting ſometimes a Spoonful of White-wine to it; making Bread into Biskets with ſweet Cow-milk, without Yeaſt or Salt, with a quick Firing; taking little at a time, but often; or, laſtly, putting a Spoonful of compound Peony-water into a Quart, or a Tea-ſpoonful of Spirit of Hartſhorn to a Pint; and thus, gradually, carrying off the Load, Heavineſs, and Flatulence or Tumult it ſeems to raiſe, which entirely proceeds from the ill State of the Stomach and Bowels, that, by a Diſtemper, are loaded with Wind, Choler, and Phlegm, where the concoctive Powers are inflamed greatly, the Glands tumid, the Lacteals obſtructed, the Perſpiration ſtopt, the Blood viſcid, and all the Functions in a ruinous State; and not from the Nature of Milk, which is the mildeſt, ſofteſt, moſt nouriſhing, and ſalutary of all Foods; and the vulgar Error, of its being phlegmatic, is from its being the beſt and moſt effectual of all Balſamics, and all Lambatives: As we ſee it is formed by the Hand of Nature for the Young, that is, the Weak and Tender; and there is no real Difference between a weak and tender Animal by Nature, and one made ſo by a Diſeaſe, but that the Caſe is much worſe in the laſt than the firſt; and, therefore, this natural Antidote is more neceſſary in it: And I never knew one, who laboured and endeavour'd heartily at it, but at laſt overcame theſe Difficulties, to his great Pleaſure and Satisfaction, unleſs the Caſe was totally gone. Drinking a little green Tea, or tepid Barley, or *Briſtol* Water, when it oppreſſes, will help it off, and relieve. What makes Milk at firſt ſo diſagreeable, painful, and oppreſſive, is the inflammatory, bilious, and acrimonious State of the Stomach and Bowels, which preſently turns the Milk into a hard cheeſy Curd, and ſends off the Whey into the Lacteals too thin and too faſt: Nothing in Milk, but the ſweet white Whey, that is, the Serum, with the lighteſt and ſmalleſt Particles of the Curd, nouriſhes or can enter the ſtreight and inviſible Mouths of the Lacteals; and hence only is the nutritive Virtue of Aſſes, Womens, and Mares-milk, and Goats-whey. Strong Rennet, or any ſtrong Acid, will turn Milk into a hard cheeſy Curd, which will neither come up, nor go down, without much Labour, Struggle, and Oppreſſion, eſpecially in weak or bilious Stomachs. Weak Rennet will make a tender Curd, which will eaſily ſlide off: So that the whole Art of making Milk agree with any Stomach, is to prevent its turning into too hard a Curd; which any Alcali will do, Sugar, Crabs-eyes, Chalk, the volatile Spirits, and the like. As the Viſcera cool, and the Choler leſſens, the Diſorders from Milk ceaſe. However, I ſhould adviſe thoſe, whoſe Stomachs abound with Bile, and ſo are in an inflammatory State, to live on Seeds, mealy and ſoft Roots, and well-dreſſed Vegetables, for ſome time; eſpecially thoſe who have bad Livers, and an Overflowing of the Gall; for, as to conſumptive, ſcrophulous, ſcorbutical, diabetical, and cancerous Caſes, Milk and Seeds are the beſt Antidote, and ſeldom diſagree. I have been told of two Pigs, fed one with the ſame Quantity of Milk, the other with ſweet Cow-whey; the laſt became the fatteſt, whiteſt, and ſweeteſt. But the moſt infallible Remedy is, for a long time to chew a little good Bark at Noon, and ſome Rhubarb at Night, conſtantly; at leaſt till this Difficulty be overcome: The firſt gives a Tenſion and Spring to the Coats of the chyliferous Tube; the ſecond does not only the ſame, but, alſo, carries off the Load and Superfluity from it, before it accumulates and acidulates too high. Sweet Cow-whey, or Orange-whey, is an admirable Antidote in ſcorbutic and cacochymic Habits, in bilious Vomitings, and hectic, or low feveriſh Caſes: It is preferable to moſt, if not all ſorts of Diet-drinks, antiſcorbutic Juices, or Ptiſans; and they who would, at leaſt all the Summer-months, drink a Quart of this, more or leſs, half in the Morning, and half at Night, would go a great Way to prevent autumnal Fevers, violent gouty Paroxyſms in Winter, ſcorbutic and ſcrophulous Humours and Defedations, and cachectic Juices; eſpecially if ſome particular Plant, as Scurvy-graſs, Ground-ivy, Colts-foot, Baum, Sage, or the like, were infuſed in it, or a little Milk of Sulphur (in caſe it is not of itſelf too purgative) were firſt taken in a Spoonful of it.

Goats-milk, or rather its Whey, is a wonderful Strengthener and Cleanſer. It is ſurpriſing to me, that our Countrymen, after they have heard of the many great Cures, in deplorable Caſes, perform'd by the drinking of Goats-whey, in *Scotland*, *Ireland*, and *Wales*, with a proper Regimen of Diet, Air, and Exerciſe, do not more generally apply to it at firſt, in low, conſumptive, waſting, ſcorbutic, and cachectic Caſes; or in all viſcid or inflammatory Juices. It was in great Eſteem among antient Phyſicians; and the Goats feeding in a pure Air, and high Places, on the moſt tender, light, and aromatic Plants, muſt communicate a Spirit, Balſam, and Sweetneſs, to the Whey, and, conſequently, to thoſe who uſe it freely and plentifully: And accordingly we find its Efficacy; it gently purges, opens, cleanſes, cools, and balmifies; and muſt ſurely be a more natural and gentle Diluent than any artificial Diet-drink whatſoever; and in ſcorbutic, bilious, and inflammatory Caſes, is a moſt ſovereign Antidote. But it is common to ſee the moſt obvious, natural, and ſimple, but moſt beneficial and ſanative Things, ſlighted and overlooked, while new, foreign, coſtly, and complicated ones, are admired: But Time and Suffering will give Wiſdom and Experience, if any thing will.

I ſhould here ſay ſomething of Womens-milk, which is indeed moſt natural and homogeneous to human Bodies in very low conſumptive Caſes, and is found extremely beneficial in them; not only to the Young and Tender, but to the antient Tender, and the Middle-aged, worn out by Diſeaſes: This Milk would be infinitely more beneficial and ſalutary, were it not for the rank, high, foul Feeding, and common Uncleanlineſs of Nurſes, and ſuch low-condition'd Perſons. If Nurſes lived on Cows-milk, Seeds, Roots, and Vegetables, well-dreſſed; and drank nothing but Toaſt and Water, or Barley-water, or unfermented Liquors, and were kept clean and ſweat; their Milk, paſſing through infinitely more fine and delicate Strainers than thoſe of any brute Animal, would be a real Nectar in Atrophies, paralytic and nervous Caſes: But, on the contrary, as Things are now conſtituted, Nurſes are the moſt humourous, voluptuous, and domineering Perſons in a great Family; and if Food and Nutriture can have any Influence on the Body, Humours, and Paſſions of the Child, I think it as neceſſary to have an healthy, clean, ſober Nurſe, as ſuch a Mother, for the Heir of a noble Family; ſince it is certain, the Child is fed and increaſed as much, and is longer under the Influence of the Nurſe's Juices and Humours, than it is confined in the Mother's Bowels; and, without all Doubt, the Body, Humours, and Paſſions, partake of the Materials with which Children, and even grown Perſons, are fed and nouriſh'd, as conſtant Experience and Obſervation teſtify; and I ſhould rather confine myſelf to the innocent and undiſeaſed Nouriſhment of Water-gruel, Cow-milk, and Seeds, than to the Milk of a foul, rank, luxurious, and vitious Nurſe. *Cheyne's Method of Cure, in Diſeaſes of Body and Mind.*

The ſame Author, in his *Engliſh Malady*, further gives his Sentiments of a Milk-diet, in the following manner.

For thoſe whoſe Conſtitutions are ſpoiled, who have bad or corrupted Juices, violent and dangerous Symptoms, great Obſtructions, are ſubject to the great and eminent Degrees of theſe Diſorders, are threaten'd with an Hectic or Conſumption, or a Deſtruction of ſome of the great Viſcera, and who have tried all the other Methods and Medicines that could be ſuggeſted, without Succeſs; for thoſe I have found no other Relief than a total Abſtinence from animal Foods of all Kinds, and all Sorts of ſtrong and fermented Liquors, keeping only to Milk, with Seeds or Grains, and the different Kinds of vegetable Food, according to the Nature of the Diſtemper; from which they have never failed to find a preſent Relief, and a conſiderable Abatement of the Violence of their Symptoms. Many have been led into this Method, without any Advice or Direction, but merely from their own Feelings, and obſerving what they were eaſieſt under: And many more have been abſolutely cured, and freed from all their Diſorders, by it; ſome even from a very ſhort time

time after they enter'd upon it, and others in a longer or ſhorter time, according to the Obſtinacy of their Diſtemper, if the Diſeaſe has not been ſo far gone, as to be paſt all poſſible Relief from natural Means. In theſe laſt Caſes it has done all that was in the Power of Art, has leſſen'd their Miſeries, and protracted their Fate, and has given more Eaſe and Quiet than they could receive from any other Method they could turn to, except Opiates and Anodynes; to which one is never to give himſelf, till he has given up all Hopes of a total Cure. Where the Nerves and Solids are naturally weak, or the Perſons ſubject to nervous Diſorders from their Infancy, there is no Method will abſolutely free them from ſome ſlight Returns of their former Symptoms; but this Diet I have found to do more than any other Method whatever: However, no one ought to undertake this Regimen, without the Advice of ſome honeſt, able, and experienced Phyſician, who has conſidered his Caſe and Conſtitution, and can direct him aright in the proper Management of it, and the Methods of keeping up the due Tenſion of his Solids, which ſuch a Diet may probably ſomewhat relax, while it is purifying the Juices, and cleanſing the Habit; and can likewiſe judge of his Conſtancy, Firmneſs, and Reſolution to go thro' with it, ſince, in ſome deep-rooted and confirmed Diſtempers of this Kind, tho' the Patient may find a conſiderable Relief for many Months, yet poſſibly, when the groſs Impurities, the Choler, Phlegm, and Salts ſtor'd up in the Habit; raiſing Sickneſs, Lowneſs of Spirits, and a Return of all, or many, of the former Diſorders; this may blaſt all his Hopes, and mightily diſcourage him; and make him condemn the Method, and blame the Phyſician who adviſ'd him. But, if he ſtands this Shock with Firmneſs and Patience, (which will be readily relieved by proper Evacuations, Volatiles and Aſtringents) he may be aſſured of Succeſs, and his perfect Recovery is at hand. But as there are incurable Diſorders, which no Method or Medicine will reach, ſo it frequently happens in this: And, even after the Patient is recovered by this Method, he muſt reſolve to continue in it ever after, at leaſt, not to indulge himſelf in a much higher Degree of Food, without ſuffering preſently, or hazarding a Return of all his Diſorders; for, as *Celſus* obſerves, in all Diſorders of the Stomach, by whatever Methods the Patient is recovered, he muſt continue in the ſame, when he is well; for the Diſeaſe will return, unleſs Health be protected by the ſame Means that reſtored it.

I would not be underſtood here (as ſome have maliciouſly and artfully miſrepreſented me, contrary to my moſt deliberate Intention) to recommend a total Milk and Vegetable Diet, or, indeed, any particular one, to every one that is ſick, or out of Order: I never once had ſuch a Dream. I have given the Preference, in my *Eſſay on the Gout*, to the common Diet of well-choſen Fleſh-meat, and good middling ripe Wine, even in that obſtinate and painful Diſtemper, commonly treated by a Milk-diet. And, in my *Eſſay on Health and long Life*, I have endeavoured, as far as I could, to enable the Patient to the proper Choice of animal Foods fit for his Conſtitution, and the Diſorders he labours under; and have, from conſidering the Nature of the Diſtemper, actually ordered ſome, who were in a Vegetable Diet, to change it for an Animal one. A total Milk and Vegetable Diet, beſides its being particular and inconvenient in a Country where animal Food is the common Diet, and affording no ſufficient Store of animal or mechanical Strength, (to Perſons naturally weak, or who have not been habituated to it from their Cradles) may bring the Patient into ſuch a State, that, without the outmoſt Riſque or Danger, he can never leave it off again. And, while he is under it, by relaxing and ſoftening the Solids, in ſome Degree, when it is a ſweetening the Juices, it brings him under a Neceſſity of keeping up their Tenſion with proper, aſtringent, warm, and cordial Medicines, (which are of the ſame Nature with a more generous Diet) and inceſſant Labour and Exerciſe: And in groſs foul Bodies, or thoſe ſubject to goutiſh, ſcorbutic, or other inflammatory Diſorders and Paroxyſms, it requires the utmoſt Care and Caution, that the Diſeaſe be not thereby, at firſt, thrown inwards, and ſo the extreme Degrees of Vapours, Lowneſs, and other nervous Diſorders, enſue, which this Diet is deſigned to prevent. Indeed, there are ſome Caſes, wherein a Vegetable and Milk-diet ſeems abſolutely neceſſary, as in ſevere and habitual Gouts, Rheumatiſms, cancerous, leprous, and ſcrophulous Diſorders, extreme nervous Colics, Epilepſies, violent hyſteric Fits, Melancholy, Conſumptions, and the like, and towards the laſt Stages of all chronical Diſtempers: In ſuch Diſtempers I have ſeldom ſeen a Milk-diet fail of a good Effect at laſt; but in moſt other chronical Diſtempers, nervous or humourous, and in all their tolerable Degrees, and firſt and ſecond Stages, a common middling, plain and moderate Diet is certainly the beſt and ſafeſt; a little animal Food of the youngeſt, lighteſt, tendereſt, thinneſt, and ſweeteſt Kind, and a ſmall Proportion of generous Liquors, to keep up the due Tenſion of the Solids, under the Regulations I have mentioned; weak Broths, and Soups made of tender young animal Subſtances, without Fat or Butter, and thickened with a due Proportion of vegetable Seeds or Grains; ſuch as thoſe of Wheat, Barley, Rice, Sage, Oats, Millet, and the like; ſuch a Diet, I ſay, will, in my Opinion, anſwer all the Ends of pure Milk and Vegetables; and, as I have found ſuch an one leſs dangerous, ſo it is a more eaſy Regulation, as Things now ſtand, and wants only a few Months in the ſame Courſe, of that Cure which might be gained, perhaps, by going into ſuch a particular Method of Diet. I am never for entering upon extreme or uncommon Means of Diet or Medicines, but in extreme and mortal Caſes; for I always think, that common Senſe is the beſt Indication of a ſound Mind, and common Life the beſt Means of temporal Happineſs, elſe they had never been common.

One great Advantage that a Milk and Vegetable Diet has over a Fleſh and Animal one, lies principally in this; that one may thereby avoid loading the Juices with too many Salts of any kind, or thickening them with more groſs and hard earthy Particles, or ſuch as cannot be broken or comminuted by the natural Force of the weak Solids; and by it Patients will not be ſo readily led into Errors in the Quantity; Nature not being tempted to receive or retain ſuch unprovoking and impoignant Viands, whereby they avoid the Snare and Temptation that Liquoriſhneſs, and high Reliſh, throws many into. Another Advantage is, that it effectually dilutes and cools too thick or hot Juices, and that a ſufficient Quantity of it may be taken to keep the Bowels and Blood-veſſels full, and ſufficiently turgid, whereby the Circulation, and natural Evacuations and Secretions will be more uniformly carry'd on in ſuch weak Habits, than can poſſibly be under an animal Diet of ſo ſmall a Quantity, as muſt be neceſſary in ſuch Caſes, unleſs it be extremely diluted with Water, and the farinaceous Vegetables, which bring it to the ſame State: And, therefore, in greatly depraved Habits, and ſuch deep and dangerous Diſeaſes as I have mentioned, it is the moſt proper and abſolutely neceſſary Regimen to carry on the natural Functions without Pain and Uneaſineſs, and to preſerve the Sides of the Capillary Veſſels from coaleſcing and growing together, and ſo preventing irremediable Obſtructions; tho', in other more ſlight Caſes, it may be not only not neceſſary, but even ſometimes inconvenient and hurtful: For tho' it will always produce at length Freedom from Pain, and Freedom of Spirits, and a greater Capacity for intellectual Functions; yet it will never beget mechanical Force and Strength, or an hardy, ſtrong Conſtitution, which, in ſome Circumſtances, Employments, Trades, and Profeſſions, is indiſpenſably neceſſary; ſo that ſuch a Courſe and Regimen is only proper for thoſe who follow intellectual Occupations, and expect chiefly mental Pleaſures, Freedom from Pain, Chearfulneſs, and Length of Days; or, in ſhort, for the Studious and Sedentary.

A total Aſs-milk Diet (about two Quarts a Day without any other Meat or Drink) will, in time, cure a Cancer in any Part of the Body, with mere common Dreſſings, provided the Patient be not quite worn out before it be begun, or too far gone in the common Duration of Life: And even in that Caſe it will leſſen the Pain, lengthen Life, and make Death eaſier, eſpecially if joined with ſmall interſperſed Phlebotomies, Millepedæ, Crabs-eyes prepared, Nitre, and Rhubarb, properly managed: But the Diet, even after the Cure, muſt be continued; and never after greatly altered, unleſs it be into Cow-milk, with Seeds.

Any Cancer that can be cut out, contracted and healed up, with common, that is, ſoft, cool, gently aſtringent Dreſſings, and, at laſt, left as an Iſſue on the Part, by a Cow-milk and Seed-diet, ever after continued in, may be made as eaſy to the Patient, and his Life and Health as long preſerved, as if, almoſt, he had never been afflicted with it, eſpecially if under Fifty.

A total Milk and Seed-diet, gentle and frequent Phlebotomies, as Symptoms exaſperate, a little Ipecacuanha, or Thumb-vomit, repeated once or twice a Week, chewing Quill-bark in a Morning, and a few Grains of Rhubarb at Night, will totally cure Conſumptions, even when attended with Tubercles, an Hæmoptoe, and Hectic, in the firſt Stage; will greatly relieve, if not cure, in the ſecond Stage, eſpecially if Riding in a warm clear Air, be joined; and make Death eaſier in the third and laſt Stage.

A total Cow-milk Diet, about two Quarts a Day, without any other Food, will, at laſt, totally cure all Kinds of Fits, Epileptic, Hyſterical, or Apoplectic, (which are all but Degrees or Symptoms of one general Diſeaſe, which I call Scorbutico-nervoſe, or the plain Scurvy, in its laſt Stage) if entered upon before Fifty: But the Patient, if near Fifty, muſt ever after continue in the ſame Diet, with the Addition only of Seeds; otherwiſe his Fits will return oftener, and more ſeverely, and at laſt cut him off.

A total Cow-milk Diet, without any other Food, will bid faireſt to cure a Hemiplegia, or even a Dead Palſy, and, conſequently, all the leſſer Degrees of a partial one, if entered upon before Fifty: And this Diſtemper I take to be the moſt obſtinate, intractable, and diſheartening one that can afflict the human Machine; and is chiefly produced by intemperate Lechery, with its neceſſary Attendant habitual Luxury. It may be retarded in its Progreſs by ſtrong Vomits, mercurial and fetid Gum Medicines, Air, Geſtation, the Pilulæ Æthiopicæ of the *Edinburgh* Diſpenſatory of the laſt Edition, with Water-beverage, and Mineral Water, and cold or hot Bathing in the reſpective Seaſons; but this is never to be eradicated, if the Stroke is deep, or Life far ſpent, but by Cow-milk only.

A total Milk and Seed-diet, with gentle Vomits before and after the Fits, chewing Bark in a Morning, and Rhubarb at Night,

Night, with Phlebotomy about the Equinoxes, will perfectly cure the Gout in Perſons under Fifty, and greatly relieve thoſe further advanced in Life; even thoſe who have chalky Nodes, and fixed Joints, eſpecially joined with Air and Exerciſe, and ſtrong and conſtant Friction; but muſt be continued ever after, if ſuch deſire to continue well.

Of theſe mentioned Caſes and Cures, I have known or treated Inſtances, ſo that they may, with high Probability, and medical Certainty, be depended on. The following are reaſonable and probable, but not ſo certain, for want of ſufficient Experiments.

A total Milk and Seed-diet, with cool Purges now-and-then, as of Manna and Cream of Tartar, or *Glauber*'s Salt, with a Pill of the Præcipitat. per ſe, or Pills of the Mercurius Alcaliſatus, with Terebinthina cocta, will, in ſix Weeks, or a Month, totally cure and eradicate any Venereal Diſtemper, in its firſt Stage, or while it is only termed a Gonorrhæa virulenta, without other Symptoms, if Bark and Rhubarb are chewed for ſome time after, to conſolidate and conſtringe.

A total Milk and Seed-diet, continued for ſix or eight Months, will totally cure and extirpate Venereal Diſtempers in their ſecond Stage, when they may be called the great Pox, with Bubos, Cancers, and cutaneous Defedations, if Pills of Præcipitat. per ſe, or of Mercurius Alcaliſatus and Gum Guaiac. with Dreſſings of the Unguentum Neapolitanum conſtantly applied, be perſiſted in during that time, which may be done without keeping Houſe, or Interruption of Buſineſs.

In thoſe who, for the laſt Stages of Venereal Diſeaſes, have unſucceſsfully gone thro' a full Salivation, a total Milk and Seed-diet, long and ſtrictly continued in, would certainly cure and eradicate the Diſtemper, if no other hereditary Diſeaſe be complicated with it: Whereas, in the common Management, a total Cure is ſeldom to be obtained, and thereby many are miſerable all their Days.

An habitual Aſthma, if managed with a Milk and Seed-diet, Quickſilver well purified, half an Ounce twice a Day, Squill Vomits about new and full Moon, and after with the Squill Pills of the *Edinburgh* Diſpenſatory, might be totally eradicated, eſpecially if a Southern Climate, and warm clear Air, were joined.

In a painful and dangerous Pleuriſy, after a good Part of the Size of the Blood has been drawn off by large Phlebotomies, and the Diſtemper, by ſaponaceous and oily Emulſions, with volatile Alcalies, is leſſened; if a total Milk and Seed-diet were inſtituted, and duly perſiſted in, the Blood and Juices would, in time, thereby be ſweetened, and a Return, a Phthiſis, and an Empyema, be effectually prevented.

A Milk and Seed-diet, with Vomits of Ipecacuanha, and a few Grains of Tartar emetic, repeated every new and full Moon; in the Intervals Alcaliſatus and Guaiac. Pills continued; and, when the Blood is ſufficiently attenuated, and the Obſtructions opened, if cold Bathing, with vegetable Aſtringents, (Bark eſpecially) were employ'd to finiſh the Cure, and the ſame Regimen ever after continued; this Method, I think, would ſooner, more pleaſantly, and more durably, cure and extirpate all kinds of Manias, Phrenſies, and Madneſſes, (which are ſo ſhamefully frequent in *Britain*) than the common one of treating them with tearing Emetics, and ſcraping Cathartics, under the uſual full ſtrong Diet of Animal Food, which does but add Fewel to the Diſtemper; and generally the Diſtemper returns in a greater or leſſer Degree, to the Party, or his Poſterity.

In any Hæmorrhage, either from the Lungs, Noſe, Anus, or Uterus, how violent ſoever, if, after ſome repeated Phlebotomies, to moderate the Flow, the Uſe of *Eaton*'s Styptic, in *Briſtol* Water, or the Tinctura Roſarum, with Bark in Subſtance, Extract, or Decoctions, were freely adminiſtered, a total Milk and Seed-diet was ordered and duly proſecuted, it would totally cure theſe Symptoms, would at laſt ſweeten and balmify the Blood and Juices, and prevent Returns. For all Hæmorrhages are of the ſame inflammatory and acrid Nature, differing only according to the Part where the Rupture of the Capillary Vein happens; and ſuppoſe a thick Curd, and a ſharp Serum, in the Blood.

A Jaundice, black or yellow, proceeding from a ſpoiled or obſtructed Liver, a viſcous or morbid Bile, or biliary Stones, which prevent the Separation of the Choler, and its Paſſage into the Inteſtines, by which means it is forced back into the Veins, is rarely, and, perhaps, never to be totally cured or eradicated, but by a Milk and Seed-diet, frequent and active Vomits, ſaponaceous Emulſions, with volatile Alcalies, Mercurial Plaiſters on the Region of the Liver, *Bath* Waters, and conſtant Riding. This Method, I know from Experience, will perform a total durable Cure, and otherwiſe I never ſaw it effected.

A total Milk and Seed-diet, with ſole Water-beverage, would, at laſt, cure and extirpate any Degree of the Scurvy, ſcorbutic Ulcers, and impoſtumated Glands, even the Lepra Græcorum and Arabum; or, at leaſt, make them infinitely better, if duly continued; and Æthiops Mineral, Cinnabar of Antimony, or the Aqua Argentea, were joined to it in a long Continuance.

Of all others, a total Aſs-milk-diet is the cooleſt, moſt ſweetening and reſtorative poſſible: Next to it is Cow or Goat-milk Whey, if not too flatulent or purgative: Cow-milk, boiled or raw, for the whole Food, is next in Degree to thoſe.

La Motte affirms, that, in abundance of Experience, he has always obſerv'd that Milk which is thinneſt to be beſt; inſomuch that he ſeldom failed telling the Condition of the Child by ſeeing the Nurſe's Milk. For the Child which ſucks Milk that is clear and thin, is generally plump, freſh, and healthy; on the contrary, when the Milk is thick, the Child is lean, very hot, and ſickly.

He, alſo, remarks, that thoſe Children, which ſuck thick Milk, ſeldom wet their Beds; but thoſe who feed on that which is thin and clear, wet them abundantly.

If Milk, which is clear, has a ſweet agreeable Taſte, as if it was ſugar'd, and ſpins out of the Breaſt with Impetuoſity, when a little preſt, 'tis a Sign the Nurſe has a great Quantity; and then it runs out of the Breaſt ſpontaneouſly, in a very little time after the Child has ſuck'd.

That Milk which is thick, has often a bitter, ſalt, or ſome other diſagreeable Taſte; and drops from the Breaſt, when preſs'd. Mean time the Breaſt is ſoft; a ſure Sign, that it does not fill with Milk.

In order to taſte the Milk, the Mouth muſt be ſeveral times rins'd with Water, and ſome Milk muſt be put upon a Plate, and a few Drops may then be taſted.

Large Breaſts are ſubject to have but little Milk. Breaſts that are moderately large, with a red Nipple, which hangs free, are to be preferred.

'Tis difficult to judge whether a Nurſe is with Child or not, becauſe they ſeldom have the firſt Symptoms of Pregnancy, as Sickneſs, Vomiting, and the like.

When a Nurſe is with Child, the Child which ſucks of her grows ill, the Nurſe becomes thin and lean, and the Milk diminiſhes; but this does not always happen before the Nurſe is far advanced in her Pregnancy.

Nurſes that have the menſtrual Flux, are ſometimes not the worſe for it, provided the Child does not grow ill with their Milk; but they are never to be choſen; for the Child frequently, during the Flux, will not ſuck, and is ill. *La Motte.*

The ſame Author adviſes, inſtead of all the boaſted Applications to the Breaſts, in order to dry up the Milk, to apply a ſoft, warm Napkin to them; and not to let them be cool'd, or touch'd, let the Pain be never ſo violent.

The greater the Violence and Impetuoſity, with which the Milk comes into the Breaſts, the ſooner the Pain ceaſes, eſpecially if it does not run out; for, if it does, the Pain is leſs, but continues longer.

Care muſt be taken, when the Milk runs out, to change the Cloths frequently, for fear the Breaſts ſhould take Cold, and the Milk curdle in them, and cauſe a Tumor.

Great Care muſt, alſo, be taken, that a Woman take no Cold at her Arms, or Hands; ſhe muſt, therefore, wear her Shift very low, and wear Gloves or Mittens; for Cold, taken at the Hands, will cauſe Tumors in the Breaſts. For this Reaſon it would be moſt prudent to keep the Hands conſtantly in Bed, if it can be done without cauſing ſlight Vapours, as it ſometimes does.

Taking Cold at the Feet will, alſo, cauſe a Tumor and Abſceſſes in the Breaſts. *La Motte.*

Of the ſalutary Quality of WHEY.

So great is the Divine Goodneſs and Clemency to Mankind, that we are not only ſupplied with a wonderful Variety of efficacious Remedies, for the Prevention and Cure of as great a Variety of Diſeaſes, from the vegetable, animal, and mineral Kingdoms, but our daily Food is, alſo, endued with Virtues adapted to the Removal of the moſt acute Diſtempers. Milk is an evident Inſtance of this, which, as it is perfectly ſuited to the Nouriſhment and Support of the Body, at every Age, in every Diſpoſition and Temperament, ſo is it beyond all Diſpute intitled to the Superiority among the Safeguards of Health; inſomuch that we hardly find any thing in Nature, either ſo ſafe or efficacious as this Liquor. But, as the moſt excellent Remedy, ill prepared, or imprudently adminiſtred, is prejudicial, ſo may Milk, of any Sort, and the Uſe of it, be attended with ill Conſequences; for the Nature and Diſpoſition of all Food and Medicine is ſuch, that it has both a ſalutary and noxious Principle, and of conſequence, unleſs the latter is skilfully corrected, muſt do Miſchief. It is, therefore, the Part of a prudent Phyſician judiciouſly to diſtinguiſh between them, reject the Pernicious, make Choice of the Beneficial, and, laying aſide the Deſtructive, to make uſe of thoſe only, which may procure Health. In this he will find great Aſſiſtance from Natural Philoſophy, but more eſpecially from Chymiſtry.

Upon this Conſideration, and from an earneſt Deſire of makeing every thing in Phyſic ſerviceable to Mankind, we ſhall conſider the medicinal Virtues of Milk, and demonſtrate that its more fluid Subſtance, called Whey, is a ſovereign and unparalled Remedy; whilſt the more groſs, heavy, and terreſtrial Part, particularly when ſeparated from the Whey, is always pernicious both in Food and Medicine.

Though

Though nothing is more wholſome, or better accommodated to the Nouriſhment of animal and even human Bodies, inſomuch that it may be juſtly ſtyled the moſt conſiderable of Aliments, yet, amongſt the Variety of Suſtenances we take, nothing is ſo dangerous, nothing occaſions ſo many violent Diſorders, as Milk: For as every Kind of Milk conſiſts of two Subſtances, the one fluid, the other ſolid, and ſince, without an intimate Union and Conjunction of theſe, it is neither ſalutary, nor yields a proper Nouriſhment, ſo, without Doubt, when the caſeous Subſtance is condenſed into a Curd, it aſſumes a different Quality, and proves unfriendly to Health. We ſeldom, however, find any Aliment which admits of ſo eaſy a Diſſolution of its Mixture, and in which the component Parts of the Mixture are ſo ſoon ſeparated from each other; and this ſo entirely, that the Craſis is not only eaſily deſtroyed by an Affuſion of ſome particular Liquids, but the caſeous Part even recedes and coagulates ſpontaneouſly.

Every one knows, that all Milk, when left at Reſt, in Summer, as alſo in Winter, if the Room is warm, much more if it thunders or lightens, will curdle of itſelf very eaſily and ſoon, the caſeous and buttery Subſtance departing from the ſerous, and adhering ſeparately to the Veſſel. It is, alſo, known, that Milk coagulates by the Affuſion of an acid Liquor, or ſuch as has any Acidity latent in it, ſuch as Vinegar, for Inſtance, Juice of Citron, *Rheniſh* Wine, or Malt Liquor; and this happens ſooner, if the Milk be warm. Yet it is ſurpriſing, that a ſtrong and concentrated Acid, ſuch as Oil of Vitriol, is ſo far from condenſing Milk, that it renders it more fluid; perhaps for this Reaſon, that the ethereal Principle, mixt with Oil of Vitriol, ſo attenuates and agitates the Parts adapted to Coagulation, as to prevent their curdling and concreting. It is remarkable, that weak Spirit of Wine, when poured into Milk, produces hardly any Alteration; but when the ſame Spirit, highly rectified, is added to it, eſpecially in a conſiderable Quantity, it converts it into a Milk-curd; which, in my Opinion, may be thus accounted for: This pure Spirit of Wine, abſorbing the humid Part of the Milk, cauſes a Seceſſion of the groſſer Subſtance from the Pores of the more liquid Part, in the ſame manner as it turns ſaturated Spirit of Sal Ammoniac into a Curd.

Theſe things produce a Coagulation of Milk, when out of the human Body: Now let us conſider, what principally deſtroys the Union of the ſerous and caſeous Parts within ourſelves. The Stomach is ſeldom without an Acid, becauſe moſt of our Food both ſolid and fluid contains an Acidity, which remains, eſpecially after the Digeſtion of the Aliments, and, having nothing to check it, adheres firmly to the Coats of the Stomach: But, as this Acid differs in its Quality and Virtues, ſo likewiſe the Coagulation, produced in the Milk, differs; for, in ſome Caſes, the Mixture of the Milk is only diſturbed, the groſſer Parts unite moderately, and ſtill remain ſwimming in the more fluid Part; but in other Caſes the groſſer Parts are converted into an hard, firm, and heavy Curd, which ſubſides, and, firmly adhering to the Coats of the Stomach and Inteſtines, is, with Difficulty, diſſolved, but afterwards, by an Aſſociation with excrementitious Sordes of a worſe Quality, lays the Foundation of dangerous Diſorders. This Conſequence, indeed, rarely follows, though the Acid of the Stomach be conſiderably ſtrong, unleſs the Stomach itſelf be infirm and weak, ſo that the Aliment continues too long in its Cavity, and unleſs it is affected with a preternatural Heat, which deſtroys the due Commixture of the various Parts of the Milk.

From what has been ſaid, we may very plainly diſcover, to what Conſtitutions, and in what Diſorders, Milk, from the Coagulation it undergoes in the Stomach, is hurtful and deſtructive. For, firſt, we obſerve, that the moſt terrible Diſorders of ſucking Infants proceed from coagulated Milk, particularly if their weak Stomachs are overloaded with the groſſer Milk, by giving them the Breaſt too frequently, ſo that they cannot duly digeſt their Contents, which degenerate into a Coagulum, that, by continuing there, becomes very acid and corroſive, and the bilious Juice being added to it in the Duodenum, it ferments, grows green, and corroding the moſt tender and exquiſitely ſenſible nervous Coats of the Stomach by its acute Acrimony, excites ſevere Pains with Inquietude and Anxiety, which are often followed by mortal epileptic Convulſions.

Beſides, Milk, eſpecially that which is replete with a large Quantity of caſeous Subſtance, is very prejudicial to old Men, partly becauſe all Food ſoon grows acid in their Stomachs; and partly becauſe the Milk itſelf, as well as the Curd, remains too long there, through the Laxity and exceſſive Languor of the periſtaltic Motion, whence ariſe anxious Pains of the Præcordia, Gripings, accompanied with a Teneſmus, and Inflation of the Belly: The Fæces, alſo, are diſcharged with Pain, a Corroſion, and Itching of the Inteſtines; the Body, alſo, is wearied, and the Appetite loſt. But there is hardly any Diſorder, in which the Uſe of Milk is ſo detrimental, as that commonly termed the hypochondriac Affection, in which, from an evident Diſturbance of the Buſineſs of Concoction and Excretion by Stool, ariſing from Spaſms, and a copious Increaſe of Flatulences, many acid Crudities are generated in the Stomach, which, as they ſoon coagulate and precipitate the Milk received there, bring on very terrible Symptoms. Nor is it by any means expedient, to feed thoſe with Milk, who are recovered from a violent Diſtemper, becauſe the Stomach cannot digeſt this ſtrong Nutriment, but retains it too long, ſo that by Stagnation it aſſumes a deſtructive Quality, and contributes to the Production of many Diſeaſes.

In what Diſeaſes *Hippocrates* prohibits a Milk-diet, will appear evidently from *Aphor. 64. Sect. 5.* which runs thus: "It is "improper to give Milk to Perſons afflicted with Pains in the "Head, to ſuch as are feveriſh, or labour under an Elevation "and Rumbling of the Præcordia. It is, alſo, improper for "thoſe afflicted with Thirſt, for ſuch as have bilious Stools in "acute Fevers, and ſuch as have loſt a great Quantity of Blood." This I take to be the Reaſon, why Milk is prejudicial in Pains of the Head: There is, by means of nervous Membranes, a great Conſent between the Stomach and Head, ſo that, if the Head is tormented with exquiſite Pain, the Stomach is likewiſe affected, and not capable of duly concocting, diſſolving, and expelling the Aliments. Beſides, a Pain of the Head often takes its Riſe from a Diſorder of the Stomach, eſpecially when the latter does not properly perform the Office of Concoction, and is overloaded with acid and viſcid Crudities. In both Caſes drinking Milk is productive of bad Conſequences, ſince it continues long on the Stomach, and is, by that means, form'd into a prejudicial Coagulum.

Beſides, *Hippocrates* forbids the Uſe of Milk in violent Fevers; nor is there any Difficulty in accounting for this. For, firſt, intenſe Heat is a very great Enemy to the homogeneous Mixture of Milk; and we are convinced by daily Experience, that Milk is ſoon condenſed into a kind of Cheeſe, by external Heat. Farther, in all Fevers, the Patient is ſomewhat coſtive, or labours under a total Conſtipation, whence that groſſer, excrementitious Matter of the Milk, which is no way ſuited to a Conjunction with the vital Humours, ſtill remains, and, being added to the Cauſe of the Fever, augments it, ſo that the ſpaſmodic Strictures are, alſo, increaſed. *Hippocrates*, alſo, thinks Milk improper for theſe, who are troubled with bilious Stools or Choler; becauſe this Diſorder derives its Origin from a very acid corroſive Juice, mix'd with the ſulphureous Parts of the Bile, and accommodated to diſſolve the Texture of the Milk. He diſapproves of Milk, likewiſe, for Perſons who have loſt a great Quantity of Blood, which, by too much exhauſting the Heat and Spirit, breaks and debilitates the Strength and Tone of the Stomach and Inteſtines, by the Aſſiſtance of which the Solution of the Food, the Elaboration of the Chyle, and Diſcharge of the Fæces, are performed; ſo that, by this means, Milk, after being drank, grows acid and thick by its Continuance, and terrible Stagnations of the recrementitious Matter happen in the Primæ Viæ.

But if we are not ſatisfy'd with the Reaſons already given, and would have them corroborated by the Teſtimonies of the moſt approved Phyſicians, both antient and modern Authors inſiſt upon the bad Conſequences of coagulated Milk. Thus, *Avicenna, L. 4. Fen. 6. Tr. 3. Sect. 96.* ſpeaking of Milk, ſays, "If "Milk becomes acid in the Stomach, from hence ariſes a Ver"tigo, Syncope, and pungent Pain, in the Mouth of the Sto"mach; and ſuch an acid Milk is ſometimes productive of a "mortal choleric Paſſion." And *Dioſcorides, Lib. 2. Cap. 64.* judiciouſly adviſes bilious and choleric Perſons to abſtain from all Milk, on account of the Coagulum. *Matthiolus, Comment. in h. l.* adds this as the Reaſon: "Milk, ſays he, formed into a "Coagulum, produces Difficulty of Breathing, oppreſſes the "Stomach, fills the Head with Vapours, and is concocted with "great Difficulty." Further, *Bellonius*, in *L. 2. Epidem. p. 211.* writes thus: "A Man labouring under a Dyſentery, after the "unſucceſsful Uſe of many Medicines, was adviſed by his Phy"ſicians to the Uſe of new Cow's-milk: This coagulating in his "Stomach, it is incredible, what terrible Symptoms, ſuch as "Swoonings, and others of a like Nature, were by that means "produced." *Henr. ab Heer. Obſervat. 15.* likewiſe, gives an Account of one, who by means of coagulated Milk, was ſeized with a cold Sweat, and breathed with ſuch Difficulty, that he dreaded a Suffocation; that he was oppreſſed with a Nauſea; and toſſed himſelf in his Bed, with frequent Deliquiums. The ſame Author, alſo, affirms, that another Patient was, by means of coagulated Milk, thrown into a Cholera. *Amatus Luſitanus, Cent. 6. Curat. 5, 6.* informs us, "that coagulated "Milk produced a heavy Weight, with Pain about the Præ"cordia; and that the Patient, when he attempted to vomit, was "immediately ſuffocated." He likewiſe, from the Authority of *Aetius*, affirms, that very bad Symptoms have been produced by Milk in Patients afflicted with a Dyſentery. More Inſtances of this Kind are to be met with in *Dodonæus's Annot. C. 17.* and *Foreſtus, Lib. 18. Obſ. 13.* 'Tis certain, that the beſt Phyſicians, from the ill Conſequences produced by coagulated Milk, have not heſitated to aſſert, that the Coagulum of Milk has a poiſonous Principle in it.

Since, therefore, ſuch imminent Dangers ariſe from Milk coagulated in the Stomach, we ſhall, next, briefly conſider what Remedies are ſuited to the Cure of Diſorders of this Kind. *Sennertus, Lib. 6. Prax. Part. 8. Cap. 39.* and in *Paralip. p. 17.* approves

proves of Emetics; and *Dioſcorides* recommends a Lixivium. But I am of Opinion, that Alkalies, whether lixivial or earthy, given before the Uſe of Milk, beſt prevent its curdling, by abſorbing the peccant Acid; and, when that is ſeaſonably corrected, the uſual Symptoms, produced by its Coagulation, are alſo prevented. But if the Milk is already condenſed and coagulated, and the Patient in a bad Situation, a pretty large Quantity of aqueous Diluters, ſuch as Infuſions of Tea, or *Paul's* Betony, are very ſerviceable for diluting the Coagulum, and diſſolving and waſhing away the viſcid Lentor. And if there is a Nauſea and Diſpoſition to vomit, this is greatly promoted by a ſufficient Draught of warm Water, eſpecially if it is rendered more ſtimulating and efficacious, by diſſolving one or two Grains of emetic Tartar in it. It is proper too, if the Strength will permit, to procure an Evacuation both by Stool, as well as by Vomit; for which Purpoſe, two or three Ounces of Manna, in an aqueous Vehicle, with two Grains of Tartar, will be ſufficient. And theſe are ſerviceable both to Adults and Infants, if the Phyſician preſcribes them with Judgment, and accommodates their Doſes to the different Ages and Degrees of Strength in different Patients.

But great Danger is not only to be dreaded from Milk coagulated in the Stomach; but, alſo, a too frequent Uſe of Milk, which has but little of the ſerous, and much of the groſs Subſtance, diſpoſed to Coagulation, ſuch as Goat's, Cow's, and Sheep's Milk, is not equally convenient for all, but detrimental to many. For Milk is leſs nutritive and ſalutary to Patients of a ſpongy and porous Habit, abounding with ſlender and numerous Veſſels; and, alſo, in Caſes where a large Quantity of inſpiſſated Humours are lodged in thoſe Viſcera, which conſiſt entirely of Blood-veſſels, ſuch as the Liver, Spleen, Kidneys, and Lungs, ſo that theſe Veſſels are full and infarcted with Blood: In this Caſe, the Exhibition of Milk is improper, leſt, by its thicker Parts, theſe Veſſels ſhould be ſtill more infarcted and obſtructed.

This Doctrine is, alſo, confirmed by a memorable Paſſage of *Galen*, quoted by *Marſilius Ficinus de ſalubri Victus Ratione*. "The frequent Uſe, ſays that Author, of Milk, which has little "of the ſerous Humidity, and much of the caſeous Subſtance "in it, is not proper for every body, and eſpecially if the Kid"neys are ſubject to generate the Stone; it excites Obſtructions of "the Liver likewiſe in thoſe ſubject to ſuch a Misfortune, as "thoſe are who have the Extremities of the hepatic Veſſels nar"row." And, for this Reaſon, *Aetius* carefully inculcates this Doctrine, that he who would uſe Milk without any Diſadvantage, ſhould have the Ducts of his Viſcera open, and his Veins large. Beſides, *Hippocrates*, by a Caſe in *Epid. Lib.* 3. affirms the Uſe of Milk to be noxious in Diſorders of the Liver: "*Apollo*"*nius*, ſays he, was a Man of large Viſcera, and had a continual "Pain about his Liver. He then became icteric, flatulent, and "ſomewhat pale; he was, at firſt, gently indiſpoſed, and, at "laſt, confined to his Bed. But, uſing a large Quantity of crude "and boiled Preparations, both of Sheeps and Goats Milk, "and taking, at the ſame time, but little Food, his Symptoms "became very terrible, his Fever was increaſed, he became co"ſtive, and diſcharged a ſmall Quantity of thin Urine." *Dioſcorides* is of the ſame Opinion with *Hippocrates*, and prohibits the Uſe of all Milk to Perſons whoſe Spleen and Liver are affected, to thoſe labouring under Epilepſies, Vertgos, Diſorders of the Nerves, and Head-achs.

Nor is there any Difficulty in aſſigning a Reaſon for this: For ſince the violent and long-continued Pains of the Head, or Abdomen, generally draw their Origin from a Suppreſſion and Interception of the free Progreſs of the Blood and Humours thro' theſe Parts; and ſince this Interception of the Circulation is immediately followed by Stagnations, Obſtructions, and Infarctions; hence, at laſt, ariſe, in the lower Belly, a Cachexy, the yellow and black Jaundice, Dropſies, and the Stone in the Kidneys; in the Head, Madneſs both of the melancholic and furious Kind, Epilepſies, and Pains attended with a Senſe of Weight; in the Loins, polypoſe Concretions, a difficult Reſpiration, Spitting of Blood, and Conſumptions. It is eaſy to perceive, that the Uſe of Milk, eſpecially after it hath ſtood ſome time, by means of the groſſer Subſtance, prone to coagulate, augments the Obſtruction of the very ſmall Canals, and is dangerous, particularly in corpulent Patients, and ſuch as have contracted a bad Habit of Body by too much Eaſe, or a too luxurious Manner of living.

But the more prejudicial, and ſubject to generate many Diſorders, that groſs Subſtance of the Milk prone to Coagulation is, the more ſerviceable in its Turn to human Nature, or the Temperament and vital Motions of the Fluids and Solids, the more ſalutary, and ſuited to prevent and cure Diſeaſes, is that humid Portion termed *Whey*. The moſt antient and learned Phyſicians long ago diſcovered its ſalutary Quality in curing Diſeaſes; and have recommended it, in the ſtrongeſt Terms, to Poſterity. Thus *Dioſcorides*, the oldeſt and beſt Writer on the *Materia Medica*, *Lib.* 2. *Cap.* 64. ſpeaks thus of the excellent Virtue of Whey: "Whey, ſays he, when ſeparated from the groſſer Parts "of the Milk, is a much more effectual Purge, and is given to "thoſe whoſe Bodies we would render ſoluble without the Uſe "of acrimonious Subſtances, as to Perſons labouring under Me-

"lancholy, the Leproſy, the Elephantiaſis, or Eruptions over the "whole Body." To this *Galen* adds, "That Whey, either drunk, "or injected by way of Cluſter, to promote Stools, on account "of its deterſive Qualities; for it cleanſes and deterges the Acri"mony from the Inteſtines without Corroſion." And in another Place he exactly delineates the ſalutary Qualities of Whey in theſe Words: "Simple Whey is particularly proper for tender "Patients, whoſe Bellies and Inteſtines only we would cleanſe "and purge; and for thoſe whoſe Inteſtines are, perhaps, eaſily "ulcerated by any Medicine; thoſe who, in conſequence of a "bilious Temperament, are ſubject to Diſorders of the Abdomen, "or labour under a Teneſmus, and whoſe Reins, Bladder, and "Uterus, are ſubject to Exulcerations; and lean Perſons, who do "not become fleſhy by Aliments, but yet want Purging. To "all theſe Whey ſhould be given, without the Addition of "Salt, or any other Medicine. Whey is, alſo, ſafely exhibited "to Children, Women, and old Perſons, even during the Heat "of a Fever, at which time, eſpecially, all other Medicines "are ſuſpected. The Uſe of Whey is ſingularly effectual on "Patients and Diſeaſes which require extraordinary Aſſiſtance; "eſpecially Eruptions of a long Continuance, livid Spots, and "all Depravations of the Humours tending to the Skin, "ſuch as a Leproſy, and others of a like Nature; inveterate "and malignant Ulcers, Achors of the Head, weeping Eyes, "an Itch of the Eyelids, Blotches in the Face, and continued "Paroxyſms of Fevers; and to thoſe who, in conſequence of a "bad State of Health, are about to fall into a Dropſy."

Others, likewiſe, have obſerved and extolled the excellent Qualities of Whey. And *Celſus*, *Lib.* 1. *Cap.* 12. aſcribes a purgative Quality to Whey and Aſſes Milk. "The Antients, "ſays he, purged by various Medicines; but in all Diſeaſes they "gave Milk, either Aſſes or Goats, and boiled it with the Ad"dition of a little Salt, removing the coagulated Part, and "ordering the remaining Whey to be drank." But the Teſtimony of *Meſue* is ſo full, that it deſerves a Place here. "The "Whey, ſays he, of Goats Milk, is, in itſelf, an innocent Me"dicine; and that Species is beſt, which is made of black Goats "Milk, who feed in good Paſture, and have newly brought "forth. This Whey attenuates, cleanſes, deterges, and, by the "nitrous Quality with which it is furniſhed, gently renders the "Body ſoluble, without any Degree of Acrimony; it alſo carries "off the black Bile produced by the parched Humours; whence "it is wonderfully beneficial to maniac and melancholic Patients. "It is good in Infarctions of the Viſcera, and beneficial in Diſ"eaſes from thence; to ſuch, for Inſtance, as are afflicted with "a Dropſy, Jaundice, or Diſorders of the Spleen. It is effectu"ally preſcribed for thoſe who labour under biliary Fevers, or "Obſtructions of the Viſcera and Veſſels. It is, alſo, proper "for Diſorders of the Skin ariſing from Bile, and parched Hu"mours; for which Reaſon it is of great Service in Lichens, "Vitiligos, Alphi, Pſoras, and Leproſies."

Nor muſt we neglect *Aetius's* Opinion of the Uſefulneſs of Whey, which he has thus declared: "Drinking Whey, ſays he, "is ſurpriſingly efficacious in Ulcers of the Lungs, Inteſtines, "Kidneys, Bladder, and Uterus; and in Eruptions and other "Aſperities of the Skin; as alſo againſt the Effects produced "by the internal Exhibition of Cantharides."

From theſe Authorities then, without alleging any more, I think it is evident, that the Antients had Whey in very high Eſteem, and preſcribed it in many Diſtempers. In a Word, they almoſt unanimouſly aſſigned to it a purgative Quality, eſpecially when ſaline, acrid, bilious Humours were to be purged off gently, and without Acrimony. Further, they warmly recommended the Uſe of it in Diſeaſes which ariſe from the Acrimony of the Juices corroding the tender nervous Coats, and Fibres, and ſubcutaneous Glands: Of which Kind are, internally, Ulcers of the Lungs, Bladder, and Kidneys; and, externally, Lichens, Impetigos, the Leproſy, the Elephantiaſis, and various other Depedations and Exulcerations of the Skin; as alſo for its ſingular Virtue in correcting the Acrimony of the Serum; and diluting, obtunding, and ſheathing up that of Cantharides. The Antients, alſo, aſcribed uncommon Virtues to Whey, in removing Obſtructions of the Veſſels of the Viſcera, and other Parts, from which ariſe terrible Diſorders, not only in the Head, but, alſo, in the Region of the Abdomen, as we have already obſerved.

This Opinion did the Antients entertain of Whey, and its Uſefulneſs. We ſhall now examine, whether it is founded on Truth and Experience: In order to which, we muſt inquire very accurately into the Elements and Principles of every Sort of Whey, from which, as from their Fountain, all its Qualities flow. Since, therefore, Whey ſecedes, and is obtained from the Milk, it will be proper to conſider, in what Proportion this fluid and ſerous Part is united with, and aſſociated to, the groſſer and leſs diſſoluble Parts, in the various Species of Milk commonly uſed. The Experiments I made for this Purpoſe were principally theſe following. I took a Pint of Cows Milk, put it into a Tin Veſſel, with burning Coals under it, and, continuing the Evaporation, till it was dry, I obtained a yellow grumous Powder, which weigh'd an Ounce and five Drams. In like

manner I evaporated ſome new Goats Milk, which yielded the ſame Quantity of Powder, except half a Dram. But Aſſes and Womens Milk ſhewed a remarkable Difference, and yielded a far leſs Quantity of the ſolid Subſtance; for from a Pound of the former, after an entire Evaporation of the Humidity, I collected hardly an Ounce of white ſweetiſh Powder; and from an equal Quantity of the latter, one Ounce of dry white Matter.

Then I made a farther Experiment upon the Powder of each Milk, and poured twelve Ounces of Rain-water upon the Powder of the Cows Milk remaining after Exhalation, and weighing an Ounce and five Drams. Then I put it upon Coals, that it might boil, and the ſolid Dregs be again diſſolved; after this I ſtrained the Liquor through a Linen Cloth, and again dried the inſpiſſated Matter, left in the Strainer, and ſtill found an Ounce and three Drams and an half; an evident Proof, that one Dram and an half only were united with the Water, and paſſed with it through the Linen. Then I again evaporated the Water thus ſtrained, which was of a pinguious and ſweetiſh Taſte, and of a whitiſh-yellow Colour; and, keeping it in continual Agitation, that it might not acquire an empyreumatic Taſte and Smell, I procured a Dram of a whitiſh-yellow, earthy, and ſweetiſh Maſs from it. I made the ſame Experiments upon the Goats Milk, and obſerved in the remaining Matter hardly any Difference, either with regard to the Weight, or Taſte, and Colour, only that in the Whey of the Goat's Milk the Taſte was ſomewhat ſweeter, and more of a pinguious Matter floated on its Surface, like Drops, as if a little Butter had been mixed with it. But a much wider Difference appeared in the Powder of the Aſſes Milk remaining after Evaporation; for, when I added the Ounce of this Powder to a Pint of pure Water, and by a gentle Fire brought it to an Ebullition and Diſſolution, it was almoſt all diſſolved, ſo that only one Dram remained in the Strainer, and about ſeven more were conſumed by the Water, and paſſed the Linen; but the Liquor in which it was diſſolv'd, and which was very ſweet, after an entire Exhalation of the Humidity, yielded more than ſix Drams of very dry white Powder, like Sugar. Laſtly, the Womens Milk, with the Powder obtained from it by Evaporation, and weighing one Ounce and one Dram, being diſſolved and ſtrained in the ſame manner, left three Drams of thick Sediment in the Strainer; but the Liquor which paſſed through, being again evaporated, yielded about ſix Drams of ſweetiſh Powder, of a ſomewhat browniſh Colour.

Now, if we accurately conſider the Nature of Whey, it is evident, that it is a ſelect Part of the Milk, freed from the groſſer and caſeous Subſtance; in which, by means of a large Quantity of aqueous Liquor, a moſt tender and ſweet Salt is united with a mucilaginous, pinguious, and ſubtle Subſtance. And from theſe three highly ſalutary Elements are the moſt excellent medicinal Virtues of all Kinds of Whey to be derived. The principal Element of Whey, and what exceeds the reſt in Quantity, is the fluid and humid Part. The gentle, ſweet, and ſaline Ingredient is the next, which, like eſſential Salt extracted from the Herbs on which Animals feed, and elaborated by means of various Commixtures, or a ſort of natural Chymiſtry, has a peculiar Faculty of ſtimulating the Excretories, and eſpecially of of promoting the Diſcharges by Stool and Urine; and, at the ſame time, blunts and temperates the bilious cauſtic Acrimony of the Humours. Hence it is, that the greater the Quantity of this ſweet Matter, contained in the Milk, is, the more efficacious it is in purging the Body; as is very manifeſt in Aſſes Milk, ſince, when boiled to half the Quantity, the two great Humidity being ſeparated, and the ſweet Particles uniting, it exerts its purgative Quality much more powerfully and readily; a Method frequently uſed by *Hippocrates*. The third Principle of Whey is its mucilaginous, more ſubtle, and pinguious Part. This is principally to be eſteemed for its Quality of moiſtening, ſoftening, and relaxing the dry criſp Fibres, ſheathing up the ſaline Acrimony of the Humours, and corroſive Juices, and of appeaſing and removing the Diſorders produced by theſe means.

Theſe are the Elements of Whey, and theſe its Virtues; which, from what has been ſaid, appear to be very ſerviceable and ſalutary in many Diſeaſes. But, before we enter upon a particular Account of the various Diſtempers in which Whey is proper, we ſhall premiſe ſome few things neceſſary to be known, concerning the Preparation of Whey, eſpecially for medicinal Uſes, and the Manner of adminiſtring it. The moſt common Method, then, of ſeparating the Serum from the caſeous groſs Subſtance is, to diſſolve the Union, and cauſe a Seceſſion by means of Heat, while the Milk is at Reſt; or, as we have already obſerved, to accelerate and produce the ſame Effect by an Affuſion of ſome acid Liquor. But, ſince Milk grown ſour by Time, or a Separation of the Whey procured by an Addition of Acids, is greatly vitiated, loſes that Sweetneſs, which is moſt agreeable to Nature, and moſt deſired in Medicine, and rather aſſumes an acid Quality, which is never ſalutary and friendly to the Body, I attempted to find a commodious and more wholſome Way of preparing it, by which the Whey may be ſeparated whilſt the Milk is yet freſh, the Sweetneſs entire, and the tender, pinguious, mucous Subſtance ſafe.

I imagined the beſt Method of doing this, as I have already obſerved, was to evaporate new Milk, and then pour upon the remaining yellow grumous Powder as much pure, light, and wholſome Water as had been carried off from the Milk into the Air in the Form of Exhalations; then to boil this Mixture for ſome time, that the ſweet, ſaline, pinguious, and tender Part might be abſorbed by the Water, and the Liquor, when freed from the groſs earthy Subſtance by ſtraining, kept for Uſe. And certainly Water of Milk, thus prepared by Decoction, or artificial Whey, has many excellent Qualities above the common Whey, and, from yellow, becomes of a white Colour, has a moſt agreeable ſweet Taſte, and is, at the ſame time, impregnated with a pinguious, oleous, and highly liquid Subſtance, which may be taken either hot or cold, without any Nauſea, and keeps longer without loſing either its Texture or Taſte.

As for the Method of giving it, let us firſt examine the Antients, our beſt Guides in this Affair, both with reſpect to the Meaſure and Time. From their Writings it will evidently appear, that they recommended the Uſe of Whey, not in a ſmall, but ſufficiently large Quantity: Its Uſe was, alſo, to be perſiſted in for ſome time; with this Caution and Difference, however, that, if they intended only to cleanſe the Primæ Viæ from Sordes, they preſcribed it in a ſmaller Quantity, and for a few Days; but if they preſcribed it in inveterate Diſorders, and ſuch as had taken deeper Root in the inmoſt Receſſes of the Viſcera, they uſed it for a longer Time, and in a larger Quantity. *Galen* has laid down theſe Rules, with reſpect to the Uſe of Whey: "A Quantity of Whey, ſays he, proportioned to the Strength of the Patient, ſhould be preſcribed; and, tho' no great Error would be committed by exhibiting too much, yet let a certain Meaſure, about five Heminæ, for Inſtance, be given." Now an Hemina, according to the Antients, was equal to twelve Ounces.

The Opinion of *Hippocrates* appears from *Lib. 7. Sect. 1. Epid.* where he tells us, that in an hepatic Flux, where there were copious Stools, reſembling the Waſhings of Fleſh, proceeding from a Diſorder of the Bile, he preſcribed Aſſes Milk, (and certainly Whey muſt be better) to the Quantity of nine *Attic* Cotylæ; not, indeed, at one, but ſeveral times, ſo that the Whole was taken within the Space of two Days. But when he uſed it as a Purgative, according to *Martianus*'s Remark *in Comment. in Aphor. 64. Sect. 5.* he ordered it in a larger Quantity, and ſometimes went as far as a Gallon. And *Valeſius*, *Com. in Epid. Lib. 7.* informs us, that "It was uſual with the Antients to give Aſſes Milk to purge the Bile, as appears from *Lib. 2. de Natura Victus in Acutis*; which Practice, ſays he, I have followed with great Advantage, obliging my Patients to drink above two Quarts of this Whey, or this Milk, which is very ſerous."

As for the Time for which this Medicine is to be perſiſted in, we muſt again have recourſe to the Antients: And, if the Diſorder is inveterate and obſtinate, *Hippocrates* order'd Aſſes-milk or Whey, principally that of Goats, to be drank for ſeveral Days; as appears from *Lib. 7. Epidem.* *Riverius* and *Sylvaticus* affirm, that Whey may be uſed for a Month, and longer; for theſe Phyſicians uſed Aſſes-milk and Whey very ſucceſsfully, in moſt violent Diſorders, for twelve, twenty, and even forty Days; and, for that Reaſon, beſtow very large Encomiums upon them. Further, we read in *Hippocrates*, *Lib. de internis Affectionibus*, that he, in a Tabes Dorſalis, preſcribed Milk for forty-five Days, mixed with a third Part of Hydromel. Nor indeed can it produce the deſired Effect, in obſtinate and inveterate Diſeaſes, where the Viſcera are affected and obſtructed; unleſs, like the Mineral Waters, it is taken in a larger Doſe, and for ſeveral Days.

For my own Part, I have always obſerved this Rule, to proportion the Quantity of Whey, to be taken at one Doſe, to the Strength of the Patient; giving to thoſe who are tender, or ſubject to a Nauſea, only one Pint; but to thoſe who are ſtronger, and of a leſs delicate Conſtitution, two Pints; and have ſometimes order'd them to drink it only in the Morning; and at other times in the Afternoon too, but in a ſmaller Quantity than in the Morning. As to the Time, during which its Uſe was to be perſiſted in, I was, likewiſe, governed by the greater or leſs Obſtinacy of the Diſorder; and ſome I have known cured in two, but others hardly in four or ſix Weeks. Laſtly, with *Martianus*, *Comm. in Hippocr. Aphor. p. 163.* I commend the giving Aſſes-milk, or Whey, at different times; not altogether, and at once; both becauſe, if the Patient is weak, and his Stomach relaxed, he cannot bear ſo large a Quantity, and becauſe the Whey itſelf, when taken at ſeveral times, renders the Body ſoluble, with much greater Succeſs and Expedition.

We now come to conſider, to what Purpoſes, and what Diſeaſes, Whey is adapted. Great Regard, then, is due to the Practice of *Hippocrates*, who uſed Whey and Aſſes-milk after ſtrong Purges, ſuch as Hellebore and Elaterium, in order to expel the

miſchievous

miſchievous and deleterious Quality of them: For, in *Lib. de internis Affectionibus*, after the Exhibition of Hellebore, he ſays, he preſcribed two Gallons of boiled Goats-whey; and, in the ſame Part, he adviſes, after Vomiting with black Hellebore, and purging with Juice of Scammony, to give Cows-milk, and its Whey, and boiled Aſſes-milk, for a time. Further, *Lib. 2. de Morbis Mulierum*, he judiciouſly declares, that, after Hellebore, boiled Whey, with a little Salt, ought to be drank for ſeveral Days, ordering, if Whey cannot be had, to boil Aſſes-milk, and exhibit it for four Days. I ſuppoſe the Reaſon why drinking Whey of Goats or Aſſes-milk, after violent Purging by ſtrong Cathartics, is ſalutary, muſt be this: Strong Purges perform their Office by a cauſtic and almoſt virulent Salt, corroding the tender Coats of the Inteſtines; and excite copious Stools, with Gripes, which from an exceſſive Diminution of the Humidity in the Inteſtines, and a violent Contraction and Stricture of their Coats, are followed by an Hardneſs, Tenſion, and Conſtriction of the Abdomen: But Whey, or diluted Milk, taken after theſe, reſtore the Juice and Humidity to the Inteſtines, mollify and relax the tenſe and criſped Fibres, blunt the Spicula of the draſtic Purgative, which ſtill adhere to the highly ſenſible Coats of the Inteſtines, and, by an eaſy, gentle Stimulus, render the Body ſoluble.

I can, alſo, affirm from Experience, that, for preventing an approaching Hypercatharſis, or curing one when preſent, whether excited by a Cathartic or Emetic, I never found a more certain or immediate Remedy than Cows-milk, which is a moſt powerful Remedy againſt the miſchievous Virulence of Arſenic. And I am convinced, from many Inſtances, that violent Vomitings, from too large a Doſe of any ſtrong Emetic, ſuch as Powder of Algarot, or the Pulvis Monchii, unskilfully exhibited, have been checked and removed by taking warm Milk, or Whey. Whence I rationally conclude, that we can hardly find a more convenient Vehicle, to give an Emetic or Cathartic in, than Whey rightly prepared; becauſe, beſides its uſeful Quality of rendering the viſcid Humours moveable, and fit for Evacuation, it does, at the ſame time, greatly temperate and correct the peculiar Virulence of ſuch Purgatives.

Beſides, I have already obſerved, that Whey, by reaſon of its native ſweet Salt, ſtimulates and irritates the Organs ſubſervient to Excretion: But this is principally to be underſtood with reſpect to the Diſcharge of the Excrements. Whey, in conſequence of its mild and gentle Operation, is moſt commodious and beneficial, in Caſes where the Strength of the Patient, and other Circumſtances, prohibit violent Purging; and, eſpecially, in Diſtempers where Purging is dangerous, and in Fevers, and almoſt all preternatural Heats. The Antients indeed generally preſcrib'd Aſſes-milk in theſe Caſes; and *Hippocrates* recommends it in a Quotidian Fever, ariſing from Bile; and in the Fever termed *Febris interficiens*, *Lib. 2. de Morbis*; and in a burning Fever. And in an Eriſypelas, *Lib. 2. de Morbis*, he adviſes to purge the Body with Milk. But, for want of Aſſes-milk, I have found, from repeated Experience, that Whey of Goats-milk, adding a due Quantity of Manna, which partakes very much of the ſame Nature with the eſſential ſweet Salt of Milk, may be ſubſtituted in its room, in the ſame Diſorders and Caſes, and, particularly, that it is given with good Succeſs in an hectic Heat.

Tho' Whey, eſpecially made of Aſſes-milk, drank plentifully, is an effectual Laxative; yet it is often expedient, when the Stomach cannot bear a large Quantity of it, to exhibit it in a ſmaller Doſe, and to increaſe and augment its purgative Quality, by ſome other gentle Laxative. For this Purpoſe, Manna, ſolutive Syrup of Succory with Rhubarb, Cream of Tartar, or the Terra foliata Tartari, are very commodious; a Decoction of it, alſo, with Tamarinds and Root of Polypody, is very proper; adding afterwards Sal polychreſtum, or Arcanum duplicatum, Manna, or even Root of Elder, which, when exhibited in a large Doſe, renders the Body ſoluble. I have often uſed laxative Whey, thus prepared, with unſpeakable Succeſs; particularly where Nature was infirm, as in old Men and Infants, or thoſe debilitated by Sickneſs, or lately recover'd, or even when, in exanthematous Fevers, Small-pox, or Meaſles, a long Coſtiveneſs render'd the State of the Patient dangerous: Beſides, when in Diſorders of the Breaſt, ſuch as a Chin-cough, a Dry-cough, or one of the moiſt or catarrhal Kind, or a ſlow Fever, it is expedient to render the Body ſoluble; this may be done by diſſolving two or three Ounces of Manna, in a Pint of Whey; adding a Dram of Cream of Tartar, or the Terra foliata Tartari, and mixing two or three Drops of the Oil of Cedar, to make it palatable: This Draught ſhould be taken at three different times. Flowers of *Egyptian* Thorn, and Peaches infuſed in warm Goats-whey Milk, augment its laxative Quality; eſpecially with the Addition of ſome digeſtive Salt, or Manna.

If it is neceſſary to preſcribe a laxative Medicine in Spring or Summer, to cleanſe the Primæ Viæ from Fæces, or remove a Cacochymy, certainly a Pint of this Whey, ſo ſtrengthen'd with Laxatives, may be advantageouſly taken every Day, for ſeveral Weeks: And this Method, uſed in the Spring, is much ſafer, and more ſalutary, for weak, extenuated, and more ſenſible Patients, eſpecially thoſe of the younger Sort, than all the common Nodules, Infuſions, or medicated Wines, intended to purge the Patient, and purify his Blood. It is, alſo, expedient, in the Beginning of a Dyſentery, gently to remove the ſharp, cauſtic Humours, which irritate, corrode, and excite Inflammations in the nervous Coats of the Inteſtines; and this Intention is excellently anſwer'd by Aſſes-milk: But, if this ſhould diſappoint you, Whey of Goats-milk, with ſome Grains of Extract of Rhubarb, and an Ounce, or an Ounce and an half of Manna, will produce the deſired Effect. And indeed the Uſe of Whey in a Dyſentery is of a very old Date: Thus *Hippocrates*, in *Lib. Epid. 6.* when *Adrianus*, and the Son of *Ceneus*, had a Pain all round the Belly, and, by Stool, diſcharg'd a large Quantity of ſomewhat bloody Matter, for twenty Days, preſcribed Goats-whey and Aſſes-milk boiled. For *Valeſius* rightly judges this Diſorder to have been dyſenteric; and, in his Comment upon this Paſſage, recommends, in an autumnal Dyſentery, Whey, heated by ignited Flint; and ſays, that, after a Patient had drank Whey and Milk, his bilious bloody Stools, attended with a violent Pain of the Belly, become abundantly more moderate.

If at any time draſtic Medicines are requiſite to carry off a large Quantity of Water, in an Anaſarca, or Leucophlegmatia, ſuch as Extract of Eſula, or black Hellebore, theſe are not only very ſecurely, but very commodiouſly and advantageouſly mixed, and drank with Aſſes-milk or Whey, taking half a Dram of the Purgative to a Pint of Whey, and drinking the Mixture at different times. In like manner, ſince it is very ſalutary, before taking the Mineral Waters, and even after the Cure is completed, to free and cleanſe the Primæ Viæ from accumulated Fæces, and retained Water, I have found nothing in my Practice ſafer and better than Whey, in which, at leaſt, three Ounces of Manna, with an Ounce and an half of Cream of Tartar, have been diſſolved: For by this I have frequently obſerved, that ſix or eight Stools have been procur'd without any Trouble, and a ſurpriſing Quantity of Water diſcharged. Beſides, when, in conſequence of a Redundance and Induration of the Fæces, it is neceſſary to render the Body ſoluble, nothing is better, or more efficacious, than to take Whey with Manna, adding a ſufficient Quantity of Oil of ſweet Almonds, and to inject the ſame, by way of Clyſter, to lubricate the Inteſtines, and ſoften the Fæces.

But, beſides theſe ineſtimable Qualities of Whey, for purging the Primæ Viæ, it has ſtill other valuable Virtues, which it exerts beyond the Primæ Viæ, and diſplays in thoſe Diſeaſes which increaſe ſlowly, draw their Origin from the affected Viſcera, and continue for a long time; among which the principal is the Scurvy, or a ſcorbutic Cachexy, the Source of ſo many Diſorders, and dangerous Symptoms. If we read with any Attention the Works of thoſe who have wrote profeſſedly on the Scurvy, ſuch as *Eugalenus*, *Brunnerus*, *Brucæus*, *Ronſæus*, *Wierus*, *Albertus*, *Martinus*, and *Drabizius*, they almoſt all candidly confeſs, that they have found more Benefit from a Milk-diet alone, or from a Decoction of Whey with the antiſcorbutic Herbs, taken for a conſiderable time, even in the worſt Symptoms attending the Scurvy, ſuch as acute Pains, Gripings of the Belly, Vomitings, Atrophy, and ſlow Fevers, than from any other Medicines whatſoever; and that thoſe who were gradually becoming weaker by this obſtinate Diſorder, gather'd more Strength from ſuch a Regimen, than from the beſt Corroboratives, and artificial Analeptics. It was the Practice of theſe experienced Phyſicians, to make a Decoction of the antiſcorbutic Herbs, as Scurvy-graſs, Brooklime, Water-creſſes, Leaves of Wormwood, Sorrel, Fumitory, Spleenwort, Dodder of Thyme, Betony, Carduus benedictus, the leſſer Centaury, and Marſh-trefoil, with Milk, and to order a Pint or more of this Decoction to be drank warm every Morning, by thoſe afflicted with the Scurvy; and, by this ſimple Remedy, they overcame the Obſtinacy of the Diſtemper, and ſubdued all its formidable Symptoms.

The moſt celebrated Writers extol Whey, as highly efficacious in the Cure of ſcorbutic Diſorders. Thus *Jo. Wierus*, in *Tract. de Scorbuto*, paſſes this juſt Encomium upon it: "That "the Patients, *ſays he*, with great Succeſs, drink the Milk boil'd "with antiſcorbutic Herbs, and then expreſſed, is rather to be "attributed to the Nature of the Whey than the Milk; ſince the "caſeous Portion, and that which generates the Butter, remains "coagulated in the Sierce; but the Whey, which paſſes through, "and conſiſts of thin Parts, deterges, opens, promotes a Diſ"charge of Urine, and is remarkably conducive to the Cure of "ſcorbutic Diſorders, as *Aetius* and *Galen* affirm." Beſides, *Matth. Martinus*, *Lib. de Scorbutico*, ſpeaks thus of the Uſe of Whey in the Scurvy: "Goats-milk, drank through the whole "Courſe of the Diſtemper, is wonderfully beneficial to the Pa"tient, as it not only renders the Body moderately ſoluble, but "is, alſo, eaſy of Digeſtion, and ſpeedily removes the want of "a due Tone in the Inteſtines by its aſtringent Quality, and is "greatly adapted to the Recovery of the Strength: However, "that it may not inflate the Hypochondria, and coagulate in "weak Stomachs, a ſmall Quantity of Water, Salt, or Su"gar, muſt be added." But this Misfortune is ſcarce to be dreaded, if, in the room of Goats-milk, the Whey of it, or Aſſes-

Aſſes-milk, is ſubſtituted; eſpecially ſince *Bald. Ronſæus*, in his Treatiſe *de Scorbuto*, adviſes the above-mention'd antiſcorbutic Herbs to be boiled, not in Milk, but Whey. Laſtly, *Moellenbrock*, in *Lib. de Arthritide vaga & ſcorbutica*, aſſerts the great Virtue of Goats-whey, in the Scurvy, affirming, "That "Whey, eſpecially of Goats-milk, is very ſerviceable in that "Diſorder." And the Authors of the *Schola Salernitana* inform us, "That Whey is of an inciding, cleanſing, and pene-"trating Quality, by reaſon of its aqueous Humidity; diſſolves "thoſe Things which are ſaline, by reaſon of its Nitre; de-"terges what adheres to the Sides of the Veſſels; renders "the Body gently ſoluble, without any Corroſion; and refri-"gerates, by reaſon of its latent volatile Alkali: Hence the "Boors of *Holland* and *Friſeland* preſerve and free themſelves "from an epidemical Scurvy, by the Uſe of Whey. But it is "render'd more ſalutary, if antiſcorbutic Herbs are infuſed or "boiled in it."

And, certainly, in the moſt obſtinate of all chronical Diſorders, the Scurvy, there is not a more certain and efficacious Remedy than ſweet Whey of Aſſes or Goats-milk, prepared in the manner already directed; ſince the Origin of this obſtinate Diſtemper is the utmoſt Impurity of the vital Humours, ariſing from the ſaline, ſulphureous, excrementitious Fæces retained in the Body, for want of due Excretions, and more corrupted by the hot inteſtine Motion, and the various Combination of the Parts with each other, which, by lacerating and corroding the interior and exterior ſolid Parts, of more acute Senſation, produce not only violent Pains, but, alſo, Spots and Ulcerations of various Kinds, on the Surface of the Body. For the Removal of theſe terrible Diſorders, there is certainly no more proper and convenient Remedy than Whey, which dilutes and temperates the ſaline and acrid Humours, opens the ſmall obſtructed Veſſels of the Emunctories; by cutting the viſcid Humours, frees the Viſcera from the Stagnation of Serum and Blood; and gently helps and promotes Excretion by Stool, Urine, and Perſpiration, without any Prejudice and Diſturbance; and is, beſides, ſalutary, and agreeable to the nervous Parts.

But from what has been already ſaid, 'tis obvious, that all theſe excellent Qualities are in Whey rightly prepared, and may ſafely be expected from it. For this Reaſon the Antients, *Hippocrates*, *Galen*, *Dioſcorides*, *Pliny*, *Aetius*, and *Meſue*, have prudently recommended the Uſe of it in Diſtempers, which derive their Origin from an Impurity of the Humours. But we muſt obſerve, that in ſuch long and obſtinate Diſorders, the drinking of Whey, as is uſual in taking the medicinal Waters, ſhould be continued for a Month, and longer, in a convenient Quantity. Beſides, though in bilious and warm Conſtitutions the Whey alone is ſufficient, yet if the Humours are thick, and the Habit groſs and cold, it is better to boil in it a moderate Quantity of the bitter Herbs, called Antiſcorbutic, which, from their volatile Oil, have a Bitterneſs very ſalutary in theſe Diſorders.

Whey is no leſs beneficial in thoſe Diſeaſes, which are accompanied with ſpaſmodic Motions and Strictures of the nervous Parts, and pervert the whole Oeconomy of the vital Motions, both of the ſecretory and excretory Kind; among which the principal in our Climate is the Hypochondriacal Diſorder, in Women termed Hyſterical, which is not only very frequent in our Days, but, alſo, very obſtinate, by reaſon of the prepoſterous Method commonly uſed in curing it.

This Diſorder affects the nervous and membranous Canal of the Stomach and Inteſtines, by continual Spaſms and Flatulences, by which the whole nervous Syſtem is drawn into Conſent, ſo that it is agitated by the ſame Commotions. Hence the Courſe of the Blood and Humours becomes unequal, as they are conveyed with Violence from the external to the internal Parts, and eſpecially to the Head and Breaſt, and there excite very terrible Symptoms. But the principal Cauſe of this obſtinate Diſorder is to be ſought for in the extreme Weakneſs of the nervous Syſtem, brought on partly by hereditary Diſpoſition, and partly by thoſe things which impair the Strength, and are unfriendly to the Texture and Motion of the nervous Parts. If to theſe is added a large Quantity of thick Blood, either for want of Motion and Exerciſe of the Body, or from an irregular Diet, this Blood, ſtagnating in the intricate Windings of the Inteſtines from an Obſtruction of a free Paſſage through the Liver, greatly augments and increaſes the Flatulencies and Spaſms. And what is ſtill more, as this Diſorder gets firm Poſſeſſion of the Viſcera ſituated in the Region of the Hypochondria, and affects the whole Syſtem of the nervous Parts, it ſpreads its Miſchiefs wider, and injures other Parts of the Body; ſo that the Head is principally affected by it, and Vertigos, Epilepſies, Palſies, Melancholy, and Madneſs are produced; but, by the Spaſms affecting the internal Parts of the Body, the wholſome Buſineſs of natural Excretion is wonderfully diſturbed and perverted, by which not only the Diſcharge of Blood by the Veins of the Anus and Uterus, but, alſo, the Elimination of the Sordes by Stool, Urine, and Perſpiration, is either abſolutely ſuppreſſed, carried on irregularly, or, ſometimes, offends by Exceſs.

For effectually vanquiſhing and ſubduing theſe dangerous Diſorders, there is not, in my Opinion, a more uſeful, ſecure, and certain Remedy, than Whey, or Aſſes Milk, or Goats Milk, mixed with the Mineral Waters; eſpecially if the Cure is undertaken at a due time, a due Quantity exhibited, and with a proper Regimen, ſuch as is uſual in drinking the Mineral Waters. So that I can with Juſtice obſerve, that more may be performed, in theſe obſtinate Diſorders, by this Method of Cure, than by the Mineral Waters alone. For a ſpaſmodic Diſeaſe of this Kind requires a Remedy which is moderate and agreeable to Nature, which renders the tenacious viſcid Humours fluid, opens the ſmall obſtructed Veſſels, temperates the ſaline acrid Humours, and promotes Excretions of all ſorts by a gentle Stimulus; all which Properties are found in ſweet Whey, inſomuch that it excels all others in this Caſe, if properly adminiſter'd; nor ſhould Patients, though it does not produce an immediate Alteration for the better, abſtain from the Uſe of it, but let other congruous Remedies, according to the Diverſity of Conſtitutions and Symptoms, be mixed with it, or exhibited at proper Intervals.

The celebrated *Italian* Phyſician, *Benedictus Sylvaticus*, thoroughly perceived theſe extraordinary Properties of Whey, who expreſly affirms, that he uſed Whey, and Aſſes Milk, in the moſt violent and obſtinate Diſorders. Nor will it be improper here to mention in what Diſorders, and what Method, he made uſe of it. He, therefore, *Conſil.* 58. *Cent.* 1. in melancholic and maniac Diſorders, recommends Whey of Goats Milk, with Syrup of Polypody, and Seeds of Apples, reduced to an Emulſion. And in *Conſ.* 6. in melancholic hypochondriac Affections, he adviſes taking two Quarts of the ſame Whey for fifteen Days. Beſides, in *Conſ.* 65. he ſays, Goats Whey, very well depurated, and in which Leaves of Wormwood have been infuſed, ſhould be preſcribed for ſeveral Days. And, *Conſil.* 73. in hypochondriac Melancholy, he orders to drop Chalybs potabilis, with Oil of Citron, into it, and ſo drink it. Beſides, he ſays, that, in a Palſy of half the Body, Whey of Goats Milk, made more purgative with Cream of Tartar and Rhubarb, and more diuretic with Ceterach, white Maidenhair, Roots of Fennel, and Parſley, adding ſome Drops of Spirit of Vitriol, is highly beneficial. He cur'd, likewiſe, an epileptic Syncope with Goats Whey: In this manner he firſt exhibited the beſt depurated Whey with Juice of Lemons; but, on the fourth Day, rendered it purgative, by infuſing one Dram of Rhubarb, with a proper Quantity of Sena-leaves, in four Ounces of it; after which, three Pints of Whey were to be drank: And, on the three intermediate Days, he ordered one Pint of the ſame Whey, having firſt ſteeped in it Flowers of Piony, Goats-rue, Baum, and Citron-peel, to be drank. He is as laviſh in his Encomiums on Whey, in the Hyſteric Paſſion, *Cent.* 2. *Conſil.* 68. and in the *Morbus Niger* of *Hippocrates*. *Conſ.* 77. in a Vomiting of Blood, *Conſ.* 82. and in a Spitting of Blood, *Conſ.* 34. and 35. The ſame great Author ſays, that he cured a Diarrhœa and Teneſmus, by ſolutive Syrup of Roſes, and Julap of Tamarinds, ordering the Patient to drink after them ſome diſtilled Goats Whey. He, likewiſe, prevented the Progreſs of a beginning cancerous Tumor in the Breaſt (*Cent.* 4. *Conſ.* 92.) by giving three Ounces of Manna, diſſolved in Goats Whey.

I myſelf can boldly aſſert, that I have found an inexpreſſible Benefit from Whey, in many Diſtempers: As a Confirmation of this, I ſhall ſubjoin ſome Obſervations, and remarkable Cures, which occurred to me in one Month's time. A Man about Thirty, not very robuſt, had taken ſome purging Pills from a Student in Phyſic, which operated ſo violently, that though he diſcharged half of them, at the time of taking, by a Vomit, yet he had, for ſeveral Days after, ſo continual a Flux, that he had an hundred Stools; by which means his Strength was entirely loſt, his Appetite impair'd, and his Sleep was reſtleſs, and ſo ſhort, as to be hardly any at all: To theſe Symptoms was added an erratic intermitting Fever, degenerating at length into one of the ſlow Kind, which ſtill more effectually deſtroy'd his Strength. In this deſperate Condition he earneſtly apply'd to me for Aſſiſtance, and, waiting on him, I found he had kept his Bed for ſeveral Weeks, and was waſted by nocturnal colliquative Sweats, and a ſlow Fever, of which a continual quick and weak Pulſe was an Indication. I adviſed him to lay aſide all Medicines, and drink ſeveral times a Day a Quart of Goats Whey, prepared in the manner I directed him, and, at the ſame time, to take twelve Drops of the Anodyne Liquor, and often drink thin Water-gruel; which Meaſures being continued for fourteen Days, his Sleep returned, his Appetite was reſtored, his Strength ſo effectually recovered, that he was rendered capable of minding his Buſineſs.

There are ſtill other memorable Inſtances of the Efficacy of Whey: For a Student of Law, being diſordered by the baneful Influence of Anger and Sorrow, was ſeized with a Nauſea, and Inclination to vomit. In order to cure this, he ſent a Friend, for a Vomit, to an Apothecary; but after taking it, he not only vomited often, but alſo fell into the utmoſt Decay of Strength, accompany'd with a burning Heat of the Stomach, perpetual Reſtleſſneſs, Thirſt, and a Loathing of Food. I, being ſent for, and fearing an Inflammation of the Stomach, ordered nothing but Whey, prepared in my manner, with ſome Ounces of an Emulſion of the Four cold Seeds, to be drank, both Night and Day, at

proper Intervals, by which the burning Heat was extinguiſhed, his Pulſe became regular, and his Sleep ſound and natural; ſo that there were great Hopes of his Recovery.

A Girl, of about three Years old, and of a tender Conſtitution, as a Preſervative againſt the Small-pox, which, at that time, was epidemical, by the Advice of a Phyſician, took a Purge of Jalap and Mercurius dulcis; which, indeed, gave her only two or three Stools, but her Appetite was entirely loſt: She paſſed reſtleſs Nights, with Toſſings, and was very much afflicted with Thirſt, an intenſe and a quick Pulſe. I attended her, and preſcribed Whey, prepared after my Method; by the Uſe of which, the Symptoms ſucceſſively ceaſed, and ſhe recovered. Since it is evident, therefore, that Whey has an happy Effect in many Diſeaſes, nothing now remains, but to recommend this moſt noble Medicine to other Phyſicians; and heartily wiſh, that it may reſtore Numbers to Health. *Frederic Hoffman.*

The common Lac Virginale is made by diſſolving a ſmall Quantity of Sugar of Lead in a large Quantity of Water.

Another Sort of Lac Virginale is thus made:

Take of Roch-alum, four Ounces; Spring-water, two Pounds: Boil away a third Part; then take of Litharge, half a Pound; Vinegar, a Pound and an half; and boil to a Pound: Strain both, and ſhake them together, till they incorporate, and look white.

This is intended for a Coſmetic, by driving in Pimples, and checking ſuch Eruptions as deform the Skin, by its cooling reſtringent Properties. But ſuch things are dangerous, becauſe they hinder cutaneous Tranſpiration, and thereby occaſion many Diſorders, not eaſily again removed.

LAC LUNÆ. See MARGA CANDIDA.

LACAPHTHON, λάκαφθον. This is mentioned by *Paulus Æginetа, L. 7. C. 22.* as an Ingredient in the Compoſition of the great *Cyphi*, where it is explain'd the Bark of a certain Tree. It is ſuppoſed to be the *Naſcaphthum*, or *Narcaphthum*, a ſort of Aromatic brought from *India*. *Caſtellus.*

LACCA. See JUJUBA INDICA.

LACCOPEDON, λαχκόπεδον. The lax Part of the *Scrotum*, call'd by the *Athenians*, λαχκοχήλας. *Ruffus Epheſius, L. 1. C. 12.*

LACERTUS. Offic. Schw. 147. *Lacertus vulgaris.* Raii Synop. A. 264. Aldrov. Quad. Ovip. 627. Jonſ. de Quad. 133. Geſn. de Quad. Ovip. 32. Charlt. Exer. 28. *Lacertus terreſtris.* Schrod. 5. 342. THE LIZARD, OR EFT.

It lives in Caverns, and Ruins, and deſolate Places. The large green Lizard is eſteemed above the reſt; but, this being rarely found in theſe Countries, what we ſay is to be underſtood of the common Lizard.

Being cut in Pieces, or bruiſed, eſpecially the Head, and applied with Salt, it extracts Splinters, Pieces of Glaſſes, and the like, out of the Body. The Fleſh, or the Aſhes of it, burnt, made into a Litus, with Fat, cure an Alopecia: It is, alſo, good againſt the Sting of a Scorpion, and the Bite of other venomous Creatures.

LACERTA VIRIDIS. Ind. Med. 64. Raii Synop. A. 264. Aldrov. de Quad. Ovip. 633. Geſn. de Quad. Ovip. 40. Charlt. Exer. 28. Jonſ. de Quad. 134. *Lacertus Hibernicus.* Mer. Pin. 169. THE GREEN LIZARD.

It is larger than the common Lizard, and found in *Ireland*; the Animal itſelf is uſed, and agrees in Virtues with the preceding.

LACERTUS AQUATILIS. See SALAMANDRA AQUATICA.

LACHLACHATUM. The Name of a Stomachic Medicine, deſcribed by *Avicenna.*

LACHRYMA. A Tear. For the Preſages to be drawn from Tears, ſee OCULUS.

The Juices of ſome Plants, which tranſude in the Form of a Tear, are, alſo, call'd *Lachrymæ.*

LACHRYMA JOBI.

The Characters are;

It has the Appearance of the *Arundo*; the Flowers are apetalous, furniſhed with a Calyx, Male, and form'd into a Spike in one Part of the Plant; the Ovary is ſeated in another Part, and furniſhed with a long Tube, and two Horns, and becomes a ſtony Shell, containing one Seed. *Boerhaave, Index alter, Pars 2. p. 166.*

Boerhaave mentions but one Species of this Plant; which is,

Lachryma Jobi. *Offic. Ger.* 82. *Emac.* 88. *Park. Theat.* 430. *Boerh. Ind. A.* 2. 166. *Tourn. Inſt.* 532. *Lachryma Jobi multis, ſive Milium Arundinaceum.* J. B. 2. 449. Raii Hiſt. 2. 1252. *Lithoſpermum Arundinaceum forte Dioſcoridis & Plinii.* C. B. P. 258. JOB's TEARS.

It is cultivated in Gardens, and the Seeds are uſed. *Dale.* It is called *Lachryma Jobi*, becauſe the Seeds are like Tears: Theſe Seeds are detergent and aperitive, and therefore good for the Stone in the Kidneys and Bladder. *Hiſt. Plant. aſcript. Boerhaave.*

It grows ſpontaneouſly, as *Parkinſon* ſays, in *Crete, Rhodes, Syria*, and other Eaſtern Countries, where the Inhabitants dip the ripe Seeds in boiling Water, and then ſtring them up like Beads, by which they ſay their Prayers. *Raii H. P.*

LACHRYMALE PUNCTUM. See FISTULA LACHRYMALIS.

LACHRYMALIS *Ductus.* See FISTULA LACHRYMALIS.

LACINIÆ, in Botany, imports the Inciſures, or Jags, on the Borders of Leaves, or Flowers. Hence they are ſaid to be laciniated.

LACONICUM, λακωνικὸν. A Stove, Bagnio, or Sweating-room.

LACTARIA. Aliments prepar'd of Milk, called, alſo, *Lacticinia.*

LACTATIO. Lactation, or giving Suck.

Morton ſays, that if, by reaſon of the want of an Appetite, there is more nutritious Juice ſuck'd out of the Blood thro' the Breaſts for a long time, than is ſupplied to the Maſs of Blood by the new Chyle from the lacteal Veſſels, it is impoſſible but an Impoveriſhment of the Blood ſhould follow, and thereupon an Atrophy of the Body, (ſeeing it is deprived of due Nouriſhment) and conſequently an hectical Heat in the Blood, Spirits, and Habit of Body, which is a kind of original Conſumption, proceeding from the Subtraction of the nutritious Juice.

Yet I muſt ingenuouſly declare, ſays he, that I have ſometimes obſerved a conſumptive Diſpoſition cured by giving Suck; and that not only in my own Wife, but in many other Women: As for Example, Mrs. *Wilſon*, one of my Neighbours, who, at other times, is conſumptive, and goes up and down like a Ghoſt, always grows fat all the time ſhe gives Suck. Mrs. *Thompſon*, upon *Snow-hill*, manifeſtly fell into a fatal Conſumption in the Habit of her Body, and upon that into a Conſumption of her Lungs, from the ſudden Weaning of her Child. But, at the ſame time, it is as obvious, that all ſuch Nurſes as grow fat in this manner, from giving of Suck, have a good Stomach; that, during the time of their giving Suck, their Appetite is very much increaſed, and from thence it is very eaſy to account for this Appearance: For Inſtance, that the Appetite being increaſed by the continual Drawing off of the nutritious Juice by the Child's Sucking, there is room made for a greater Quantity of new and oily Chyle, by which the Blood is every Day enriched, which conduces more to the Cure of a conſumptive Diſpoſition, than all the Medicines in the World. But if the Appetite, during the time of giving Suck, grows languid, and thereupon, by reaſon of the little Food which is taken in, a leſs Quantity of new Juice is ſupplied to the Blood, than is carried off by the Breaſts, an hectical Diſpoſition in the Blood and Spirits muſt inevitably follow; and an Atrophy or Conſumption in the Habit of the Body.

The firſt thing that preſages the Approach of this Conſumption, is a want of Appetite; and therefore I give this Caution to all Nurſes, that, when they find their Appetite to abate for ſome time, they forthwith wean their Children. The ſecond Sign is a Weakneſs and Faintneſs of the Spirits, proceeding from a diſpirited and impoveriſhed State of the Blood. A third Sign is an hypochondriacal Oppreſſion, and frequent hyſteric Fits and Choakings. Which Appearance does not proceed from the Sucking of the Child drawing the Vapours upward, (as is commonly thought) but a too plentiful Subtraction, and too great an Expence, of the nutritious Juice: By which means the Spirits themſelves become, in the ſame manner as the Blood, poor and windy, by reaſon they have loſt their natural and original Vigour; whereupon there follows an Obſtruction, and this inordinate and ungovernable Motion of the Spirits in the Nerves and Fibres of the Muſcles, and upon that, Oppreſſions, and ſuffocative and convulſive Contractions of ſome Parts, commonly called Hyſterical.

Theſe preſaging Symptoms, in the Progreſs of the Diſtemper, have an Atrophy, and an hectical Heat, following them (which is not ſtrange); and often terminate in a Conſumption of the Lungs, together with a Cough, Shortneſs of Breath, and the like. Nevertheleſs this Conſumption is originally in the Habit of the Body, and that from too great an Expence of the nutritious Juice. This Conſumption, when it once comes to the Degree of a Maraſmus, and to terminate in a Conſumption of the Lungs, proves fatal and incurable. But, in the Beginning, it is eaſily cured; firſt, by the ſpeedy Weaning of the Child, whereby the Cauſe, which diſpoſed the Perſon to it, is removed. Secondly, By giving the Patient plentiful Nouriſhment of ſuch Food as affords a good Juice. Thirdly, By exciting and reſtoring the Appetite by Chearfulneſs of Mind, the Enjoyment of a benign and open Air, and by moderate Exerciſe. And, laſtly, if her hectical Diſpoſition requires it, the ſick Woman muſt be put upon the Uſe of a Milk-diet, or of the Chalybeate Waters. But let her abſtain from Wine, and all Evacuations but what are neceſſary. *Morton. Phthiſiologia.*

LACTEA VASA. The Lacteal Veſſels. See CHYLUS.

LACTEA FEBRIS. A Milk Fever, frequent after Delivery. See PUERPERIUM.

LACTICA. The *Arabian* Name for that Species of Fever, which the *Greeks* called TYPHOS, or TYPHODES.

LACTICINIA. Aliments prepared of Milk; which are eſteemed very improper, whenever the Powers of Digeſtion are weak: For, tho' Milk, when freſh drawn from the Animals which afford it, is eaſily digeſted, and, in many Caſes, of excellent Virtues; yet, when boiled, as it generally is in preparing various Sorts of Aliments from it, it acquires a very different Nature, and lays a Foundation for many Diſorders.

LACTIFERUS. Lactiferous Plants are ſuch as abound with a milky Juice, ſuch as the *Tithymalus*, *Sonchus*, and *Lactuca*.

LACTUCA.

The Characters are;

The Root is almoſt conſtantly fibrous, and generally annual; the Leaves are ſmooth, and placed alternately; the Branches terminate in a ſort of an Umbella; the Calyx is ſlender, oblong, and ſquamous; the Seeds are oblong, flattiſh, and acuminated at both Ends. *Boerhaave*, *Index alter*, *Pars* 1. *p.* 81.

Boerhaave mentions fifty-five Species of this Plant, none of which have any particular medicinal Virtues attributed to them, that I know of, except the 1ſt, 4th, 5th, 6th, 9th, and 12th, all which are thus diſtinguiſhed:

The firſt is the

Lactuca, ſylveſtris; Coſta ſpinoſa. *C. B. P.* 123. *Raii Hiſt.* 1. 223. *Synop.* 3. 69. *Tourn. Inſt.* 473. *Boerh. Ind. A.* 81. *Lactuca ſylveſtris laciniata.* Park. Theat. 813. *Lactuca ſylveſtris foliis diſſectis.* Ger. Emac. 309. *Lactuca ſylveſtris, ſeu Endivia multis dicta folio laciniato, dorſo ſpinoſo.* J. B. 2. 1003. JAGGED-LEAVED WILD LETTUCE.

It grows in Hedges, and flowers in *June*; the Herb and Seeds are in Uſe. *Dale.* The Wild-lettuce reſembles the Garden-lettuce, according to *Dioſcorides*; only has a longer Stalk, ſlenderer and rougher Leaves, and a bitter Taſte. Whether what the Antients have told us of the Virtues of the Wild-lettuce in preventing Venereal Dreams, and extinguiſhing amorous Deſires, no leſs effectually than the Garden Kind, belongs, in reality, to the Plant above deſcribed, I am not, ſays *Ray*, entirely convinc'd. That it is narcotic and ſoporiferous, and on that account reſembling the Poppy in Qualities, as we are inform'd by *Pliny* and *Dioſcorides*, is abundantly evident from its ſtrong and rank Smell of Opium; but all Opiates in general ſeem rather to irritate than extinguiſh a Venereal Appetite, at leaſt, if moderately taken, in the ſame manner as Wine, and other generous Liquors, with which, in ſome meaſure, they agree in Virtues. Thus *Ray*, to which he adds, that Dr. *Liſter*, out of Curioſity, receiving the Fume of the lighted Herb up his Noſtrils, was ſuddenly ſeized with a vertiginous Diſorder, after the ſame manner as thoſe who firſt learn to ſmoke Tobacco. *Raii Hiſt. Plant.*

The fourth is the

Lactuca; ſylveſtris; odore viroſo. *C. B. P.* 123. *Tourn. Inſt.* 473. *Boerh. Ind. A.* 81. *Lactuca Sylveſtris.* Offic. *Lactuca ſylveſtris major odore Opii.* Ger. Emac. 309. Raii Hiſt. 1. 221. Synop. 69. *Lactuca ſylveſtris lato folio, ſucco viroſo.* J. B. 2. 1002. *Lactuca ſylveſtris Endiviæ foliis, odore viroſo.* Park. 813. WILD-LETTUCE.

It grows in Hedges, and flowers in *June*; the Herb and Seeds are uſed, and are effectual, according to *Dioſcorides*, for mitigating of Pain.

The fifth is the

Lactuca, ſylveſtris; folio ad latera ſpinoſo.

The ſixth is the

Lactuca; ſativa. *C. B.* 122. *Raii Hiſt.* 1. 200. *Hiſt. Oxon.* 3. 57. *Ger.* 239. *Emac.* 306. *Tourn. Inſt.* 473. *Boerh. Ind. A.* 82. *Lactuca.* Offic. *Lactuca ſativa vulgaris non capitata.* J. B. 2. 997. *Lactuca Hyemalis.* Park. Parad. 498. GARDEN-LETTUCE.

Lettuce is a Plant ſo well known, that it needs very little Deſcription; it has yelloviſh, green, roundiſh Leaves, narroweſt next the Stalk, which is ſmooth; and the Leaves, which grow on it, in ſome meaſure encompaſs it. The Flowers grow on the Tops, and are ſmall and yellow, like thoſe of the Sow-thiſtle, but much leſs, growing on long ſcaly Calyces, and turning into Down, bearing ſhort, flat, whitiſh Seed. The Roots are neither large nor ſpreading, dying after Seed-time. It is ſown in Gardens. The Leaves and Seed are uſed.

Lettuce is much uſed at the Table in the Spring, among Sallads; and is the principal Ingredient in moſt of them, being grateful to the Stomach, allaying Heat, quenching Thirſt, and attempering the Sharpneſs of Humours in the Body; it provokes Urine, increaſes Milk in Nurſes, and is believed to make People ſleepy. The Seed is one of the Four ſmaller cold Seeds. *Miller's Bot. Off.*

In the Decline of Age, which is naturally wakeful, I ſuffer'd very much, ſays *Galen*, by want of Sleep; for which Diſorder I uſed in the Evening to eat a Lettuce, which was my ſovereign and only Remedy. Many boil the tender Herb, before it produces Stalks, in Water, as I myſelf now do, ſays *Galen*, ſince my Teeth begin to fail me.

For a Phrenſy, Delirium, burning Fever, and other like Diſorders, let there be applied to the Temples, the Coronal Suture, and the Wriſts, a double or treble Linen Cloth, well moiſten'd in Water of Lettuce, in which purified and cryſtallized Nitre, or Sal Prunellæ, have been diſſolved, in the Proportion of half an Ounce to a Pint. I prefer this Remedy, ſays *Simon Paulli*, far before Oil of Roſes, mixed with the Juice of Lettuce in ſuch Caſes. *Raii H. P.*

The ninth is the

Lactuca; Romana; longa; dulcis. *J. B.* 2. 998. *Tourn. Inſt.* 473.

The twelfth is the

Lactuca; capitata. *C. B. P.* 123. *Tourn. Inſt.* 473.

Theſe two, ſays *Dale*, are indiſcriminately claſſed with the former.

Lactuca is, alſo, a Name for ſeveral Sorts of CHONDRILLA; which ſee.

The *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave*, informs us, that Lettuce is in very great Eſteem among the *Italians*; that no Herb more powerfully reſolves, and brings away the black Bile; that the Antients eſteemed the fourth and fifth Species poiſonous, to which he ſeems to give Credit, becauſe their Juices approach near the Nature of Opium; and that Lettuces are excellent in acute Diſorders, which ariſe, during the Summer, from exceſſive Heat of the Blood and Bile. *Antonius Muſa* is ſaid to have cured *Auguſtus Cæſar* by Lettuces; and they are ſaid to excite an Appetite.

Lettuces in general are eſteemed emollient, refrigerating, ſaponaceous, reſolvent, diuretic, and ſomewhat laxative; but they are better raw, than boil'd. In the Book above-quoted a Story is related of an *Engliſh* Noblemen, who indulged himſelf very much in eating Lettuces, and during that time had no Children; but upon leaving off Lettuces, as he was adviſed, his Lady, the next Year, brought him a Child. This agrees with what *Dioſcorides* ſays upon the Subject of Lettuces, which is, that they are Enemies to Venereal Inclinations; and he adds, that they are prejudicial to the Eyes.

Athenæus and *Conſtantine Cæſar* ſay, that the *Pythagoreans* called this Plant the *Eunuch*; and the Antients fabled, that, after the Death of *Adonis*, *Venus* lay upon a Bed of Lettuces, in order to repreſs her lewd Inclinations; and for this Reaſon ſome of the *Pagans* made a religious Scruple of eating them.

Four Ounces of the Juice of Lettuce are ſaid, by *Sennertus*, to be a Poiſon.

LACTUCELLA. The Sow-thiſtle. *Blancard.*

LACTUCIMINA. APHTHÆ. *Blancard.*

LACTUMEN. The ſame as ACHOR; which ſee.

LACUNÆ. Certain Glands, or rather excretory Ducts, in the *Vaginæ*, are thus called. The Glands, alſo, or their excretory Ducts, in the Urethra, have ſometimes this Appellation.

LACUNE. TERRA SIGILLATA. *Rulandus.*

LADANUM.

CISTUS LADANIFERA. Offic. *Ciſtus Ladanifera Cretica vera.* Park. Theat. 666. *Ciſtus Ladanifera Cretica flore purpureo.* Tourn. Cor. 19. Itin. 1. 59. *Ciſtus a qua Ladanum in Creta colligitur.* Bellon. Obſ. lib. 1. cap. 7. *Ciſtus, Ledon Cretenſe.* C. B. Pin. 467. Jonſ. D. *Ciſtus Laurinis foliis.* Wheel. Itin. 219. *Ciſtus Ledon Matthioli.* Ger. 1107. Emac. 1289. *Ladanum Creticum.* Alpin. Exot. 89. THE TRUE LADANIFEROUS SHRUB.

It is a Shrub of two or three Feet high, having pretty large, five-leav'd, roſe-coloured Flowers; and ſeveral Branches about the Thickneſs of a little Finger, hard and brown, divided into leſſer Twigs, of a rediſh Colour, having the Leaves ſet by Pairs, which are thick, and full of Veins, of a dark-green Colour, about an Inch and an half long, and three Quarters of an Inch broad, waved about the Edges, and ſtanding on ſhort Foot-ſtalks.

From this Ciſtus the beſt Ladanum is procur'd in the Iſland of *Candy*, and other Places in the *Archipelago*; they make uſe of a kind of Whip, of two Rows of Leather Straps, with which they bruſh and beat theſe Shrubs; the Gum, which ſweats out from the Leaves, ſticking on the Straps, which they ſcrape off with Knives, when they are ſufficiently loaded.

There are three Kinds of Gum-labdanum in the Shops, the fineſt is of a ſhining black Colour, when broken, ſomewhat hard, but eaſily ſoftening by Heat, of an inflammable Subſtance, having a ſweet pleaſant Smell. The ſecond Sort comes over in Rolls, like the *Spaniſh* Juice of Liquorice; but is tougher, harder, not ſo black, but more droſſy, and of a leſs fragrant Smell. The laſt and coarſeſt Sort is made up in Rolls, twiſted about like the Rolls of a ſmall Wax-candle: This is full of Sand and Droſs, and of a weaker Scent than either of the former.

This Gum is not much uſed inwardly, though ſome commend it for Looſeneſs and Gripes, cauſed by ſharp Humours. The Fume of it comforts the Brain, and ſtops catarrhous Defluxions. Outwardly applied, it ſtrengthens the Stomach, and ſtays Vomiting. *Miller's Bot. Off.*

In the Time of *Dioſcorides* it was gathered from the Hairs of the Goats, which fed among the Trees which produce it; but at preſent, according to M. *Tournefort*, the *Greek* Monks gather it

it from the ſame Trees, with a ſort of Rakes. The *Greek* and *Turkiſh* Ladies carry little Balls of *Ladanum* to ſmell to, as ours do Noſegays, or Oranges. It is an excellent Balſamic in Dyſenteries and Hoarſeneſs; and, being likewiſe aſtringent, it ſtrengthens the Stomach and Inteſtines, and, when applied outwardly in Plaiſters, is uſeful in the ſame Intentions. The *Emplaſtrum Stomachicum* of *Charas*, of which Labdanum is the Baſis, has been ſucceſsfully uſed in habitual Vomitings. It is, alſo, an Ingredient in the *Prior of Cabriere's* Plaiſter for *Hernias*. *Geoff.*

Dale ſays, it mollifies, digeſts, maturates, and attenuates; and that, externally applied, it ſoftens, and is anodyne, and good for the Tooth-ach, *Alopecia*, Heart-burn, Pains of the Stomach, and hyſteric Fits.

LÆMOS, λαιμός. The Gullet.

LÆTIFICANS. An Epithet for ſeveral Shop Compoſitions, which are deſigned for raiſing the Spirits.

LÆVIGATIO, Levigation, is the Reduction of a hard Subſtance to a Powder, by grinding it on a Porphyry.

LAGANON. A ſort of coarſe Cake, mentioned by *Galen*, *L.* 1. *C.* 4. *de Alimentorum Facultatibus.*

LAGAROS, λαγαρός, lax. An Epithet for the Right Ventricle of the Heart.

LAGNEIA, or LAGNEUMA, λαγνία, or λάγνευμα. Venereal Intercourſe. *Hippocrates.*

LAGOCHEILOS, λαγόχειλος. A Perſon who has a Hare-Lip. *Galen.*

LAGON, λαγών. The Flank.

LAGOPHTHALMIA. See ECTROPIUM.

LAGOPUS, in Botany, is a Name for the *Trifolium*; *arvenſe*; *humile*; *ſpicatum*.

LAGOPUS, in Zoology, is the *Perdix Alba*. See PERDIX. It imports Hare-footed.

LAMAC. Gum Arabic. *Rulandus.*

LAMARE. Sulphur. *Rulandus.*

LAMBDACISMUS. A Defect in the Speech, which conſiſts in an Inability to pronouce certain Conſonants.

LAMBDOIDES. The Name of a Suture in the Skull, ſo called from its Reſemblance to the *Greek* Letter Λ, *Lambda*.

LAMBITIVUM. A Linctus, or Eclegma.

LAMINA. Properly, a Plate of Metal, or of any other Subſtance. The Tables of the Skull, in Anatomy, are called the External, and Internal Laminæ.

LAMIUM.

The Characters are;

The Galea is entire and hollow, the Beard bifid, and ſhaped like a Heart. The Calyx is quinquefid, and oblong like a Tube. The Seeds are triangular.

Boerhaave mentions ſeventeen Species of this Plant; which are,

1. Lamium; purpureum; fetidum; folio ſubrotundo; ſive Galeopſis Dioſcoridis. *C. B. P.* 230. *Tourn. Inſt.* 183. *Boerh. Ind. A.* 157. *Lamium rubrum.* Offic. Ger. 568. Emac. 703. Raii Hiſt. 1. 559. Synop. 3. 240. *Lamium vulgare, folio ſubrotundo, flore rubro.* Park. Theat. 604. *Galeopſis, ſive Urtica iners, folio & flore minore.* J. B. 3. 323. RED ARCHANGEL.

This Archangel is much ſmaller than the *Lamium album, non fœtens, folio oblongo*, having little, ſquare, and frequently rediſh Stalks, which have a couple of Leaves growing on them, near the Ground, on long Foot-ſtalks, and uſually no more till towards the Top, where they grow thick together on very ſhort ones: They are much of the Shape of the *Lamium album, non fœtens, folio oblongo*, but a great deal leſs, and rounder pointed. The Flowers grow among the upper Leaves, being almoſt hid by them; they are ſmall, labiated, and galeated leſs than the Flowers of the *Labium album, non fœtens, folio oblongo*; they are of a pale-red Colour. The Root is ſmall and fibrous, dying, after it has ripened its Seed. It grows every-where in Hedges by Highways, and flowers in Summer. The whole Plant has a ſtrong, earthy, unſavoury Smell. The Leaves and Flowers are uſed.

This is accounted good for an Exceſs of the Catamenia, and of Uſe againſt all other Hæmorrhages. Outwardly applied, it is ſerviceable in Wounds and Inflammations. *Miller's Bot. Off.*

The Flowers are recommended for ſtopping a Dyſentery, and Hæmorrhages from Wounds. The Herb, bruiſed and applied, is ſaid to diſcuſs all ſorts of Tumors; and to be of Service to Wounds, putrid Ulcers, and Inflammations. *Dale.*

2. Lamium; purpureum; fetidum; folio ſubrotundo; minus.

3. Lamium; album; fetidum; folio ſubrotundo. *C. B. P.* 231.

4. Lamium; album: fetidum; folio ſubrotundo; minus. *C. B. P.* 231.

5. Lamium; album; non fetens; folio oblongo. *C. B. P.* 231. *Boerh. Ind. A.* 157. *Lamium album, Urtica mortua.* Offic. *Lamium album.* Ger. 568. Emac. 702. Raii Hiſt. 1. 559. Synop. 3. 240. *Lamium vulgare album, ſive Archangelica flore albo.* Park. Theat. 604. Tourn. Inſt. 183. *Galeopſis, ſive Urtica iners, floribus albis.* J. B. 3. 322. WHITE ARCHANGEL.

The Roots of this Archangel are long, ſlender, and creeping along the upper Part of the Earth, and ſending forth ſeveral ſquare hollow Stalks, about a Foot high; the lower Leaves ſtand on long Foot-ſtalks, thoſe towards the Top have ſhorter; they are, in Shape, like the common Stinging-nettle, are hairy, and roundly indented about the Edges; the Flowers grow, towards the Top, at the Joints, with the Leaves encompaſſing the Stalks in thick Whorles; they are large and white, with an hollow Galea; and the Labella cut into two Segments, having three or four black Apices ſtanding in the Middle; the Calyces end in five Points, containing four brown Seeds in each Calyx. It grows every-where by Hedge-ſides, and flowers in *April* and *May*. The Flowers are uſed.

They are accounted a Specific againſt the Fluor Albus, and are uſed in a Conſerve, or Decoction, for that Purpoſe, which is to be continued for ſome time. Some commend the Herb as of great Uſe againſt the King's-evil, and all ſcrophulous Swellings.

The only officinal Preparation is the Conſerve of the Flowers. *Miller's Bot. Off.*

This Plant is emollient, inciding, diuretic, and lithontriptic. It is good againſt hyſteric Fits; and the Root is recommended for the Jaundice. *Dale.*

6. Lamium; purpureum; non fetens; folio oblongo. *C. B. P.* 231.

7. Lamium; Parietariæ facie. *M. H. Blæſ.*

8. Lamium; Parietariæ facie; flore albo.

9. Lamium; maximum; ſylvaticum; rubrum. *Flor.* 2. 68.

10. Lamium; foliis caulem ambientibus; majus. *C. B. P.* 231.

11. Lamium; folio caulem ambiente; minus. *C. B. P.* 232. *M. H.* 3. 386.

12. Lamium; rubrum; minus; foliis profunde inciſis. *Rali Synop.* 129.

13. Lamium; maximum fœtens; purpureum; Galea hormini. See HORMINUM SYLVESTRE.

14. Lamium; alba Linea notatum. *C. B. P.* 231.

15. Lamium; quæ Moldavica, Orientalis; Hederæ terreſtris folio. *T. Cor.* 11.

16. Lamium; Italicum; maximo flore rubro; glabrum.

17. Lamium; perenne; villoſum, folio Catariæ criſpo; flore magno, variegato. *Vail. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 157.

LAMIUM is, alſo, a Name for ſeveral Sorts of GALEOPSIS; which ſee.

LAMIUM MONTANUM. A Name for the *Meliſſa*; *humilis*; *latifolia*; *maximo flore, purpuraſcente.*

LAMIUM PALUDOSUM. A Name for the *Marrubiaſtrum*; *paluſtre*; *fœtidum.*

LAMIUM PEREGRINUM. A Name for the CASSIDA; which ſee.

LAMNEIA, λαμνεία. The ſame as LAMINA. *Caſtellus* from *Moſchion.*

LAMPE, λάμπη. It imports Froth or Foam; or a pinguious Subſtance floating on the Surface of Vinegar, or the Pickle of Olives; or the Bubble on the Surface of Urine, in *Actuarius.*

LAMPETRA. Offic. Rondel. de Piſ. 1. 398. Jonſ. de Piſc. 79. Schonef. Ichth. 40. Charlt. de Piſc. 34. Mer. Pin. 188. *Lampetra Rondeletii.* Raii Ichth. 105. Ejuſd. Synop. Piſc. 35. *Lampetra major.* Aldrov. de Piſc. 539. Salv. de Aquat. 63. *Muſtela, ſive Lampetra.* Bellon. de Aquat. 75. THE LAMPREY, or LAMPREY-EEL.

Lampreys are of two Sorts, the Sea and River Lamprey; and both of them are uſed for Food. Thoſe which are tender, delicate, fat, well-fed, and taken in fine, clear, and running Water, are beſt. They are nouriſhing, and increaſe the ſeminal Juices; the Fat is of a mollifying and diſſolving Nature. Thoſe who have had the Small-pox, anoint the Face and Hands with it, to efface the Marks.

Lampreys are alleged to be pernicious to thoſe who have a Weakneſs in the Nerves, or are ſubject to the Gout and Gravel. It abounds with Oil, volatile Salt, and Phlegm; and agrees, eſpecially in Spring, with young People of an hot and bilious Conſtitution, with ſuch as have good Stomachs, and whoſe Humours are thin. But thoſe who are old, phlegmatic, and abound with groſs Humours, ſhould either abſtain from it, or uſe it moderately.

REMARKS.

The Lamprey is a Fiſh ſhaped like a large Eel. Its Fat hath a delicious Taſte. It anciently was, and ſtill is, much eſteem'd. It lives in ſtony Places, and feeds upon Moſs and Water. It is ſaid, that, ſoon after it has produced its Young, it inſenſibly decays and dies, and all in the Space of two Years.

The Sea Lamprey is of the Number of thoſe Fiſhes that leave the Sea in the Beginning of the Spring, in order to ſpawn in the Rivers; and, after a proper time, return, with their Young, to their former Place.

The River Lamprey continues in freſh Water, and is often found in Brooks, which the Sea-water never reaches. In Shape and

and Taſte it reſembles the Sea Lamprey; but differs from it in Size, being much leſs.

In Spring the Lampreys are tender and delicious Food; but at all other times they are ſaid to be hard, tough, and almoſt taſteleſs. Their oily and balſamic Parts, which eaſily unite with, and repair the Decays of the Solids, make them very nouriſhing; but the dull, viſcous, and groſs Juices, which they alſo contain, render them hard of Digeſtion; but their Digeſtion is ſtill eaſier than that of an Eel.

Lampreys may be boil'd, roaſted, fried, or baked in Pies; they are, alſo, ſalted and dried for keeping, or potted. Some antient Authors have recommended the drowning of the Lamprey in Wine, that it may depoſite in it its malignant Quality. But I am of Opinion, that Wine and Spice are proper for ſeaſoning this Fiſh, not upon account of its imagined malignant Quality, but becauſe they will promote the Digeſtion of the Lamprey, by attenuating its thick and viſcous Juices. *Lemery des Drogues.*

LAMPODES, λαμπώδης. Frothy. See LAMPE.

LAMPROS, λαμπρὸς, in *Hippocrates*, is, Vigorous, or in full Health.

LAMPSANA.

The Characters are;

The Calyx is monophyllous, deeply jagged in many Places, and paſſes into a ſtriated Capſule, full of thin ſharp-pointed Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Lampſana. *Offic. Ger.* 199. *Emac.* 255. *Raii Synop.* 77. *Tourn. Inſt.* 479. *Boerh. Ind. A.* 93. *Lampſana Dodonæi.* J. B. 2. 1028. Raii Hiſt. 1. 256. *Soncho affinis Lampſana domeſtica.* C. B. P. 124. *Intybus, ſive Endivia erecta lutea Napifolia, Lampſana dicta.* Hiſt. Oxon. 3. 54. NIPPLEWORT.

It is frequent in Gardens and Fields, and flowers in *June* and *July*. It is eſteemed excellent for curing ulcerated Nipples, whence its Name *Nipplewort*. It is ſaid to be drying, detergent, and digeſtive. The Leaves and Stalks may be boiled, and uſed as Food.

It is not eaſy to determine, exactly, what the true Lampſana of *Dioſcorides* is.

2. Lampſana; folio ampliſſimo, criſpo. *Petiver. Hort. Ind.* 2. *Boer. Ind. alt. Plant. Vol.* 1. *p.* 93.

LAMPYRIS, λαμπυρὶς, is a Name for the Glow-worm. See CICENDELA.

LANA. Wool. The εἰρία ῥυπαρὰ, *Lana ſuccida*, ſordid Wool, or that which is greaſy, and impregnated with the Sweat of the Sheep, is frequently recommended by the Antients. Thus *Hippocrates* directs this Sort of Wool, well carded, and impregnated with Oil and Wine, to be bound upon Tumors, *Lib. de Fracturis.* And he mentions it in many other Places. And *Celſus* directs it as a proper Application in many Caſes; and in *Lib.* 4. *Cap.* 5. he recommends ſulphurated Wool as a proper Application to the Stomach, in caſe of an Inflammation.

The εἰρία ὑσσωπὰ is the ſame as the εἰρία ῥυπαρά.

Dioſcorides informs us, that of ſordid ſoft Wool, that about the Neck and Inſide of the Thighs is beſt. Dipt in Vinegar and Oil, or Wine, it is of Service, at firſt, in Wounds, Contuſions, Excoriations, Bruiſes, and Fractures of the Bones: For it imbibes whatever Liquor it is immerſed in; and is emollient, by reaſon of its Oeſypum. It is, likewiſe, beneficial in a Cephalalgia, Pains of the Stomach, and any other Part, if it is applied with Vinegar, and Oil of Roſes. *Lib.* 2. *Cap.* 82.

But burnt Wool is an Eſcharotic, ſuppreſſes Excreſcences of the Fleſh, and cicatrizes Ulcers. Being clean and carded, it is burnt in a crude Earthen Veſſel, like other things. In the ſame manner is Wool, dyed with Sea-purple, burnt. But ſome card it without cleaning; and, moiſtening it with Honey, burn it the ſame way. Others diſpoſe Splints, at a Diſtance from each other, upon an open-mouth'd Earthen Veſſel, and between them lay thin Splinters of the *Teda* (ϑαλίων): Upon theſe they place the Wool, carded and dipt in Oil, in ſuch a manner that it may not drop; then, laying Splints and Wool again alternately between, they gently ſet Fire to the Wood, and gather the Remains. But if any Fat, or Pitch, flows from the Pine, they collect, and lay it by. This calcined Wool is a good Ophthalmic. After it has been put into an Earthen Veſſel with Water, waſhed, and well ſtirred with the Hands, when the Aſhes ſubſide, that Water is poured off, and freſh put in, and likewiſe ſtirred: This is continued, till, being applied to the Tongue, it has no ſharp Taſte, but, as it were, aſtringes. *Dioſcorides, L.* 2. *Cap.* 83.

OF OESYPUM.

The Fat of ſordid Wool, termed *Oeſypum*, is thus prepared:

Take ſoft ſordid Wool, uncarded, and not cleaned; waſh it in warm Water, and, at the ſame time, expreſs all the Sordes; throw this into a large-mouth'd Veſſel, and, when you have poured the Water to it, take it up in a Ladle, and drop it again from a great Diſtance, till it froths; or ſtir it well with a Stick, till a Quantity of ſordid Scum is collected; then ſprinkle into it ſome Sea-water. And when the Fat, which ſwam at the Top, ſubſides, put it into another Earthen Veſſel, and, having poured Water to it, ſtir it again; then ſprinkle the Froth with Sea-water, and take it out. Continue this, till the Fat is conſumed, and no Froth remains. When you have well preſſed the Oeſypum, if any Impurity is left behind, remove it immediately, and, pouring out the firſt Water, Drop by Drop, add ſome freſh: Stir it with your Hand, till the Oeſypum, applied to the Tongue, hath no ſharp Taſte, but, as it were, aſtringes, and appears fat, pure, and white: Thus prepared, put it into an Earthen Veſſel.

Let this be done in the Summer. Some, ſtraining off the Fat, waſh it in cold Water, and rub it with their Hands, as Women do Cerate; for thus it becomes whiter. Others, after waſhing the Wool, and ſeparating the Sordes, boil it, with Water, in a Pot, over a gentle Fire, collect the riſing Fat, and waſh it in Water, as we have already mentioned; then, ſtraining it off, they put it into an Earthen Pot, with warm Water, cover it with a Linen Cloth, and expoſe it to the Sun, till it becomes ſufficiently thick and white. Some, after two Days, pour away the firſt Water, and put in freſh.

That is beſt which is light, ſmells ſtrongly of ſordid Wool, and grows white while it is rubbed in the Veſſel, and has nothing hard or compact in it, as if it was adulterated with Cerate or Fat. It has a Faculty of warming, cloſing Ulcers, and mollifying; but, principally, of the Fundament, and Vulva, with Melilot and Butter: Applied with Wool, it promotes Delivery, and the Menſes. It is ſerviceable, with Gooſe-fat, in Ulcers of the Ears and Genitals. It is, likewiſe, efficacious in Corroſions, and itchy Eruptions, of the Corners of the Eyes, Calloſities of the Eyelids, and when the Hairs of the Eyelids fall off; but it is burnt in a new Veſſel, till, being calcined, it loſes its Fat. The Smoak of this, collected, is a very good Ophthalmic. *Dioſcorides, Lib.* 2. *Cap.* 84.

LANARIA. A Name for the *Lychnis*; *ſylveſtris*; *quæ Saponaria vulgo.*

LANARIUS. A Species of Hawk.

LANCETTA, or LANCEOLA. A Lancet.

LANGII *Aqua Epileptica. Langius's* Epileptic Water is thus prepared:

Take of the Flowers of the Lilies of the Valley, twelve Handfuls; and infuſe them for five Days, in four Quarts of generous *Spaniſh* Wine. Then diſtil with Glaſs Veſſels, in a Bath of warm Water, till the Flowers are left almoſt dry, in the Bottom of the Retort. Then take of recent Flowers of Lavender moderately dried, one Ounce; Cinnamon, ſix Drams; Nutmegs, Miſelto, Peony-root, and Dittany, recent Flowers of Roſemary moderately dried, and of Stœchas, each half an Ounce; Long-pepper, and Cubebs, of each two Drams: Let all be groſſly powdered, and macerated for eight Days, in a Veſſel, cloſely ſtopt, with the diſtilled Water above deſcribed; then diſtil again.

It fortifies the Brain, and refreſhes the vital Spirits; it rarefies and diſſipates thick Phlegm, excites the Appetite, and is particularly uſed in an Epilepſy. The Doſe is from two Drams to an Ounce. *Lemery's Pharm. Univerſ.*

LANGUOR. Faintneſs, or Feebleneſs.

LANIGERA *Arbor.* The Cotton-tree.

LANIGERUS. Lanigerous Trees are ſuch as bear ſuch a wooly or downy Subſtance as is commonly contained in the Catkins of the Willow.

LANIUS. The ſame as LANARIUS.

LANS. *Rulandus* explains this, *Argentum mortuum.*

LANTANA. A Name for the VIBURNUM; which ſee.

LANTOR. The Name of a Species of Palm-tree, which grows in *Java.*

LANUGINOSUS. Lanuginous ſignifies downy, or cover'd with a ſoft Down, as a Quince.

LANUGO, in Botany, is Down, which grows on ſome Plants. See CHNUS.

LANX. A Balance, or Pair of Scales for weighing. *Rulandus* explains *Lanx* by *Amygdalæ Dulces.*

LAONICA *Curatio.* A Method of curing the Gout, by evacuating the arthritic Matter from the Part affected, by Topics. *Caſtellus.*

LAOS. Tin. *Rulandus.*

LAPACTICUS, λαπακτικὸς, imports looſening, or evacuating the Belly.

LAPARA. The Flanks; that is, the Parts which are ſituated betwixt the ſpurious Ribs, and the Hips, or Oſſa Ilia.

LAPAROS, λαπαρὸς, imports ſoft, or empty.

LAPATHUM.

The Characters are;

The Calyx is hexaphyllous, three of the Leaves being larger, and red, the other three leſſer, and green; within theſe Leaves are

are placed fix Stamina. The larger Leaves, being come to Maturity, close, and form a triangular Vessel, while the other three wither and fall off; for which Reason some rather take the Leaves for a Flower, and its Calyx. The End of the Pedicle within the Calyx produces a Placenta, on which grows a triangular Ovary, adorned with three Tubes, their Apices elegantly fimbriated, which appear on the Sides without the Segments of the Capsula. The Seed is shining and triangular. *Boerh. Ind. alt. Pars* 2. *p.* 84.

Boerhaave mentions eighteen Species of this Plant; which are,

1. Lapathum; præstantissimum; Rhabarbarum Officinarum dictum. See RHABARBARUM, and RHAPONTICUM.

2. Lapathum; Alpinum; folio subrotundo. *Hist. Oxon.* 2. 578. *Boerh. Ind. A.* 2. 84. *Hippolapathum.* Offic. *Hippolapathum rotundifolium.* Ger. 313. Emac. 389. *Hippolapathum rotundifolium vulgare.* Park. 154. *Lapathum hortense rotundifolium sive montanum.* C. B. P. 115. *Lapathum folio rotundo Alpinum.* J. B. 2. 987. Tourn. Inst. 504. *An Rhabarbarum rotundifolium fimbriatum.* Munt. Herb. Brit. 194.? BASTARD MONKS RHUBARB.

This is the Rhubarb, which, according to *Dale*, the Herb-women of *London* sell for the true Monks Rhubarb. The Stalk is two or three Cubits high, and the Leaves are very broad, like those of the Burdock, of a pale-green Colour, distinguish'd with numerous Veins, and of a subastringent Taste. The Root is thick, oblong, brown without, and intensely red within. The medicinal Virtues ascribed to it are much the same as those of the true Monks Rhubarb.

3. Lapathum; hortense; folio oblongo; sive secundum Dioscoridis. *C. B. P.* 114. *Tourn. Inst.* 504. *Boerh. Ind. A.* 2. 84. *Lapathum sativum Lapas.* J. B. 2. 985.

This Dock grows frequently to be as tall as a Man, having, at the Bottom, several large, long, and pointed Leaves, growing on reddish Foot stalks. The Stalk is red, having a few smaller Leaves growing on it; is branched toward the Top, and full of pretty big stamineous Flowers, succeeded by a large triangular Seed. The Root is thick at the Head, and divided into several Branches, of a brown Colour on the Outside, and a deep-yellow or saffron Colour within, full of reddish Veins, of a styptic Taste, and tinging the Spittle of a yellow Colour. It is planted with us in Gardens, but grows wild in divers Parts of *France*, *Italy*, and *Germany*.

This is the *Rhabarbarum Monachorum*, which has been used in *England* many Years, and what *Gerard* and *Parkinson*, and, also, Mr. *Ray*, took to be the true: But if we may credit *John Bauhine*, that is another Species of *Lapathum*, called by him, *Lapathum majus sive Rhabarbarum Monachorum*; and is the *Lapathum hortense latifolium*, *C. B.* and the *Hippolapathum sive Rhabarbarum Monachorum*, *Dodonæi*. But since these two so nearly resemble one another, that Mr. *Ray* did not distinguish them, we may suppose ours will answer all the Intentions which it is used for, as well as the other.

Monks Rhubarb is opening, and a little purgative, being somewhat of the Nature of the true Rhubarb, but not so strong: It is frequently used in Diet-drinks for the Scurvy, and to open Obstructions of the Liver and Spleen, and help the Jaundice.

Tho' this Plant grows easily enough in our Gardens, yet, as Mr. *Dale* observes, our Herb-women generally impose upon us, for it, the Root of the *Lapathum rotundifolium Alpinum*, *C. B.* or, *Hippolapathum rotundifolium vulgare*, *Bastard Rhubarb*, *Park.* which is rather a larger Root of a paler yellow Colour, wanting the reddish Veins, and give a fainter Tincture to the Spittle. *Miller's Bot. Off.*

4. Lapathum; aquaticum; folio cubitali. See BRITANNICA.

5. Lapathum; hortense; latifolium. *C. B. P.* 115. *Boerh. Ind. A.* 2. 85. *Tourn. Inst.* 504. *Rhabarbarum Monachorum.* Offic. *Hippolapathum sativum.* Ger. 313. Emac. 389. Raii Hist. 1. 171. *Lapathum majus sive Rhabarbarum Monachorum.* J. B. 2. 985. *Lapathum sativum sive Patientia.* Park. Theat. 154. *Lapathum sativum Antiquorum aut longifolium sive Patientia.* Munt. Herb. Brit. 198. MONKS RHUBARB.

See *Lapathum, Hortense, folio oblongo.*

This is said to purge off the yellow Bile, and serous Humors, taken in the Quantity of a Dram powder'd, with a Scruple of Ginger, in a Morning fasting, in warm Broth. If substituted for Rhubarb, it must be taken in a double Dose. The Juice of the Root, with Sulphur, used as a Topic, cures the Itch; and with the Meal of Lupines, it cures Pimples, Freckles, the Alphus, and other cutaneous Disorders, according to *Matthiolus*. A Tincture of the Root prepared with Wine, or the dry'd Powder taken in pure Wine, is said to expel the Stone from the urinary Passages; and, taken with the Juice of the Horehound, it is recommended for the Jaundice.

6. Lapathum; ramis procumbentibus; seminis involucro dentato; foliis inferioribus instar fidium. *M. H.* 2. 580.

7. Lapathum; folio acuto, plano. *C. B. P.* 115. *Tourn. Inst.* 504. *Boerh. Ind. A.* 2. 85. *Lapathum acutum*, *Oxylapathum.* Offic. *Lapathum acutum.* Ger. 311. Emac. 388. Raii Hist. 1. 175. Synop. 56. *Lapathum sylvestre angustifolium.* Schrod. 4. 90. *Lapathum acutum majus.* Park. 1214. *Lapathum acutum sive Oxylapathum.* J. B. 2. 983. Munt. Herb. Brit. 209. SHARP-POINTED DOCK.

Mr. *Ray* mentions this Dock as that in common Use; but 'tis certain, that the Dock which is commonly used in the Shops, and which has, I believe, been always used, is the common Dock, or the *Lapathum sylvestre folio subrotundo*, *C. B.* or the *vulgatius*, or *common Dock*, *Park.* whose Leaves are sometimes sharp-pointed, and sometimes round. As for the *Lapathum acutum* of Mr. *Ray*, it seems to be the *Lapathum acutum minus* of *John Bauhine*, according to his Description; and the *Hydrolapathum minus*, *Park.* and of *Lobel*'s Icons, which has a small Root full of small Strings at the Bottom, and is seldom or never used. But the Root of the common Dock is pretty large and thick, running down deep into the Earth, brown on the Outside, and having a thick, deep-yellow, and sometimes a little reddish Bark, with a thick, tough, hard Pith in the Middle, of a paler Colour. The Leaves are pretty large, in some Plants long and sharp-pointed, in others broad and round, growing on long Foot-stalks. It grows to be a Yard or more in Height, much branched, having the Flowers, which are small and stamineous, set about the Branches in Whorles, with here-and-there a few smaller Leaves growing among them: The Seed is of a bright reddish brown Colour, and a triangular Shape. It grows every-where in moist Places, and among Ruins and Rubbish. The Root and Seed are used.

The Roots of this Dock are aperitive and cooling, and much used to cleanse and purify the Blood, free it from its salt sharp Humours, and they are good for the Scurvy, Rheumatism, and all manner of itchy, scabby Eruptions; for which Purpose they are frequently put in Diet-drinks and Apozems, and used outwardly in Ointments. The Seed is drying and binding, good to stop Spitting of Blood, and Hæmorrhages of all Kinds. *Miller's Bot. Off.*

Willis recommends the Roots of this Dock in a Diet-drink, as a most excellent Antiscorbutic. And they are said by others to be effectual in a Jaundice. The Seeds, taken in Powder, corroborate the Liver, and stop all Sorts of Fluxes.

8. Lapathum; folio acuto, crispo. *C. B. P.* 115. *M. H.* 2. 579. *Lapathum, acutum, crispum.* J. B. 2. 988.

Tabernæmontanus's Figure is very good. It is strange, that *Morison* should confound the *Lapathum folio acuto, crispo*, *C. B. Pin.* with the *Lapathum aquaticum minus*, *J. B.* and that he should not apprehend, that this last Species is the *Pusillum fontilapathum*, *& Lapathiolum vocatum tenellum*, *Adv. Pena* and *Lobel* affirm, that their Plant has its Leaves more narrow than the *Potamogeton*. *J. Bauhine* relates their Description, which ends thus; *folia angustiora multo quam Potamogetonis*: And adds afterwards, that *Pena* and *Lobel* have called it *Pusillum fontilapathum*, *& Lapathiolum vocatum tenellum*. *Morison*, on the contrary, to *folia angustiora multo quam Potamogetonis*, adds, *Pusillum fontilapathum*, *& Lapathum tenellum vocati*, comparing this Plant with itself. *J. Bauhine* is by no means excusable, for having confounded the *Fontilapathum* of *Lobel* with the *Hydrolapathum minus* of the same Author: These two Plants are represented very distinctly in *Lobel*.

The Root of this Plant is very bitter, astringent, pale, yellow, and gives a pretty deep Tincture of red to blue Paper; its Leaves are sourish, and give the same Paper a lively Tincture of Red, which gives Reason to conjecture, that they contain more acid Salt; and that the Root has more acid Salt and Earth. This acid Salt approaches to that of Nitre; for it does not blacken the Tincture of Galls, any more than that of Sorrel. The Root of Dock is generally used at *Paris* in Broths, and aperitive Ptisans. For Example, they scrape two Ounces of it, and boil in lean Broth, in which, having strain'd it, they dissolve half a Dram of chalybeated soluble Tartar; they boil, also, two Ounces of the same Root, and as much of the Enula Campana, in two Quarts of Water; they add to it, at last, a Stick of Liquorice; they strain the Ptisan, and dissolve in it one Dram of vegetable Salt. They give several Glasses of it every Day, to those who have the Itch, Tetters, or other Diseases of the Skin; it is very good for the St. *Antony*'s Fire, Heat of the Blood, and for the Small pox. The Root bruised is apply'd to Ulcers on the Legs, and is an Ingredient in the Ointment for the Itch: They boil for that Use in a very little Water, and a good deal of Butter, four Ounces of the Root of this Plant, and as much of that of Enula Campana, minced small; they strain them thro' a Sieve, and mix an Ounce and an half of Flowers of Sulphur, with six Ounces of the strain'd Liquor. *Martyn's Tournefort.*

9. Lapathum; minimum. *C. B. P.* 115. *M. H.* 2. 579. *Lapathum acutum minimum.* J. B. 2. 985.

10. Lapathum; folio longissimo, crispo.

11. Lapathum; folio acuto, rubente. *C. B. P.* 115. *Raii Hist.* 1. 174. *Synop.* 56. *Hist. Oxon.* 9. 579. *Boerh. Ind. A.* 2. 85. *Tourn. Inst.* 504. *Lapathum sanguineum.* Offic. Park. 1226. *Lapathum sativum sanguineum.* Ger 313. Emac. 390. *Lapathum sanguineum sive Sanguis Draconis Herba.* J. B. 2 988. Munt. Herb. Brit. 211. BLOODWORT.

It is cultivated in Gardens, and flowers in *June*. The Leaves and Seeds are used in Medicine. The Leaves, taken in Broth, loosen the Belly; and the Seeds powdered, and taken in any astringent Liquor, are recommended as effectual for stopping too profuse menstrual Discharges, and other uterine Fluxes. *Dale* from *Camerarius*.

12. Lapathum; annuum; acutum; polyſpermum.

13. Lapathum; ſylveſtre; folio ſubrotundo; ſeminis involucris dentatis. *M. H.* 2. 580.

14. Lapathum; anguſtifolium; capſulis verticillatis; pendulis; eleganter dentatis.

15. Lapathum; folio ſplendente, latiſſimo; ſeminum involucris planis.

16. Lapathum; Ægyptium; capſula ſeminis alba & crenata. *Lippii.*

17. Lapathum; Orientale; Frutex humilis; flore pulchro. *T. C.* 38.

18. Lapathum; Africanum; ſpinoſum; latifolium. *H. M.* 102. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 84.

Lapathum is, alſo, a Name for ſeveral Sorts of SPINACHIA; which ſee.

Lapathum unctuoſum, a Name for the *Chenopodium*; *folio triangulo.*

LAPE, λάπη. The *Latin* Interpreters of *Hippocrates* uſually tranſlate this, *Pituita*, Phlegm; ſuch a Fluid as is diſcharg'd from the Mouth by way of Salivation.

LAPIDILLUS. The Name by which *Blaſius* calls a ſort of chirurgical Spoon, with which Stones are taken out of the Bladder, after the Inciſion is made.

LAPILLATIO. A Term in *Paracelſus*, importing the Generation of a Stone.

Lapis Bononienſis, *Phoſphorus Bononienſis*, *Spongia Solis*, *Lapis Lucidus.* Mont. Exot. 14. *Lapis Bononienſis.* De Laet. 206. Charlt. Foſſ. 20. Worm. Muſ. 46. *Lapis illuminabilis.* Aldrov. Muſ. Metall. 688. *Phoſphorus Kircheri quibuſdam. Fosforo o Pietra lucida di Bologna.* Bocc. Obſ. Nat. 224. BONONIAN PHOSPHORUS, LIGHT-CARRIER.

This is a ſmall, grey, ſoft, gloſſy, fibrous, ſulphureous Stone, about the Bigneſs of a large Walnut; when broken, having a kind of cryſtal or ſparry Talc within; found in the Neighbourhood of *Bologna*, or *Bononia*, in *Italy*; and, when duly prepared, making a Species of Phoſphorus.

This Stone is found in divers Parts of that Country; particularly in a River at the Foot of Mount *Palermo*, where a Chymiſt, one *Vincenzo Caſciarlo*, having gather'd ſome Pieces, and carried them home, in hopes, by the Fire, to extract Silver out of them; inſtead of what he expected, found that admirable Phenomenon they exhibit; which conſiſts in this, that having been expoſed to the Light, they retain it; and ſhine, for the Space of ſix or eight Hours, in the Dark.

We are inform'd in the *Philoſophical Tranſactions*, that the true Way of preparing this Stone is loſt.

But we are inform'd in the *Hiſtory of the Royal Academy of Sciences*, for 1715. in M. *Homberg*'s Eloge, that this great Chymiſt recover'd it.

It is eſteem'd cauſtic, eſcharotic, and emetic.

Lapis variolatum. Offic. Ind. Med. 95. *Variolites Lucernenſis niger variolis, ſeu puſtulis variolis ſimillimis, partim albeſcentibus, partim verò puniceis, & quaſi jam ad ſiccitatem tendentibus undique inſignitus.* Lang. Hiſt. Lapid. 40. *Variolites Lucernenſis niger.* Ejuſdem Icon. 41. THE SMALL-POX STONE.

This Stone is by ſome recommended to be worn about the Neck, by way of Amulet, in order to promote the Eruption of the Small-pox.

Lapis Umbrarum. See UMBRA.

There are, alſo, many chymical Preparations, which go by the Name of *Lapis*: Thus ſeveral Cauſtics have the Appellation of *Lapis Infernalis*; ſee CAUSTICA: And the *Lapis Prunellæ* is the *Sal Prunellæ*. Beſides many others, mention'd under their reſpective Articles.

Lapis Vini is Tartar.

LAPPA *major, & minor.* See BARDANA.

LAPPAGO, according to *Blancard*, is the ſame as APARINE.

LAPPULA CANARIA. A Name for the *Caucalis*; *arvenſis*; *echinata*; *magno flore:* And for the *Caucalis*; *arvenſis*; *echinata*; *latifolia.*

LAQUEUS, in Surgery, is a Nooſe, and belongs either to Bandages, or Inſtruments for making Extenſion, in Fractures and Luxations. *Oribaſius* has a Book expreſly upon this Subject. A certain malignant Inflammation of the Tonſils, is called *Laqueus Gutturis.*

LARBASON. *Stibium*, or Antimony. *Pliny*, *Lib.* 33. *Cap.* 6.

LARDUM. Bacon. This appears to be in general an extremely improper and unwholſome Aliment, eſpecially for People who do not uſe the moſt ſtrong Exerciſe; for thoſe who do, may almoſt eat any thing without Injury: Beſides that Swines-fleſh, conſider'd as an Aliment, is none of the beſt, for Reaſons given under the Articles ALCALI, and PORCUS, when harden'd by Salt, and dried by Smoke, it is render'd more indigeſtible, and, in conſequence of that, productive of Obſtructions in a very great Degree. We may add, that the Fat of Bacon frequently becomes rancid and acrimonious, and hence has no ſalutary Effect upon the Stomach, and often even excoriates the Mouth and Throat.

LARIX.

The Characters are;

The Leaves (which are long and narrow) are produced out of little Tubercles, in form of a Painter's Pencil, (as in the Cedar of *Libanus*) but fall off in Winter. The Cones are ſmall and oblong, and (for the moſt part) have a ſmall Branch growing out of the Top; theſe are produced at remote Diſtances from the Male Flowers on the ſame Tree: The Male Flowers are (for the moſt part) produced on the under Side of the Branches, and, at the firſt Appearance, are very like ſmall Cones.

Boerhaave mentions two Species of this Plant; which are,

1. Larix; Orientalis; fructu rotundiori, obtuſo. See CEDRUS.

2. Larix. *Offic. Ger.* 1183. *Emac.* 1385. *Raii Hiſt.* 2. 1405. *Park. Theat.* 1533. *C. B. P.* 493. *Boerh. Ind. alt.* 2. 180. *Larix folio deciduo conifera.* J. B. 1. 265. Tourn. Inſt. 586. THE LARCH-TREE.

This is a Tree as large as the Pine, having its Branches growing in a regular Order like the Fir, with its Leaves in Cluſters, twenty or thirty together, in a round Knot, appearing like the Bruſh of a Pencil, and falling off every Year; the Cones are oval, about as big as a Pigeon's Egg, with broad and ſmooth Scales. This Tree grows in great Plenty in the *Stirian Alps*, and the Mountains of *Tirol* and *Carinthia*. From this Tree, cut into the very Heart, towards the lower Part of the Trunk, according to *Matthiolus*, is gotten the *Venice* Turpentine. See TEREBINTHINA VENETA.

LARVA. A Maſk. Certain Bandages contrived for the Face are thus called. See FACIES.

LARUS. Offic. *Larus major.* Aldrov. Ornith. 3. 62. *Larus Hybernus.* Balen. *Larus major Aldrovandi.* Will. Ornith. 261. Raii Ornith. 351. Ejusd. Synop. A. 129. *Larus fuscus sive Hybernus.* Ejusd. 130. Will. Ornith. 266. THE CODDY-MODDY.

The Brain, Heart, and Stomach, are used in Medicine. The Brain, dried, cures an Epilepsy, according to *Cœlius Aurelianus.* The Heart is said to facilitate Delivery; and the Stomach to help Digestion. *Dale.*

LARYNGOTOMIA. Laryngotomy. The same as *Bronchotomia.* See ANGINA.

LARYNX.

The Larynx forms the Protuberance in the upper and anterior Part of the Neck, called, commonly, *Pomum Adami.* Anatomists term it, the Head of the Trachea Arteria; and it is larger, and more prominent, in Men than in Women.

It is principally made up of five Cartilages, the Names of which are, *Cartilago Thyroides*, which is the anterior and largest; *Cricoides*, the inferior, and Basis of the rest; two *Arytenoides*, the posterior and smallest; and the *Epiglottis*, which is above all the rest: These Cartilages are connected together by Ligaments, and they have, likewise, Muscles, Glands, and Membranes, belonging to them.

The *Cartilago Thyroides* is large and broad, and folded in such a manner as to have a longitudinal Convexity on the fore Side, and two lateral Portions, which may be term'd *Alæ*. The upper Part of its anterior middle Portion is form'd into an angular Notch; the upper Edge of each *Ala* makes an Arch, and, together with the middle Notch, these two Edges resemble the upper Part of an Ace of Hearts, in playing Cards.

The lower Edge of each *Ala* is more even, and the posterior Edges of both are very smooth, being lengthened out both above and below by Apophyses, which I name the *Cornua* of the Thyroide Cartilage. The superior Apophyses are longer than the inferior, and the Extremities of all the four are rounded like small Heads, which, in the inferior Apophyses, have a shining Surface on the Inside, resembling an articular Eminence.

On the Outside of each *Ala*, near the Edge, is a prominent oblique Line, which runs from behind forward. The upper Extremity of this Line is near the superior Apophysis, or Cornu, and both that and the lower Extremity end in a small Tuberosity, the lowest being often the most considerable. These Tuberosities serve for the Insertion of Muscles and Ligaments. The Inside of the *Alæ*, and the convex Side of the anterior Portion, are very uniform; and this Cartilage ossifies gradually in old Age.

The *Cricoide Cartilage* resembles a kind of thick, irregular Ring, very broad on one Side, and narrow on the other; or it may be compared to a small Portion of a thick Tube, cut horizontally at one End, and very obliquely at the other. I distinguish it into a Basis and Top, into an anterior, posterior, and two lateral Sides. The Basis is almost horizontal, when we stand; and to this the *Aspera Arteria* is connected, so that the *Cricoides* may be looked upon as the upper Extremity of the *Trachea.*

The posterior Portion of the *Cricoides* is larger than the rest, and its posterior or convex Side is divided by a longitudinal Eminence, or prominent Line, into two distinct Surfaces, for the Insertion of Muscles. The Top is gently sloped above this prominent Line, and terminates on each Side by a kind of obtuse Angles, formed between it and the oblique Edge of each lateral Portion of this Cartilage. At the upper Part of each of these Angles there is a very smooth articular Surface, gently convex.

The whole posterior Side is distinguished into two lateral Portions, by two prominent Lines, each of which runs down almost in a strait Direction from the articular Surface at the Top, a little below the Middle of this Side, where it terminates in another articular Line, a little concave; and near these four articular Surfaces there are small Tubercles. The two superior Surfaces are for the Articulation of the *Cartilagines Arytenoidææ*, as we shall see presently; and the two inferior, for the Articulation of the inferior Cornua, or Appendices, of the *Cartilago Thyroides.*

The *Cartilagines Arytenoidææ* are two small, equal, and similar Cartilages, which, joined together, resemble the Spout of an Ewer, and they are situated on the Top of the *Cricoides.* In each we may consider the Basis, Cornu, two Sides, one posterior and concave, the other anterior and convex, and two Edges, one internal, the other external, which is very oblique. The Bases are broad and thick, and have each a concave articular Surface, by which they are joined to the *Cricoides.*

The *Cornua* are bent backward, and a little toward each other. In some Subjects they are very loose, appearing like true Appendices, and easily separable from the rest. Between their inner Edges they form a kind of Fissure, and their outer oblique Edges terminate each by a thick prominent Angle.

The *Epiglottis* is an elastic Cartilage, nearly of the Figure of a Purslane-leaf, narrow and thick at the lower Part, thin and slightly rounded at the upper Part, gently convex on the fore Side, and concave on the back Side. It is situated above the anterior or convex Portion of the *Cartilago Thyroides*; and its lower Extremity is tied by a short, pretty broad, and very strong Ligament, to the middle Notch in the upper Edge of that Cartilage. It is perforated by a great Number of Holes, something like those in the Leaves of the *Hypericum*, or *St. John's Wort*, which are hid by the Membranes which cover its two Sides.

The *Cartilago Thyroides* is connected to the *Cricoides*, by several short, strong Ligaments, round the Articulations of the two inferior Cornua with the lateral articular Surfaces of the *Cricoides.* The Apices of the superior Cornua are fixed to the posterior Extremities of the great Cornua of the *Os Hyoides*, by slender round Ligaments, about a Quarter of an Inch in Length.

In the Middle of each of these Ligaments, we often meet with a small Cartilage of an oval Figure, and much thicker than the Ligaments. The *Thyroides* is likewise connected to the *Os Hyoides*, by a short, broad, strong Ligament, one End of which is inserted in the superior Notch of the Cartilage, and the other in the lower Edge of the Basis of the Bone. It has, also, two Ligaments in the middle of the concave Side, which belong to the *Arytenoidææ.*

The *Cricoides* is tied to the lower Part of the *Thyroides*, by a strong Ligament; and by the Ligaments already mentioned, to the inferior Cornua of that Cartilage. Its Basis is fixed to the first cartilaginous Ring of the *Trachea Arteria*, by a Ligament exactly like those by which the other Rings are connected together; and the membranous or posterior Portion of the *Trachea* is, likewise, fixed to the posterior Part of the Basis of the *Cricoides.*

The *Cartilagines Arytenoidææ* are connected to the *Cricoides* by Ligaments, which surround their Articulations with the Top of that Cartilage. Anteriorly, the Basis of each *Arytenoides* is fixed to one End of a ligamentary Cord, which, by its other End, is inserted about the Middle of the concave Side of the anterior Portion of the *Thyroides.* At their Insertions in the *Thyroides*, these two Ligaments touch each other; but a small Space is left behind them, where they are fixed in the two *Arytenoides*; and they seem, likewise, to have a small Adhesion to the Top of the *Cricoides.* This is what is called the *Glottis.*

Under these two ligamentary Cords there are two others, which run, likewise, from behind, forward. The Interstice between the superior and inferior Cords on each Side forms a transverse Fissure, which is the Opening of a small membranous Bag, the Bottom of which is turned outward, that is, toward the *Ala* of the *Thyroides.* These two *Sacculi* are the Ventricles mentioned by the Antients, and restored by M. *Morgagni*, who has given an excellent Description of them. They are principally formed by a Continuation of the internal Membrane of the *Larynx*, and the inner Surface of their Bottom appears sometimes to be glandulous.

On the anterior Surface of the *Arytenoide Cartilages* there is a small Depression between the Basis and the convex upper Part. This Depression is filled by a glandulous Body, which not only covers the anterior Surface of each *Arytenoides*, but is, also, extended forward, from the Basis, over the posterior Extremity of the neighbouring ligamentary Cord. They are larger, and more sensible, in some Subjects than in others; and they are covered by the Membrane which lines the neighbouring Parts. These Glands were discovered by M. *Morgagni.*

I have already described the Ligaments which connect the *Epiglottis* to the Notch of the *Thyroides*, and to the Basis of the *Os Hyoides.* These two Ligaments, and a third, which ties the Basis of the *Os Hyoides* to the Notch of the *Thyroides*, form a triangular Space, filled with a cellular or pinguious Substance, and with small Glands.

The *Epiglottis* has, also, two lateral Ligaments, by which it is connected to the *Arytenoides*, all the Way to their Points or *Cornua.* It has, also, a membranous Ligament, which, running along the Middle of its anterior or concave Side, ties it to the Root or Basis of the Tongue. This Ligament is only a Duplicature of the Membrane which covers the *Epiglottis*, continued to the neighbouring Parts. Lastly, there are two lateral membranous Ligaments belonging to it, fixed near the glandulous Bodies called *Amygdalæ.*

The *Epiglottis* is not only perforated by the regular Holes already mentioned, but has, likewise, a great Number of small irregular Scissures and Breaks, which are so many different *Lacunæ*, situated between its two Membranes, and filled with small Glands, the excretory Orifices of which are principally on the back Side of this Cartilage.

The *Larynx* gives Insertion to a great Number of Muscles, which may be divided into Common, Proper, and Collateral. The Common Muscles, according to the general Acceptation of the Term, are all those which move the whole Body of the *Larynx*, one Extremity of them being inserted in the other Parts; and these are four in Number, two on each Side, and are named

Sterno-thyroidæi,
Thyro-Hyoidæi, or *Hyo-thyroidæi.*

The Proper Muscles are those inserted wholly in the *Larynx*, and which move the Cartilages separately. These have been divided

divided in various Manners, but may all be reduced to the following Pairs;

Crico-thyro-hyoidæi
Crico-arytenoidæi Laterales.
Crico-arytenoidæi Posteriores.
Thyro-arytenoidæi.
Arytenoidæi.
Thyro-epiglottici.
Aryteno-epiglottici.
Hyo-epiglottici.

By the Collateral Muſcles, I underſtand thoſe which are inſerted by one Portion in the Larynx, without appearing to contribute any thing to the Motions of it. Of this Kind are the Thyro-pharyngæi and Crico-pharyngæi.

The Larynx may, alſo, be moved by Muſcles which are not immediately inſerted in it, but altogether in other Parts: Such are the Mylo-hyoidæi, Genio-hyoidæi, Stylo-hyoidæi, Omo-hyoidæi, Sterno-hyoidæi, and eſpecially the Digaſtrici of the lower Jaw, by reaſon of their particular Adheſion to the Os Hyoides. It is, alſo, probable, that thoſe Muſcles of the Pharynx, which are inſerted in the Baſis Cranii, may, in certain Circumſtances, move the Larynx in ſome ſmall Degree.

The Sterno-thyroidæi are two long, flat, narrow, thin Muſcles, like Ribbands, broader above than below, and ſituated along that Part of the Neck which lies between the thyroide Cartilage and the Sternum. They are covered by the Sterno-hyoidæi; and they cover the thyroide Glands, paſſing immediately before them.

Each Muſcle is fixed, by its lower Extremity, partly in the ſuperior Portion of the inner or back Side of the Sternum, partly in the Ligament and neighbouring Portion of the Clavicula, and partly in the cartilaginous Portion of the firſt Rib. Sometimes it runs a great Way down on the firſt Bone of the Sternum, and croſſes the Muſcle on the other Side. From thence it runs up, on the Aſpera Arteria, cloſe by its Fellow; paſſes before the thyroide Glands, over the cricoide Cartilage; and is inſerted, by its upper Extremity, in the lower Part of the lateral Side of the thyroide Cartilage, and partly along that whole Side. I have found this Muſcle double, one diſtinct Portion of it being inſerted into the Baſis, and the other laterally.

The Thyro-hyoidæi, or Hyo-thyroidæi, are two flat thin Muſcles, lying cloſe by each other, between and above the former. Each of them is inſerted, by its upper Extremity, partly in the Baſis, and partly in the neighbouring Part of the great Cornu of the Os Hyoides, and, by its lower Extremity, in the lower Part of the lateral Side of the Thyroide Cartilage, immediately above the ſuperior Extremity of the Sterno-thyroidæus; and both this ſuperior Extremity of the laſt-named Muſcle, and the lower Extremity of the Thyro-hyoidæus, are, at their Place of Union, confounded a little with the Thyro-pharyngæus inferior.

The Crico-thyroidæi are two ſmall Muſcles, ſituated obliquely ar the lower Part of the thyroide Cartilage. They are inſerted, by their lower Extremities, in the anterior Portion of the cricoide Cartilage, near each other, and, by their ſuperior Extremities, laterally in the lower Edge of the thyroide Cartilage, at a Diſtance from each other: By this oblique Situation they repreſent a *Roman* V.

Each of theſe ſmall Muſcles is, in a manner, double, its upper Extremity inſerted in the thyroide Cartilage being, in ſome Subjects, very broad, and divided into two Portions, one anterior, and the other more lateral, and more oblique. They may, alſo, be eaſily ſeparated into two diſtinct Muſcles, whereof one may be called *Crico-thyroidæus anterior, ſive Internus*; the other *Lateralis, ſive Externus.*

The two Muſculi Crico-arytenoidæi poſteriores are ſituated poſterioly, at the large or back Portion of the Cricoides, filling almoſt the two longitudinal Surfaces of that Portion, and diſtinguiſhed by the prominent Line between theſe two Surfaces already mentioned. Each of them runs up obliquely, and is inſerted, by its upper Extremity, in the poſterior Part of the Baſis of the arytenoide Cartilage of the ſame Side near the Angle of that Baſis.

The two Crico-arytenoidæi Laterales are ſmall, and ſituated more laterally than the former. Each Muſcle is fixed, by one End, to the Side of the broad Part of the Cricoides, and, by the other, to the lower Part of the Side of the neighbouring Arytenoides.

The two Thyro-arytenoidæi are very broad, each Muſcle being ſituated laterally between the Thyroides and Cricoides. It is fixed, by a broad Inſertion, in the Inſide of the Ala of the thyroide Cartilage; and the Fibres, contracting from thence, run from before, backward; and from below, upward, towards the neighbouring arytenoide Cartilage, in which they are inſerted, from the Glottis to the Angle of the Baſis. In ſome Subjects, theſe Muſcles cover almoſt both Sides of the Glottis.

The Arytenoidæi are ſmall Muſcles, lying on the poſterior concave Sides of the arytenoide Cartilages. Dr. *James Douglas*, in the firſt Edition of his Treatiſe on the Muſcles, divided them into two Kinds, one of which he called *Arytenoidæi majores*, and the other, *Arytenoidæi minores*; and it muſt be owned, that there is ſome Variety in different Subjects. I ſhall here confine myſelf to what I have moſt frequently and moſt diſtinctly obſerved; and that is, that there are two Crucial Arytenoidæi, and one Tranſverſe.

The crucial Muſcles run each obliquely from the Baſis of one arytenoide Cartilage, to the middle and upper Part of the other, the Left Muſcle covering the Right, as is obſerved by M. *Morgagni*, in his firſt *Adverſaria.*

I look upon theſe Muſcles as ſuperior Crico-arytenoidæi; becauſe I have always found them partly inſerted in the upper neighbouring Portion of the Cricoides. The Arytenoidæus Tranſverſalis is inſerted, more or leſs directly, by both Extremities, in the two arytenoide Cartilages; and this I look upon as the true Muſculus Arytenoidæus.

The two Thyro-epiglottici croſs the Thyro-arytenoidæi, being inſerted in the inner lateral Part of the Thyroides, and laterally in the Epiglottis.

The Aryteno-epiglottici are ſmall fleſhy Faſciculi, each of which is fixed, by one Extremity, in the Head of one of the arytenoide Cartilages, and by the other in the neareſt Edge of the Epiglottis.

I never had the Opportunity of examining the Hyo-epiglottici in very muſcular Subjects; and, therefore, I am not ſure, that the Fibres, which go from the convex Side of the Baſis of the Os Hyoides, to the convex Side of the Epiglottis, are really fleſhy.

The Larynx ſerves particularly to admit and let out the Matter of Reſpiration; and the Solidity of the Pieces, of which it is compoſed, hinders not only external Objects, but, alſo, any hard thing, which we ſwallow, from diſordering this Paſſage. The Glottis, being a narrow Slit, modifies the Air which we breathe, and, as it is very eaſily dilated and contracted, it forms the different Tones of the Voice, principally by means of the different Muſcles inſerted in the Cartilagines Arytenoidææ, to which the other Muſcles of the Larynx, both proper and common, are Aſſiſtants.

The whole Larynx is, likewiſe, of Uſe in Deglutition, by means of its Connection with the Os Hyoides, to which the digaſtric Muſcles of the lower Jaw adhere; which Muſcles raiſe the Larynx, together with the Os Hyoides, every time we ſwallow.

The Facility of varying and changing the Tone of the Voice depends on the Flexibility of the Cartilages of the Larynx, and decreaſes in proportion as we advance in Age; becauſe theſe Cartilages gradually harden and oſſify, though not equally ſoon in all Perſons; and this Change happens, not only to the Cartilago Thyroides, but alſo to the Cricoides and Arytenoides.

The Muſculi Sterno-thyroidæi ſerve, in general, to pull down the thyroide Cartilage, and the whole Larynx along with it. They may, alſo, aſſiſt the Sterno-hyoidæi in its Actions, and compreſs the thyroide Gland. The Thyro-hyoidæi may, as Occaſion requires, either draw up the Larynx toward the Os Hyoides; or draw that Bone downward toward the Cartilago Thyroides.

It is difficult to determine the Uſe of the Crico-thyroidæi, from their Situation. They may either pull the Cricoides obliquely backward, or the Thyroides obliquely forward; and, by this Action, the inferior Cornua of the Thyroides, and ſmall articular Surfaces of the Cricoides, muſt ſlide upon each other.

Both the lateral and poſterior Crico-arytenoidæi may ſeparate the arytenoide Cartilages, and thereby open or dilate the Glottis; but they do not both perform this Action in the ſame manner; the lateral Muſcles ſeparate theſe Cartilages obliquely forward, and, at the ſame time, looſen or relax the Sides of the Glottis; but the poſterior Muſcles ſeparate them obliquely backward, and, at the ſame time, ſtretch or extend the Sides of the Glottis; and, when both Muſcles act equally, they ſeparate the Cartilages directly.

The Thyro-arytenoidæi, acting together, draw both the arytenoide Cartilages forward, and, conſequently, looſen the Glottis, and render it capable of the ſmalleſt Quaverings of the Voice. They may, alſo, probably compreſs the lateral Sinuſes or Ventricles of the Larynx, and, alſo, the arytenoide Glands.

The Arytenoidæi bring the arytenoide Cartilages cloſe together, and preſs them againſt each other; and, when the Cartilages are in this Situation, they may, at the ſame time, be inclined either forward by the Thyro-arytenoidæi, or backward by the Crico-arytenoidæi poſteriores. By this means the Glottis, when ſhut, may be either relaxed or tenſe, and, in this laſt Caſe, it is entirely ſhut, as when we hold in our Breath, in ſtraining.

The general Uſe of the Epiglottis is to cover the Glottis like a Penthouſe, and thereby hinder any thing from falling into it when we eat or drink; and for this Purpoſe it is depreſſed. It alſo ſerves to hinder the Air, which we inſpire, from ruſhing directly upon the Glottis; but, by ſplitting it, as it were, obliges it to enter it by the Sides, or in an oblique Courſe. The Muſcles of the Epiglottis do not appear to be abſolutely neceſſary for that Cartilage; for in Deglutition it may be ſufficiently depreſſed by the Baſis of the Tongue, and it may raiſe itſelf again by its own Elaſticity. The Thyro-epiglottici and Aryteno-epiglottici may ſerve to ſhut any lateral Openings, that might remain when

the

the Epiglottis is depreſſed by the Baſis of the Tongue; and the Hyo-epiglottici may pull it a little forward in ſtrong Reſpirations, as in Sighing, or Yawning. *Winſlow's Anatomy.*

LASANON, λάσανον, is a Trivet for culinary Uſes. But *Heſychius* explains it, a ſort of Cloſe-ſtool: And in *Hippocrates, Lib. de Superfœtatione*, it ſeems to import a Chair, or Stool, contrived for a Woman in Labour to ſit in, in ſuch a manner, that the Weight of the Child, when born, may help to bring away the Secundines.

LASCIVUS is an Epithet in *Paracelſus* for the *Chorea Sancti Viti*, St. *Vitus*'s Dance.

LASER. The Juice of the LASERPITIUM. See SILPHIUM.

LASERPITIUM.

The Characters are;

The Root is perennial, large, acrid, and lacteſcent; the Leaves are broad, large, and more or leſs lobated; the Petals of the Flowers are ſhaped like an Heart, expanded, narrow below, and broad above; the Top of the Ovary, below the Placenta, ends in Teeth, which ſuſtain, like a ſhort Calyx, a large white Placenta; the Seed is gibbous, furniſhed with four foliaceous Wings in longitudinal Directions, which are either flat or curled.

Boerhaave mentions ſixteen Species of this Plant; which are,

1. Laſerpitium; foliis latioribus, lobatis, nigrioribus; ſemine plano.

2. Laſerpitium; foliis latioribus, lobatis. *Tourn. Inſt.* 324. *Boerh. Ind. A.* 61. *Thapſia Officinarum.* Chom. 64. *Gentiana alba.* Offic. *Libanotis Theophraſti minor.* Ger. 857. Emac. 1010. Park. Theat. 931. Raii Hiſt. 1. 427. *Libanotis latifolia altera, ſive vulgatior.* C. B. P. 157. *Libanotis Theophraſti quorundam, ſive Seſeli Æthiopicum, Matthiolo Cervicaria alba.* J. B. 3. 164. THE LESSER HERB FRANKINCENSE OF THEOPHRASTUS.

It is found on the Mountains of *Switzerland*, and the *Pyrenees*, and flowers in *July*. The Root is ſaid to be alexipharmic, and good in uterine Diſorders. *Dale.*

3. Laſerpitium; majus; Alpinum; foliis rotundioribus. *T.* 324.

4. Laſerpitium; foliis amplioribus; ſemine criſpo. *T.* 324.

5. Laſerpitium; humilius; Paludapii folio; flore albo. *T.* 325.

6. Laſerpitium; humilius; Paludapii folio; flore purpuraſcente. *T.* 325.

7. Laſerpitium; foliis anguſtioribus, ſaturatius virentibus. *M. U.* 28. 64. *Laſerpitium lobis anguſtioribus, ſaturate virentibus & lucentibus, ſemine criſpo.* M. U. Elench. Tab. IV. *Laſerpitium, lobis anguſtioribus ſaturate virentibus.* M. H. 3. Sect. 9. Tab. XIX. No. 8. *Laſerpitium, e regione Maſſiliæ allatum.* J. B. 3. 2. 137. *Laſerpitium Gallicum.* C. B. P. 156. LASERWORT.

It is cultivated in Gardens, and flowers in the Summer. The Root is uſed, which is heating, and recommended againſt Sugillations, ſtrumous Swellings, Tubercles, iſchiadic Pains, and Excreſcences about the Anus. It is ſaid to repreſs Venereal Inclinations. *Dale.*

8. Laſerpitium; lobis anguſtioribus, dilute virentibus, plurifariam diviſis. *M. U.* 64. 28. *M. Bloef.* 278. *M. H.* 3. 321.

9. Laſerpitium; folio anguſto, multifido; flore albo; alis ſeminum planis.

10. Laſerpitium; latifolium; non ſinuatum. *T.* 324.

11. Laſerpitium; anguſtifolium; non ſinuatum, ſemine criſpo.

12. Laſerpitium; ſelinoides; ſemine criſpo. *T.* 324.

13. Laſerpitium; anguſtifolium; umbella contracta & concava. *T.* 324. *Schol. Bot.* 167.

14. Laſerpitium; tenuifolium; lobis obſcure virentibus. *Plukn. Phyt.* 198. *Fig.* 4.

15. Laſerpitium; foliis anguſtis, nigricantibus, multifidis; flore purpuraſcenti, alis ſeminum planis.

16. Laſerpitium; Orientale, folio mei; flore luteo. *T. C.* 23. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 61.

LASION, λάσιον, in *Hippocrates, Prædict. Lib.* 2. ſignifies Rough, or Hairy. *Laſion* is expounded, by *Galen*, a Linen Cloth, that is, one which is rough and villous.

LASSITUDO. Laſſitude. See COPOS.

LASTAURUS. One abandoned to Venereal Pleaſures. *Caſtellus* from *Caſp. Rejes.*

LASUR, in *Paracelſus*, is what he calls the tranſplanted Extract from Silver.

LATER. A Brick. Theſe are of ſome Uſe in Medicine, being frequently heated, and applied to various Parts; or they are laid on Cataplaſms, in order to preſerve a perpetual Heat.

The Oil of Bricks, otherwiſe called *Oleum Philoſophorum*, is thus prepared:

Let hot Bricks be quenched in Oil of Olives, until they have imbibed all the Oil; and then let them cool, and the Oil be drawn from them by a Retort, and ſeparated from the Spirit.

LATERA-LICTRO. Quickſilver. *Rulandus.*

LATERALIS MORBUS. The Pleuriſy.

LATER'UM. A Lixivium. *Rulandus.*

LATHYRIS. A Name for the *Tithymalus*; *latifolius, Cataputia dictus.*

LATHYRUS.

The Characters are;

The Ovary, cover'd with a membranaceous Vagina, becomes a round or compreſſed Pod, with ſometimes a cylindrical, and ſometimes angular Seed. It hath a compreſſed Stalk with a raiſed Rib, and a leafy Border; and has only one Pair of Leaves, which terminates in a Tendril.

Boerhaave mentions nineteen Species of this Plant; which are,

1. Lathyrus latifolius. *C. B. P.* 344. *Tourn. Inſt.* 395. *Boerh. Ind. A.* 2. 41. *Lathyrus*, Offic. *Lathyrus major latifolius.* Ger. Emac. 1229. Raii Hiſt. 1. 894. Synop. 3. 319. *Lathyrus major perennis.* Park. Theat. 1061. *Lathyrus major latifolia, flore majore, purpureo, ſpecioſior.* J. B. 2. 303. *Clymenum Dioſcoridis quibuſdam.* PEAS EVERLASTING, or CHICHLING VETCH.

It grows in Woods and Thickets, and flowers in the Summer. The Juice expreſſed from the whole Plant, together with the Root, is uſed in Medicine. This, when drank, is ſaid to be effectual againſt Vomiting of Blood, and the Cœliac Paſſion, and to reſtrain Hæmorrhages of the Uterus, and from the Noſe. The Leaves and Pods, bruiſed, and applied to Wounds, promote their Cicatrization.

2. Lathyrus; latifolius; minor; flore majore. *Ind.* 158.

3. Lathyrus; major, Narbonenſis; anguſtifolius. *J. B.* 3. 304.

4. Lathyrus; diſtoplatyphyllos; hirſutus; mollis; magno & peramœno, flore odoro.

5. Lathyrus; Tingitanus; ſiliquis Orobi; flore amplo ruberrimo. *M. H.* 2. 55.

6. Lathyrus; arvenſis; repens; tuberoſus. *C. B. P.* 344. *Terræ Glandes.* Dod. p. 550. *Arachidna Theophraſti.* Col. 1. 304, 305. Deſcr. 301. Ic. *Glans Terræ & Pſeudo-apios.* H. Eyſt. Æſt. o. 13. F. 13. Fig. 5. *Chamæbalanus leguminoſa.* J. B. 1. 17. 324.

Fuchſius, being willing to accommodate himſelf to *Dioſcorides*'s Deſcription of the Apios, would have the Leaves of this Plant reſemble thoſe of Rue. I believe *Pena* and *Lobel* have confounded our *Lathyrus* with the *Bulbocaſtanum*; for they ſay not only, that its Roots are aſtringent, and have the Taſte of Cheſnuts, but, alſo, that it is found at *Colmars* in *Provence*. Now I have found only the Bulbocaſtanum about this Town, the Roots of which the People eat raw, or boiled, and call it *Piſſagous. Martyn's Tournefort.*

7. Lathyrus; ſylveſtris & dumetorum flore luteo. *Boerh. Ind. A.* 2. 42. *Lathyrus ſylveſtris, flore luteo.* Park. Theat. 1062. Ger. Emac. 1231. *Lathyrus luteus ſylveſtris dumetorum.* J. B. 2. 304. Raii Hiſt. 1. 894. Synop. 3. 320. *Lathyrus ſylveſtris luteus foliis Viciæ.* C. B. P. 344. Tourn. Inſt. 395. EVERLASTING TARE.

This grows in Woods and Thickets, flowering in *June*. The Herb is uſed as an Aſtringent. *Dale* from *Monti.*

8. Lathyrus; Hiſpanicus flore luteo.

9. Lathyrus; anguſtifolius; lepto-macrolobus; ſemine rotundo; flore rubello. *M. H.* 2. 55.

10. Lathyrus; latifolius; flore gilvo.

11. Lathyrus; anguſtifolius; ſiliqua alata; vexillo cœruleo, alis variegatis. *Ind.* 159.

12. Lathyrus; ſativus; flore & fructu albo. *C. B. P.* 343. Lathyrus, ſive Cicercula. *Dod.* 522.

13. Lathyrus; anguſtifolius; ſemine maculoſo. *C. B. P.* 344.

14. Lathyrus; anguſtifolius; ſemine maculoſo, minori.

15. Lathyrus; folio tenuiore; floribus rubris. *J. B.* 2. 308.

16. Lathyrus; anguſtifolius; ſemine maculoſo, fuſco minore.

17. Lathyrus; ἀμφίκαρπος; ſupra & infra tetram ſiliquas gerens. See ARACHYDNA.

18. Lathyrus; Orientalis; flore vix conſpicuo.

19. Lathyrus; luteus; latifolius. *Bot. Monſp. Boerh. Ind. alt. Plant. Vol.* 2. *p.* 41.

LATHYRUS, VICIOIDES. A Name for the *Clymenum Hiſpanicum*; *flore vario*; *ſiliqua plana*: And for the *Clymenum*; *Hiſpanicum*; *flore vario*, *ſiliqua articulata.*

LATIBULUM is uſed by *Theodorus Craanen* for the Fomes, or Matter, exciting a Fever.

LATICA. A continual quotidian Fever, without any Intermiſſion.

LATISSIMUS DORSI. This is a broad, thin, and moſtly fleſhy Muſcle, lying between the Axilla, where it is very narrow, and the Back, by which it expands itſelf by radiated Fibres, both in Length and Breadth, from the Middle of the Back, all the Way to the lower Part of the lumbar Region; and from this Situation it has its Name.

Its Inſertions, without reckoning that in the Arm, are partly tendinous, and partly fleſhy. In the firſt Place, it is ſometimes, but not always, fixed in the inferior Coſta of the Scapula, near

the Angle, by a Faſciculus of fleſhy Fibres. In the next Place, it is fixed by an Aponeuroſis, in the ſpinal Apophyſes of the ſix, or ſeven, and, ſometimes, eight loweſt Vertebræ of the Back, in thoſe of all the Vertebræ of the Loins, in the ſuperior Spines and lateral Parts of the Os Sacrum, and the external Labium of the poſterior Part of the Os Ilium.

Beſides all this tendinous Courſe, it is inſerted by fleſhy Digitations in the laſt four falſe Ribs. Theſe Digitations cover thoſe of the Serratus inferior Poſticus, and mix with thoſe of the Obliquus externus Abdominis, there being ſometimes Faſciculi of Fibres common to both Muſcles. It is not always fixed to the loweſt falſe Rib; and ſometimes that Inſertion is by a particular kind of Aponeuroſis, which is pretty ſtrong. I have, alſo, ſeen it fixed to the firſt falſe Rib by a very ſmall, thin Digitation.

From all theſe Inſertions the Fibres of this Muſcle tend in different Directions to the Arm. At the middle of the Back they are almoſt tranſverſe, and they become more and more oblique, as they deſcend. Towards the Region of the Loins their Obliquity decreaſes again, and on the Ribs they are almoſt longitudinal. As they run up, they contract in Breadth, and under the Axilla they terminate in a flat Tendon, turned almoſt in the ſame manner as that of the Pectoralis major, but more ſimply, and without any Adheſion between the two Planes. The upper Edge of this flat Tendon is turned inward, anſwering to the lower or lateral Part of the Muſcle; and the lower Edge, which hides the other by croſſing a little over it, anſwers to the upper or poſterior Part of the Muſcle.

The Tendon, thus formed, is fixed in the Os Humeri, a little below the ſmall ſuperior Tuberoſity, in the inner Edge of the bony Groove or Chanel, the Cavity of which it alſo lines, by a tranſverſe ſmooth Expanſion, nearly as is done by the Tendon of the Pectoralis Major from the other Edge; ſo that theſe two Tendons, meeting by their Extremities in the Groove, appear, in ſome meaſure, to be continued with each other: I ſay, in ſome meaſure; becauſe the Tendon of this Muſcle is not ſo broad as that of the Pectoralis Major.

The Tendon of the Latiſſimus Dorſi is accompanied by another flat Tendon, belonging to the Teres Major; but it is inſerted higher up than that other Tendon, and nearer the Chanel, ſo that the lower Edge of the Tendon of the Latiſſimus Dorſi may be ſaid to encroach on the upper Edge of the other Tendon. Theſe two Tendons communicate by ſome collateral Fibres, and are both ſtrengthened by the ſame ligamentary Frænum, which runs down from the Inſertion of the Subſcapularis, below that of the Teres major.

This Muſcle is covered by the Trapezius, from the ſixth to the laſt Vertebra of the Back, and covers the Serratus inferior Poſticus. Its Aponeuroſis is, at firſt, narrow, but increaſes in Breadth as it deſcends between the Vertebræ, and Os Ilium. It adheres ſtrongly to that of the Serratus inferior Poſticus, and ſtill more to the Tranſverſalis Sacro-lumbaris and Longiſſimus Dorſi. This Muſcle, together with the Pectoralis Major, forms the Cavity of the Axilla.

The Latiſſimus Dorſi ſerves, in general, to bring down the Arm, when raiſed; and this it does principally by its inferior Portion. By the ſame Portion, and by the Connection of the Scapula with the Os Humeri, it ſerves to depreſs the Shoulder, or to maintain it in that Situation, againſt any Force that endeavours to raiſe it; as when we lean upon the Elbow, in Sitting, or walk upon Crutches.

By its dorſal Inſertion, by the Paſſage of its Tendon on the Inſide of the Os Humeri, and by its Inſertion in the fore Side of that Bone, it may turn the Arm round its Axis, called Rotation, by Anatomiſts; as it happens, when, having bent the fore Arm, we turn it behind our Back.

By its Inſertion in the Criſta of the Os Ilium, and in the falſe Ribs, it becomes neceſſary to raiſe the Head laterally on one Side, when we lie on the other: For the Shoulder being then depreſſed, and brought near the Thorax, the Clavicle becomes the fixed Point of one or two of the Muſcles, which raiſe the Head in this Situation. Any Perſon may make the Experiment in Bed, by lying at full Length on his Side; for if, when he raiſes his Head in this Poſture, he lay his Hand on the anterior Edge of this Muſcle, he will find it conſiderably ſtretched, and, alſo, that this Tenſion ceaſes, whenever he ceaſes to lift his Head.

The Connection of this Muſcle with the falſe Ribs is the Cauſe of that Uneaſineſs which we find in breathing, when the Arm is pulled ſtrongly downward, to preſs upon any thing; as when we ſeal a Letter, or lean upon a ſhort Cane, the fore Arm being extended.

The ſmall Portion, inſerted in the inferior Angle of the Scapula, may be an Aſſiſtant to the Teres Major.

This Muſcle ſuſtains the Weight of the whole Body, when, with the Arms raiſed, we hang by the Hands; as when we graſp the Branch of a Tree, in climbing.

It performs the ſame Office, when we either ſit or ſtand, with the whole Arm more or leſs extended horizontally, and preſs the Hand from above downward, againſt any Reſiſtance; as when we ſupport ourſelves in this Situation, by a very long Cane graſped by the Hand; or lay hold of the upper Part of an Halbert, and preſs the lower End ſtrongly againſt the Ground.

Theſe laſt three Uſes cannot, however, be well executed by this Muſcle alone, without the Aſſiſtance of the Pectoralis Major. *Winſlow's Anatomy.*

LATON. Braſs. It has ſome other alchemiſtical Significations, of very little Importance to Medicine.

LATUS PULSUS is a broad Pulſe, that is, when the Artery is preternaturally diſtended at every Pulſation.

LATÆ PUSTULÆ are Puſtules, which ſpread wide at the Baſe, without riſing to a Head.

LAVACRUM. A Bath.

LAVAMENTUM. A Fotus, or Fomentation. *Blantard.*

LAVANDULA.

The Characters are;

The Galea of the Flower is roundiſh, erect, and generally bifid; the Beard is divided into three almoſt equal Segments: The Whorles of the Flowers are cloſely collected into thin ſlender Spikes at the Tops of the Stalks and Branches: The Plant has a ſingular fragrant Smell. *Boerh. Ind. alt. Part* 1. *p.* 152.

Boerhaave mentions eight Species of this Plant; which are,

1. Lavandula; latifolia; Indica; ſubcinerea; Spicâ breviore. *H. R. Par. T.* 198.

2. Lavandula; latifolia. *C. B. P.* 216. *Tourn. Inſt.* 198. *Boerh. Ind. alt.* 152. *Lavendula.* Offic. *Lavendula major ſive vulgaris.* Park. Theat. 72. Raii Hiſt. 1. 512. *Lavendula flore cæruleo & albo.* Ger. 467. Emac. 583. *Pſeudo-nardus, quæ vulgò Spica.* J. B. 281. *Spica Officinarum German.* GREATER LAVENDER.

This has broader Leaves than the Lavandula; anguſtifolia; not quite ſo white or hoary: The Flowers grow upon taller Stalks, and the Spikes are rather larger; but each particular Flower is leſs. It is planted in Gardens; but is ſeldom met with in *England.*

It is much of the Nature of the Lavandula; anguſtifolia; but is never preſcribed in the Shops. *Miller's Bot. Offic.*

The Herb and Flowers are in Uſe, and are of fine Parts, and friendly to the Head and Nerves: It is principally uſed in Catarrhs, Palſies, Convulſions, the Vertigo, Lethargy, and Trembling of the Limbs; for provoking Urine, and the Menſes, and expelling the Fœtus; and for the Gripes, proceeding from Flatulencies: Outwardly it is of Service in Lixivia, for the Head and Members, and in Maſticatories. *Dale* from *Schroder.*

3. Lavandula; anguſtifolia. *C. B. P.* 216. *Tourn. Inſt.* 198. *Boerh. Ind. alt.* 152. *Spica Lavandula vulgaris.* Offic. *Lavendula minor ſive Spica.* Ger. 468. Emac. 584. Raii Hiſt. 1. 513. Park. Theat. 73. *Pſeudo-nardus quæ Lavendula vulgò.* J. B. 3. 282. COMMON LAVENDER or SPIKE.

The common Lavender is a ſhrubby Plant, abiding many Years, having a great many woody Branches, thick ſet with long, hoary, narrow Leaves, two at a Joint, which are round-pointed, and broadeſt at the End; from among theſe ſpring ſeveral ſquare Stalks, having but few Leaves upon them, and thoſe narrower than the lower, bearing, at the Tops, long verticillated Spikes, of blue, galeated, and labiated Flowers, ſet in hoary Calyces: It grows wild in the Southern Parts of *France* and *Spain*; but is cultivated with us only in Gardens, and flowers in *July*. This is the Lavender which grows every-where in our Gardens, and is commonly uſed, the broad-leaved being to be found only in ſome Gardens of the Curious; though *Gerard*, *Parkinſon*, and even Mr. *Ray*, took the broad-leaved to be our common Lavender.

Lavender is cordial and cephalic, good for all Diſeaſes of the Head and Nerves; helps Convulſions, the Palſy, and Weakneſs of the Limbs; is good to expel Wind from the Stomach and Bowels, and prevents the Colic. It is outwardly uſed in warming and ſtrengthening Fomentations. *Miller's Bot. Offic.*

Spiritus Lavendulæ Compositus.

Compound Spirit of Lavender.

Take Flowers of Lavender, one Gallon; pour upon them four Gallons of *French* Brandy, and thereunto add freſh Flowers of Sage, Roſemary, and Betony, of each one Handful; of Borrage, Bugloſs, Lilies of the Valley and Cowſlips, of each two Handfuls; of the Leaves of Baum, Feverfew, and of the Orange-tree, freſh-gather'd, or the Flowers of Stœchas, Oranges, and Bay-berries, of each one Ounce: Digeſt theſe together, and draw off in Balneo Mariæ, two Gallons and an half: Then add of the outer Bark of Citrons, and of yellow Sanders, of each ſix Drams; of Cinnamon, Nutmegs, and Mace, of the leſſer Cardamom-ſeeds, and Cubebs, of each half an Ounce; of Aloes-wood, one Dram: Digeſt theſe for twenty-four Hours, and filtre the Spirit; then, if it be thought proper, add of Muſk, Ambergriſe, and Saffron, of each half a Scruple; red Roſes dried, and red

red Sanders, of each half an Ounce. Let the Species be tied up in a thin Bag, and ſuſpended in the Spirit.

The Sweets are here left at Diſcretion, becauſe in many Purpoſes they are diſagreeable to the main End of the Compoſition; proving to ſome particular Conſtitutions the oppoſite to a Cordial, or a Cephalic, which this Medicine is in the higheſt Degree. This has long been celebrated in all nervous Caſes, and is now greatly uſed in the Shops. In the Decays of Age, and convulſive or apoplectic Shocks, ſuch as bring on Palſies, and Loſs of Memory, this is of very good Service, and has been ſo much remarked for ſuch Efficacy, as almoſt univerſally to obtain the Name of Palſy-drops: It may be taken from twenty to one hundred Drops at a time: The beſt way is upon Sugar, and letting it gradually diſſolve in the Mouth; becauſe, by that means, it ſoaks more immediately into the Nerves, and has a much greater Effect on the Spirits, than when it is diluted by any Vehicle, and carried with it into the Stomach.

4. Lavandula; anguſtifolia; flore albo. *C. B. P.* 216.
5. Lavandula; folio diſſecto. *C. B. P.* 216.
6. Lavandula; folio diſſecto; flore albo.
7. Lavandula; folio longiori, tenuius & elegantius diſſecto. *T.* 198. *Commelin. Rar.* 27.
8. Lavandula; maritima; Canarienſis; ſpicâ multiplici, cœruleâ. *Pluken. Alm. Phyt. T.* 303. *Fig.* 5. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 152.

The *Hiſtoria Plantarum*, aſcribed to *Boerhaave*, gives the following Account of Lavender. The Plant takes its Name *a lavando*, from Waſhing or Bathing, becauſe it was uſed in Baths, on account of its Fragrancy; or becauſe all the Species were Ingredients in Lyes, in order to give a ſweet Smell to Linen; or enter'd the Compoſition of the beſt *Lavacra*, or Waſhes for the Face, in order to render it ſhining and fragrant: It is, alſo, called *Spica*, Spike; becauſe, among all the verticillated Plants, this alone bears a Spike: Many call it *Nard*; and, perhaps, this is the true Nard of the Antients, which I ſhall not diſpute, ſince we cannot arrive at any Certainty in the Matter.

It is the chief of all the cephalic Plants, being very comfortable and reviving, under Faintings and Languiſhments of the Brain and Heart; whence it is very proper in Lethargies, Apoplexy, Palſy, and Epilepſy. Preparations of it are a ſimple Water, Spirit, and a precious Oil: It is recommended in Diſorders incident to Virgins. The Conſerve of the Flowers is a moſt noble Remedy againſt cephalic Diſeaſes, raiſing the cold and languiſhing Spirits; but, in hot Diſorders, it is prejudicial. The Plant is an Emmenagogue, and a potent Promoter of the Lochia, after the Birth. To prepare the Conſerve, gather the Flowers in a fair Morning, and bruiſe them with an equal Quantity of dry Sugar, and reſerve the ſame in Gallipots. The Plant being an Evergreen, it is beſt to gather it when freſh; for then it has the greateſt Virtue. All the Lavenders have a moſt fragrant, ſweet, and reviving Smell, but a very bitter and penetrating Taſte. The Oil made of this Plant is called Oil of Spike; but the Shops generally make it with Turpentine, impregnated with the Flowers; and the Turpentine has indeed the Smell, but not all the Virtue, of the Flowers communicated to it; and, therefore, ſhould only be called *Oleum Terebinthinæ Spicatum*: But the true Oil of Spike ſhould be made only of the Flowers with Water. That Lavender is far more potent and penetrating, and of greater Efficacy, in cephalic, uterine, and nervous Diſorders, than the Flowers of Roſemary, appears from the Oil of it diſtilled, and from the Salivation excited by the Leaves and Flowers in chewing; whence it is much commended in ſoporific and catarrhous Diſorders. Lavender, given in a Phrenſy, proceeding from an Inflammation, infallibly deſtroys the Patient; but it is good for vertiginous old Perſons, and Diſtempers owing to Dulneſs, and want of Spirits.

That Sort of Epilepſy, which is cauſed by a diſorder'd Impetus of the nervous Fluid, is cured by the Water of the Flowers of Lavender; but this antiepilectic Virtue is utterly loſt in the Decoction or Extract.

If either a Palſy, Lethargy, or Vertigo, ariſe from a cold languid Cauſe, the eſſential Oil of Lavender is a moſt excellent Remedy.

Lavandula; foliis crenatis. A Name for the *Stœchas*; *folio ſerrato.*

LAVARETUS. A River Fiſh, ſomewhat like a Trout, found in the Rivers about *Lyons*, and the Lakes of *Savoy*. *Lemery* recommends it in Diſorders of the Breaſt, and for a Conſumption.

LAVARONUS. A Sea Fiſh, which is very like the Lavaretus, found in the *Mediterranean Sea*, and called, alſo, *Cabaſſonus Maſſilienſium*, and *Capaſſonus Genuenſium*. *Lemery* informs us, that it is good for the Stomach, reſtorative, and nouriſhing. Certain ſmall Stones are found in the Head, which, taken powder'd, are recommended as aperitive, and good for the Gravel.

LAVATERA takes its Name of the Phyſician *Helveticus Lavaterus*, the Friend of Monſieur *Tournefort*, upon which account *Tournefort* ſo intitled it.

The Characters are;

The Leaf, Flower, Style, and Cup of the Flower, have the Appearance of a Mallow: The Style becomes a Fruit, which is armed in Front with a hollow Shield; the Seeds, which are ſhaped like a Kidney, growing to the inner Part.

The Species are;

1. Lavatera; folio & facie Althææ. *Tourn.*
2. Lavatera; folio & facie Althææ; flore albo.
3. Lavatera; Africana; flore pulcherrimo. *Boerh. Ind. Miller's Dictionary, Vol.* 1.

LAVATIO. Bathing; or a Bath.

LAUCANIA, λαυκανία, or λαυκανίδ. The Throat, or Oeſophagus.

LAUDANUM. This ſeems to be a barbarous Word, introduced by ſome of the enthyſiaſtical Chymiſts, derived from *Laus*, Praiſe, and importing the Medicine, thus call'd, to be worthy of Praiſe. The Word is generally apply'd to Preparations of Opium, either in a liquid, or ſolid Form. The *Laudanums*, directed in the College Diſpenſatory, are, the *Laudanum*, the *Laudanum liquidum Sydenhami*; and the *Laudanum liquidum Tartarizatum.*

The *Laudanum*, commonly called the *London Laudanum*, is thus prepared.

Take of Theban Opium, extracted with equal Parts of Spring-water, one Ounce; of Saffron, extracted in the ſame manner, one Dram and an half; of Caſtor, one Dram: Let all theſe be diſſolved in a Tincture made with half an Ounce of the Species Diambræ, without the Perfumes, and Spirit of Wine; and put into it ten Drops of the Oil of Nutmegs: Laſtly, evaporate the Whole into a Maſs over a Bath-heat.

It may be given from one to four Grains, either in a Pill, or diſſolved in a Draught. Many prefer this to any liquid Form, becauſe the Doſe cannot ſo eaſily be determined by ſo many Drops, as by ſo much Weight; for Drops may contain more or leſs, according to the Shape of the Phial they are dropt from, and the Slowneſs of their Drain; beſides the Uncertainty of a Menſtruum ſuſtaining juſt ſuch a Quantity of Opium. This Medicine is very ready to grow too dry in the Shops, and, alſo, mouldy; both which may be prevented by a very ſmall Portion of Salt of Tartar in its Compoſition, and proportioning the Doſe ſo much larger accordingly. This is what is almoſt always ordered in the preſent Practice; and, therefore, the Shops are never without it. The *Laudanum liquidum Sydenhami* is deſcribed under the Article DYSENTERIA.

Laudanum liquidum Tartarizatum, tartarized liquid Laudanum, is thus prepared.

Take of Opium, two Ounces; of Saffron, one Ounce; of Cinamon, Cloves, Mace, Nutmegs, and Aloes-wood, each one Dram; Tincture of the Salt of Tartar, two Pints: Digeſt for ſome Days, then ſtrain the Liquor, and evapotate it to half its Quantity.

This is among *Shipton's Additamenta* to the laſt College Diſpenſatory, and is by many eſteemed for the Tartar, which is judged to open the Body of the Opium, ſo that it more freely gives its Tincture, and makes it not ſo adheſive and agglutinating. It, alſo, differs little from what *Wilſon* has in his Courſe of Chymiſtry.

A great Variety of Laudanums are delivered by different Pharmaceutic Writers; and *Quincy*, a good Judge of Compoſitions, gives us the following *Laudanum Balſamicum*, Balſamic Laudanum.

Take of Opium, in Extract, two Ounces; Liver of Sulphur, four Ounces; Extract of Saffron, and Liquorice, of each one Ounce; Flowers of Benjamin, half an Ounce; Balſam of *Peru*, two Drams: Mix them by a very gentle Warmth, ſo as juſt to ſtir in the Flowers of Benjamin, in a clean Pan-kin. If the Extracts are too ſoft, boil or ſimmer them up a little higher, before the Benjamin and Balſam of *Peru* are put in.

This, ſays *Quincy*, was communicated to me by a Gentleman of great Worth and Ingenuity in the Study of Medicine, tho' he never made it his Practice; upon whoſe Recommendation I firſt try'd it, and have been encouraged by its great Succeſs to uſe it many Years. I have known it give Liberty of Breath to aſthmatic Perſons, who could not be truſted with any other Kind of Opiates; and enabled ſome Perſons to paſs their Winters here in Town with Comfort, who, without it, would have been forced to fly into the Country for Breath. And, beſides the Service it does to the Lungs, further than the Good it infallibly procures as an Opiate, it is very efficacious in raiſing a Diaphoreſis; and by that means breathes out a great deal from the Muſcles, and remote Parts, which would occaſion rheumatic and arthritic Pains, with many

many other bad Symptoms. Its Doſe is from one to ten or twelve Grains.

LAUDANUM LIQUIDUM, CUM CAMPHORA: *Liquid* LAUDANUM, *with Camphire.*

Take of the beſt Opium, four Ounces; put it into a Matraſs, and pour upon it, of Water, eight Pounds: Place it in a digeſting Furnace, and keep it ſcalding hot for three Days; run it thro' a Flannel, and preſs out all the Liquor, which evaporate to two Pounds, and put by in a Bottle.

Put of choice *Engliſh* Saffron, into a Matraſs, one Ounce; and pour upon it tartarized Spirit of Wine, ſix Ounces: Digeſt them in a gentle Heat, till the Saffron looks pale. Into another Matraſs put of Cinnamon, one Ounce; of Cloves, two Drams; Pimento and Ginger, of each one Dram: Pour upon them, alſo, Spirit of Wine tartarized, ſix Ounces; and digeſt for two or three Days. Into a fourth Matraſs put half an Ounce of Camphire, moiſten'd with a little of the tartarized Spirit of Wine; and let them digeſt, till the Camphire is diſſolved: Preſs the Tinctures of Saffron and Spices thro' a Flannel, and mix them with the Diſſolution of Opium; and pour all into the Matraſs, with the diſſolved Camphire: Let them ſtand two or three Days in a gentle Heat, and decant for Uſe.

This is an excellent Diaphoretic, becauſe the Camphire exerts itſelf that way. Its Doſe is from ten to forty Drops.

A pectoral, ſudorific, liquid Laudanum is made in the following manner.

Take of Soap of Tartar, four Ounces; Extract of Opium, two Ounces; Saffron, half an Ounce; Ginger, two Drams: Beat them in a Mortar; and add Balſam of Sulphur, aniſated, two Ounces: Grind them till they are well united; put them into a Matraſs, and pour upon them, of Sal Volatile Oleoſum, half a Pound; and of rectified Spirit of Wine, two Pounds: Let them digeſt forty-eight Hours in a gentle Heat, often ſhaking the Matraſs; then add of ſtrong diſtil'd Vinegar, four Ounces; ſhake the Veſſel, and they will ferment a little: When that is over, cloſe the Matraſs again; and let it ſtand three Days and Nights, in a gentle Sand-heat, ſhaking it as before: When ſettled, decant the Clear, filtre the Sediment, and put them together into a Bottle.

This is the neareſt of any liquid Form to the *Laudanum Balſamicum*; and, therefore, may be preſcrib'd in all the like Intentions, where the Patient cannot take a Pill or Bolus; but, for want of Acquaintance with it, this is not in Preſcription, or made in the Shops. Its Doſe is from ten to fifty or ſixty Drops.

Laudanum liquidum, cum Sale Volatili Oleoſo, liquid Laudanum, with Sal Volatile, may be thus prepared.

Take of Opium, in Extract, four Ounces; put into a Marble Mortar; grind it with Tincture of Tartar, half a Pound, which muſt be put to it by little at a time; grind them, till the Opium is well mixed with the Tincture of Tartar; then put them into a Matraſs, and add to them of Sal Volatile Oleoſum, one Pound; upon which drop, of ſweet Spirit of Nitre, half a Dram; ſhake them well together, which will raiſe a little Fermentation: When that is over, make a circulating Veſſel of the Matraſs; lute the Juncture well with the Bladder, and ſet in a gentle Heat of Digeſtion ſix Days, ſhaking it about every Day; then let it ſettle, and decant into a clean Veſſel, which keep well ſtopt for Uſe.

This is more carminative than any of the other Laudanums, and is moſt agreeable, where there is any Doubt of the Efficacy or Succeſs of an Opiate, being admirably guarded againſt any Inconvenience. It may be taken from ten to thirty or forty Drops.

LAUDANUM LIQUIDUM, CUM SPIRITU NITRI DULCI: *Liquid* LAUDANUM, *with dulcified Spirit of Nitre.*

Take of the beſt Opium, two Ounces; which ſlice, and put into a Matraſs with Saffron, one Ounce; add to them ſweet Spirit of Nitre, one Pound; invert into the Mouth of the Matraſs another Glaſs; lute it, and ſet it in Digeſtion five Days, ſhaking it about every Day; then let it cool, and drop into it, by degrees, of Sal Volatile Oleoſum, an Ounce and an half: When the Fermentation is over, ſtop and lute it up again, and let it ſtand three Days longer in Digeſtion; then let it cool; ſet it inclining to ſettle; and then gently decant it into a Phial for Uſe.

If to this be added, of Juniper-berries, two Ounces, it will be yet more carminative. This is preferred by ſome as a moſt certain and excellent Anodyne, and great Expeller of Wind; and it ſeldom or never offends the Stomach or Bowels, as many other Preparations of Opium do. It may be given to thirty Drops in a Doſe.

LAUDANUM LIQUIDUM, CUM SUCCO CYDONIORUM: *Liquid* LAUDANUM, *with Juice of Quinces.*

Take of Opium, two Ounces; *Engliſh* Saffron, one Ounce; and of the Juice of Quinces, a Pound and an half: Let the Opium be thin ſliced, and with the Saffron be put to the Juice of Quinces in a Glaſs Body; ſome add Yeaſt of Ale to ferment it: Set them in a gentle Heat of Sand, to digeſt till the Fermentation is over, and the Saffron ſubſides: Then expreſs the Juice, and let it ſtand to ſettle; when it is ſettled, pour it off by gentle Inclination: Put the Liquor into a Matraſs; and add to it two Ounces of Cinnamon; of Cloves, one Ounce and an half; and of *Jamaica* Pepper, one Ounce: Let them be bruiſed, and put into the Liquor to ſtand in Digeſtion fourteen Days: Then again expreſs the Juice, gently evaporate it to a due Conſiſtence, and put it up for Uſe. Its Doſe is from ten to forty or fifty Drops.

This very much reſembles the Laudanum of *Helmont*, of which Mr. *Boyle* informs us, in the *Philoſophical Tranſactions*, there are two Sorts; the one uſed by the elder *Helmont*, the other by his Son. The former was a great Secret, communicated to me (ſays Mr. *Boyle*) by an expert Chymiſt; which, becauſe I have not Leave to publiſh, meeting with *F. M. Baron Van Helmont*, Son to the famous *Johannes Baptiſta*, I obtained from him ſome Directions about the Laudanum he uſes; which, tho' he confeſſed, and I ſoon perceived to be differing from his Father's, yet he ſeemed to think it not inferior, and more parable.

Take of Opium, a quarter of a Pound; the Juice of Quinces, four Pounds at leaſt. The Opium being cut into very thin Slices, and then, as it were, minced to reduce it into ſmaller Parts, is to be put into, and well mixed with the Liquor, firſt made lukewarm, and fermented with a moderate Heat for eight or ten Days, rather more than leſs: Then filtre it, and, having infuſed in it of Cinamon, Nutmeg, and Cloves, of each an Ounce, or an Ounce and an half, let them ſtand three or four Days more; if it be a full Week, it may be ſo much the better: Then filtre the Liquor once more, having let it boil a Walm or two, after the Spices have been put in. This being done, evaporate away the ſuperfluous Water, to the Conſiſtence of an Extract, or to what other Conſiſtence you pleaſe. Laſtly, incorporate very well with it, two Ounces of the beſt Saffron reduced to fine Powder, or as much Extract as can be obtained from that Quantity of Saffron.

According to the Conſiſtence you deſire to have your Medicine of, you may order it ſo, as either to make it up into a Maſs of Pills, (in which Form I have cauſed it to be given) or keep it in a liquid Form; but, in this latter Caſe, the Evaporation muſt have been made more ſparingly, that after the putting in of the Saffron, or its Extract, it may not grow too thick. In this Form the Doſe may be from five or ſix Drops, to ten or fewer, according to Circumſtances; and of the Pills, a ſomewhat leſs Quantity is required.

LAUDANUM MERCURIALE PARACELSI.

Take any Quantity of Virgin Mercury, or of Mercury well depurated by Trituration with Vinegar and Salt, or with a Lixivium. Pour upon this a ſufficient Quantity of rectify'd Spirit of Nitre, to diſſolve it; then evaporate the Spirit of Nitre, as in making the red Sublimate of Mercury, with Aqua-fortis. Thus you will obtain a Precipitate of the Colour of red Poppy-flowers: Pour upon this Precipitate a ſufficient Quantity of Alcohol, to riſe three Fingers-breadth above it; and digeſt it for forty Days, or a Philoſophical Month, and then the Spirit of Wine will become mucilaginous: Upon this Appearance, gently decant the Spirit of Wine, and draw off the moſt ſpirituous Part from a Cucurbit fitted with an Head; an oleous Maſs will remain in the Bottom of the Veſſel, which diſtil in a Retort; thus a Part of the Mercury will be revived, and a Portion of it will be paſs'd over in the Form of Oil.

Take of this Oil, ten Parts; and of Crocus Solis, (Saffron of Gold) one Part: Digeſt them till the Oil becomes as red as Blood, which then decant, and place it in the Heat of a Philoſophical Furnace, incloſed in a Glaſs Veſſel, hermetically ſealed, till they unite into a fix'd Tincture.

The Doſe is from one Grain, to three at moſt. *Collect. Chym. Leydenſ. C.* 276.

LAUDINÆ, in *Poterius*, are Pills, in which Opium is a principal Ingredient.

LAVENDULA. See LAVANDULA.

LAVER. A Name for the *Becabunga*, Brook-lime. *Blancard.*

LAVIGNON. A ſmall Sea Shell-fiſh, about the Size of the Muſſel. The Fiſh is eſteemed aperitive. The Shell is uſed in the ſame Intentions as Crabs-eyes.

LAVIPEDIUM. A Bath for the Feet.

LAURAX. The ſame as LABRAX.

LAUREOLA. A Name for ſeveral Species of THYMELÆA.

LAURIFOLIA *Javanenſis*. See MAGOSTANS.

LAURO-

LAURO-CERASUS.

The Characters are;

It hath broad, thick, ſhining, evergreen Leaves, ſomewhat like thoſe of the Bay-tree: The Cup of the Flower is hollow and Funnel-ſhap'd, ſpreading open at the Top, and is divided into five Parts: The Flower conſiſts of five Leaves, which expand in form of a Roſe, having many Stamina in the Centre. The Fruit (which are like thoſe of the Cherry-tree) are produced in Bunches, and the Stone is longer and narrower than that of the Cherry.

Boerhaave mentions but one Sort of this Plant; which is the

Lauro-cerasus. *Offic. Ger. Emac.* 1603. *Raii Hiſt.* 2. 1549. *J. B.* 1. 420. *Tourn. Inſt.* 628. *Boerh. Ind. A.* 2. 228. *Ceraſus folio Laurino, C. B. P.* 410. *Ceraſus Trapezuntina, ſive Lauro-ceraſus.* Park. Theat. 1518. *Padus exotica folio amplo, craſſo, ſemper-virenti.* Rupp. Flor. Jen. 108. LAUREL, or CHERRY-BAY.

This is a Plant too well known to require a Deſcription. The Berries are recommended as good Antiſcorbutics.

Dr. *Madden* communicated to the Royal Society the following curious and uſeful Particulars, relative to the Laurel.

A very extraordinary Accident, which happened at *Dublin* ſome Months ago, has diſcovered to us a moſt dangerous Poiſon, which was never before known to be ſo, tho' it has been in frequent Uſe among us: I mean the Simple-water, diſtil'd from the Leaves of the *Lauro-ceraſus*. It is at firſt of a milky white Colour, but the Oil, which comes over the Helm with it, being in a good meaſure ſeparated from the Phlegm, by paſſing it thro' a Flannel-bag, it becomes as clear as common Water.

It has the Smell of the bitter Almond, or Peach-kernel; and has been for many Years in frequent Uſe among our Houſewives and Cooks, to give that agreeable Flavour to their Creams and Puddings. It has alſo been much in Uſe among our Drinkers of Drams, and the Proportion they generally uſe it in, has been one Part of Laurel-water to four of Brandy.

Nor has this Practice, however frequent, ever been attended with any apparent ill Conſequences, till ſome time in *September* 1728. when it happened, that one *Martha Boyſe*, a Servant, who lived with a Perſon that ſold great Quantities of this Water, got a Bottle of it from her Miſtreſs, who gave it to her Mother *Anne Boyſe*, as a very rich Cordial.

Anne Boyſe made a Preſent of it to *Frances Eaton*, her Siſter, who, being a Shop-keeper in the Town, gave about two Ounces of it to a Woman called *Mary Whaley*, who had bought ſome Goods of her.

Mary Whaley drank about two Thirds of what was filled out, and went away. *Frances Eaton* drank the reſt. *Mary Whaley* went to another Shop to buy ſomewhat elſe, and, in about a quarter of an Hour after ſhe had drank the Water, (as I am inform'd) ſhe complained of a violent Diſorder in her Stomach. She was carry'd home, and, from that time, loſt her Speech, and dy'd in about an Hour, without Vomiting, or Purging, or any Convulſion.

The Shop-keeper, *Frances Eaton*, writ Word to her Siſter *Anne Boyſe*, of what had happened, who came to her upon the Meſſage; and affirmed, that it was not poſſible the Cordial (as ſhe called it) could have occaſioned the Death of the Woman; and, to convince her of it, ſhe filled out about three Spoonfuls, and drank it. She continued talking with *Frances Eaton* about two Minutes longer, and was ſo earneſt to perſuade her of the Liquor's being inoffenſive, that ſhe filled out two Spoonfuls more, and drank it off. She was hardly well ſeated in her Chair, when ſhe died without the leaſt Groan or Convulſion.

Frances Eaton, who, as was before obſerved, had drank ſomewhat above a Spoonful, found no Diſorder in her Stomach, or elſewhere; but, to prevent any ill Conſequence, took a Vomit immediately, and has been well ever ſince.

Mary Whaley was bury'd without being examined by any one, that I can find, except the Coroner. I went to ſee *Anne Boyſe*, about twenty-four Hours after her Death, but could not prevail to have her opened. She was about ſixty Years old; her Countenance and Skin appeared well-coloured, and her Features were hardly altered, ſo that ſhe look'd like one aſleep. Her Belly was not ſwelled, nor had ſhe any other external Mark of Poiſon.

This Accident brought into Diſcourſe another of the like Nature, which happened four Years before, in the Town of *Kilkenny*. The Son of Mr. *Evans*, an Alderman of the Town, miſtook a Bottle of this Laurel-water for a Bottle of Ptiſan. What Quantity he drank, is uncertain; but he dy'd in a few Minutes, complaining of a violent Diſorder in his Stomach. This Affair was not much regarded at that time, becauſe he laboured under a Diſtemper, to which, or to an improper Uſe of Remedies, his Death was attributed by thoſe about him.

To ſatisfy myſelf farther, as to the Effects of this Poiſon, I, with a few Friends, made the following Experiments.

I. *Octob.* 3. 1728. We gave a large Setting-dog three Ounces of Laurel-water by the Mouth: In three Minutes he began to be ſtrongly convulſed. His Convulſions continued about five Minutes; after which I untied him. He then fell into a moſt violent Difficulty of Breathing, which laſted about eight Minutes, and abated gradually; upon which, he endeavoured to raiſe himſelf, but could not. I ty'd him down again, and gave him an Ounce and an half more; upon which he ſunk at once, and without any Return of his Convulſions, or Difficulty of Breathing, expired in two Minutes.

Upon opening the Stomach, I found in it the whole Quantity of Water which he had taken; its Surface was covered with Froth, but it was not otherwiſe altered in its Colour, Conſiſtence, or Smell. The Inſide of the Stomach was not at all inflamed, nor was there any viſible Alteration in the Tunica Villoſa.

The Veins of the Stomach, all the Meſeraic Veins, and, alſo, the Vena Cava, were much diſtended with Blood; the Arteries, on the contrary, were remarkably empty. The Liver and Gall-bladder were no way altered. The Kidneys were unuſually full of Blood, and appeared of a bluiſh Colour, almoſt as deep as that of the violet Plum. Upon making an Inciſion into one of the Kidneys, the Blood flow'd in much greater Plenty, and was more fluid than uſual. In the Heart there appeared nothing preternatural. The Brain was no way altered.

II. *Octob.* 24. We gave an Ounce and an half of the ſame Water to a Bitch of a ſmaller Size. She was immediately let looſe, and in two Minutes loſt the Uſe of her Limbs. She attempted ſeveral times to raiſe herſelf, and walk; but ſhe ſtaggered and reeled about, and then fell down.

She repeated this, without ceaſing, about five or ſix Minutes. At laſt ſhe was violently convulſed, eſpecially in the Muſcles that extend the Head and Spine. About the Space of a Minute ſhe had that ſort of Convulſion called the *Opiſthotonos*, the Back of her Head being drawn almoſt to her Tail.

After this ſhe vomited plentifully, and her Convulſions ceaſed. She then lay ſtill for ſeven or eight Minutes, labouring for Breath, (but not ſo violently as in the former Caſe) and foaming at the Mouth. We gave her an Ounce more of the Water; upon which her Difficulty of Breathing increaſed, and ſhe dy'd in two Minutes.

Upon opening the Abdomen, Thorax, and Head, we found every thing in the ſame State, as in the former Inſtance.

III. *Octob.* 25. We gave two Ounces of the Water to a Dog of the ſame Size with the former, which produced the like Appearances, as in the foregoing Caſe. This Dog was dying half an Hour; for the Doſe was not repeated, becauſe he did not vomit up what he had taken. Upon opening him, we found every thing in the ſame State, as in the former Inſtance.

IV. *Octob.* 26. We gave two Drams and an half of the Water to a Dog of a middle Size, and immediately unty'd him. He then ran about the Room very briſkly for about a Minute, and ſeemed to be no way affected with it; yet he ſoon loſt the Uſe of his Limbs. He often attempted to raiſe himſelf and walk, but ſtill fell down again, before he had mov'd two Yards from the Place.

After this, he vomited plentifully, conſidering that he had faſted twenty-four Hours; upon which, he was ſeized with a Convulſion more violent than any of the former Dogs, eſpecially in the Muſcles which extend the Head and Spine. Theſe Convulſions continued about eight or ten Minutes; upon their ceaſing, he lay ſtill, breathing deeply, tho' regularly, and ſeemed to be aſleep. In about ten Minutes he raiſed himſelf, took ſome Food, and walked about tolerably well. We left him, and, returning after three Hours, found him perfectly recovered.

V. *Octob.* 28. We injected an Ounce of the Water into the Inteſtinum Rectum of a ſtrong Spaniel-dog, and let him looſe. In the Space of two Minutes he began to loſe the Uſe of his Limbs, and to ſtagger, as the others had done. He was convulſed more violently than any of the reſt, and principally in the Muſcles of the Neck and Spine. The Muſcles of his Eyes were ſtrongly convulſed, which Appearance was not obſerved in the other Dogs. He foamed at the Mouth, yelled frequently, and breathed with more Difficulty than any of the reſt. His Convulſions continued twenty Minutes: Upon their ceaſing, he lay quiet, as tho' he ſlept, only his Eyes were open. His Limbs were now grown perfectly paralytic.

We raiſed him ſeveral times, and ſet him on his Legs, but he did not attempt to uſe them. He continued in this way about fifteen Minutes longer, and then was ſeized with another violent Convulſion, which, in five Minutes, put an End to his Life.

Upon opening the Abdomen, we found the Veins of the Stomach and Guts very much diſtended with Blood, as in all the former Inſtances. In the Heart, Lungs, and Brain, there was no viſible Alteration.

VI. *Octob.* 30. We injected an Ounce and an half of the Water, diluted with three Ounces of common Water, into the Anus of a ſmall Bitch. Before we could untie her, ſhe was ſeiz'd with Convulſions, and yelled much. She fell as ſoon as ſhe was looſed, and never after endeavoured to riſe. She had Convulſions, and great Difficulty of Breathing, about two Minutes. She then lay ſtill, with her Limbs ſtiff and extended, about three Minutes; during which time her lower Jaw was convulſed, and pulled alternately to and from the upper Jaw, with a very quick Motion. After this her Limbs became paralytic, and ſhe gaſped for Breath about two Minutes longer. She was quite dead, in ſeven or eight Minutes from the Injection of the Clyſter. In the Abdomen, Thorax, and Brain, every thing appeared as uſual.

VII. *Nov.* 2. We injected half an Ounce of the Water, diluted with three Ounces of common Water warmed, into the Anus of a ſmall Bitch. In the Space of four Minutes ſhe began to breathe with Difficulty. We let her looſe, but ſhe was not able to ſtand, or walk without ſtumbling. The Muſcles which extend the Head, were convulſed; and her fore Legs were affected for three or four Minutes with a Tetanus, but had no convulſive Motion. She vomited and purged plentifully. She did not yell, nor ſeem to ſuffer much Pain, nor did ſhe loſe her Senſes all the time. In half an Hour ſhe recovered.

VIII. The next Day we injected a Dram of the Water into the external Jugular of the ſame Bitch. She was ſeized with Convulſions as violent as the former, before we could untie her. They laſted about five Minutes, after which ſhe recovered gradually, and continued well.

IX. *Nov.* 20. We injected four Ounces of the Water, by the Anus, without any Dilution, into a ſtrong Dog of a middle Size. He was ſeized with Convulſions and Difficulty of Breathing, in leſs than two Minutes after the Injection. He fell to the Ground as ſoon as his Convulſions began, and never once attempted to riſe; nor were his Convulſions in any ſort ſo violent, neither did they continue ſo long, as in the former Inſtances. He bled at the Noſe about four Spoonfuls. The Blood was of a very bright florid Colour. His Convulſions laſted about four Minutes; after which, he became entirely paralytic, and died in three Minutes more. We found the Stomach, Inteſtines, Liver, *&c.* in the ſame State as thoſe above-mentioned. Upon cutting about an Inch from the lower Part of one of the Lobes of the Lungs, the Blood flowed from it in great Plenty, and appeared more florid and fluid than uſual.

X. *Dec.* 14. We gave five Ounces of Laurel-water by Clyſter to a Dog, ſomewhat of the Size and Shape of the *Italian* Grey-hound. He ſeemed at firſt to be no way affected by it, but, in about five Minutes, he began to droop, and loſe the Uſe of his Limbs. He did not once yell or ſtruggle, as the others had done, but ſunk gradually, till he became at laſt entirely paralytic. He had not any Convulſion, except a kind of *Spaſmus Cynicus*, a few Minutes before he died, which happened in half an Hour after the Injection of the Clyſter. Upon opening the Abdomen, we found the Veins much diſtended with Blood; as were, alſo, the Veins and Sinuſes of the Brain.

XI. *Dec.* 19. We gave three Ounces of the Water, in the ſame manner, to a Cur of the Lap-dog Size. He died in ſeven Minutes, without any Convulſion, except a Tetanus in the Muſcles which extend the Head.

The *Lauro-teraſus* being an Ever-green, and abounding with a warm eſſential Oil, we imagined that other Ever-greens might partake of the ſame poiſonous Quality. Accordingly we made Trial of a Water diſtilled in an Alembic from the Leaves of the Yew-tree, ſo much talked of by the Antients; and whoſe very Shade they ſuppoſed to be fatal to thoſe who ſat or ſlept under it.

XII. We gave three Ounces of this Water by Clyſter to a very ſmall Cur-dog; but he was not in the leaſt affected with it.

XIII. We, alſo, gave, by the Mouth, two Ounces of a Water diſtilled from the Leaves of the Bay-tree to a young Spaniel, without any Effect.

XIV. We afterwards made an Experiment with the diſtilled Water of Box-leaves, which had a very ſtrong narcotic Smell. We injected five Ounces of this Water, by the Anus, into a ſmall Cur-dog; but he was no way affected with it, though we kept him twelve Hours after the Operation.

XV. Being deſirous to know whether the Virulency of Laurel-water proceeded from the Fire in Diſtillation, we poured warm Water upon ſome Laurel-leaves bruiſed, and made a ſtrong Infuſion of them. We poured an Ounce of it down a Dog's Throat, half of which was ſuppoſed to enter his Stomach; and, five Minutes after, another Ounce was given in like manner. The Dog ſeemed to be ſomewhat ſick at his Stomach, but was ſoon as lively as ever. A few Minutes after, another Ounce was given to him by the Mouth, of which we ſuppoſe a fourth Part to have been loſt. He ſoon after ſtared and trembled very much. In five Minutes another Ounce was exhibited, upon which he trembled as before; but, in a little time, he appeared eaſy and lively.

Imagining that theſe ſmall Quantities loſt their Power, during the Intervals of giving them, in ten Minutes after his taking the former Doſe, we poured down his Throat two Ounces and an half at once. He immediately tumbled on his Back convulſed, and tumbled over three or four times, but quickly returned to his Feet. He ſtaggered, his Eyes ſtared, and he ſat down like a Dog that is tired. At length he ſhut his Eyes, his Neck became extended, and we apprehended he was falling into Convulſions; but, inſtead thereof, he vomited a vaſt Quantity of indigeſted Chyle, in which appeared a great Portion of the Infuſion; after which he ſeemed to be perfectly recovered.

In about twenty-five Minutes after this, we gave the ſame Dog, by the Mouth, two Ounces of the Juice expreſſed from Laurel-leaves; and, in about ten Minutes more, another Ounce was given him in the ſame manner. In a few Minutes he began to loſe the Uſe of his hinder Legs, but he quickly recovered them. Upon his taking another Ounce ſoon after the former, he fell into a great Difficulty of Breathing, and yelled much. After this he was ſeized with very ſtrong Convulſions, which affected his lower Jaw and hinder Legs moſt remarkably.

In about five Minutes theſe Convulſions were ſucceeded by an entire Reſolution of all the Limbs. He breathed with great Difficulty, and very ſlowly. No Appearance of Expiration. Sometimes we obſerved two Attempts at Inſpiration, without Intermiſſion, or cloſing of the Mouth. At other times there was near a Minute between two Inſpirations.

After this he was ſeized with a Trembling in his Limbs, and, in about three quarters of an Hour from his taking the laſt Ounce, he died without any ſtruggling, with his Tail extended.

Dr. *Rutty* informs us, that Bole, Vinegar, and Milk, were given to a Dog which had ſwallowed ſome of the Laurel-water. The Bole and Vinegar were not obſerved to do much Good, but the Dog which drank the Milk, recover'd without any bad Symptoms; but, at that Diſtance of Time, the Doctor could not recollect the Proportions which were given: He thinks, a Pint of Milk.

There are other Hiſtories of Experiments made with Laurel-water upon Dogs, which are much to the ſame Effect. *Philoſ. Tranſact. Abr. Vol.* 7. *p.* 365.

LAURO-SERRATÆ, *odoratæ*, and the *Laurus*, *non-odorata*, are Names given to the *Euonymo adfinis*; *Æthiopica*; *ſempervirens*; *fructu globoſo*, *ſcabro*; *foliis ſalicis rigidis*, *ſerratis*.

LAURO-SIMILIS. See LAURUS.

LAURUS.

The Characters are;

It hath a Flower conſiſting of one Leaf, which is ſhaped like a Funnel, and divided into four or five Segments; the Male Flowers, which are produced on ſeparate Trees from the Female, have eight Stamina, which are branched into Arms; the Ovary of the Female Flowers becomes a Berry, incloſing a ſingle Seed within a horny Shell, which is cover'd with a Skin.

Boerhaave mentions twelve Species of this Plant; which are,

1. Laurus; Indica. *Hort. Farneſ. Ald.* 61. *Cinnamomum*, *ſpurium*. Vulgô.

2. Laurus; latifolia; παλαλύκεγ, Dioſcoridis. *C. B. P.* 460. *Tourn. Inſt.* 597. *Boerh. Ind. alt.* 2. 215. *Raii Hiſt.* 2. 1690. *Laurus latifolia*. Offic. *Laurus major ſive latifolia*. Park. Theat. 1488. THE BROADER-LEAVED BAY-TREE.

It agrees in Virtues with the common Bay-tree. *Dale.*

3. Laurus; latifolia; Fœmina.

4. Laurus; vulgaris. *C. B. P.* 460. *Tourn. Inſt.* 597. *Boerh. Ind. alt.* 2. 216. *Laurus*. Offic. Ger. Emac. 1407. Park. Parad. 598. J. B. 1. 405. Raii Hiſt. 2. 1688. *Laurus minor*. Park. Theat. 1488. *Laura mas & fœmina*. Ger. 1222. THE COMMON BAY-TREE.

This grows to be a Tree of a moderate Bigneſs in its native Climate; but here, with us, it is lower, and runs out into many Branches; the leſſer Twigs being uſually of a reddiſh-brown Colour, as are, alſo, the Footſtalks of the Leaves, which are oblong, broadeſt in the Middle, and ſharp-pointed at the End; firm, hard, and ſtiff, of a darker Green above, and paler underneath, of a pleaſant ſtrong Scent: The Flowers grow in Cluſters upon the younger Branches, among the Leaves, each conſiſting of a whitiſh monopetalous Flower, divided into five Segments; theſe are followed by oval Berries, included in a black thin Skin, and parted in two in the Middle. It is planted in our Gardens, but grows wild in *Italy*, *Spain*, and the Southern Parts of *France*, and flowers in *May*; the Berries are ripe in *October*: The Leaves and Berries are uſed.

They are both heating and drying, emollient and reſolving; very good for Wind in the Stomach and Bowels; help the Colic, comfort the Head and Nerves, and are good againſt infectious Diſtempers: They provoke Urine, and the Menſes, and expel the Secundines. Outwardly they are uſed in warming and ſtrengthening Fomentations and Ointments.

Officinal Preparations are the Electuary of Bay-berries, the Plaiſter of Bay-berries, and the Oil of Bays. *Miller's Bot. Off.*

The Laurus has an heating Quality in its Leaves, Bark, and Berries. *Dioſcorides* makes it an Emollient, and *Galen* a Drier. Hence a Decoction of them, eſpecially of the Leaves, is very proper for an Inſeſſion, in Diſeaſes of the Uterus and Bladder: The green Leaves, bruiſed and applied, heal the Stings of Waſps, Bees, and Hornets, and reſiſt the Poiſon of Serpents; particularly, the Seps, Dipſas, and Viper: Boil'd in Oil, they are of Service, as *Pliny* ſays, for promoting the Catamenia; the tender Leaves, bruiſed with Polenta, are effectual for Inflammations of the Eyes; bruiſed with Rue, they mitigate Inflammations of the Teſtes; and with Oil of Roſes, or Oil of Iris, they eaſe the Headach. But *J. B.* thinks, we ought to be cautious of uſing the Leaves in Inflammations; and is, therefore, of Opinion, that, inſtead of *Inflammationes* [Inflammations], we ought to read *Inflationes* [Inflations]. The Leaves bruiſed with Honey are good in Aſthmas; but the Bark of the Root is to be avoided by pregnant Women. The Root taken to the Weight of half a Dram, in ſweet-ſcented Wine, breaks the Stone, and is good for the Liver. The Leaves, taken in a Potion, oppreſs the Stomach,

and

and excite Vomiting. In the *Greek* Text of *Dioſcorides* we read, περαίνει τὸν στόμαχον, "mitigates the Stomach;" for which *Cornarius* reads βαρύνει, "oppreſſes." That there is an Error in one of the two Members of the Clauſe, is certain, from their Repugnance, [περαίνει τὸν στόμαχον, καὶ ἐμέτους κινεῖ]; but the Miſtake, in *J. Bauhine*'s Opinion, lies not in the firſt, but in the latter of them: For it is certain, he ſays, as well from Experience, as the Authority of *Galen*, that the Laurus is all aromatic and bitteriſh, with ſomewhat of Aſtringency, and friendly to the Liver; which Qualities are ſo far from ſubverting the Stomach, that they rather corroborate that Part, and correct a Nauſea; for which Reaſon it is grown into a Cuſtom, to boil Bay-leaves with ſome Sorts of Meats, eſpecially Fiſh; and ſo far are theſe Leaves from exciting a Nauſea, that they render the Food the more ſavoury and grateful to the Stomach: Therefore he judges the Word κινεῖ, "excites," to have crept into the Text, and ought to be expunged; and that *Pliny* made uſe of a corrupt Copy. But *Salmaſius* ſays, that *Pliny* is at leaſt cotemporary, if not more antient than *Dioſcorides*; and, therefore, both of them tranſcribed from ſome more antient Author thoſe things which are the ſame in both; and, conſequently, ſince both *Pliny* and *Dioſcorides* agree in aſcribing this emetic Quality to the Laurus, it is not to be doubted, but that the laſt Member of the Clauſe ſtands uncorrupted, and that the firſt is wrong, and ought to be corrected by the Help of the other; as it was rightly done by *Cornarius*. Whether the Leaves have really ſuch an emetic Quality, or whether the contrary, appears from Experience. *Gaſpar Hoffman*, having propoſed the Queſtion, Whether Bay-leaves are ſalutary or noxious to the Stomach? anſwers, that he was induced, by a Multi ude of Authorities, to believe the latter. Therefore, ſays *Ray*, I conclude, with *Marcellus Virgilius* and *Cornarius*, that for περαίνει, in *Dioſcorides*, we ought to read βαρύνει. *Dioſcorides* and *Pliny* proceed as follows.

The Berries are more heating than the Leaves, and provoke the Menſes, if bruiſed, and outwardly applied, or taken inwardly: Bruiſed, and made into an Eclegma, with Honey or Balſam, they are good for a Conſumption, the Orthopnœa, and Defluxions on the Breaſt: Taken in Wine, with their Rind peeled off, they are effectual againſt an inveterate Cough; for they concoct and expectorate Phlegm: Thus *Pliny*. At preſent we make no Uſe of the Berries, in Diſeaſes of the Breaſt and Lungs; but exhibit both Berries and Leaves, in Diſorders of the Stomach, Liver, Spleen, and Bladder; for they heat a cold Stomach, promote a Concoction of cold Humours, excite a languiſhing Appetite, and remove a Loathing, open Obſtructions of the Liver and Spleen, provoke Urine and the Menſes, and expel the Secundines. To facilitate the Birth, ſwallow ſeven Bay-berries before Sleep. *Cheſneau*. The Berries taken in Wine thus, are good againſt the Poiſon of Scorpions, and abſterge the Vitiligo. To this *Pliny* adds, that, made into a Litus with Oil, they cure Epinyctides, the Lentigo, running Ulcers, Ulcers of the Mouth, and ſcald Heads; and that the Juice of the Berries cures Itchings of the Skin, and the Phthiriaſis. The expreſſed Juice of the Berries, with old Wine, and Oil of Roſes, inſtilled into the Ears, eaſes their Pains, and helps Deafneſs. No venomous Creature will approach thoſe who are anointed with it: The Berries, taken in Wine, are a Remedy againſt inward as well as outward Poiſons, and reſiſt the Venom of Serpents, Scorpions, and Poiſons: Made into an Ointment with Oil and Vinegar, they are uſed about the Regions of the Liver and Spleen; and, mixed with Honey, they are of Service in Gangrenes. Some adviſe taking an Acetabulum of the Root, green rather than dry, in Water, as a great Accelerator of the Birth. As a Remedy for the Uvula:

Take a Quarter of a Pound of the Berries, and boil them in three Pints of Water to one Third: Which uſe warm, as a Gargariſm.

The Leaves of the Laurus rubbed, and now-and-then ſmelled to, are a Preſervative againſt the Contagion of the Peſtilence; for which Reaſon the Emperor *Commodus*, as *Herodian* writes, in the Time of the Plague, by the Advice of his Phyſicians, wore the Laurus, and retired to Places abounding with the ſame Plant: For Evergreens, according to the Opinion of *Gremb. Cardilucius*, and other Followers of *Helmont*, are Alexiterials againſt the Peſtilence, reſiſt Corruption, and defend themſelves againſt both Heat and Cold: Whence God has plainly ſignified to us, that theſe perennial Plants are always ready at hand, for the daily Uſe of Mankind; for they contain within them a Balſam, preſervative againſt all Corruption.

For Black Cattle affected with the *Coriago*, that is, when they are hidebound, we are adviſed, by *Columella*, to boil Bay, and foment their Backs with the warm Decoction, and to take up the Skin every-where, and to ſtretch it, which is beſt done in the open Air, and under the fervent Rays of the Sun.

Oil of Bay is often mention'd by the Antients and Moderns; one Sort is expreſſed from the freſh Berries bruiſed, another is prepared of the Berries bruiſed, or entire, and put into boiling-hot Water, and ſuffered to bubble up; the Oil which ſwims on the Water, is afterwards collected into Veſſels. Another Oil is extracted by Diſtillation, in the following manner: Take of Bay-berries, two Pounds; bruiſe them, and pour upon them three or four Pints of warm Water; after they have ſtood for ſome time, diſtil them in an Alembic, or by a Worm, by which means your will obtain an Oil and Water, which are to be ſeparated by the Tritorium: There is alſo an Oil of Bay which is prepared of the Leaves or Berries boiled in *Oleum Omphacinum*, or Oil of unripe Olives.

Oil of Bay is heating, mollifying, opens the Pores, and removes Laſſitudes; it is of Service in all nervous Diſorders, Pains of the Ears, and Diſtillations. It is an excellent Remedy for Diſeaſes of the Kidneys, contracted from Cold, being rubbed on the Parts; and relieves the Patient, if any thing will do it. Its heating Quality cauſes it to be uſed in the Palſy, Convulſions, Sciatica, Sugillations, inveterate Pains of the Head, Diſtillations, and Diſeaſes of the Ears: The Method is to heat it in the Calyx of a Pomegranate, and then anoint the affected Part with it. In a Pain of the Colon it is of admirable Service, being injected in a Clyſter, as it is, alſo, in the Horror, or ſhaking Fit of a Fever; but in hot and bilious Temperatures, it is to be avoided. It deſtroys Worms, Lice, Nits, and other Vermin: In ſhort, it is effectual in cold Diſtempers, but principally, if uſed outwardly; for, inwardly taken, it excites a Nauſea.

Schroder ſays of the diſtilled Oil, that it is an excellent Diſcuſſer of Flatuſes and Ventoſities, eſpecially in pregnant Women ſubject to convulſive Diſorders, and, alſo, in the Colic; it reſtores the Limbs under apoplectic Fits; being rubbed thereon, and put into the Ears, it eaſes their Pains, and quickens the Hearing. It abſterges the Impetigo, Lentigo, and all manner of Spots in the Face; and cures ichorous Pains of the Head, the Phthiriaſis, and Tinea.

The *Emplaſtrum Laurinum*, or Plaiſter of Bay, is good for the Dropſy; for Pains proceeding from a Flatus, or ſome cold Cauſe; and for the Pain of the Colic: The Electuary of Bay-berries, alſo, diſſipates Flatulences.

If the dry'd Branches of Bay be rubbed very faſt one againſt another, and Powder of Sulphur be caſt thereon, a Flame will ſuddenly burſt forth; which ſeems ſtrange, becauſe the Wood of Bay is of a light and ſpongy Subſtance. But nothing is ſo fit for this Purpoſe, according to *Pliny*, as Ivy to be rubbed, and Bay to rub: Since, however, the Attrition is mutual, it ſeems indifferent, ſays *Ray*, whether the Ivy, or the Bay, rub, or be rubbed. *Raii Hiſt. Plant.*

For the *Electuarium de Baccis Lauri*, ſee ELECTUARIUM.

For the *Emplaſtrum è Baccis Lauri*, ſee EMPLASTRUM.

The *Oleum Laurinum*, or Oil of Bays, is thus ordered to be prepared, in the College Diſpenſatory.

Take of Bay-berries, ripe, and gathered not many Days, any Quantity: After bruiſing them, boil in a ſufficient Quantity of Water, and force out their Oil with a Preſs: Beat again the remaining Fæces, and pour hot Water upon them, as before, and again preſs out all that you can: Then ſeparate the Oil that ſwims upon the Water, for Uſe. *S. A.*

This is ſaid to be an effectual Cure for Aphthæ in Children, if rub'd upon the Crown of the Head.

Laurus Sylveſtris. See TINUS.

LAUTISSIMA VINA. Wines impregnated with Myrrh. *Linden.*

LAWANG. A Tree which grows in *Java*. By the Taſte of a Specimen of the Bark, *Ray* thinks it a Species of Saſafras. *Hiſt. Plant.*

LAXA CHIMOLEA, in *Paracelſus*, is a purging Medicine principally recommended in the Venereal Diſeaſe, being the Powder of the Flowers of ſaline Minerals. *Johnſon* ſays, that *Laxa Chimolea* is a Salt growing upon Stones, as the *Anatron*, or *Uſnea Lapidea*.

LAXANTIA MEDICAMENTA. Laxative Medicines, with reſpect to the Belly; or relaxing Medicines, relative to the entire Habit.

LAXATIO. Laxation with reſpect to the Belly, or the entire Habit.

LAXATIVA. The ſame as LAXANTIA. Both imply the ſame as ECCOPROTICA.

LAXITAS. Laxity; that is, a Defect of due Rigidity and Strength, in the Fibres, Veſſels, and Viſcera.

I intended

I intended the Doctrine of Relaxation for this Article, and have accordingly referred to it from many other Articles; but finding, upon Reflection, that it would be more diſtinct and proper, under the Article FIBRA, I have there explained it at large. See, therefore, FIBRA.

LAZARI *Morbus*, or *Malum*. The *Elephantiaſis*, or Leproſy.

LAZULI *Lapis*.

Lapis Lazuli. Offic. Schrod. 352. Calc. Muſ. 467. Geoff. Prælect. 74. Worm. 65. Boet. 273. Charlt. Foſſ. 27. *Cæruleus Lapis*. Matth. 1354. *Lapis Cyanus, ſive Lazuli*. Aldrov. Muſ. Metall. 870. *Cæruleus*. Ejuſd. 349. *Cæruleus nativus*. Theoph. de Lap. Ed. Lugd. Bat. 1647. *Cyanus, ſeu Lapis Lazuli*. De Laet. 90. *Cæruleum nativum*. Schw. 375. Woodw. Att. Tom. 2. P. 1. p. 42. AZURE STONE.

This is a hard blue Stone, with Gold and Silver-coloured Specks and Veins; and is found of two Kinds, one that can bear the Fire, and the other that cannot. The firſt is brought from *Aſia* and *Africa*, and is called the Oriental Stone; the other is found in ſome Places in *Germany* and *Italy*, being dug out of Gold, Silver, and Copper Mines, and is ſofter than the Oriental. The Oriental produces the Ultramarine Blue, which never changes with Age. But the *German* Ultramarine is eaſily affected by external Cauſes, and in time turns green. The beſt Lapis Lazuli is of a deep-blue Colour, marked with ſome Gold Specks, hard to break, and durable in the Fire.

It purges upwards and downwards, and is recommended by Authors in melancholy Affections, Quartan Agues, Apoplexies, and Epilepſies. They attribute to it a corroding Quality, with ſome Aſtringency; the firſt of which, *Dioſcorides* and *Galen* ſay, may be corrected by waſhing it in Water; but they are miſtaken; for, both waſhed and unwaſhed, it vomits and purges, and what the Water carries off from it differs from what remains, only in the Fineneſs of the Parts. The blue Colour of this Stone ariſes, undoubtedly, from ſome Parts of Copper mixed with it, from which, alſo, its purgative Quality proceeds; but it may very reaſonably be asked, why an acrid and purgative Medicine of this Kind ſhould be uſed in the Confectio Alkermes, deſigned for a ſtrengthening Cordial. To anſwer this, it is to be conſidered, that the antienr Phyſicians acknowledged two Virtues in this Stone, one purgative, the other ſtyptic; which, though contrary to each other, were nevertheleſs found in the ſame Subject. The ſtyptic Quality, by which it becomes a Strengthener, they counted natural to it, when it was found in Gold Mines, mixed with ſmall Particles of Gold; the cathartic Quality they conſidered as merely accidental, ariſing from the Mixture of heterogeneous Parts. Therefore, on account of the ſtrengthening Virtue of this Simple, they endeavoured, by various ways, to correct the other, as by repeated Ablutions and Calcinations; but whether they have ſucceeded or not, is with me ſtill a Doubt; though I muſt own, that long Experience has ſhewn, that no bad Accident ever happens from the Confectio Alkermes rightly prepared. Whence it may be conjectured, that by Calcination the purgative Virtue of the Stone is very much leſſened, or entirely deſtroy'd; but I cannot ſay, that it contributes any thing to the cordial Virtues of the Confection. The Antients thought it purged off particularly the Atra Bilis, but, I am afraid, upon no good Grounds; for the black Colour of the Stools, after taking it, is not ſo much owing to the Nature of the Fæces, as to the Tincture which all Steel and Copper Medicines communicate to them.

As there are many Medicines of more certain Efficacy among us, we ſeldom uſe the Lapis Lazuli in any thing but the Confection already mentioned; all the Magiſteries, Tinctures, and Elixirs, which the Chymiſts prepare from it, being laid aſide. *Geoffroy*.

When *Geoffroy* mentions the Lapis Lazuli, as an Ingredient in the Confectio Alkermes, he means a Sort directed in foreign Diſpenſatories; for in ours it has been long omitted.

The Doſe, according to *Schroder*, is a Dram of the Stone reduced to a fine Powder. *Schroder*, alſo, directs a Magiſtery, Elixir, and Extract of this Stone, which the Curious may ſee in his *Pharmacopœa Medico-Chymica*, L. 3. C. 8.

LAZURIUS. Of an azure Colour. This Colour is, by *Paracelſus*, eſteemed very bad in a Leproſy. The *Lazurium Argenti*, or *Pulvis Lazurius*, is the *Crocus Lunæ*, Saffron of Silver.

LEÆNA. A Lioneſs. *Leænæ Emplaſtrum* is the Name of a Plaiſter mentioned by *Aetius*, *Tetrabib*. 2. *Serm*. 3. C. 85. And *Paulus Ægineta* deſcribes two under this Name, L. 7. C. 17.

LEBERIS, λεβηρὶς, ſignifies the *Exuviæ*, or Sloughs of Serpents. *Hippocrates*, in *Lib*. 2. *de Morbis Mulierum*, recommends the Exuviæ of Vipers as a Cure for Sun-burns on the Face.

LEBIAS, λεβίας. The Name of a Fiſh, the ſame as *Hepatus*.

LECHENEON, λεχηνῶν. A Name for the *Torcular Herophili*. *Galen*. See LENOS.

LECHIA. The Name of a Fiſh, which ſome take to be the *Centrina*, others the *Anna*, of the Antients. *Caſtellus*.

LECHO, λεχώ. A Woman in Child-bed. *Moſchion*.

LECISCION, λεχίσιον. A ſmall *Acetabulum*, relative to the Meaſure thus called. *Hippocrates*.

LECITHOS, λέκιθος, is interpreted a ſort of Puls; according to ſome, a Pea, or wild Vetch (*Aracus*). It is, likewiſe, expounded, a decorticated Lentil, or the Meal of decorticated Lentils. It is ſometimes wrote λέκυθος.

Lecithos, λέκιθος, is, alſo, the Yolk of an Egg. This Homonomy renders it difficult to determine, whether *Hippocrates*, when he applies the Epithet, λεκιθώδης, to the *Hypoſtaſis* of Urine, *Epidem*. L. 4. and to *Pus*, *de Morbis*, L. 2. means to compare them to the Meal of Lentils, or to the Yolk of an Egg.

LECTIO. Reading. This is ſaid, by *Celſus*, L. 1. C. 4. to be bad, eſpecially after Supper, for thoſe whoſe Heads are weak. And in L. 1. C. 8. he recommends reading with an audible Voice, for ſuch as have weak Stomachs. It is, alſo, directed by *Paulus Ægineta*, as an Exerciſe, L. 1. C. 19.

LECTUALIS MORBUS. A Diſeaſe which confines a Perſon to his Bed.

LECTUS. A Bed. See ÆORA.

LEDUM. A Name for ſeveral Species of CISTUS.

LEFFA. *Rulandus* explains this *Herbarum Prædeſtinatio*.

LEFFAS. See BUR.

LEGNA, λίγνα, in *Hippocrates*, imports the Margin, or Edges, of the Mouth of the Womb, called *Os Tincæ*, or *Amphideon*.

LEGUANARIA is the ſecond Species of *Ziziphus* in *Boerhaave*.

LEGUMEN is a Species of Plant which are called *Puls*; ſuch as Peas, Beans, and the like; and are ſo call'd, becauſe they may be gather'd by the Hand, without cutting. Mr. *Ray* reckons all thoſe Plants, which have a papilionaceous Flower, among the Legumens.

Legumen, Terræ glandibus ſimile. A Name for the *Lathyrus*; *Sylveſtris, & dumetorum, flore luteo*.

LEIOBATOS, λειόβατος. The ſame as LEVIRAIA.

LEIOPODES, λειόποδες. Even-footed. Thoſe are thus called, the Soles of whoſe Feet are without the uſual hollow Part.

LEIPHÆMOI, λείφαιμοι. Thoſe are thus called, who labour under a Deficience of Blood, or who have not a ſufficient Quantity of Blood. From λείπω, to be deficient, and αἷμα, Blood.

LEIPODERMOS, from λείπω, to be deficient, and δέρμα, the Skin. A Perſon is thus call'd, who has loſt his Prepuce, whether by Section, or a Diſeaſe.

LEIPOPSYCHIA, λειποψυχία, from λείπω, to leave; and ψυχὴ, the Soul, or Life. A fainting Fit.

LEIPOTHYMIA, from λείπω, to leave, and θυμὸς, the Mind. The ſame as LEIPOPSYCHIA.

LEIPYRIAS, λειπυρίας, from λείπω, to leave, and πῦρ, Heat, or Fire. A Species of very malignant and dangerous *Cauſus*, or burning Fever, wherein the internal Parts are ſcorch'd, as it were, with Heat, whilſt the external Parts are cold.

LELYTHUS. A Pea, according to *Blancard*.

LEME, λήμη. The *Sordes* of Eyes.

LEMMA, λέμμα, is expounded by *Erotian*, the Husk, or Hull; and imports whatever is taken off in Decortication.

LEMNIA TERRA. *Dale* mentions two Sorts of this Earth; which are,

1. *Terra Lemnia*. Offic. Aldrov. Muſ. Metall. 262. *Terra Lemnia rubra*. Worm. 10. Charlt. Foſſ. 5. *Lemnia Terra*. Matth. 1360. *Lemnia vel ſigillata vera*. Kentm. 3. *Lemnia terra*. Dougl. Ind. 52. *Terra ſigillata Turcica rubra*. Mont. Exot. 14. EARTH OF LEMNOS.

The *Lemnian* Earth is a fat, viſcid, ſlippery Clay, of a pale red Colour. It is brought to us in little Cakes or Troches, marked with different Characters, each weighing about four Drams. It has its Name from the Iſland of *Lemnos*, where it is dug; and it is not a little ſurpriſing to find how much this Earth has been celebrated in all Ages. Even in the Time of *Homer* and *Herodotus*, a great many very ſolemn Rites were obſerved in digging it. In the Days of *Dioſcorides*, it was made up with the Blood of a ſhe Goat, newly killed; and the Prieſts of *Venus* ſtamped it with proper Images. In *Galen's* Time the Goat's Blood was omitted, but many other ſuperſtitious Ceremonies ſtill remained; which, when *Petrus Bellonius* was at *Lemnos*, were laid aſide, and others ſubſtituted in their Place. It is dug, ſays that Author, only on the ſixth Day of *Auguſt*; as much being then taken out, as is ſuppoſed to be ſufficient for a whole Year. When the Vein is opened, the *Greek* Prieſts rehearſe ſome Forms of Prayer, at which all the conſiderable Inhabitants of the Iſland, both *Greeks* and *Turks*, are preſent. The Vein being afterwards cloſed, and covered with common Earth, the Inhabitants are forbid, under the ſevereſt Penalties, to open it any more during that Year. The greateſt Part of this Earth is ſent to *Conſtantinople* to the Grand Signor, with whoſe Seal it is marked; the reſt is ſold to Merchants by the Governor of the Iſland, ſometimes with, and ſometimes without, his Seal upon it. *Bellonius* remarks, that at *Conſtantinople* they have the Art of counterfeiting it ſo dexterouſly, that the falſe Earth can hardly be diſtinguiſhed from the true. That *Lemnian* Earth is reckoned the beſt, which,

when

when bruiſed between the Fingers, or held in the Mouth, appears moſt like Fat, and contains leaſt Sand. The Antients have ſaid much about the Virtues of this Earth; but there is ſome Room to think, that the Reputation it had among them, was more owing to the ſuperſtitious Ceremonies obſerved about it, than to its intrinſic Qualities. *Dioſcorides* recommends it as an Antidote againſt Poiſons and Dyſenteries. *Galen* ſays, that, when outwardly applied, it heals all freſh Wounds; and *Fernelius* is of Opinion, that, whether applied outwardly or inwardly, it ſtops all Fluxes of Blood. Some have celebrated its alexipharmic Qualities in all peſtilential and contagious Diſtempers; but many of the Moderns think it to be a mere alcaline Earth, endued with no other Quality but that of abſorbing Acids. This, however, muſt be a Miſtake; becauſe no Earths of this kind raiſe an Effervescence with Acids; and it appears by its Analyſis, not to be altogether deſtitute of the Virtues attributed to it by the Antients. It yields a ſmall Quantity of volatile urinous Salt, and of a bituminous Oil, and of a Salt not much different from Sea-ſalt; whence we may conclude, that this Earth is impregnated with a kind of Sal Ammoniac, mixed with a bituminous Oil, by which the Action of Acids upon it is prevented; and that its Virtues muſt be, in ſome Degree, alexipharmic, diaphoretic, detergent, and vulnerary. This ſealed Earth needs no other Preparation than to be finely powdered, or diſſolved in a proper Liquor. In Dyſenteries, Ulcers of the Inteſtines, and Hæmorrhages, it may be adminiſtered in Draughts or Boluſes, in the following manner.

Take of *Lemnian* Earth, finely powdered, one Dram; of Syrup of Quinces, an Ounce; Plantain-water, and Knot-graſs-water, each three Ounces: Mix them into a Potion, to be taken by Spoonfuls.

Take *Lemnian* Earth, Conſerve of red Roſes, and Hips, of each half an Ounce; of Syrup of Barberries, a ſufficient Quantity to make them into a ſoft Electuary; a Dram of which is to be taken Morning and Evening.

Take of *Lemnian* Earth, half a Dram; Syrup of Clove-gilliflowers, an Ounce; the ſimple Waters of Baum, Viper's-graſs, and *Carduus Benedictus*, each two Ounces; Treacle-water, ſix Drams: Mix and make them into a Potion, to be taken by Spoonfuls ſeveral times in a Day.

In external Applications, this Earth is often joined with Bole.

The *Lemnian* Earth is uſed in *Venice* Treacle, in the Confection of Hyacinth, *Renodæus*'s Bezoardic Powder, in *Hoffman*'s Orvietan, in the antivenereal Pills of *Charas*'s Pharmacopœia regia, and in that Author's Plaiſter for fractured Bones.

The Inconveniencies that may ariſe from uſing this Earth too long, or in too great Quantities, are common to it, with all the other abſorbent Earths. They load the Stomach, by adhering cloſely to, or plaiſtering its inner Surface, which cauſes a very diſagreeable Senſation; and, by cloſing the Orifices of the Glands of the Stomach and Inteſtines, they hinder Digeſtion, and may occaſion the Fluids, which ought to be excreted there, to be carried to other Parts of the Body; from which Cauſes many Diſorders may follow. The Way to prevent Accidents of theſe Kinds is, to give theſe Abſorbents in ſmall Quantities, diluted with much Liquor, and diligently to obſerve the Effects they produce. *Geoffroy.*

2. *Terra Lemnia alba.* Offic. *Terra Lemnia ſigillata alba.* Charl. Foſſ. 5. *Terra ſigillata Lemnia alba.* Worm. 9. *Terra Lemnia vel ſigillata candida.* Kentman. 1. *Terra ſigillata Turcica alba.* Mont. Exot. 14. WHITE EARTH OF LEMNOS.

It is a little tenacious and lubricious from its Fatneſs; whence it adheres to the Tongue, but without Mordacity: It is digged in the Iſland of *Lemnos*.

As to its Virtues, it ſtops an Hæmorrhage from the Uterus, and the menſtrual Flux; reſiſts Poiſons, and malignant Diſeaſes; and cures the Bite of a mad Dog. *Dale.*

LEMNISCUS, λήμνισκος, a Tent. In *Celſus*, *L.* 7. *C.* 28. it is a Peſſary made of Linen, rolled up in the Form of a long Tent, which he directs to be introduced into the Vagina, after an Inciſion made for opening the Paſſage into it, when preternaturally cloſed.

LEMPNIAS is the *Terra Sigillata*. *Lempnias Calcis* is the Scales of Braſs, which ſeparate when it is beaten by the Hammer. *Lempnias*, and *Lempnia*, alſo, import *Auripigmentum*. *Caſtellus.*

LENIENS, LENIS, and LENITIVUS, import mild, deſtitute of Acrimony, ſoftening, or laxative.

LENOS, ληνὸς, in *Hippocrates*, is a Chanel, or Excavation, made in ſome Machines for making Extenſion, and reducing fractured Bones.

Herophilus gave the Name of ληνὸς, *Lenos*, to that Place within the Head, where ſeveral Sinuſes of the *Dura Mater* meet, from its Reſemblance to a Part of a Wine-preſs. It is called *Torcular Herophili.* See CAPUT.

LENS.

The Characters are;

The Leaves are conjugated, and grow to one Rib, which terminates in a Tendril. The Pod is ſhort, and full of orbiculated Seeds, convex on both Sides. *Boerhaave*, *Index alter*, *Pars* 2. *p.* 44.

Boerhaave mentions three Species of this Plant; which are,

1. Lens; vulgaris. *C. B.* 346. *Boerh. Ind. A.* 2. 44. *Lent.* Offic. J. B. 2. 317. Raii Hiſt. 1. 904. Synop. 3. 323. *Lens minor.* Ger. 1049. Emac. 1224. Park. Theat. 1068. *Lens vulgaris ſemine ſubruſo.* Tourn. Inſt. 390. LENTILS.

This is a ſmall Puls, leſs than a Tare or Vetch, having many long-wing'd Leaves, conſiſting of many narrow ſmall oval *Pinnæ*, ſet oppoſite with Claſpers at the End of the Leaf. The Flowers are ſmall and white, leſs than thoſe of Tares, but like them in Shape, ſtanding, for the moſt part, ſingly, on a long Foot-ſtalk; and are ſucceeded by ſhort flattiſh Pods, containing two round Seeds, leſs than Tares, and flatter. It is ſown in ſome Parts of *England* in the Fields, flowering in *May*, and the Seed is ripe in *July*.

The Antients affirm, that Lentils, eaten with their Skins on, bind the Body, and ſtop a Looſeneſs; and yet, at the ſame time, the Liquor they are boiled in looſens the Belly. They are but rarely uſed in Phyſic, tho' the Flour of them may be uſed outwardly in Cataplaſms, for the ſame Purpoſes as Bean-flour. *Miller's Bot. Off.*

They are ſown in Fields, and the flattiſh, yellowiſh Seeds are in Uſe. Lentils dull the Eye-ſight, are difficult of Digeſtion, incommode the Stomach, and generate Flatulencies, both in that Part, and the Inteſtines: They ſtop a Looſeneſs, and are prejudicial to the Nerves, Lungs, and Head. *Dale* from *Dioſcorides.*

Lentils boiled, and made into a Cataplaſm, with Polenta, mitigate the Pain of the Gout: A Cataplaſm of the ſame, prepar'd with Honey, conglutinates ſinuous Ulcers, cleanſes foul Ulcers, and breaks and abſterges Cruſts round their Margins. A Cataplaſm of Lentils, twice boiled in Vinegar, diſcuſſes Hardneſſes, and ſtrumous Swellings; the ſame, prepared with Melilot or Quinces, with a Mixture of Oil of Roſes, cures Inflammations of the Eyes or Anus: But, in conſiderable Inflammations, and large fiſtulous Cavities of the Part laſt named, they boil Lentils with the Rinds of Pomegranates, or dried Roſes, and mix Honey therewith: They are, alſo, effectual againſt a Nome, or phagedenic Ulcer degenerated into a Gangrene, if prepar'd as before, or with an Addition of Sea-water: The ſame Preparation cures Puſtules, Herpes, Eryſipelas, and Chilblains. A Cataplaſm of Lentils, boiled in Sea-water, relieves Women whoſe Breaſts are diſtended with grumous Milk. *Dioſcorides*, *Lib.* 2. *Cap.* 129.

The *Hiſtoria Plantarum*, aſcribed to *Boerhaave*, recommends a Decoction of Lentils, for waſhing the Puſtules of the Small-pox, when ſuppurated.

2. Lens; major; vulgaris, ſemine cinereo & nigro variegato.

3. Lens; monanthos. *Boerh. Ind. alt. Plant.*

Lens, paluſtris. A Name for the *Lenticula*; *paluſtris*; *vulgaris.*

LENTA FEBRIS. A ſlow Fever. See HECTICA.

LENTIBULARIA. The Name of two Plants, mentioned by *Tournefort*, and *Ray*, in his *Synopſis.*

1. Lentibularia. *Riv. Irr. Mon. Ic. Milleſolium paluſtre galericulatum.* Ger. Emac. 828. *Aquaticum flore luteo galericulato.* J. B. 3. 783. Park. 1258. *Aquaticum lenticulatum.* C. B. P. 141. It is found in the Ditches and Ponds in *Lincolnſhire*, and in the Iſle of *Ely*.

2. Lentibularia minor. *Pet. H. B.* 36. 12. *Milleſolium paluſtre galericulatum minus, flore minore.* Syn. 2. 79. 3. Pluk. Alm. 251. T. 99. f. 6. *Aparine aquis innatans Treviſana foliis Percepier, capreolis donata, ſive Aparine fluitans capreolis donata.* Bocc. Muſ. P. II. p. 23. T. 4. Found by Mr. *Dent*, on *Feverſham-Moor* in *Cambridgeſhire*; and in *Yorkſhire*, by Mr. *Dodſworth.*

Both Sorts obſerved, by Mr. *Lawſon*, in the Ditches by the Cauſſey, over the *Moſs* to the *Fell-End*, near *Witherſlack*, *Weſtmorland*: In the River on *Hounſlow-Heath*, by Mr. *Dandridge.*

The Flowers of this are paler than thoſe of the former.

LENTICULA.

The Characters are;

It grows in the Water, and is ſeated on its Superficies; its Appearance is quite ſimple, and foliaceous; and its Roots ſlender, capillaceous and pellucid. *Boerhaave.*

Boerhaave mentions three Species of this Plant; which are,

1. Lenticula; paluſtris; vulgaris. *C. B. P.* 362. *Boerh. Ind. alt.* 19. *Lens paluſtris.* Offic. Ger. 680. Emac. 829. Raii Synop. 3. 129. J. B. 3. 784. Raii Hiſt. 1. 117. *Lens paluſtris ſive aquatica vulgaris.* Park. 1262. *Lenticularia minor monorrhiza foliis ſubrotundis utrinque viridibus.* Mich. Nov. Gen. 16. DUCKS-MEAT.

This is a ſmall Plant, which frequently covers the whole Surface of Ponds and Ditches, conſiſting only of ſmall, round, green Leaves; having neither Flower nor Seed perceivable; only from the Middle of the under Side of each Leaf, ſmall, white, thready Roots.

Ducks-meat is of a cooling mollifying Nature, good to be applied to Inflammations, St. *Antony's* Fire, or the Shingles; alſo

for the Gout, either applied by itſelf, or mixed with Barley-meal. Six Ounces of a ſtrong Infuſion, made in White-wine, taken for nine Days together, is commended as a Cure for the Jaundice. *Miller's Bot. Off.*

Tragus, *Matthiolus*, and *Dalechampius*, fanſied they obſerved, that this little Plant, taking Root in the Ground, became like ſome Species of Water-creſs; but they ſeem to be miſtaken: This Story is ſomething like that of the Shells producing Sea Ducks.

The Ducks-meat is thought to be very cooling and lenifying. Some apply it as a Cataplaſm to eaſe the Gout and Inflammation of the Parts; but the repelling of the Humours is to be feared in theſe Sorts of Remedies: For which Reaſon, to aſſwage the Pain of the Hæmorrhoides, powder two Handfuls of Ducks-meat with half an Ounce of Myrrh: Put it all in a Linen Bag, and bathe the Piles with the Water which drops through this Bag. *Martyn's Tournefort.*

2. Lenticula; paluſtris; major. *Commel. Ind.* 63.

3. Lenticula; aquatica; triſulca. *C. B. P.* 362. *J. B.* 3. 786. *Hederula aquatica.* Lob. Ic. 2. 36. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 19.

LENTICULA likewiſe implies a Freckle, or ſmall Puſtle on the Skin of the Face and Breaſts; ſee EPHELIS; where the Cure of theſe is directed from *Celſus*, *Lib.* 6. *Cap.* 5. *Lenticularis Febris* is a Species of Fever, attended with numerous Eruptions, about the Size of Lentils. *Lenticulares Glandulæ* are the ſmall Glands of the Inteſtines, thus called on account of their Size.

LENTICULARE. A Lenticular; a chirurgical Inſtrument. See *Tab.* XXVIII. *Fig.* 3, 4, and 5. They are called Rugines.

LENTIGO. A Freckle.

LENTISCINUM VINUM. Wine impregnated with Maſtich.

LENTISCUS.

The Characters are;

The Leaves are pinnated, and grow to one common Rib, without an odd one at laſt. The Male Flower, which grows on one Male Plant, is thus produced: The End of the Pedicle opens into a ſhort, green, quadrifid Calyx, expanded in form of a Star; within which ariſe four, five, or ſix ſhort Stamina, with large red Apices; theſe Flowers are collected into a Tuft. The Ovary, on the other Female Plant, grows cloſe to the Apex, of a long, thick, and ſometimes ramous Pedicle, cloven at the End, as it were, in the Form of a Calyx: This Ovary is furniſhed with a ſtrait thick Tube, whoſe Apex is expanded into three or four very rough reflexed Lips. *Boerh. Ind. alt. Par.* 2.

Boerhaave mentions three Species of this Plant; which are,

1. Lentiſcus; vulgaris. *C. B. P.* 399. *Lentiſcus.* J. B. 1. 285. Dod. p. 871. Lugd. 63. *Fœmina.* COMMON MASTICH-TREE.

The Maſtich-tree, in its native Places, will grow to be a Tree of ſome Bigneſs, having many crooked Branches, cover'd with an Aſh-coloured Bark. The Leaves conſiſt, generally, of four Pair of Pinnæ, without a ſingle one at the End, ſet on a Foot-ſtalk, which has a narrow Film on each Side; they are in Shape like thoſe of Myrtle, but larger, harder, and firmer. The Flowers grow in Cluſters, being ſmall and ſtamineous; and after them follow ſmall blackiſh Berries. The Maſtich-tree grows in the Southern Parts of *France*, and in *Italy*; but it yields the Gum Maſtich only in the ſland of *Scio*, or *Chios*, in the *Archipelago*. The Gum of the Wood is uſed.

The Gum, which is the Maſtich of the Shops, is procured from the Body, or the greater Branches of the Tree, by cutting them acroſs, in the Beginning of *Auguſt*; the Gum flowing out in Drops from the Wounds. It is an hard, brittle, reſinous Gum, almoſt tranſparent, of a whitiſh Colour, tending to a yellow, but turning white, and clinging together, if chew'd in the Mouth: It comes over in ſmall, yellow, almoſt pellucid Drops, of a pleaſant Smell, of a reſinous, and ſomewhat reſtringent Taſte.

Maſtich is heating and drying; ſtrengthens the Head, and the nervous Syſtem; helps a Cough, and Spitting of Blood; ſtrengthens the Stomach, and ſtays Vomiting: It is very good to preſerve the Gums and Teeth; the Ladies in *Turkey* chew it continually, for that Purpoſe, and to procure a ſweet Breath. It is applied, outwardly, in Plaiſters, for the Head-ach and Tooth-ach. The Wood is drying and binding, good for all kinds of Fluxes. A Tooth-pick made of it is accounted a Preſerver of the Teeth.

Officinal Preparations are, the Emplaſtrum de Maſtiche, and the Unguentum Maſtichinum. *Miller's Bot. Off.*

Maſtich is a Reſin of a tranſparent Gold Colour, and, when burnt, of a very agreeable Smell: It may be chewed like Wax; whereas Sandaracha breaks under the Teeth, and by this theſe two Subſtances may be diſtinguiſhed. It is uſed inwardly, from half a Scruple to a Dram, in Diarrhœas and Hæmorrhages, and is an Ingredient in many purgative Compoſitions, as a Corrector. *Geoffroy.*

Maſtich is recommended in a Prolapſus Ani, or Uteri; it cures a Nome, and provokes Urine. *Dioſcorides.*

It blunts and corrects the Acrimony of Cathartics; ſtrengthens the Head, and the nervous Syſtem; and cures Coughs and Spitting of Blood. *Schroder.*

2. Lentiſcus; vulgaris; foliis minoribus & pallidioribus. *H. L. maſ.*

3. Lentiſcus; vera; ex Inſulâ Chio; cortice & foliis fuſcis. *J. Commel. Cat. Hort. Amſt.* 192. *C. Commel. Plant. Uſu.* 83. *Boerh. Ind. alt.* 2. 174. *Lentiſcus.* Offic. *Lentiſcus ex Chio, ex qua fluit Maſtiche.* Ind. Med. 73. Tourn. Itin. Ed. Angl. 1. 285. THE MASTICH-TREE.

It grows plentifully in the Iſland of *Scio*, and flowers in *March* or *April*. The Parts in Uſe are, firſt, the nodous and brachiated ſmall Branches, which are of the Thickneſs of a Man's Finger, white on the Inſide; but cover'd with an Aſh-colour'd Bark, and of a reſinous Taſte and Smell; the other Part of Uſe in Medicine is the *Reſina Maſtiche Offic.* MASTICH.

Dale ſays, this is the true Maſtich-tree, and differs in Species from the preceding.

LENTISCUS PERUANA. See MOLLE.

LENTOR. A Viſcidity or Sizineſs.

A viſcid or ſizy State of the animal Fluids is productive of many Diſtempers: Thus *Boerhaave* informs us, that a pinguious Viſcidity, from vegetable Aliment, is cauſed,

Firſt, By a Diet of crude and unfermented farinaceous Subſtances, and auſtere immature Vegetables. For the Meal of farinaceous Vegetables, mixed with Water, forms a viſcid kind of Paſte; but Fermentation deſtroys this Viſcidity.

Secondly, By a Defect of good Blood; a ſufficient Quantity of which is neceſſary to the Aſſimilation of the Aliments, and the Converſion of their Juices into good Blood.

Thirdly, By a Debility of the Veſſels and Viſcera, (ſee FIBRA) or a Defect and Inactivity of the Bile; which laſt is very powerful, when in a due State and Quantity, in attenuating Viſcidities of alimentary Subſtances.

Fourthly, By a Diminution of animal Motion; for Motion ſtrengthens the Solids, attenuates the Fluids, and promotes the due Digeſtion and Aſſimilation of the Aliments.

Fifthly, By a Diſſipation of the moſt fluid Parts of the Blood, through the relax'd ſecerning Veſſels; for it is evident, that when the moſt fluid Parts are loſt, what remains muſt become more thick and viſcid. Hence the Error of thoſe is obvious, who prepoſterouſly carry off the fineſt Particles of the Blood by enormous Quantities of Sudorifics and Diuretics.

Sixthly, By the Retention of the thicker Parts of the Fluids, on account of the Debility of the excretory Organs. See FIBRA.

This Viſcidity is originally form'd in the firſt Organs of Digeſtion; from whence it is propagated to the Blood, and the Fluids thence derived: And when any of theſe viſcid Particles paſs the Lacteals, and get into the Blood, their immediate Effects are, principally, manifeſt in the Lungs, where they cauſe a Dyſpnœa, not being able to paſs readily the ſmall Veſſels thereof.

The Effects of ſuch a Viſcidity in the firſt Organs of Digeſtion, are,

An utter Proſtration of Appetite; and of this I have ſeen frequent Inſtances, in thoſe that have deſtroy'd theſe Organs, by drinking Drams: Theſe utterly loſe their Appetite, and, when they vomit, diſcharge a viſcid Subſtance, ſometimes much reſembling Frogs-ſpawn.

A Senſe of Repletion, Nauſea, and Inclination to vomit, becauſe theſe Viſcidities, adhering to the Coats of the Stomach, excite an uneaſy Senſation, in the manner a Feather does, when thruſt down the Throat.

A Crudity of the Aliments taken in, becauſe they cannot be digeſted.

Hence, likewiſe, the Bile is render'd inert and unactive, being, as it were, inviſcated by theſe Viſcidities, and carried along with them through the inteſtinal Tube, and loſt.

Hence, alſo, ariſe pituitous, and, as it were, vitreous Concretions of the Stomach, and inteſtinal Tube, which are productive of exceſſive Pains, when adhering to the Coats of theſe Organs.

Coſtiveneſs, and Tumors of the Belly, are, moreover, excited, for want of a proper Stimulus from the Bile, and a Retention of the groſs viſcid Fæces: This is frequent in Children.

Hence, alſo, a due Preparation, Perfection, and Secretion of the Chyle is prevented.

In the Blood, Sizineſs, Paleneſs, and Immeability, are generated: In the Veſſels, Obſtructions, and Concretions. Hence, alſo, pale and inſipid Urine, viſcid Saliva, and leucophlegmatic Tumors. The due Secretions are, likewiſe, prevented, and the more ſubtle Parts of the Fluids become deficient; whence a Coalition of the ſmalleſt Canals is induced.

It is obvious, that from theſe Cauſes all the Digeſtions, Circulations, Secretions, Excretions, and the vital, natural, and animal Motions muſt be diſturbed; whence a Suffocation of the Circulation, and Death, muſt enſue.

From what has been ſaid above, the Diagnoſtic, Prognoſtic, and Anamneſis, relative to Diſorders proceeding from glutinous Viſcidity, may be collected, and the proper Methods of Cure are indicated.

With reſpect to the Cure; it is to be performed, firſt, By a conſtant Uſe of Aliments and Drink well fermented, and duly ſeaſoned with attenuating Salts, and Aromatics. For Fermentation deſtroys the Viſcidity of all the farinaceous Vegetables. Rice, or Oats, boiled, make a kind of Jelly, or Glue, which is deſtroyed by Fermentation. Beer, well fermented, does not cauſe Phlegm; but Ptiſans will: Therefore, in cold languid Diſeaſes, ſtrong Beer is proper; and in hot inflammatory Diſorders, Ptiſans. *Boerhaave* ſays, that ſtrong Beer is a moſt noble Remedy in theſe cold Diſorders, ariſing from Viſcidity; and affirms, that he has known many Cures performed by the Uſe of *Brunſwick* Mum, and well fermented Biſcuit, only.

Aromatics incide and deſtroy the Viſcidity of the fizy Humours. The principal of theſe are Cinnamon, Mace, Nutmegs, Orange-peel, Thyme, Origanum, aromatic Cloves, Ginger, Pepper, the leſſer Galangals, Citron-peel, Aniſe, Coriander, Mother of Thyme, and Cardamoms.

Secondly, By Broths made of Animals abounding with exalted volatile Salts; ſuch are thoſe mentioned under the Article ACIDA, as Remedies for Diſorders proceeding from a Redundance of Acid; and theſe Broths muſt be ſeaſoned with ſuch acrid Vegetables as thoſe directed under the ſame Article, for the Cure of Diſeaſes ariſing from an Acid.

Thirdly, By ſtrengthening the Veſſels and Viſcera. See FIBRA.

Fourthly, By Exerciſe and Motion; for, without a due Degree of theſe, nothing can relieve, at leaſt cure. See FIBRA.

Fifthly, By diluting, reſolvent, ſtimulating, bilious, and ſaponaceous Medicines.

Materials proper for diluting and reſolving are ſpecified under the Article FIBRA.

Stimulating Medicines are ſuch as by their Bulk, Denſity, Figure, and Mobility, increaſe the contractile Force of the Fibres, when applied to them. The principal of theſe are,

Firſt, Saline Acids; and theſe are either natural, as the Juices of Citrons, Oranges, Grapes, and other acid Summer-fruits, and the native Salts procured from the preſſed Juices of Vegetables; or produced by Fermentation, as *Rheniſh* and *Moſelle* Wine, Vinegar of Wine and of Beer, Spirit of Vinegar, Tartar, Cream of Tartar, ſour Milk, and ſour Whey; or produced by Fire, as Spirit of Sea-ſalt, of Sal Gem, of Nitre, of Vitriol, and of Sulphur by the Bell.

Secondly, Alcaline Salts, which are either fixed or volatile; fixed alcaline Salts are all thoſe prepared from the Aſhes of Plants, as Salt of Wormwood, of Carduus Benedictus, of Tartar, and Pot-aſh. Volatile Salts are all thoſe diſtilled from putrefied animal Subſtances, as Salt and Spirit of Hartſhorn, of human Blood, of Bones, and of Sal Ammoniac.

Thirdly, Compound Salts, as Sea-ſalt, Sal Gem, native and artificial Sal Ammoniac, Nitre, Borax, Tartarus Tartariſatus, and Tartarus Regeneratus.

Fourthly, Acrid aromatic Oils; as the diſtilled Oils of Wormwood, of Citron-peel, of Orange-peel, of Caſſia Lignea, of Chamomile, of Cinnamon, of aromatic Cloves, of Hyſſop, of the Woods of Guaiacum, Juniper, and Safafras, of Mace, of Marjoram, of Mint, of Nutmegs, of *Cretan* Origanum, of Peny-royal, of Roſe-wood, of Roſemary, of Rue, of Savine, of Sage, of Lavender, of the Seeds of Aniſe, Dill, Carawaies, and of Fennel, of Amber, of Tanſy, and of Turpentine.

The Oils, by Expreſſion, of bitter Almonds, of Bay-berries, of Mace, and of Nutmegs.

The native Oils; as Balſam of *Gilead*, of *Tolu*, of the Palm, of *Peru*, of *Capivi*, of *Mecca*, and of Turpentine.

The empyreumatic acrid Oils, diſtilled by the Retort; as of Blood, of Bones, of Horns, of Eggs, of Urine, of Woods, and of Bricks.

Fifthly, Inflammable Spirits produced by Fermentation, from farinaceous Vegetables, and the Juices of Summer-fruits.

Sixthly, Acrid aromatic Plants, ſuch as abound with Salt and Oil; as Leaves of Southernwood, Wormwood, Maudlin, Dill, Aniſe, Birthwort, Arum, Betony, Calamint, Motherwort, Germander, the greater Celandine, Scurvy-graſs, Dittany, noble Liverwort, Eryſimum, Hemp Agrimony, Fennel, Ground-ivy, Ivy, Hyſſop, Bays, Lovage, Marjoram, Horehound, Feverfew, Baum, Mint, Creſſes, Nep, Tobacco, Origanum, Dittander, Arſmart, Leeks, Penyroyal, Roſemary, Rue, Savine, Savory, Sage, Water-Germander, Mother of Thyme, Soldanella, Thyme, Tanſy, Paul's Betony, and Nettles.

The Flowers of Maudlin, Oranges, Marigolds, Clove-gilly-flowers, leſſer Centaury, Chamomile, Citrons, Saffron, Eupatorium, Lily of the Valley, Hops, Melilot, Marum Syriacum, Sage, Scabious, Camels Hay, Lavender, *Arabian* Stœchas, Tanſy, and of the Lime-tree.

The Roots of Acorus, Garlick, Angelica, healthful Wolfsbane, Birthwort, wild Radiſh, Carline-thiſtle, Caryophyllus montanus, Onions, the greater Celandine, Contrayerva, Garden and Oriental Coſtmary, Turmeric, Sow-bread, Cyperus, Leopardsbane, Fraxinella, bulbous Fumitory, Galangals, Gentian, Elecampane, Maſterwort, Orris, Loveage, Spignel, Ginſeng, Reſtharrow, Butter-bur, Parſley, Sow-fennel, Peony, Leeks, Sneezwort, Pellitory of *Spain*, Radiſh, Madder, Butchers-broom, Satyrion, Figwort, Seſeli, Squills, Valerian, Ramſons, Swallow-wort, Zedoary, and Ginger.

The Seeds of Dill, Aniſe, Smallage, Columbines, Carawaies, Celeri, Coriander, Cumin, Carrot, Rocket, Eryſimum, Fenugreek, Lovage, Navew, Creſſes, Fennel-flower, Parſnep, Parſley, Leeks, Radiſh, Wormwood, Seſeli, Muſtard, Treacle-muſtard, Anacardium, Cardamoms, Burdock, the Grains of Chermes, and the Seed of Cubebs, Juniper, Bays, Nutmegs, and Peach-kernels.

The Barks of Guaiacum, Safafras, Juniper, Oranges, Citrons, Lemons, and Cinnamon.

Aromatic Juices; as Aſafetida, Gum Ammoniac, Anime, Bdellium, Benzoin, Gum Elemi, Galbanum, Gum Lac, Labdanum, Maſtich, Sagapenum, Juniper, Tacamahaca, Ambergriſe, liquid Amber, Aloe, Myrrh, Storax, and Frankincenſe.

Seventhly, Inſects; as Millepedes, Ants, May-worms, and Cantharides. And, alſo, the Parts of ſome Animals; as Caſtor, Civet, Musk, Urine, and the Dung of Birds which drink but little.

Eighthly, Decoctions, Extracts, Conſerves, Preſerves, Tinctures, Spirits, Waters, volatile, oleous, and ſpirituous Salts, Pills, and Powders prepared from theſe Materials.

Bilious Medicines are the Galls of Quadrupeds, and Fiſhes, eſpecially of the Lupus marinus, and Eel.

Take, for Example, of the Gall of a Bull, and of the Lupus marinus, each four Drams; let them exhale over a gentle Fire, till they acquire the Conſiſtence of Honey; then mix them with a ſufficient Quantity of the powder'd Root of Arum, and make the Whole into Pills, of three Grains in Weight each. Take one every Morning, Noon, and Night, an Hour before Meals.

To this Claſs belong the Lapis Hyſtricis, or Pedra del Porco, an Infuſion of which in the Water of Carduus Benedictus, or *Rheniſh* Wine, is exhibited in the Quantity of two or three Ounces. And the Preparation, recommended by *Helmont*, of the Gall and Liver of an Eel, roaſted by a gentle Fire, and given in the Quantity of a Dram, with three Ounces of *Rheniſh* Wine.

Among ſaponaceous Medicines, none is more recommended in theſe Caſes, than *Venice* Soap, made into Pills, with the Addition of a ſmall Quantity of Bile; for theſe not only diſſolve Viſcidities, but ſupply, in ſome Degree, the Defect of the Bile.

Sixthly, Frictions; Heat, excited by Exerciſe; Baths, prepar'd with aromatic Vegetables; or dry Baths, as they are called; or Stoves and Veſicatories, either of ſtimulating Vegetables, or Cantharides, contribute to the Cure of theſe Diſorders.

But, in the Cure of theſe Diſorders, great Care muſt be taken not to miſtake, for a morbid Viſcidity, that uſeful, natural, and glutinous Juice, which anoints, lubricates, and defends, many Parts of the Body; and is particularly remarkable in the Eyes, Eyelids, Noſe, Mouth, Fauces, Oeſophagus, Stomach, Inteſtines, Pelvis, Ureters, Bladder, Urethra, the mucilaginous Vaginæ of the Tendons, the Commiſſures of the Joints, the Larynx, Aſpera Arteria, and Bronchia of the Lungs. For in theſe it is natural and neceſſary for defending the Parts from the Effects of Acrimony, to which they would otherwiſe be expoſed. Unskilful Practitioners, who look upon every thing that is thick and tenacious, to be morbid, and treat it accordingly, on this Occaſion frequently fall into fatal Errors, to the great Prejudice of their Patients.

This Species of Viſcidity I have now been treating of, is directly the Reverſe to an inflammatory Spiſſitude; and thoſe Subſtances, which are medicinal in this, are poiſonous in the other; and *vice verſa*. See INFLAMMATIO.

LEO is a Name for a Species of Inſect called the Lion-piſmire, for a Sea Animal, for a Shell-fiſh of the Lobſter kind, for the Serpent called *Cenchrites*, for the Leproſy, and is a Term given by the Spagiriſts to ſome of their Preparations; all figuratively denominated from

LEO. Offic. Aldrov. de Quad. Digit. 2. Geſn. de Quad. Digit. 572. Jonſ. de Quad. 78. Chart. Exer. 14. Schw. Quad. 101. Raii Synop. a. 162 THE LION.

The Fat only is in Uſe; which, waſhed according to the Directions given by *Dioſcorides*, (for which ſee the Article ADEPS) and put into the Ears, eaſes the Pains thereof; and is ſucceſsfully uſed to anoint Limbs benumbed with Cold: Some uſe it for ſcirrhous Tumors, and Chilblains.

LEO FEROX. Ger. *Acarnæ affinis Leo ferox.* J. B. *Acarna minor caule non folioſo.* C. B. *Acarna minor caule non folioſo, ſive Leo & Carduus ferox.* Park.

This is a Species of Acarna, or Fiſh-thiſtle, mentioned by *Ray*; but of no Uſe in Medicine.

LEONTIASIS, λεοντίασις, LEONTION, λεόντιον, and LEONINA LEPRA, are Names for the ELEPHANTIASIS. See LEPRA.

LEONTOPETALON.

The Characters are;

rolt has a thick, tuberous, perennial Root. The Flower is wſaceous, pentapetalous, or hexapetalous, naked, and furniſhed with

with five Stamina. The End of the Pedicle of the Flower forms an orbicular Placenta, ſeated within the Flower, on which Placenta grows the Ovary, furniſhed with its Tube, or Pointal, which becomes an angulous, ſimple, acuminated Bladder, from the Centre of whoſe Bottom ariſes a ſtrait Axis, ſurrounded by globulous Seeds growing to it.

Boerhaave mentions but one Species of this Plant; which is,

Leontopetalon. *Offic. Ger.* 182. *Emac.* 236. *C. B. P.* 324. *Boerh. Ind. A.* 208. *Raii Hiſt.* 2. 1326. *Park. Theat.* 682. *Leontopetalon quorundam.* J. B. 3. 489. *Leontopetalon foliis Coſtæ ramoſæ innaſcentibus.* Tourn. Corol. 49. BLACK TURNEP.

It grows in *Apulia* in *Italy*, and flowers pretty late in the Year. The Root is in Uſe; which, according to *Dioſcorides*, cures the Bites of Serpents. *Galen* aſcribes to it a digeſtive, heating, and drying Quality. *Dale.*

LEONTOPODIUM. Offic. *Leontopodium majus.* Park. 684. (*quoad deſcript.*) *Gnaphalium Alpinum.* Germ. 517. Emac. 641. *Gnaphalium Alpinum magno flore, folio oblongo.* C. B. 264. *Gnaphalium Alpinum pulchrum.* J. B. 3. 161. Raii Hiſt. 1. 296. *Filago Alpina capite folioſo.* Tourn. Inſt. 454. LIONS-FOOT.

It grows on hilly Places, and flowers in *July*. The Root, worn as an Amulet, is ſaid to perform the Effects of a Philtre, and to diſcuſs Tubercles. The Herb, bruiſed and boiled in Oil, is ſucceſsfully uſed by the common Sort of People for Lividneſs, Bruiſes, Concuſſions, Contuſions, and other ill Effects of Blows and Strokes. *Lob. Buxb.*

Leontopodium, Creticum. A Name for the *Plantago*; *Cretica*; *minima*; *tomentoſa*; *caule adunco.*

LEONURUS. *Lions-tail.*

The Characters are;

The Calyx is long, tubulated, and incloſes the Seeds; the Galea is imbricated, and much longer than the Beard, which is divided into three Parts. The Flowers are diſpoſed in very cloſe Whorles.

Boerhaave mentions three Species of this Plant; which are,

1. Leonurus; perennis; Africanus; ſideritis folio; flore phœniceo, majore. *Breyn. Prodr.* 2.

2. Leonurus; minor; Capitis Bonæ Spei vulgo.

3. Leonurus; annuus; Americanus vulgo. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 180.

There are no medicinal Virtues attributed to either of theſe Plants at preſent, that I know of.

LEOPARDUS. See PARDUS.

LEPAS. A kind of Shell-fiſh, adhering to Rocks. *Galen. Exeg.*

LEPHANTEUS, or LEPHANTE. The firſt Species of Tartar, of a middle Nature betwixt Stone and Mud, and admits of being cut. *Rulandus.*

LEPIDIUM.

The Characters are;

The Fruit is like the Head of a Spear, and full of Seeds, which are, for the moſt part, of an oblong Figure.

Boerhaave mentions four Species of this Plant; which are,

1. Lepidium; latifolium ſerratum. *Boerh. Ind. A.* 2. 9. *Lepidium, Piperitis.* Offic. *Lepidium latifolium.* C. B. P. 97. Raii Hiſt. 1. 828. Synop. 3. 304. Tourn. Inſt. 216. *Lepidium Pauli.* J. B. 2. 940. *Lepidium Pauli & Plinii Piperitis.* Chab. 296. *Lepidium Æginetæ.* Mer. Pin. 71. *Piperitis ſive Lepidium vulgare.* Park. Theat. 855. *Raphanus ſylveſtris Officinarum, Lepidium Æginetæ Lobelio.* Ger. 187. Emac. 241. DITTANDER.

The common Dittander has a ſmall, white, ſlender, creeping Root, hard to be got out of a Garden, where it has been once planted. The lower Leaves grow on long Foot-ſtalks, are ſmooth, oblong, ſharp-pointed, and ſerrated, four or five Inches long. The Stalks grow to be half a Yard high, ſmooth, and having leſſer and narrower Leaves growing alternately; ſometimes indented about the Edges, and ſometimes not. The Flowers that grow on the Top of the Stalks are ſmall, white, and four-leav'd, and the Seed-veſſels ſmall and round. It grows in moiſt Places near Rivers, and flowers in *June* and *July*. The whole Plant has a hot and biting Taſte, like Pepper.

The Leaves of Dittander, bruiſed and mixed with Hog's-lard, and apply'd as a Cataplaſm to the Hip, help the Sciatica; chew'd, they cauſe a great Flux of Rheum to run out of the Mouth, and by that means are ſaid to help ſcrophulous Tumors in the Throat. The Women, in *Suffolk*, give them boiled in Ale, to haſten the Birth. *Miller's Bot. Off.*

This Plant gives a deep-red Colour to blue Paper; it is acrid, aromatic, and taſtes like Pepper and Muſtard. The Salt of the Dittander ſeems to reſemble the *Terra foliata Tartari Mulleri*, but is united with a little oily volatile Salt.

Thus this Plant is antiſcorbutic, ſtomachic, and good for hypochondriac Diſorders; a Tincture is drawn from it with Spirit of Wine, or it may be drank in a Ptiſan: The Root is bruiſed with freſh Butter, and apply'd to the Parts affected with the Gout. *Martyn's Tournefort.*

2. Lepidium; glaſtifolium. *C. B. P.* 97. *Lepidium non repens.* J. B. 2. 941. *Cochlearia, altiſſimo folio. T.* 215.

3. Lepidium; gramineo folio; ſive Iberis. *Tourn. Inſt.* 216. *Boerh. Ind. A.* 2. 9. *Iberis.* Offic. J. B. 2. 948. *Iberis latiore folio.* C. B. P. 97. Park. Theat. 853. *Iberis Cardamantica.* Germ. 197 Emac. 253. *Lepidium anguſtifolium Tournefortii, Iberis Officinarum S. Dale.* Rupp. Flor. Jen. 67. SCIATICA CRESSES.

The lower Leaves of this Creſs are two or three Inches long, and about half an Inch broad, indented pretty deeply about the Edges, and growing on long Foot-ſtalks. The upper Leaves are long and narrow, not cut in, and ſet on without Foot-ſtalks; it ariſes to be a Foot high, or more, branch'd, and bearing on the Top Spikes of ſmall, white, four-leav'd Flowers, ſucceeded by round Seed-veſſels, containing ſmall rediſh Seed. It grows wild in the warmer Countries, but with us, only in Gardens, and flowers in *June*.

The Leaves and Roots are commended by the Antients againſt the Sciatica, being beaten in a Cataplaſm with Hog's-lard, and apply'd to the Part affected, and kept on four Hours to a Man, and two to a Woman, the Place afterwards being waſhed with Oil and Wine; but, at preſent, it is but rarely us'd. *Miller's Bot. Off.*

They reſemble Naſturtium in Smell, Taſte, and Virtues, only they are leſs drying. *Galen.*

4. Lepidium; humile; minus; incanum; Alepicum. *T.* 216. *Draba, Chalepenſis, repens, foliis minus cinereis & quaſi viridibus.* M. H. 2. 314. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 9.

LEPIDIUM is alſo a Name for the *Plumbago quorumdam.*

The *Lepidium* is alſo a Name for the *Draba.* Offic. *Draba Dioſcoridis.* Ger. Emac. 274. *Draba vulgaris.* Park. Theat. 849. Raii Hiſt. 1. 821. *Draba umbellata, vel Draba major capitulis donata.* C. B. P. 109. *Draba ſive Arabis.* Chab. 295. *Draba multis flore albo.* J. B. 2. 939. *Draba, Lepidium humile incanum arvenſe.* Tourn. Inſt. 216. *Thlaſpi Draba dictum.* Buxb. 318. ARABIAN MUSTARD, or TURKEY CRESSES. *Dale.*

It is cultivated in Gardens, and flowers in *June*; the Herb and Seed are uſed. The Herb is boiled with Ptiſan, eſpecially in *Cappadocia*; and the dry Seed ſerves inſtead of Pepper for Seaſoning of Meats. *Dioſcorides.*

LEPIDOCARPODENDRON, from λεπὶς, Scales; καρπὸς, Fruit; and δένδρον, a Tree.

The Characters are;

The Leaves are entire, and generally diſpoſed in a diſorderly Manner. The Calyx conſiſts of a Multitude of Leaves, placed one upon another, after the Manner of Scales, in different ſucceſſive Orders; when mature, it is contracted into the Shape of a ſquamous Veſſel, which cloſes itſelf. The Flowers, which are numerous, are compoſed of a Multitude of Floſcules, fill the Bottom of the Calyx, and are apetalous, anomalous, capillaceous, and hermaphrodite. From the Middle of the Flower proceeds the Ovary, furniſhed with one or more long Tubes, and growing in an oblong Caſe, which ends in two long Filaments. The Seed is adorned with a long Filament, having a ſmall Feather on its Apex.

Boerhaave mentions twelve Species of this Plant; which are,

1. Lepidocarpodendron; folio ſaligno lato; caule purpuraſcente.

This grows near the Cape of *Good Hope.*

The Bark of it is recommended in a Diarrhœa.

2. Lepidocarpodendron; folio ſubrotundo, rigido; in pedunculo longo, craſſo; flore maximo, purpureo.

3. Lepidocarpodendron; folio oblongo, viridi; limbo rubro ornato; ſquamarum apice; & margine, lanuginoſis.

4. Lepidocarpodendron; foliis anguſtis, longis, ſalignis, nervo rubro; florum plumis violaceo-purpureis.

5. Lepidocarpodendron; foliis anguſtis, brevioribus, ſalignis; calycis ſquamis elegantiſſime ex roſeo, aureo albo, atro rubro variegatis; florum plumis albis.

The Flower abounds with a ſweet and wholſome Liquor, which the Inhabitants of the Country where it grows are very fond of.

6. Lepidocarpodendron; foliis anguſtis, longioribus ſalignis; calycis ſquamis elegantiſſime ex flavo, fuſco, albo, nigro variegatis; florum plumulis, atropurpureis.

7. Lepidocarpodendron; folio ſaligno viridi; nervo & margine flavo; cono longo, ſuperiori parte maxime clauſo.

8. Lepidocarpodendron; foliis longiſſimis, anguſtiſſimis, fructum elegantiſſime ex rubro, flavo, & albo, variegatum, inſtar Coronæ ſuccingentibus; radice repente.

9. Lepidocarpodendron; acaulon; foliis paucis, latis, nervo & marginibus, rubris ornatis; fructu parvo.

10. Lepidocarpodendron; acaulon; ramis numeroſis e terra excreſcens; calyce floris immaturo extus, ex rubro & flavo, variegato, intus flavo.

11. Lepidocarpodendron; foliis anguſtiſſimis, gramineis; cancellato; ſemine coronato.

12. Lepidocarpodendron; foliis ſericeis, brevibus, confertiſſime natis; fructu gracili, longo. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 183.

LEPIDOIDES SUTURA. From λεπὶς, a Scale, and εἶδος, Form. A Name for the ſquamous Suture of the Skull.

LEPIDOSARCOMA. A Name given by *Marcus Aurelius Severinus*, to an uncommon Tumor, found in the Mouth, which was a *Sarcoma*, full of irregular Scales.

LEPIS, λεπὶς. A Scale, as of Metal; or the Husk, or Hull of Seeds.

LEPORINA LABRA. Hare-Lips. *Roſtrum Leporinum* is a Piece of Fleſh appearing betwixt the Diviſions of the Hare-Lip.

LEPRA. The Leproſy.

In treating of puſtulous and pruriginous cutaneous Diſorders, which being accompanied with Itching, Pain, Heat, Inflammation, Exulceration, and various Symptoms, ariſe from an impure, acrid Serum, ſtagnating between the exhaling Veſſels and the nervous and tendinous ſmall Fibres of the Skin, and corroding them; it will not be improper to premiſe, that each of theſe Diſorders of the Skin have very different Denominations, according to the different Acrimony of the peccant Humour, and the Degree of the ſubcutaneous Diſorder. Thus they are called the Itch, moiſt and dry, virulent, malignant, and venereal, a Pſora, a Serpigo, a Leproſy, an Impetigo, and Elephantiaſis, an Herpes miliaris, or Exedens, the Tinea Capitis, and Gutta Roſacea, all which we ſhall briefly and accurately explain.

The moſt gentle Degree of theſe Diſorders is a benign Itch, whether moiſt or dry; which, appearing in the Joints principally, at the Beginning, inſenſibly and gradually ſpreads through the remaining Parts of the Body, except the Head only. In the moiſt Kind, indeed, which ſeizes Infants principally, and Children, who are ſanguine, phlegmatic, and of a ſpongy Habit of Body, the Puſtules are turgid with a ſanious, purulent Humour, and it is attended with a greater Inflammation, which, from a rediſh Circle about its Edges, degenerates to a Suppuration. To this Claſs we ought, alſo, to refer the ſmall running Ulcers in the Heads of Infants, called Achors. But in the dry Kind, to which lean, old Perſons, and thoſe of a melancholy, choleric Temperament, are moſt ſubject, the Puſtules are of a ſmaller Size, and replete with a little ſerous Ichor, which, by irritating the highly tender Fibres of the Nerves under the Cuticula, bring on an almoſt intolerable Heat and Itching.

When the dry Itch is ſcaly and cruſty, and, after the Abraſion of the Cuticle or Eſchar, leaves bloody Spots under the Skin, it, upon the Approach of Heat, produces a painful and almoſt intolerable Itching, and is cured with very great Difficulty, or, being cured, returns very readily. This Diſorder is called Impetigo, a Tetter, or a virulent Itch, and is moſt familiar to ſcorbutic Perſons, and thoſe afflicted with a ſerous Cacochymy; and, if it is in a great Degree, it is termed a leprous Pſora. The Curious may conſult *Barbette* in his *Chirurgia*, *Lib.* 1. *Cap.* 8. and *Wepfer*, *Obſerv.* 214. and in the worſt Kind of this Diſeaſe the Head is very often affected, and a Cruſt grows all over the Body, without excepting even the Face, Lips, and Hands. Beſides, the whole Skin, becoming ulcerous, diſcharges a ſerous, corroſive Sanies, and the Cuticula is ſoon after ſeparated, ſo that dry Scales may be eaſily taken off, whilſt the ſubjacent Skin, which is of a dark-red Colour, diſcharges an acrid Moiſture. Hence a fetid Smell is produced, and the Patients, having a keen Appetite, complain of an inſatiable Thirſt.

But if this Species of the Itch, ſucceeding a Gonorrhœa, Buboes, and other Diſorders of the Genitals, not only ſeizes the whole Body, but particularly the Face, and is attended with Nodes and Tophi, of various Parts; and if the Pains, which accompany it, being corroding, penetrating, intenſe and pungent, increaſe in the Night; the Diſorder is called venereal, and malignant.

As the Herpes miliaris propagates itſelf, as it were, by creeping, it is, by ſome, termed a Serpigo, and, poſſeſſing only the Surface of the Body in certain Places, ſuch as the Legs, Thighs, Hands, Scrotum, and Perinæum, excites many ſmall Eminences in the Skin, or little pruriginous Puſtules, without Moiſture, and as large as a Millet-ſeed, which, when the Scales come off, diſappear indeed, but return, at certain Periods of Time, in the ſame Places. Sometimes the Head itſelf, likewiſe, is infeſted with ſuch an Herpes; as *Helwigius*, in *Obſerv. Phyſico-medicis*, *Obſ.* 38. affirms. To this Claſs we may, alſo, refer that Species of Scurf, which is principally familiar to old Men, affects the Skin with an almoſt intolerable Itching, without Puſtules and Papulæ, and requires a perpetual Scratching with the Nails: Sometimes, alſo, it attacks the Pubes and Scrotum ſeparately, and ſometimes the End of the Inteſtinum Rectum, eſpecially when the Hæmorrhoids begin to ceaſe through an Exceſs of Age, or any other Misfortune.

The Herpes exedens, which *Hippocrates* only calls an Herpes, and *Celſus*, *Lib.* 5. *Cap.* 18. *Sacer Ignis*, and which is not unlike an ulcerous Eryſipelas, corrodes the whole Skin, to the ſubjacent Fleſh, with an Ulcer, and ſeparates it into Scales, ſometimes thick, and ſometimes thin, eſpecially about the hairy Parts of the Head; and, when it diſappears, it leaves hard Tumors on the Part affected.

But when an Herpes of the malignant Kind ſeizes the Breaſt and Præcordia, and is accompanied with a Cardialgia, preternatural Heat, Itching, Inflammation of the Skin, painful Exulceration, and ſmall and lucid Puſtules, like a Belt diſperſed on the Breaſt for a Hand's Breadth, the Diſorder is termed *Zona Ignea*, or the Shingles. See *Marcus Aurel. Severini*, *Lib.* 4. *de Abſceſſibus*, *Cap.* 9. *Nicol. Tulpius*, *Lib.* 3. *Schulzius*, *Ann.* 3. *Ephem. Obſ.* 4. who obſerv'd it prove fatal, and *Jo. Langius*, who obſerved it to have ariſen from an Ulcer of the Leg, prepoſterouſly and unſeaſonably conſolidated.

The cruſty and ſcaly Itch, which principally invades the Legs, as far up as the Knees, is, by ſome, diſtinguiſhed by the Title of Elephantiaſis, while the Legs are tumefied like Bags, upon which pretty large Cruſts appear, and theſe Cruſts, being abraded, leave rediſh Spots uneaſy to the Patient by their Itching, and great Vellication; and diſcharge a thick Humour, which is ſoon condenſed into freſh Scales and Cruſts. But the true Lepra of the *Arabians*, or Elephantiaſis of the *Greeks*, is a much more loathſome Diſeaſe, which *Aretæus* has given us the beſt Deſcription of, *Lib.* 4. *Cap.* 13. and *Celſus*, *Lib.* 3. *Cap.* 25. in this manner: "Almoſt unknown in *Italy*, but very frequent in ſome Countries, is that Diſeaſe, which the *Greeks* term ἐλεφαντίασις, and which is reckoned among the chronical Diſorders. By it the whole Body is ſo diſordered, that the Bones are ſaid to be vitiated. The Surface of the Body is covered pretty thick with Spots and Tumors, the Redneſs of which is, by degrees, converted into a black Colour. The external Skin becomes unequally thick, thin, hard, and ſoft; and is, in a manner, render'd rough by certain Scales; the Body grows lean; the Face, Legs, and Feet, ſwell. When the Diſeaſe is of long ſtanding, the Fingers and Toes are concealed under a Tumor, and a ſlight Fever ariſes, which eaſily deſtroys the Patient labouring under ſo many Diſorders."

There is a wide Difference between the Itch and Leproſy, and that ulcerous Diſorder, in which white ſordid Ulcers, ſeizing principally the muſcular Parts, ſuch as the Back, Arms, Thighs, Legs, and Loins, diſcharge a putrid Sanies, and ſometimes appearing in one Limb, and ſometimes in another, often continue for many Years. And this Kind of Diſorder is moſt incident to common People, Beggars, and Perſons of mean Stations, who live upon impure and ſordid Aliments. Many of our Phyſicians, alſo, aſſert, that *Lazarus* was afflicted with this Diſeaſe. Large Quantities of Worms are, alſo, ſometimes found lodged within theſe Ulcers, ſo that they can hardly be extirpated by any Remedies.

All theſe ſubcutaneous puſtulous Diſorders principally ſpread themſelves, and infect by Contagion; for which Reaſon they are eaſily propagated by lying together; by uſing Beds, or Clothes, tainted with a foul pinguious Sweat; but above all by the Skins of Animals, and the Clothes made of their Wool: For Wool is the fitteſt Medium for conveying this Diſorder, ſince, by its lax and porous Sponginеſs, it abſorbs thoſe impure exhaling Particles, and retains them longer, ſo that they will not be immediately diſperſed into the Air. For as Odours, diffuſed from any fragrant Subſtance whatever, continue a long time in Linen, Gloves, and Clothes, ſo likewiſe in contagious Diſeaſes, as the Plague, Small-pox, Meaſles, and petechial Diſorders, the putrid Effluvia, which are the Fomes of the Diſeaſe, by inſinuating themſelves deeply into thoſe porous Subſtances, eſpecially when made of Wool, often lie latent for a long time before they exert their Power of Infection.

That the Seat of theſe Diſeaſes, already enumerated, is the Compages of the Skin, which is tubulous, framed of various Fibres, and the univerſal Emunctory of the Body, our very Senſes ſufficiently demonſtrate. But, indeed, to ſpeak my Sentiments freely, I am fully perſuaded, that the Membrana Pinguedinoſa of the Skin is the principal Seat and Place where the Fomes of the impure and corrupt Matter primarily reſides, which, whilſt it cannot tranſpire freely through the Pores and exhaling Tubes of the Skin, continues there a long time, and by this long Continuance being rendered more acrid, does, by corroding, irritating, and inflaming the nervous Fibres of the Skin, generates various Puſtules and Papulæ. For, in the whole Body, there is no Part either ſolid or fluid, which, preſerving its proper Craſis, can, for a more conſiderable time, retain and conceal a fetid and vapid Humour, before, by a fermentative Motion from ſome peccant Temperament of the Air, it protrudes and expels it from the moſt latent Places in which it is lodg'd, than the Fat itſelf, in which, according to my Opinion, the Seeds of the Small-pox and Meaſles, the Purple Fever, the *Lues Venerea*, and other Diſorders of a like Nature, lie concealed for a long time. Beſides, as is certain from Experience, Bodies very replete with Fat are not only longer and more grievouſly afflicted with theſe Diſeaſes of the Skin, but, alſo, after a Cure, more eaſily relapſe into their former Diſorder, a plain Indication that the Fewel of the Diſtemper is concealed in the Fat.

But, if we conſider the Patients moſt ſubject to theſe Diſorders of the Skin, who are principally Infants and Children; as they are obnoxious to the Small-pox, Meaſles, Aches of the Head, and Defedations of the Skin of all Kinds, ſo they are principally ſubject to ſcabious and puſtulous Diſeaſes, not only from the ſoft and ſpongy Subſtance of their ſolid Parts, and their weak Tranſpiration, but, above all, for this Reaſon, becauſe, through the ſedentary Life of pregnant Women, and the Weakneſs of their Digeſtion, the Juices, by which the Infants are nouriſhed while in the Womb, are not temperate, but impure;

pure: Hence it is no Wonder, that the tender Bodies of Infants, alſo, are contaminated with Sordes, and full of ſuperfluous and peccant Humours; which, when, ſome time after, by a bad Conſtitution of the Air, the Energy of the contagious Fomes, or any other Cauſes, they are put into a fermentative Motion, excite innumerable Diſorders, and particularly deform the external Parts of the Body with various Eruptions.

'Tis a common Tradition, that Achors, a Tinea Capitis, and the Itch, preſerve Infants and Children from the Small-pox and Meaſles, or at leaſt have Efficacy enough to make them of a milder Sort: But, if it was neceſſary, I could produce many contrary Inſtances of Children, afflicted as well with the Itch, as other ulcerous Diſorders of the Skin, who, ſoon after they were cured of theſe troubleſome Diſtempers, fell into a confluent Small-pox, and Meaſles of the malignant Sort: From which we may reaſonably conclude, that each of theſe puſtulous Diſtempers has a peccant and corrupted Matter of a peculiar, and, as it were, ſpecific Quality, lodged in the Fat, for its reſpective Cauſe.

We now come to give ſome Reaſons, why theſe Diſorders of the Skin are ſo different in different Patients; and this, as far as I can comprehend, is to be aſſigned principally to the Difference of their Ages: For, ſince the Texture of the Skin is greatly changed with the Age, and differs very much in Children and young Perſons, from what it is in Adults, and thoſe advanced in Years; hence it happens, that thoſe puſtulous Diſeaſes, which differently affect the Skin, aſſume different Natures and Geniuſes, and exert themſelves in different Manners. For it is certain, from Phyſiology, that in the Bodies of Children, and young Perſons, there are more ſmall Canals in the Skin, a greater Number of Pores, and open Orifices, in its Surface, than in Adults, and Perſons farther advanced in Years, where the Veſſels are rendered narrower, coaleſce, and become ſolid. Thus in old Men the cellular Interſtices of the Membranes of the whole Body, and particularly thoſe between the Skin, and ſubjacent Parts, are leſs replete with a pinguious Humour, in conſequence of which Wrinkles are formed. Hence, through a Defect of Fat, the exhaling Veſſels and Pores of the Skin are contorted, incurvated, and compreſſed. From what has been ſaid, it will be no difficult Task to aſſign a Reaſon, why, in Old-age, the dry Itch, a Serpigo accompanied with an intolerable Itching, and an Herpes miliaris, are moſt common; whereas, on the contrary, in Infants and Children of ſanguine, phlegmatic, and pinguious Habits, ſuch Diſorders are rather produced, as, in conſequence of a large Quantity of Fat and Serum, diſcharge much Sanies. To this we may add, that in Children, and young Perſons, eſpecially of a ſanguine Temperament, the Blood is intimately mixed with the pinguious, chylous, and nutritive Parts; and for this Reaſon affords a larger Quantity of Matter and Aliment, not only to ſound Bodies, but, alſo, to ſuch as are, in ſome meaſure, decayed and corrupted, than in ſcorbutic and cacochymic old Men, whoſe Blood is generally replete with ſaline, ſulphureous, and viſcid unactive Particles.

Farther, that we may know for what Reaſons certain Eruptions appear in certain Places, and in ſome poſſeſs the ſuperior, and in others the Trunk, and inferior Parts, I think it muſt not be omitted, that as ſeveral other Diſeaſes, ſo, likewiſe, the Diſorders of the Skin, generally at ſtated times, invade certain Parts, according to the different Ages of the Patients. Thus we obſerve, in Infants and Children, Favi, Achors, a Tinea Capitis, Epiphoras, purulent Inflammations of the Eyes, and Serpigos appearing frequently on the Forehead and Chin. In young and adult Perſons, the Itch, Herpes, and other Diſorders, ſeize principally the Hands, Arms, and Back; and, laſtly, in the Decline of Life, or when Old-age comes on, Itchings are perceived in the Anus, Scrotum, and Perinæum; and a Pſora, Leproſy, Elephantiaſis, and Eryſipelas, ulcerate the Feet.

It is alſo expedient to inquire, why, in different Patients, the peccant Humour, which ſupports the puſtulous and pruriginous Diſeaſes of the Skin, differs ſo ſurpriſingly in its Acrimony, Viſcidity, Conſiſtence, and other Qualities. And this, in my Opinion, depends upon the different Temperament and Tone of the Skin. Hence, when the State of the Skin is ſpongy, ſoft, and thin, as it is in ſanguine Perſons, a greater Quantity of Ichor, Sanies, and purulent Matter, is found collected in the Veſicles; which, being dried, is changed into Scales and Cruſts. For two kinds of Humours are contained in the Skin, and ſecreted from it; the one mucous, which is incloſed in the ſpongy Cells of the Corpus reticulare, lying immediately under the Skin; and the other ſebaceous, which is inſenſibly diſcharged from the cutaneous Veſſels and Lacunæ: When, therefore, the nervous Fibres, by which the Cuticle is united to the Cutis, are lacerated and corroded by an acrid Humour, the relaxed Epidermis is raiſed into ſmall Veſſels full of ſaline Serum; which afterwards open into ſmall Ulcers. But it is otherwiſe in choleric Patients, thoſe of a more compact Habit of Body, and old Perſons, who are rather affected with a dry Itch, and other Puſtules and Pimples, filled with none, or but little Moiſture: And theſe Diſorders are brought on by a copious Generation of viſcid Humours, and the Narrowneſs of the Tubes of the Skin, induced by a Loſs of the natural Strength; which diſcovers itſelf ſufficiently, not only by the languid State of all the Functions, but, eſpecially, by the Slowneſs and Weakneſs of the Pulſe, which ſhews the Circulation of the Blood and Humours to be faint and languid.

Having ſaid thus much in general of the Diſeaſes of the Skin, we now come to conſider their true and genuine Cauſes, in a more particular manner. Now the genuine, proximate, and immediate Cauſe of theſe Diſorders is no other than an impure, viſcid, and acrid Serum, which, by ſtagnating in the ſmall Tubes of the Skin, lacerating the nervous Fibres, and producing there a ſlight Inflammation, produces various Corroſions, Puſtules, and Exulcerations; and, conſequently, excites all the cutaneous Diſeaſes with the Symptoms already enumerated. But of how peccant and virulent a Nature this corrupted Matter, ſtagnating under the Skin, is, appears ſufficiently from this, that almoſt all dangerous and mortal Diſeaſes, whether acute or chronical, and eſpecially thoſe rooted in the nervous Syſtem, may be relieved by forcing this virulent Matter to the Surface of the Body externally; and, on the contrary, augmented by repelling it to the internal Parts.

The Truth of this is confirmed by Experience; for we have numberleſs Obſervations made by Authors of Veracity, who inform us, that ſpaſmodic Aſthmas, arthritic Pains, Gout, and many other Diſtempers, have been removed by the Itch alone, and recurred upon a Suppreſſion of it. Thus *Sennertus, in Paralipom.* tells us, that a continual Fever, Blindneſs, and Epilepſy, were produced by this means. And *Sebizius* remarked a Woman, afflicted with the Itch, who, upon the Application of a Mercurial Girdle, had her Tongue ſwelled to ſo enormous a Bulk, that, hanging out of her Mouth, not without Danger of a Gangrene, it could hardly be reduced to its natural Size. *Hagendornius, Cent.* 1. *Hiſt.* 9. *& M. N. B. dec.* 1. *ann.* 2. *Obſ.* 313. aſſure us, that Suffocation followed a repelled Itch: And, in *Cent.* 2. we have an Account of a ſcorbutic Itch, treated with a Mercurial Ointment, which terminated in a Gout; and, at another time, proved the Cauſe of a Gutta ſerena. *Amatus Luſitanus, Curat. Med. Cent.* 2. *Curat.* 33. mentions a young Man, who, when afflicted with the Itch all over his Body, anointed himſelf with an Ointment, in which Arſenic was mixed, and in the Morning was found dead in his Bed, by his Servants. He, alſo, tells us, that he knew another, who, by anointing himſelf in the ſame manner, was ſeized with Madneſs: And in another, he ſays, ſome Tubercles aroſe, which were very difficult to cure Nor muſt we omit what *Hoechſtetterus, Dec.* 8. *Obſervat.* tells us: "A young Taylor, ſays he, having the Itch, uſed a Mercu-" rial Ointment, without purging his Body; by which the Diſ-" temper being thrown to the internal Parts of his Body, both " his Legs, from the Coxendix, became weak and motionleſs, " like as if they had been paralytic. His Body was rendered " ſoluble; and things calculated for preparing and eliminating " the peccant Humours were given; but, finding no Relief " from them, he was ſeized with Convulſions, and died." And the ſame Author, *Dec.* 1. *Caſu* 2. ſays, that ſpurious and malignant Fevers have been produced by a raſh and prepoſterous Cure of puſtulous Diſorders.

And I myſelf have obſerved, in delicate Patients, that a perverſe Uſe of drying Topics, in cutaneous Diſorders, has produced a Difficulty of Breathing, a Phthiſis, Loſs of Appetite, and the utmoſt Anxieties of the Præcordia. I have, alſo, known an Anaſarca, and Tumors of the Scrotum, ariſe from the ſame Cauſe. And beſides, this Opinion of mine, concerning the viſcid and acrid Quality of the peccant Manner, is ſtill more confirmed by opening a Vein in theſe Diſorders, when the Blood is found ſo viſcid, and, as it were, condenſed into a Coagulum, that it can hardly be ſeparated. The ſame is very plainly proved by a remarkable Obſervation on the noxious Effect of a repulſed Itch, which *Schulzius* has inſerted in *Vol.* 1. *A. N. C.* A certain Man, having led a ſedentary Life for many Years, and being violently and for a long time afflicted with a moiſt Itch, he was altogether, and at once, freed from it by the Uſe of external Remedies; upon which he was immediately ſeized with Deliquiums; and afterwards, when the Itch could not be recalled by any means, he became hemiplectic, convulſive, and lethargic. Upon opening his Body, the Peritonæum appeared very thick, adhering to the Omentum, full of unſeemly, black, green, and livid Streaks, and diffuſing a moſt fetid Smell. His Inteſtines were diſtended with Flatulences, and full of green Eruptions; and his Stomach, Liver, Spleen, the Inteſtinum Colon, and Duodenum, were ſo united into one Maſs, that no Part of them could be ſeparated without a Knife, or Dilaceration. The Spleen was preternaturally thick and hard, and the Gall-bladder thick, and replete with a viſcid Humour reſembling a ſaturated Solution of Gamboge.

'Tis not, therefore, to be doubted, but in cutaneous Diſorders there is a large Quantity of glutinous and tenacious, impure and corrupt Serum. But, if we accurately examine into the mediate and remote Cauſes contributing to the Production of this Serum, the firſt, which occurs, is the Strength of the Solids, impaired and rendered inſufficient for a due and brisk Contraction: Which being diminiſhed, the Circulation of the Blood,

and the Secretion and Excretion of the ſuperfluous Humours depending on it, decreaſe; the fluid Parts are not ſufficiently attenuated, and intermixed with the ſolid, but, in Proceſs of Time, greatly degenerated from their former ſalutary Temperature. Beſides, under ſuch a diminiſhed Motion of the Blood, the Structure of the Organs and Viſcera, deſtined as well for Sanguification, as the Secretion of the laudable Juices, ſuch as the Liver and Spleen, is depraved in a wonderful manner: Hence the Veſſels and Paſſages being rendered more narrow, and the acrid, ſaline, and viſcid Particles not properly ſeparated, enter this Mixture of the Blood, and infect, contaminate, and corrupt it with an impure Taint, or Fomes, which ſupplies large Matter for theſe Diſeaſes. Hence it is, that we find hypochondriac, ſcorbutic, and cachectic Perſons, who are afflicted with ſuch a State of the Blood and Viſcera, are ſubject to ſeveral cutaneous Diſorders. Since, therefore, the Blood and Viſcera cannot be eaſily corrected, and reſtored to their former Condition, the Reaſon is evident, why it is not only difficult entirely to remove Diſorders of this Kind, if they have taken deep Root, and are become inveterate, but, alſo, why, after being once cured, they eaſily recur with their former Virulence.

But to this ſo dangerous and noxious a Depravation of the ſolid Parts, and of the Viſcera themſelves, many Cauſes concur in ſome Patients; the principal of which are, in Men, a Suppreſſion of the hæmorrhoidal Diſcharge; in Women, a Suppreſſion of the Menſes; in young Perſons, a Suppreſſion of Hæmorrhages from the Noſe; and, in plethoric Patients, the Omiſſion of accuſtomed Veneſection. For, ſince in ſuch a State of Things, eſpecially if a luxurious Manner of living is uſed, the Redundance of the Blood and Humours cauſes a ſlower Circulation, and an impeded Depuration of the vital Juices, the Blood cannot but be inſenſibly, and by degrees, impregnated with various Impurities. This happens more frequently, when the ſalutary Buſineſs of Tranſpiration is retarded by an Air, cold, moiſt, vapid, and replete with noxious Vapours: For this Reaſon, alſo, Perſons dwelling in low and moiſt Houſes, inhabiting Marſhes, and Places obnoxious to Inundations of Water, or confined in Priſons, or People living in cold and moiſt northerly Countries, are, above all others, afflicted ſo frequently with the Itch, and other cutaneous Diſtempers. Nor is any thing, but the moiſt and unequal Temperament of the Air, in the Spring and Autumn, to be blamed, for the Appearance or Return of theſe Diſorders, at thoſe Seaſons eſpecially, and for their exciting a greater Itching and Heat at ſome times, than at others; and in *M. N. C. Dec.* 3. *Ann.* I. *Obſ.* 205. we are informed, that ſuch a thing happened at the Increaſe of the Moon. For the Atmoſphere, or circumambient Air, has a ſurpriſing Influence on the Tone of the Skin, and the Succeſs of Tranſpiration depending either on its Conſtriction or Relaxation; and as a good, pure, and elaſtic Air preſerves a due Craſis of laudable Blood, ſo an impure and vapid Air has an Effect directly oppoſite; as *Lucretius*, *Lib.* 6. *Verſ.* 1110. has obſerved, in the following Lines.

Eſt Elephas morbus, qui propter flumina Nili
Gignitur Ægypto in media, neque præterea uſquam.

Nothing likewiſe is more common, than for ſudden Changes of Air, and Journeys from a pure and light, to a thick and denſe Atmoſphere, to bring on various cutaneous Diſorders; though it is not to be denied, that a Change of Food, Water, and Liquors, which, by changing the Diſpoſition of the Blood, generates new Particles, and thoſe perhaps, not correſponding to the Diameters of the Emunctories, contributes, alſo, to the Production of ſuch Diſorders. Hence I know ſeveral, who, coming from *France*, and Countries ſituated on the other Side of the *Rhine*, and other Places, which produce Wines, to *Germany*, where they met with a more rigid and inclement Atmoſphere, have, after ſome Months, been ſeized with the Itch. *Lucretius* therefore, in the Place already quoted, very juſtly derives the Origin of many Diſeaſes from a Change of Air, in theſe Words:

——Inde aliis alius locus eſt inimicus,
Partibus ac membris varius concinnat id aer.
Proinde, ubi ſe cœlum, quod nobis forte alienum
Commovet, atque aer inimicus ſerpere cœpit,
Ut nebula ac nubes paulatim repit, & omne
Qua graditur, conturbat, & immutare coactat.

Beſides theſe we ought to reckon, among the more remote Cauſes, a bad Digeſtion of the Aliments, which happens, either when proper Food is devoured in an exceſſive Quantity, or when incongruous Aliments are uſed, ſuch as Fleſhes ſmok'd, or over-ſalted Bacon and Pork, too pinguious Subſtances, ſweet Things, crude Summer Fruits, Peas, and Beans, generally are. To which likewiſe belong ſeveral Sorts of Drinks, ſuch as acid Wine, acid Malt-liquors, and impure Waters. For, by means of theſe, many viſcid, ſaline, and acrid Crudities muſt neceſſarily be accumulated in the Primæ Viæ; which, being conveyed into the Blood, are not intimately enough mixed and digeſted, nor ſufficiently depurated through the Strainers, particularly through the Emunctories of the Skin; whence the Blood, in conſequence of a difficult Circulation, is rendered cacochymic. And this happens the rather, if, beſides the Paſſions of the Mind, ſuch as Sorrow and Uneaſineſs of Temper, which have great Efficacy in retarding and inſpiſſating the Blood, an idle and ſedentary Life is likewiſe added. For this Reaſon, alſo, Weavers and Taylors more frequently labour under a loathſome Itch of the Hands, and even a cruſty one of the Legs and Shins, with a pale Face, and a ſomewhat tumid State of the Body, in conſequence of their coarſe Method of Living, and Omiſſion of Exerciſe.

The Prognoſtic which we now come briefly to explain, varies according to the Variety of the Diſorders: And, firſt, it is to be obſerved, that an Itch, communicated by Contagion, is more eaſily cured, ſince, adhering only ſuperficially, it has not taken deep Root in the Skin, than that, which draws its Origin from a native Dyſcraſy of the Blood and Humours. The moiſt Itch, likewiſe, and particularly when it is not very much ſpread, is generally more mild and ſlight than one of the dry, pruriginous Kind: For the latter fatigues the Patients Night and Day with an almoſt intolerable Itching, and by interrupting Sleep impairs the Strength. Patience, therefore, muſt be injoined, becauſe ſo great an Impurity of ſerous, acrid, and lixivial Juice cannot be ſuddenly temperated, diluted, corrected, and gently diſcharged. Beſides, all cutaneous Diſorders, when recent, are more eaſily cured, than thoſe which are become inveterate, and confirmed by Length of Time, or a Want of due Care: And theſe, again, are more eaſily cured in young Perſons, by reaſon of their free Tranſpiration, than in thoſe more advanced in Years; ſince the latter, according to *Celſus*, are very ſubject to chronical Diſeaſes. The Diſorders of the Skin, which proceed from an internal Fault of the Viſcera, are not only removed with more Difficulty, and indeed not at all, unleſs the Corruption of the Viſcera is firſt taken away, but they are, alſo, eaſily renewed, and return afreſh; and ſometimes degenerate into an Hectic and Dropſy. From hence we may eaſily judge, in what manner we ought to form a Prognoſtic, if ſuch Diſorders invade after intermitting Fevers, the Small-pox, the Meaſles, and the *Lues Venerea*. Beſides, all ſubcutaneous Diſorders are more obſtinate, if there are obſerved, in the muſculous and pinguedinous Parts of the Back and Arm, ſmall Nodes in the Shape of Glands, externally inviſible, but internally palpable, like Vetches, Beans, and Peas; a manifeſt Indication, that not the indurated Glands of the Skin, but the viſcid Humour, ſtagnating in the Membranes and pinguedinous Cells, is the Cauſe. But eſpecially with reſpect to the Elephantiaſis, which is commonly the higheſt Degree of cutaneous Diſeaſes, *Aretæus*, *Lib.* 8. *Cap.* 13. forms the following Prognoſtic: "Medicines, "a proper Regimen, Inſtruments, and Fire, ſhould concur to-"gether at the ſame time, for the Cure of cutaneous Diſorders. "And, if you apply theſe to a recent and growing Diſorder, there "are ſome Hopes of Recovery. But if it is arrived at the laſt "Stage, fixed in the Viſcera, and, beſides, invades the Face, then "all Hope of the Patients Health is entirely deſtroy'd." When the Small-pox or Meaſles follow an Herpes Miliaris, infeſting the Head with Tooth-achs, Head-ach, Catarrhs, and Defluxions, the Caſe is not without Danger: And ſometimes, after the Death of ſuch Patients, I have known a morbid, black, and ſphacelated Space found in the Crown of the Head. The Leproſy was at all times eſteemed very contagious; and therefore have Phyſicians thought it proper, that leprous Perſons ſhould be ſeparated from the Society of Men, and baniſhed out of Cities into ſolitary Places; tho' I have often, and but lately, ſeen a Man of Learning, who, labouring under the true Symptoms of a Leproſy, has been converſant with his Domeſtics, for a Year and more, without any Prejudice to them. But it is otherwiſe in *Greece*, where this Kind of Diſeaſe is much more contagious.

As to the proper and ſecure Method of curing theſe Diſorders, we muſt obſerve, that the Antients were very well ſkilled both in diſcovering and curing moſt Diſeaſes of the Skin; and the more ſo, becauſe the two principal of them, the Leproſy and Elephantiaſis, which conſtitute, as it were, the higheſt Degree of cutaneous Diſeaſes, were very frequent in their Countries, and afforded them a convenient Opportunity not only of knowing thoroughly the particular Characters of theſe Diſtempers, but, alſo, of diſcovering better the true Efficacy of the Remedies adapted to their Cure; ſo that it is now eaſy for us to adapt our Meaſures to the leſs Degrees, and ſlighter Species of the Skin. But above all the reſt, as the moſt ſerviceable to our preſent Purpoſe, I prefer that moſt accurate Obſerver *Aretæus*, who, in his Deſcription of the Elephantiaſis, *Lib.* 4. *Cap.* 13. ſo naturally, and, as it were, to the Life, paints the Diſpoſition and Progreſs of this horrid Misfortune, that it evidently appears, that the whole Maſs of Blood and Humours is entirely viſcid, tenacious, and almoſt coagulated, and the ſpirituous Principle of the vital Juices abſolutely depreſſed; ſo that by this means the ſalutary Secretions and Excretions being ſuppreſſed, the whole Body abounds with tenacious, acrid, and corrupt Humours. And, for the Removal of theſe Cauſes, he propoſes this excellent Method of Cure.

After

After Bleeding, he preſcribes Milk mixt with a fifth Part of Water to be given for Drink, to render the Body ſoluble; and Veratrum, by which he means white Hellebore, to be taken every other Day in Spring and Autumn. He alſo thinks the Shavings of Elephants Teeth an excellent Medicine, given with Wine, and the Fleſh of Vipers, either reduced to Troches, or boiled with Squills and Broths; and, for this Purpoſe, he greatly extols all Medicines prepared from Vipers. Among Externals, he adviſes thoſe things, which deterge and reſolve Tumors; and orders the Sordes to be waſhed off with Soap in a Bath. He alſo preſcribes a Bath, in which have been boiled the ſharp-pointed Dock and Sulphur, as a very great Detergent. For removing the Tumors, he orders the Fat of a Lion and Bear, mixt in equal Portions with alkaline Salt; but for mitigating the ſharp Fluxions, and appeaſing the Exulcerations, he propoſes a Decoction of Fenugreek, Barley, and Oil of Roſes, both for the ſake of deterging and moiſtening; and, if the Fleſh is livid, he firſt orders a Scarification to be made, that the Part may be render'd ſucculent: For Food, which ought to be plain, of a laudable Juice, and eaſy of Concoction, he ſtrongly recommends a Decoction of Cabbage, with a Solution of Cumin: For Supper, the *Staphylinus*, Carrot; among Sea-ſubſtances, Oyſters and Rock-fiſhes; among Birds, Partridges and Pigeons; among Fruits, Summer-fruits and ſweet Wines. Nor does he think leſs Regard ſhould be had to Sleep, Watchings, and Places choſen for Habitations, as well as to the Exerciſes of the Body, which he orders to be carried on by Running, Talking, and various Contorſions of the Body; and to be continued properly without Laſſitude. *Aretæus*, alſo, greatly extols the Efficacy of white Hellebore in this Diſeaſe; for he calls it the moſt efficacious of all Purgatives, free from every peccant Quality, which, in a ſmall Quantity, and moderate Doſe, was the only Remedy for all inveterate Diſeaſes, that had taken deep Root, and which render'd a difficult Reſpiration eaſy, and a pale Complexion gay and florid.

Celſus, *Lib.* 3. *Cap.* 25. propoſes a Cure, not unlike this, for the Elephantiaſis. "Immediately at the Beginning of the Diſ-"order, Blood ſhould be taken away, for two Days, or the Body be "render'd ſoluble with black Hellebore: Abſtinence then, as far "as it can be ſupported, muſt be uſed; then the Strength a little "repaired, and the Body render'd ſoluble: After this, when the "Body is eaſed, Exerciſe is neceſſary, and, eſpecially, Running: "Sweat muſt, alſo, be provoked, firſt, by Exerciſe of the Body, "and, then, by a dry Heat. Friction ſhould be uſed, and Care "taken, in the mean time, that the Strength be preſerved; and "Bathing ſeldom uſed. The Aliment ought neither to be pin-"guious, glutinous, nor flatulent. Wine, beſides, is properly "given on the firſt Days. Plantane triturated, and uſed by way "of Ointment, ſeems to preſerve the Body beſt."

From a due Conſideration of all theſe Things, we may conclude, that the whole Method of Cure, and all the Powers of the Remedies, ought to aim at, and, as it were, conſpire together to diſcharge out of the Body the Maſs of corrupt, glutinous, and acrid Humours, by ſufficient Bleeding and Abſtinence, by Purges, both gentle, as Milk is; and draſtic, as Hellebore: Then, that by congruous Aliments, and a proper Regimen of Diet, Juices of a laudable Quality, and agreeable to Nature, may be generated; and, laſtly, that by external, deterſive, conſolidating, and drying Remedies, the Parts may be freed from Pains, Tumors, Itching, and Ulcers. And indeed theſe Intentions of Cure, as well as the Medicines propoſed for anſwering them, are very proper and expedient. We ſhall therefore, from the Antients, take our Methods of Cure; not only for the Elephantiaſis, but, alſo, for more gentle Diſeaſes of the Skin, ſuch as the Itch, Herpes, and Gutta Roſacea. But, ſince all theſe exanthematous, ulcerous, and pruriginous Diſorders, differ widely from each other, in reſpect to Places, Patients, and Temperaments, and, likewiſe, in regard to the Habit of Body, and Manner of Life, and ſince, in this learned Age, the healing Art is ſupplied with efficacious Remedies, we ſhall act moſt judiciouſly, if we confine the Method of the Antients within certain Bounds, and purſue it, in our Climate, with ſome proper Cautions.

And, firſt, as to diminiſhing the depraved Humours by various Bleedings, it muſt be obſerved, that the Quantity of Blood, to be evacuated by opening a Vein, ſhould be eſtimated from the different Redundancy of it, according to Age, Strength, and Cuſtom. Nor are old Perſons, who have been accuſtomed to artificial or natural Evacuations of the Blood, to be entirely diſſuaded from ſuch Diminutions: For I have known Inſtances of old Perſons, both Men and Women, after the Age of Fourſcore, whoſe Veins have been open'd, in ſeveral Diſeaſes of the Skin, with remarkable Advantage; or in whom natural Excretions of the Blood have been revived by an hæmorrhoidal Flux, with Relief: But if the Patients are fat, and of a ſpongy Habit of Body, where there is generally found a large Quantity of Veins, and a Smallneſs of them, I have obſerved it to be a more ſpeedy and ſecure Method of Relief, to diminiſh the Maſs of Blood and Humours by Scarifications, made at a convenient Seaſon, eſpecially when the Strength, impaired by the Length of the Diſorder, and want of Appetite, has required only a moderate Depletion: Nor is this kind of Remedy always ſufficient, when hypochondriac Perſons, and thoſe afflicted with hæmorrhoidal Diſorders, fall into ſuch Diſtempers. But then it is more expedient to attempt and contrive a due Evacuation of Blood, by Leeches applied to the Anus.

It ſometimes happens, that ſome Patients, in which a Plethora rather of a ſerous than of a ſanguine Kind offends, bear a copious Diſcharge of Blood very ill. In this Caſe, therefore, other Meaſures ſhould be taken; and if a voracious Appetite, as it frequently happens, gives Riſe to the Diſtemper, Abſtinence, in Conjunction with proper Cautions, ſhould be recommended for the Cure: But this ſalutary Method principally conſiſts in this, that the Patients abſtain from all pinguious, boiled, and glutinous Fleſhes, ſuch as Pork and Beef are; from Milk-meats, and all Things which inflate, and afford much Nouriſhment; and rather uſe Fleſhes well roaſted, and light, ſuch as thoſe of Birds, Partridges, Chickens, and Pigeons; and ſometimes Biſcuit; interpoſing, to preſerve a Solubility of the Body, Raiſins, boiled Damaſcene-plumbs, laxative Apples, and other lubricating Subſtances of this Kind. But, ſince a ſudden Change of Food is often prejudicial, this Remedy of Abſtinence ſhould be enter'd upon in ſuch a manner, that the Patients, not altogether, and at once, but rather inſenſibly, and, as it were, by degrees, deſcending from a plentiful to a more ſcanty Diet, may accuſtom themſelves to it imperceptibly, without Damage, and continue it, according to their Circumſtances, for ſeveral Days or Weeks. This Caution is equally neceſſary after the Cure, that we may not ſuddenly aſcend again to a plentiful Diet.

Beſides theſe, under the whole Progreſs of this Cure, drinking Malt-liquors, at other times cuſtomary, ought to be prohibited, ſubſtituting in its Room large Quantities of Decoctions, prepared of ſuch Ingredients as contribute to purify and ſweeten the Juices, dry up the ſuperfluous Humours, and corroborate the ſolid Parts; ſuch as the mild and frequently uſed Roots of China, Sarſaparilla, ſharp-pointed Dock, Vipers-graſs, Succory, Liquorice, and Polypodium; the Barks of Saſſafras, Caſcarilla, Cinnamon, Miſſelto; the Shavings of Saſſafras, and red Sanders, and others of the ſame Kind; which, according to the various Intentions propoſed, may be variouſly mixed with each other, and ſo boiled in pure Water, two Pints, or a *Meaſure*, of which may be allowed for each Ounce of the Ingredients.

But it is likewiſe proper, for the Progreſs and Completion of this Cure, to free the Primæ Viæ from the Colluvies of vitiated Humours, by gentle Purgatives; which ſhould be repeated often, as well during the Cure, as after it is finiſhed. This Deſign may beſt be anſwered by Remedies gently evacuating; among which we juſtly reckon Infuſions of Manna, Rhubarb, Sena-leaves, Cream of Tartar, the bitter purging Salts, Caſſia, the Herbs Fumitory and Dodder of Thyme; together with the Roots of Succory and Polypodium, prepared with Water and Wine.

But if the growing and refractory State of the Diſeaſe raiſes a Suſpicion of Malignity, or, in ſome, ſeems not to yield to Abſtinence, it is expedient to uſe more powerful and efficacious Remedies, as well from the Claſs of Purgatives, as of Diaphoretics, and Cleanſers of the Blood, that the tenacious and viſcid Humours, by which the Paſſages of the Viſcera are infarcted, and a continual Pabulum ſupplied to the Diſtemper, may the better and ſooner be diſcharged, both by Stool, and all the Emunctories of the Body. Now the moſt antient Fathers of Phyſic, *Hippocrates*, *Aretæus*, *Galen*, and others, have, for this Purpoſe, greatly recommended the moſt draſtic Purgatives, eſpecially Hellebore, both white and black, Coloquintida, and Scammony. But ſince, in our Days, we are acquainted with more efficacious and ſafer Remedies, we juſtly reject theſe, and uſe the Root or Reſin of Jalap, the Extract of black Hellebore, Elaterium mixed with Mercurius dulcis, or Æthiops Mineral, and Gum Ammoniac; and, among compound Remedies, the Extractum Panchymagogum Crollii, in the Form of Pills: Or, if a Powder is more agreeable, it may be prepared of a few Grains of the Reſin of Jalap, mixed with equal Quantities of ſweet Almonds, and Mercurius dulcis; to which a Drop or two of the Oil of Mace, or of the Oil of Saſſafras, may be commodiouſly added.

Among thoſe Things, which, by ſtimulating the ſolid Parts to an excretory Motion, ſomewhat more powerfully colliquate the tenacious Humours, the Wood Guaiacum, with its Bark, is to be preferred above all others, which as, by a proper Uſe, it is very often, alone, ſufficient entirely to eradicate the Lues Venerea, ſo, likewiſe, is it no deſpicable Remedy, in deſtroying ſubcutaneous Diſorders, which are of a Nature ſtill more mild. Beſides this, we may, in a particular manner, refer to this Claſs, Medicines obtain'd from the mineral Kingdom; among which the moſt conſiderable are, the tartarized and acrid Tincture of Antimony, medicinal Regulus of Antimony, Sulphur of Antimony, corrected in *Glauber*'s Method, Preparations of Cinnabar, and, if a Venereal Taint is ſuſpected, a Decoction of crude Antimony: Which Medicines, given in a convenient Doſe, and in the Morning, with purifying Decoctions, to be drank in Bed, or added to other Diaphoretics, afford very great Relief, ſince, by moving the Lymph, they open the Obſtructio is

of

of the glandular Tubes, and, conſequently, very efficaciouſly depurate the Blood and Lymph.

Though theſe Remedies already propoſed to depurate the Maſs of Blood and Humours are of great Efficacy; yet there are Caſes, ſuch as the Elephantiaſis, and Venereal Itch, where the Cauſe of the venomous Taint being more deeply fixed, little Benefit and Advantage is procured from them, but ſtronger Remedies are ſtill required; than which, if the Patient's Strength permits, none are more powerful in ſubduing and deſtroying the moſt obſtinate Diſeaſes of the cutaneous Kind, than Mercury, and its Preparations, the ſubtile Particles of which, by entering and penetrating into the inmoſt Receſſes of the Veſſels, correct, extricate, and diſſolve the viſcous Humours impacted in them, and, by increaſing the ſyſtaltic Force of the Fibres in the whole Body, expels them through the Emunctories of every kind, by Stool, Sweat, and eſpecially through the ſalival Glands and Ducts, by means of a copious Diſcharge of Saliva. And by this ſtated, and, as it were, univerſal Evacuation, it generally happens, that all the impure Sordes are quickly, though with ſome Trouble, eliminated, and the whole Body, by that means, purged, and, as it were, reſtored to a new State and Condition.

But there are various Methods, propoſed by Phyſicians, for giving Mercury, which we will briefly examine. Thus, there are ſome who make an Unguent of live Mercury, thoroughly extinguiſhed with Pomatum, adding Flowers of Sulphur and Camphire, with which the Joints, Ancles, Knees, Elbows, and Soles of the Feet, are to be well rubbed, in order to promote a Salivation. But others chuſe a better and ſafer Method of uſing Mercury, internally; whilſt, by a previous Preparation of the Body, by means of Alteratives, Correctors, and Evacuants, Mercurius dulcis, duly prepared, and mixed with double the Quantity of Crabs-eyes, and diaphoretic Antimony, is duly exhibited; riſing gradually from three or four Grains to one Scruple. By this means a ſufficiently large Diſcharge of Saliva is excited, and muſt be carried on, under a due Regimen, and with proper Cautions, ſometimes interpoſing Decoctions, for depurating the Blood, for one or two Weeks. This Intention is, alſo, anſwered by alterative and diaphoretic Preparations of Mercury, ſuch as the Mercurius Solaris, and Jovialis, of which a few Grains, mixed with Conſerve of Roſes, may, for ſome Weeks, with great Advantage, be exhibited every Morning, drinking, in Bed, after it, under a diaphoretic Regimen, about a Pint of ſome proper Decoction. But it muſt be obſerved, that each of theſe Methods of Cure require an Air very temperate, a ſpare, thin Diet, and a careful Abſtinence from the Uſe of pinguious or boiled Fleſh, and Acids.

But it often happens, that we muſt proceed in a Method much more mild and gentle, when neither Purgatives, nor copious Bleedings, nor Decoctions with a drying Diet, nor Mercurials themſelves, can ſafely be admitted. For, if the Patient is either an Infant, or too old, the Vigour of the Body and Strength impaired, the nervous Syſtem highly delicate; if the Body is found rather dry and lean, than pinguious and lax; or if the Acrimony and Mordacity, rather than the Thickneſs and viſcid Tenacity of the Humours offends; then muſt we enter upon a Method quite different: And, in this State of the Diſorder, not only the Antients, but, likewiſe, the moſt judicious of the Moderns, have greatly extolled Preparations of Milk, and eſpecially Aſſes Milk, the Whey of Cows and Goats Milk, and Milk mixed with Water. Thus, beſides *Hippocrates*, *Celſus*, and *Aretæus*, who, in their Writings, attribute an extraordinary Virtue to Milk, *Dioſcorides*, particularly, *Lib.* 2. *Cap.* 7. thinks a Cure with Milk, properly managed, highly beneficial in an Itching on the Surface of the Body, in Spots, and a Depoſition of peccant Humours on the Skin. But in the Book already cited he recommends Whey for cutaneous Affections, in theſe Words: "Whey is properly given to thoſe whom we intend to purge "gently againſt the Leproſy, Elephantiaſis, and Effervescences "breaking out through the whole Habit of the Body." And indeed the Power of this dietetic Remedy is very great, as it not only dilutes, and renders fluid, the thick, viſcid, and almoſt coagulated Humours, opens the obſtructed Paſſages of the Viſcera, and, by temperating the acrid Saltneſs of the Humours, moiſtens the dry Parts, and relaxes thoſe which are conſtricted, but, alſo, gently eliminates, expels, and evacuates the noxious Humours, both by Stool and Urine.

Since it is of no ſmall Conſequence to determine both the Quantity and proper Time of drinking Milk and Whey, we ſhall be in the leaſt Danger of erring, if we take the Antients for our Guides in theſe reſpects. Among theſe, then, *Hippocrates*, *in Lib. Epid.* 7. adviſes to drink Aſſes Milk, or Whey, eſpecially that of Goats Milk, for ſeveral Days. And, *Lib.* 9. *de Intern. Affect.* he ſays, he preſcribed Milk, with an Addition of a third Part of Hydromel, for forty-five Days. That Whey may be taken for ſome Months, and longer, both *Sylvaticus* and *Riverius* affirm, who uſed it in very violent Diſorders of the Skin, for twelve, twenty, and forty Days, with good Succeſs; for which Reaſon they beſtow great Encomiums upon it. Of the ſame Opinion is *Hugenius*, *Epiſt. & Conſultat. Medic. Tom.* 2. *Lib.* 1. who thus recommends drinking of Whey in a large Quantity, for a conſiderable and inveterate Itching of the whole Body: "They, ſays he, who drink a ſmall Quantity of "it, are diſappointed in the Deſign of Alteration or Expurga"tion. Let the Quantity, therefore, be eight Pints, or more, "a Day." And, *Lib. citat. Tom.* 1. *Lib.* 12. *Epid.* 1. he aſſerts, that he uſed to give this Whey, in the ſame manner the medicinal Waters are uſually exhibited. Thus, for Inſtance, the firſt Day he exhibits ſix Pints, with three Ounces of the ſolutive Syrup of Roſes. The next Day he gives only ſimply Whey; continuing, for twenty Days ſucceſſively, to raiſe the Quantity gradually to nine or ten Pints.

Whenever theſe exanthematous Diſorders are maintained and ſupported by a ſcorbutic Lues, or hypochondriac Affection, which frequently happens, a much greater Advantage will be procured, when the above-mentioned Courſe of Milk is ſo managed, as to be calculated and adapted to alleviate the other Diſorders with which they are complicated. For which Purpoſe we can hardly find a better Method of Relief, than the due Uſe of medicinal Waters, eſpecially thoſe of a temperate Kind, impregnated with a ſaline and ſpirituous Principle, ſuch as the *Selteran* Springs, or thoſe of *Toenſtein*, *Wildungen*, or *Egra*, mix'd with an half or a third Part of Milk, uſed under a due Regimen; as alſo after the previous Uſe of Evacuants, and other Medicines, which are alſo to be interpoſed.

But if theſe Waters cannot be had, the End will be beſt anſwer'd by a Decoction of ſuch Herbs as depurate the Blood, and are particularly deſtined to theſe Diſorders, with Milk or Whey, both ſweet, and ſomewhat ſour. The moſt conſiderable of theſe Herbs are Fumitory, Dodder of Thyme, common Dodder, Baum, Spleenwort, Marſh-trefoil, Brooklime, Dandelion, Borrage, Endive, Succory with its Root, together with many others; which partly, being furniſhed with a penetrating volatile Salt, incide and diſſolve the viſcid Humours, depurate the impure Juices, and reſtore a proper Balſam, *i. e.* Quality, to the Blood; and partly, by aſſiſting the languid Digeſtion of the Stomach with their bitter balſamic Principle, conduce greatly to a Regeneration of laudable Blood. Nor are thoſe, therefore, fruſtrated, who, after having prepared their Body, take of the Juice of the before-mentioned Herbs, freſh and contuſed, an Ounce, or more, with Whey, for ſeveral Weeks.

Laſtly, Among the beſt Remedies for violent Diſorders of the Skin, we may, alſo, reckon the Uſe of Vipers, which is very highly eſteemed both among the Antients and Moderns, and, therefore, not to be omitted. In *Hippocrates*, indeed, there is no one Paſſage, that I know of, which injoins the Uſe of Vipers. But *Aretæus*, *Galen*, *Aetius*, and, among the *Arabians*, *Rhaſes* and *Avicenna*, not only highly extol the Virtues of theſe Animals in the Cure of the Leproſy, Elephantiaſis, and all Diſorders of the Skin ariſing from a malignant Impurity, but, alſo, promiſe a wonderful Renovation of the whole Body by their means. *Andromachus*, firſt Phyſician to *Nero*, made Troches of Vipers the principal Ingredient of his *Theriaca*, or grand Alexiterial Medicine. And the beſt Phyſicians of *Italy*, *France*, and *Germany*, *Mercurialis*, *Quercetan*, *Solenander*, *Ballonius*, and others following theſe, have, likewiſe, beſtowed great Commendations on Vipers; till *Julius Palmarius*, a Phyſician at *Paris*, *Lib. de Morb. Contagiis*, *Cap.* 9. ſharply reprehended the Promiſes and weak Credulity of the Antients in this reſpect, enforcing his Opinion by the Teſtimony of *Joannes Fernelius*, who aſſerted that Medicines prepared from Vipers, and exhibited to Perſons afflicted with an Elephantiaſis, had never produced any ſalutary Effect, ſince neither the Conſtitution of the Viſcera was made better, nor the verrucous Blotches, nor the increaſing Deformity of the Skin amended; but all the Symptoms rather exaſperated. Nevertheleſs, there have been, and ſtill are, many amongſt the Moderns, who, giving Credit to the Antients, and long Tradition, perſuade themſelves, that there is a peculiar, and, as it were, ſpecific Virtue in Vipers, and Decoctions or Broths prepared from them, againſt cutaneous Diſorders; and, therefore, preſcribe Vipers, procured from *Italy*, often at a great Expence, in different Forms, ſuch as Powders, Troches, or Broths, or even in the Form of a volatile Salt, chymically extracted, with Hopes of the deſired Effect.

But to declare my Opinion freely and ingenuouſly in this Affair; I am fully perſuaded, from many Obſervations, confirm'd by ſatisfactory Reaſons, that no Benefit, ſufficient to encourage the Uſe of viperine Medicines, can be expected from them, in correcting the Impurities of the Blood. Nor does any accurate complete Obſervation occur in the Writings of the Antients or Moderns, from which any one can certainly know and affirm, that the Qualities of Vipers are ſpecific, and directly oppoſite to theſe Diſeaſes; eſpecially as other Remedies were, for the moſt part, mixed with them, or uſed at the ſame time, which render the Effect very doubtful. Thus have I known ſeveral Inſtances, where in an Atrophy, Phthiſis, leprous Pſora, Itch, Tinea Capitis, and other Diſorders of this kind, various Medicines made up of Vipers have either done no Good, or, if they have, it ought rather to be referred to the other Ingredients mixed, and exhibited in Conjunction with them. If any ſalutary Effect, therefore, ariſes from Vipers, it is certainly no other

than may be expected from all other dried Parts of Animals, endued with a certain gelatinous, gently ſulphureous, and volatile Juice; and conſequently theſe extravagant Encomiums on Vipers are of little Value, as they are founded on the Prejudice of Authority only. The remarkable Obſervations of *Zwoelffer* on the *Pharmacopœa Auguſtana*, *p.* 211. relating to Viperine Medicines, are worthy the Peruſal of the Curious.

Since the Cauſes of theſe Diſorders are different, the Cure ſhould likewiſe differ. That we may not, therefore, be led into an Error, we ſhall accurately inquire into and diſtinguiſh between the Cauſes, which bring the particular cutaneous Diſorders on. Thus, if through exceſſive Eating, and a ſedentary Life, the Redundance of the Humours lays a Foundation for the Diſeaſe, Abſtinence and Exerciſe are above all things neceſſary: If crude, viſcid Humours, in Conjunction with an highly phlegmatic Temperament, are the Cauſe, ſuch Medicines as evacuate by Stool, infuſed in Wine, will be ſerviceable, adding, at the ſame time, thoſe things which gently promote Tranſpiration: If the Body is plethoric, and theſe Aſperities and Exulcerations of the Skin ariſe from an Omiſſion of Bleeding, or a Suppreſſion of a critical Diſcharge of Blood, the Cure ought to begin with Bleeding, either by opening a Vein, or by means of Cupping-glaſſes, with the Addition of ſuch Remedies as are adapted to recover theſe ſalutary Excretions: If the Patient is young, lean, and of a choleric Habit, the greateſt Benefit will, all other Circumſtances being alike, be found from diluting Medicines, which correct the Acrimony, and cool the waſting Heat of the Humours, ſuch as Whey, Mineral Waters with Milk, nitrous Preparations, and Doſes of Manna, to promote Evacuation by Stool: If the Weakneſs of the Viſcera and Stomach is obſerved to favour the Generation of impure Juices, Strengtheners of the Stomach, which aſſiſt Digeſtion, will prove very beneficial: But if a Suppreſſion of inſenſible Tranſpiration through the Pores, and an Obſtruction of the cutaneous Ducts is the principal Cauſe, the Phyſician ought to open the obſtructed Orifices of the Pores, by gently diaphoretic Infuſions, and Frictions.

Since chronical and dangerous Diſtempers are terminated by the Itch, and various Eruptions of the Skin, as by their Criſis, great Care muſt be taken not to evacuate by Stool, Urine, or even Bleeding, leſt the virulent Matter ſhould be retracted from the Surface to the internal Parts of the Body. *Joann. Langius*, *Epiſt.* 16. *Tom.* 1. has a remarkable Paſſage to this Purpoſe: "I have "more than an hundred times, ſays he, ſeen an Itch and œdematous Tumors of the Feet, which aroſe after the Criſis of "different Fevers, but eſpecially of a Quartan, ſpontaneouſly "diſappear, without any Aſſiſtance of Medicines. But if Phlebotomy had been then uſed, or any Medicine exhibited, there "would have been great Danger of retracting the Matter of "the Diſorder entirely into the Viſcera, through thoſe Veſſels, "by which it had been expel'd."

This Caution is likewiſe neceſſary, when Nature in a ſalutary manner endeavours to propel Eruptions, and is not of herſelf ſufficient to execute her Deſign: For if, at that time, a Phyſician ſhould adminiſter ſuch Remedies, as retain and repel the Impurities to be removed to the Skin, ſuch as plentiful Bleeding, any Purgatives, Aſtringents, and, in weak Patients, Refrigerants, and eſpecially nitrous Medicines, given in large and frequently repeated Doſes, he will greatly prejudice the Patient, and, by his bold Attempt, convert the benign into a malignant Diſeaſe. At this time the Strength of Nature ſhould rather be aſſiſted in expelling the Impurities by gentle Diaphoretics, which, by a certain active ſulphureous Principle, augmenting the ſyſtaltic Motion of the Fibres and nervous Parts, render the Circulation of the Blood more quick, and determine its Courſe to the Surface of the Body, ſo that by this means the excrementitious Sordes are eliminated by cuticular Exhalation. And Nature herſelf, whom we ought to take for our Guide in Practice, chooſes this Way; as we may conclude, not only from ſpontaneous Sweats, and ſuch as often flow in large Quantities, but, alſo, from many Inſtances, in which the Itch, and other Diſorders of the Skin, eſpecially if they took their Riſe from Contagion, or the Relicts of another preceding Diſeaſe, ſuch as intermitting and continual Fevers, Gout, convulſive Colic, and Aſthmas, have been removed by Sweats ariſing ſpontaneouſly, or excited by Art.

The beſt and moſt proper Medicines for promoting a Diaphoreſis, and rendering the Blood and Humours more fluid, are Infuſions of the Herbs Scordium, Paul's Betony, Scabious, Fumitory, and Carduus Benedictus; the Flowers of Elder, and the Roots of Burnet, and the ſharp-pointed Dock. Theſe Decoctions, if liberally drank contribute very powerfully to the Expulſion of the peccant Matter. To this Claſs, ſays *Hoffman*, alſo, belong, and may be mixed, or interpoſed, with the above-mentioned Infuſions, the Mixtura Simplex, my anodyne mineral Liquor, mix'd with a third Part of the Spiritus Bezoardicus Buſſii, or the ſuccinated Spirit of Hartſhorn. Or, alſo, the diaphoretic Powders, prepar'd of diaphoretic Antimony, Ceruſs of Antimony, and what is analogous to it, the *Materia Kruegneri Perlata*, with an Addition of a ſmall Quantity of crude Antimony, medicinal Regulus of Antimony, diſtil'd Sulphur, and its Flowers; Cinnabar, Æthiops Mineral, and other Subſtances of a like Nature already mentioned in the Method of Cure. And theſe Powders may, in the Evening, as ſpirituous Liquors are in the Morning, be exhibited in a Vehicle of the Waters obtained from the Flowers of Elder, Carduus Benedictus, Fumitory, or Scabious.

Though diaphoretic Medicines ſhould be aſſociated with others, and duly interpoſed, yet by themſelves, they are not ſufficient for producing a Cure; and a Treatment abſolutely diaphoretic, eſpecially in dry Patients, is ſo far from conducing to Health, that it rather augments the Diſeaſe, and, from a ſimple Itch, produces a puſtulous Diſorder with an Increaſe of Itching. Since this is the Caſe, it ſeems abſolutely neceſſary to order not only proper Drinks in choleric Perſons, for Inſtance, weak Decoctions, and Preparations of Milk, and, in Patients of lax and phlegmatic Habits, more ſtrong and ſaturated Decoctions, to be drank in a ſufficient Quantity; but likewiſe to preſcribe Remedies, which evacuate the Sordes of the Primæ Viæ; and, at the ſame time, diminiſh the Viſcidity of the Serum and Lymph, ſuch as Pills render'd efficacious by a due Quantity of Mercurius dulcis, or, in weak Patients, gentle laxative Infuſions, which are to be repeated every ſix or eight Days. But for Infants and Children afflicted with the Itch, I muſt particularly recommend the following Purge.

Take of the Pulvis Cornachini, one Scruple; of Mercurius dulcis, eight Grains; of the Syrup of Succory, with Rhubarb, two Drams; and of Fumitory-water, half an Ounce: Make into a Draught; which however is to be proportioned to the Age of the Patient.

An Itching, eſpecially if Decoctions of the Woods and Sudorifics are uſed, is often increaſed to a Fainting, becauſe the ichorous Exhalations, and highly ſubtle acrid Salts, are, by means of theſe, propel'd in greater Quantity to the Surface of the Body. When this happens, we muſt abſtain from every thing which throws the Humours into Commotions, and rather exhibit Milk, mixed with the Waters of antiſcorbutic Herbs, ſuch as Watercreſſes and Fumitory, Whey, either alone, or impregnated with the Virtues of alterative Herbs, nitrous Preparations, Emulſions, and Baths of ſweet Water.

The Itch, and other Defedations of the Skin, if they recede before their Time, or are treated with external ſulphureous, mercurial, refrigerating Remedies, are immediately attended with a Complication of the worſt Symptoms. In which Caſe, beſides what we have already recommended to expel them, Mercurius dulcis is very efficacious, exhibited rather as an Alterative, than a Laxative; as alſo eight or ten Grains of the Flowers of Sulphur, given with ſome Abſorbent; only we muſt omit the Sulphur, while the Mercury is taking; but we muſt refrain from both, if the Diſorder is accompanied with any Degree of a Fever, which frequently happens.

Tho' Mercury, as it were, ſpecifically deſtroys the malignant Nature of cutaneous Diſorders; and tho' Relief is often hoped for in vain from other Remedies, if it cannot be obtained from Mercurials internally exhibited; yet a Salivation is very cautiouſly to be undertaken and entered upon in theſe exanthematous Diſorders, eſpecially if the Patients are cachectic and ſcorbutic. For, unleſs the Humours are previouſly corrected and prepared, the Diſcharge of the Saliva is not only ſlowly made, and attended with an Inflammation of the Fauces, a falling out and blackening of the Teeth; but Vomitings, Gripes, Cardialgias, Diarrhœas, Dyſpnœas, and many other Diſorders, are alſo produced. But ſince a Sweiling of the Tonſils and Fauces, a Relaxation of the Gums, and Difficulty of Swallowing, are almoſt inſeparable from this Method of Cure, the Fauces muſt be treated with Gargariſms, which are lenient, and proper to preſerve the Tone of the Parts; the Body is to be preſerved in a perpetual Diaphoreſis; all hot and acrid Diuretics are to be avoided; and laſtly, with reſpect to the Regimen, the Acceſs of the cold Air, cold Drinks, all acid, ſaline, and crude Aliments, are, as much as poſſible, to be avoided. Beſides, a very exact Judgment is required, that the Cure may not be protracted ſo long as to deſtroy the Strength of the Perſon to be ſalivated; nor the Effect, either thro' the Fault of the Phyſician, or the Patient, prove inſufficient, and the Fomes remain, which may ſupply a new Pabulum for the Diſorder. That we may, therefore, proceed ſecurely in both Caſes, we ought to conſider the Bulk and Conſtitution of the Patient, the Duration of the Diſeaſe, the Quantity of morbid Matter, and the Violence of the Symptoms.

To Infants, indeed, fixed, abſorbent, laxative, and depurating Medicines are more ſafely exhibited, becauſe in them the nervous Syſtem is too weak to bear Mercurials without being injur'd; yet if theſe gentle Remedies do no Service, and the Itch is of the malignant Kind, I have known Mercurials given without Prejudice, provided the Doſe is duly proportioned to the Age, and a proper Regimen ſtrictly obſerved.

In every Species of the Herpes, which ſeizes the Præcordia like a Girdle, and often happens in hypochondriac and arthritic Patients, Diaphoretics, eſpecially of a fixed Nature, and Waters of the ſame Virtues, are an excellent Preſervative; not omitting, however,

however, other Remedies. These are, also, to be used in obstinate Ulcers, and internal Abscesses; since, by their means, the viscid and acrid Humours are commodiously altered, corrected, and gently eliminated.

Nor are Topics to be omitted, the proper Use of which is very advantageous in perfectly curing Defedations and Ulcerations of the Skin. But, since different cutaneous Disorders require different Remedies, I shall briefly and distinctly enumerate the principal of them. When moist Pustules, and running Ulcers, require drying, and when, from an excessive Relaxation of the cutaneous Ducts, a gentle Constriction is requisite, for this Purpose a small Quantity of Flowers of Sulphur, used externally by way of Ointment, by contracting the Skin, hinders the further Discharge of the Matter, and has therefore been esteemed from the Times of *Aetius*, *Aretæus*, and *Oribasius*. This Medicine is to be dissolved in Linseed-oil, and reduced to the Consistence of an Ointment, by the Addition of a due Quantity of Cerus and Tutty. The Unguentum de Alabastro, mixed with Tutty, is, also, no less efficacious in destroying superfluous Moisture. If, Pain, Redness, Heat, and Itching, are joined, the Unguentum de Cerussa, prepared of a Solution of Litharge in austere Vinegar, Cerus and Hog's-lard, seems preferable to all other Remedies, especially if, in order to render it more agreeable, Flowers of Sulphur, and a few Drops of the Oleum Rhodii, are added to it. To mollify and mitigate a dry and painful Itch, a Mucilage of the middle Rind of the Lime-tree, extracted with Rose-water, or with Linseed-oil, Cerus, and a little Saffron, reduced to the Form of a Plaister, is of singular Service.

But, if deep Ulcers are to be purified and consolidated, distilled Oil of Juniper and Bays, or Balsam of Sulphur, mixed with the same Oil and Æthiops Mineral, may be used. Lastly, we must not neglect the cosmetic Ointments, very useful in all Disorders of the Skin, after the Cure, the Method of preparing which we have laid down before. Besides these, some Remedies of the Antients are very proper, and especially that of *Hippocrates*, who, *Lib. Epidem.* 2. recommends Lime-water for an Impetigo and Leprosy, which, according to the Advice of *Sponius*, ought to be so corrected, as to retain nothing of an ulcerating Quality. And the Method of *Sylvaticus*, *Cent.* 1. *Consult.* 22, 23. is equally good, who, after exhibiting two Pints of Goats Whey, mixed with Citron-juice, for fifteen Days, greatly extols the external Use of an Ointment prepared of Sulphur, Nitre, Mercury, and Oil of Sweet-almonds.

As to the particular Cure of a Tinea Capitis by external Applications, having first used all Remedies proper for a Cacochymy, the following Ointment is very efficacious:

Take of the Oil of Yolks of Eggs, one Ounce; of Gunpowder, Tobacco and Flowers of Sulphur, each two Drams; of the Essence of *Benjamin* and *Peruvian* Balsam, each half an Ounce: Make into an Ointment.

After the Use of this Ointment for some Days, the Head is to be washed with a Decoction prepared of equal Quantities of Wine, and a Lixivium boiled with Scordium, round Birthwort, Club-moss, Flowers of Lavender and Myrrh: When these prove ineffectual, some exhibit Preparations of Mercury internally and externally; apply over the Head a Cap, prepared of common Pitch, and Balsam of Capivi; by which means they take off all the Hair, and procure a Consolidation by means of the Oil of Yolks of Eggs. However, I must leave it to others to determine when this violent Method is proper, with this Caution only, that this desperate Remedy should never be applied but in desperate Cases.

Among external Remedies we may, also, reckon Baths, both natural and artificial; which last are commodiously prepared of pure Water boiled with the Roots of Elecampane, and those of the Dock, together with the Herbs Fumitory, Scabious, and Soapwort; and are very successfully used in a leprous Psora and Elephantiasis, after the Use of Internals to purify the Blood, both for strengthening the Tone of the Skin, and washing off the impure and scaly Sordes. Nor do we find less Advantage from Baths prepared with the Scoriæ of Iron or Copper; one of which partakes of the terrestrial, saline, sulphureous Substance of *Mars*; whilst the other is impregnated with a large Quantity of Sulphur, and vitriolic Salt, and consequently very efficacious in strengthening the Tone of the fibrous Parts. And for this Reason Baths of this Kind have proved very serviceable in cutaneous Diseases, arising from an excessive Thickness and Corruption of the serous and lymphatic Humours; such as the Itch, Serpigo, Herpes, and Achors. To this Class of Remedies we may, also, refer Baths of sweet River-water, boiled with Bran, and corrected with a due Mixture of new Milk, which afford great Relief, especially in a dry Itch, and all Disorders accompanied with an extreme Roughness of the Skin, and particularly in the troublesome Itching of old Men.

Since no Medicine at all, unless properly used, is of any Service, and since it is of great Moment to the due performing of every Cure, in what Order, and what Time, Remedies are administred, it will not be improper to add the genuine Method of using these Topics, already proposed with due Caution and Circumspection. I must therefore observe, that external Remedies should always be the last, and never us'd, till the whole viscid, acrid, and corrupt Mass of the Blood and Humours has been reduced to a mild Temperament, by proper internal Correctors and Cleansers. Nor, during the Use of external Applications, should we entirely neglect Internals, especially Diaphoretics, which should rather be continued, that the Impurities, which may accidentally remain within, may be expelled. But if these Cautions are not observed, there arise a thousand Symptoms, much worse than the former, and often attended with the Hazard of the Patient's Life. Thus have I frequently observed, that an Itch seizing some particular Part, the Hands, for Instance, the Legs, the Nape of the Neck or Face, or when suppressed in a preposterous manner, by consolidating Liniments, has excited violent Disorders of the nervous System, as Cramps and epileptic Spasms, Iliac Passion, inflammatory Fevers with Deliriums, Cardialgias, Asthmas, and dropsical Tumors, which are hardly to be cured, but by a Return of the former Distemper. The Curious, says *Hoffman*, may consult my *Medicina Consultatoria*; where, *Cent.* 1. *Case* 28. I have shewn, that a Spitting of Blood, and an Epilepsy, arose from an ill-cured Itch. In the Reflection upon *Case* 9. *Cent.* 1. I have shewn, that it contributed to a Vertigo. But mercurial Ointments are generally used with almost unavoidable ill Consequences. After anointing some Days, the Eruptions, which appeared in a few tendinous and nervous Parts, vanish surprisingly, because, without doubt, the fibrous and nervous Parts of the Skin suffer some Stricture from this active Medicine, by which the Particles of the peccant Humour are partly expelled from the subcutaneous Tubes, and partly repelled to the internal Parts. But certainly, if the Body is not before sufficiently cleansed from impure Sordes, Transpiration is diminished, and the Force of the morbific Matter impetuously determined to the internal Parts, especially those of the nervous and tendinous Kind. Whence, besides other Disorders, I have known fixed arthritic Pains produced.

There is still another cutaneous Disorder, call'd a *Gutta Rosacea*, which is nothing but an unseemly rediish Colour of the Face, attended with little Scales, and sometimes with Pustules and unequal Tubercles, and arising from a more or less impure Serum carry'd to the capillary Vessels of the Face in a large Quantity. But there are several Species of the *Gutta Rosacea*, the most inconsiderable of which is, when a more than natural Redness appears about the Nose, in the Forehead, or certain Parts of the Face. The Disorder is still worse, if it is attended with Scales; and worst of all, if the Face is covered with Pustules and Tubercles. And these different Degrees depend on different Causes in various Patients: For every Gutta Rosacea does not proceed from depraved and impure Juices, which Nature advantageously propels to the Surface of the Body, and Skin of the Face; but is rather, in some, produced by a Turgescence and Distention of the small capillary, or even the lateral Vessels, which at other times convey no coloured Lymph. But it is otherwise, when the Cause of this Eruption is to be sought in the subtle, active, acrid Matter, which, the more volatile it is, the more it penetrates into the Texture of the nervous Membranes, and does far greater Mischief in those Bodies, which are afflicted with a Weakness of the nervous System, and a scorbutic Disposition of the Blood.

The slighter Stage of this Distemper in sound, robust Patients, and those infected with no noxious Taint or Impurity, requires a gentler and less troublesome Treatment; but, arising in such generally from a violent Ebullition of the Blood to the superior Parts, is often happily removed by cooling, diluting and deriving Remedies only. But it is more obstinate in scorbutic Bodies, in which it is never mitigated without such Remedies, as purify the Blood. In such Cases, therefore, I have with very good Success ordered the following Potion to be taken for several Weeks.

Take of the Waters of Fumitory, Brooklime, Water-cresses, and Sorrel, each one Pint; of Goat's-whey, three Pints; of the Arcanum Duplicatum, three Drams; and of depurated Nitre, one Dram: Make up into a Potion, of which one Pint is to be drank in the Morning, and another in the Afternoon, if it agrees with the Stomach.

For others, with an Intention to depurate the Blood, I have prescribed in the following manner:

Take of the Herbs Fumitory, Spleenwort, and Scabious, each one Handful; of the Roots of Succory, one Ounce; and of Caper-bark, half an Ounce: Of these, when mixt, boil one Ounce in two Pints of Goat-whey; and, when the Liquor is strained, let the Patient drink as much as he pleases.

In order to promote a due Evacuation, I, once or twice a Week, order an Infusion of two Drams of the following Ingredients, with the last-mentioned Medicines.

Take

Take of Polypodium, half an Ounce; of the beſt Rhubarb, two Drams; of the Troches of Agaric, and white Mechoacan, each one Dram; of pure Nitre, the Arcanum duplicatum, and Fennel-ſeeds, each half a Dram.

Beſides theſe, eſpecially in more ſucculent Patients, we ſhould not omit Scarifications in the Nape of the Neck, Scapulæ and Back, nor lenient Baths for the Feet, prepared of River-water and Bran, uſing for Drink a cooling Ptiſan, or only Spring-water depurated with calcin'd Hartſhorn; or with Wheat-flour, made palatable with Sugar, and Bark of Citron. Having previouſly taken theſe Meaſures, and other Circumſtances not contraindicating, I apply the following Epithem, which I have found of all others the moſt efficacious.

Take of Frogs Spawn-water, and of the Waters of Elder and Bean-flowers, each two Ounces; of the Aqua ſclopetaria, one Ounce; of the Magiſtery of Lead, two Drams; of the Sugar of Lead, two Scruples; and Vitriol of Copper, eight Grains: Mix, and apply.

But the utmoſt Caution is requiſite in the Application of all Topics. For Experience has fatally taught us, that the worſt Symptoms have followed a prepoſterous Uſe of them in Patients of impure and delicate Habits. Thus I have known Inflammations of the Eyes and Cardialgias produced by them; and I had once an Opportunity of obſerving an Hemicrania produced only by an Epithem prepared of Frogs Spawn-water, a Mucilage of Quince-ſeeds, Citron-juice, and Flowers of Sulphur.

Dr. *Towne* ſays, that the *Elephantiaſis*, which is no rare Diſeaſe among the Negroes, bears a great Affinity to the beſt Accounts we have of the *Lepra* of the *Arabians*.

Thoſe Blacks are the moſt ſubject to it, who, after ſevere acute Fevers, long-continued Intermittents, or other tedious Illneſſes, are either much expoſed to the Inclemency of rainy Seaſons, and the cold penetrating Dew of the Evenings, or are conſtrained to ſubſiſt upon bad Diet, and undigeſtible unwholſome Food.

In the Beginning, the Perſon is weak, cachectical, and emaciated, till the Glut of vitiated Humours ſubſide into the Legs and Feet, which are the Seat of this Diſtemper, and at this time begin to appear œdematous, and puffed up with watry Tumors, as in an Anaſarca; but the Swelling does not retain the Mark of any Preſſure in the ſame Degree, or ſo long, as in that Diſtemper.

By degrees, the Leg becomes more and more tumefied, and the Veins are much diſtended with varicoſe Swellings, which are very apparent from the Knee down to the Extremities of the Toes. Then the Skin begins to grow rugged and unequal; its vaſcular and glandulous Compages are enlarged, and a ſcaly Subſtance, with a ſort of Chops and Fiſſures in the Interſtices, appears upon its Surface. Theſe ſeeming Scales do not dry up, and fall off; but are daily protruded forward, and ſtretched in their Dimenſions, till the Leg is enlarged to an enormous Bulk, ſo that in Size, Shape, and all other external Appearance, it minutely repreſents the Leg of an Elephant, whence the Diſeaſe receives its Denomination.

But, notwithſtanding that this ſcaly Coat appears to be harſh, callous, and inſenſible; yet, if it be touched ever ſo ſuperficially with a Lancet, the Blood will freely ouſe out; and if the Epidermis, which affords this monſtrous Appearance, be pared off to the Thickneſs of the Scarf-skin in thoſe Parts, an Infinity of Orifices of the Blood-veſſels will preſent themſelves to the Eye, when aſſiſted with a Microſcope.

Tho' the Limb continues to proceed to this inordinate Magnitude, yet the Appetite of the Negro remains good, his Digeſtion ſtrong, and his Secretions regular; nor is he ſenſible of any other Inconveniency, than the Burden of carrying ſuch a Load of Leg along with him.

In this Condition, ſeveral have been known to live twenty Years, and even to a longer Period, and have performed chearfully all the Duties of their Servitude, which were conſiſtent with ſuch diſproportionate Limbs.

This Addition of Bulk is generally confined to one Leg at a time; but there have been ſeveral Inſtances, where it has invaded both together.

Amputation of the diſeaſed Leg has been performed many times, but has always failed of a Cure; for the Diſtemper conſtantly takes Poſſeſſion of the remaining Leg.

Sometimes White People, whoſe unhappy Circumſtances have reduced them to Hardſhips but little inferior to what the Blacks are obliged to undergo, have given us Proof, that this Diſeaſe is not limited to one Colour, any more than to one Climate.

The ſame Author, ſpeaking of another cutaneous Diſorder, which he calls the *Joint Evil*, ſays, that many of the Negroes of the *Leeward Iſlands*, as well Natives as thoſe imported from *Guinea*, are ſubject to this Malady, which is equally remarkable in its Appearances, as it is fatal in its Conſequences, being of ſo virulent a Nature, that it eludes the Force of the moſt powerful Remedies hitherto diſcovered.

The Deſcription of it is as follows: It firſt appears in ſuperficial Spots of a brown copper Colour, diſpers'd over ſeveral Parts of the Face, but eſpecially on the Noſe, without Unevenneſs, or Senſe of Pain in the Beginning. Theſe Spots ſpread by ſlow Degrees, till a great Part of the Body is covered with them. Then the Nails curl inwards, and the Extremities of the Fingers and Toes begin to ulcerate. Theſe Ulcers, which never digeſt, but generally look dry, without much Foulneſs or Fetor, gradually creep from Joint to Joint, till they have corroded all the Fingers and Toes. The next Attack this unconquerable Enemy makes, is upon the Trunk of the Body, where it ſpreads in Patches; and at this time the Diſtemper becomes infectious. Theſe Defedations of the Skin never penetrate very deep into the muſcular Fleſh, but extend themſelves in Circumference, and diſcharge a thin Ichor, which inſenſibly dries up, and emaciates the Patient, ſometimes in a few Years; though there have been ſome Negroes under theſe Circumſtances, who have protracted a miſerable loathſome Life for the Space of ten, twelve Years, or longer.

Among the numerous Attempts which I have known made to reſiſt this ſtubborn Diſeaſe, antimonial Preparations afford the greateſt Relief; but I never heard, that they perfected a Cure: On the other hand, all Preparations of Mercury aggravate the Diſtemper, exaſperate the Ulcers, and make them ſpread the faſter. This is conſtantly true, in whatever Form, or with whatever Intention, Mercury be given, whether as alterative, purgative, or to raiſe a Salivation, either internally exhibited, or externally applied.

The Negroes, who are great Pretenders to the Knowledge of ſpecific Virtues in Simples, apply ſeveral Kinds of Plants on theſe Occaſions; but I could never obſerve the leaſt beneficial Effect produced by them.

This being a Diſeaſe not taken notice of (as far as I know) by any Author, I hope I ſhall be excus'd for giving the Deſcription of it; though I am forced to leave it to future Induſtry, and greater Sagacity than my own, to inveſtigate the Cure.

LEPRAS. The Name of a Sea-fiſh, about a Foot long. *Lemery* ſays, it is eſteem'd aperitive.

LEPTOMERES, λεπτομερὴς, from λεπτὸς, ſubtile, ſmall, minute, and μέρος, a Part. This Term is explain'd in that Part of the Preface, where the Medicine of *Aſclepiades* is treated of, who introduced this Word.

LEPTUNON, λεπτύνων. Attenuating.

LEPTYSMOS, λεπτυσμὸς. Extenuation, or Attenuation.

LEPUS. Offic. Schrod. 5.299. Schw. Quad. 103. Mer. Pin. 168. Raii Synop. A. 204. Aldrov. de Quad. Digit. 247. Jonſ. de Quad. 109. Geſn. de Quad. Digit. 605. Charlt. Exer. 23. THE HARE.

However delicious the Hare may be eſteem'd among the modern *Britons*, our Anceſtors thought it a Crime to taſte it, as we learn from *Cæſar*; and in this they agreed with the *Jews*. Tho' the Hare lives on Vegetables and Water only, yet the habitual Exerciſe of this Animal exalts its Salts, and renders it ſomewhat alcaleſcent; and this Tendency is much increas'd, if it is kill'd immediately after being heated by ſtrong Exerciſe.

The Aſhes, Head, Eye, Blood, Lungs, Brain, Heart, Liver, Gall, Kidneys, Teſticles, Uterus, Coagulum, Fat, Dung, Hair, and the Bone called *Aſtragalus*, are uſed in Medicine.

The Aſhes of the entire Hare burnt to a Blackneſs, or of the whole Skin, are recommended in the Stone, an Alopecia, and Chilblains, apply'd externally in the two laſt. The Head cures an Alopecia, and whitens the Teeth. The Eyes are eſteem'd effectual for promoting Delivery, and for expelling the Secundines, and a Mole. The Blood cures Freckles, and Pimples of the Face; and is ſaid to be good in a Dyſentery, the Cœliac Paſſion, and the Stone. The Lungs are good for an Aſthma, Epilepſy, and for Chilblains, as a Topic. The Brain, rub'd on the Gums of Children, facilitates Dentition, and is good for Tremors of the Limbs. The Heart cures the Epilepſy, Pains of the Uterus, and a Quartan. The Liver moderates a Diarrhœa, and hepatic Flux. The Gall is good for an Ophthalmia, and the Tooth-ach. The Kidneys and Teſticles are given for the Stone, to promote Conception, for Incontinence of Urine, and Diſorders of the Bladder. The Uterus, alſo, promotes Conception. The Coagulum, or Rennet, diſcuſſes concreted Blood, promotes Conception, and cures the Epilepſy. The Aſtragalus is recommended againſt the Gravel, Colic, Epilepſy, and for promoting Delivery. The Fat, eſpecially if old, apply'd externally, is ſaid to draw Thorns and Splinters out of the Fleſh, to break Abſceſſes, and to cure Pains of the Teeth. The Dung is recommended for the Stone and Dyſentery, and is eſteemed a good Application to Burns. And the Hairs ſtop Hæmorrhages. *Dale* from *Schroder*.

LEPUS MARINUS. Offic. Charlt. Exer. 51. Rondel. 1. 520. Bellon. Aquat. 437. Geſn. Aquat. 475. *Lepus marinus primus*. Aldrov. Exang. 78. Jonſ. Exang. 9. THE SEA-HARE.

It is taken in the Sea, and, according to the Deſcription of *Dioſcorides*, reſembles a ſmall Loligo, or Cuttle-fiſh. Bruiſed either by itſelf, or with the *Urtica Marina*, (a ſort of Shell-fiſh) and the Part anointed therewith, it extirpates the Hair. *Dioſcor.*

LEPYRION, λεπύριον. The Shell of an Egg; or the Bark of Plants. *Hippocrates.*

LEROS, λῆρος. A ſlight Delirium. *Hippocrates.*

LESEOLUS. *Paracelſus*, in his Book *de tribus primis Eſſentiis*, calls the Jaundice *Morbus Leſeoli*, and informs us, that the *Leſeolus* will cure the Jaundice, and nothing elſe; but I don't find, that he explains it farther.

LESMIN. A Name for the *Jaſminum*; *ſive Sambach Arabum*. Alpini.

LETA. A red Heat. *Rulandus*.

LETCHI. The Name of a delicious Fruit, which grows in *Canton*, and other Parts of *China*, much admir'd by the Inhabitants. It is eſteemed heating, when eat in large Quantities. *Lemery des Drogues*.

LETHARGUS, from λήθη, Oblivion, and ἀργὸς, lazy, ſlothful.

Sleepy Diſeaſes are related to apoplectic and paralytic Diſorders, and often accompany them: The Account of them is ſo confuſed and intricate in moſt Writers, that Readers are entirely at a Loſs, whom to credit: Hence ſome Phyſicians, as *Hollerus* and *Rondelitius*, have made many Complaints of that Confuſion; and *Hartman*, *Riverius*, and *Paulus Barbette*, to avoid this Error, choſe rather to treat of theſe Diſeaſes in general, than any particular Species of them: But, as my Intention is to explain the various Cauſes and Cures of them, I thought it proper to be explicit in the Deſcription of the various Signs: And whatever a diligent and long Experience has taught me, in this Affair, upon reading lately the *Pathologia Cerebri* of *Bartholomew de Moor*, I found exactly agreeable to the Obſervations of that great Man, *Cap.* 7. *de Affectibus ſoporoſis*. I ſhall, therefore, purſue his Method, and retain thoſe Names which he has given to each Species of Somnolency.

By ſleepy Affections I mean, a preternatural Propenſity to Sleep; and that, for the moſt part, an invincible Drowſineſs, ſometimes without, ſometimes attended with, a Fever; ariſing from an Impediment of a ſufficient Influx of the nervous Fluid unto the Medulla Oblongata of the Brain, and the Nerves themſelves deſtined to Senſe and Motion. There are ſeveral Species of theſe Diſorders, the principal of which are, the Coma Vigil, Coma Somnolentum, Carus, and a Lethargy. All agree in this, that there is a preternatural Propenſity to ſleep: They differ, however, with regard to the Degree, Cauſes, and Cure; ſo that it cannot be amiſs to examine accurately the Nature of each Species.

A Coma Vigil manifeſts itſelf by theſe Signs: The Patients complain of a burning and extenſive Pain in the Head, attended with a Senſe of Ebullition within the Head; they are very much inclined to ſleep, and anxiouſly deſire it: They, however, either do not ſleep at all, or, if they do fall aſleep, they awake immediately, but little relieved; but, as yet, free from any Delirium. Nor have long-protracted Watchings preceded this Affection: Whence, thoſe who, after long Watchings, cannot refrain from Sleep, are not to be thought afflicted with this Coma. This Coma, likewiſe, differs from an obſtinate Watching [*Pervigilium*], which is frequent in acute Fevers; for in this there is not any Propenſity to ſleep, which, however, is very troubleſome to Perſons afflicted with a Coma. This Diſorder is always ſymptomatic; for it is often a Symptom in acute, burning, and malignant Fevers, and an Inflammation of the Dura Mater, and, in theſe, often precedes a Phrenſy: And I have known, in ſome Inſtances, the ſame Symptom ſometimes attend an Hemiplegia.

Theſe are the uſual Signs of the Coma Somnolentum: The Patients are languid, altogether free from any febrile Heat, nor have they, commonly, any other Complaints, than a conſtant Drowſineſs; they always ſleep involuntarily, and are often overcome with Sleep at their Meals, in Converſation with their Friends, or in the midſt of their Buſineſs: They awake at Intervals, but, being drowſy again, ſoon after fall aſleep. This Diſorder principally ſeizes old Men, who live luxuriouſly, and neglect Bleeding; nor does it ſpare the Young, when adequate Cauſes concur: It is, likewiſe, always idiopathic, and in this, too, diſtinguiſhes itſelf from a Coma Vigil, in which they who deſire Sleep, cannot procure it; which they, who are afflicted with a Coma Somnolentum, enjoy in abundance.

A Carus is a moſt profound Sleep, out of which the Patients cannot be rouſed by Clamours, Agitations, or even Prickings with a Needle; or, though they ſeem ſenſible of the Stimulus of the Needle, yet either do not ſpeak, or immediately relapſe into their former Sleep. This Diſorder is either idiopathic, or ſymptomatic, and often attended with a Fever: But of this, as *Bartholomæus de Moor* judiciouſly obſerves, *Cap.* 7. *Pap.* 198. there are three Species. The firſt is, that which accompanies acute Fevers, about their Beginning, or their Increaſe, to which ſometimes Convulſions and Hiccups ſucceed, which ſoon prove fatal. The ſecond is, When the Patients, after having laboured under violent acute Fevers, on account of a very great Weakneſs, fall into a profound Sleep, and continue in it for ſeveral Days; being awaked, they anſwer Queſtions, but fall aſleep again immediately, and at length awaking, recover, without remembering any one thing they ſpoke during that Sleep. Such a Sleep, likewiſe, happens in acute Fevers, eſpecially eruptive, about the critical Days; and then, if attended with a Sweat, is a very good Preſage. The third Species of a Carus occurs in Perſons at the Point of Death from a Fever; for, a Day or two before Death, the Patients, exhauſted of all their Strength by the Violence of the Fever, lie deprived of Senſe and Motion, and oppreſſed with a profound Sleep, and under that expire.

Laſtly, the Lethargy, ſo called, ἀπὸ τῆς λήθης, from Oblivion, is an heavy and perpetual Sleep, with ſcarce any Intervals of Waking.

Being awaked, they anſwer; but like thoſe who are prematurely raiſed from a deep and quiet Sleep; but, ignorant of what they ſay, and forgetful, they immediately relapſe into their former Drowſineſs: Some call for the Chamber-pot, take it into their Hands, but, falling aſleep again immediately, forget to make Water; or, gaping, forget to ſhut their Mouths. Thus appears the Difference between that and a Coma Somnolentum. But a Lethargy is accompanied with a Fever, which becomes a Symptom thereof, and is mild, and principally manifeſts itſelf by a Frequency of the Pulſe, and a leſs frequent and febrile Reſpiration: Hence it differs from a Carus, which is often a Symptom, or the Conſequence, of a Fever, and is, likewiſe, attended with an Inſenſibility. It differs, alſo, from an Apoplexy, which invades ſuddenly, with an Abolition of all Senſe and voluntary Motion, and a Stertor; and kills ſooner than a Lethargy, as it is ſeldom continued longer than the ſeventh Day.

Having premiſed thus much, we ſhall add ſome anatomical Diſſections of Perſons who have died of theſe Diſorders, and then enter into an accurate Examination of the Cauſes. The learned *Bonetus*, in his *Sepulchretum Anatomicum*, *Lib.* 1. furniſhes us with Diſſections of Perſons, who have expired in ſleepy Affections. It would be too tedious to recount all the Inſtances he produces; it ſhall therefore ſuffice, to quote the principal Heads of them: Thus he found, in many, a copious Serum diffuſed through the Subſtance of the Brain, yet in ſuch a manner, that the exterior or cortical Part of it, with the Meninges, was principally overflowed with Water: And he likewiſe remarks, that in ſome he found the interior Parts and Ventricles of the Brain, the Cortex being entire, replete with extravaſated Serum; but theſe Subjects were never, through the whole Courſe of their Lives, afflicted with a ſleepy Affection. The more this Inundation of the Brain penetrated into the Medulla thereof, the greater Degree of Sleepineſs he obſerved to have continued during Life. Farther, in ſome, who died of Drowſineſs, he found Abſceſſes, Scirrhoſities, and Tumors, in the Brain; but thoſe, alſo, poſſeſſed only the anterior and cortical Region of it. And, laſtly, in ſome, the Brain being dry, and free from a ſerous Colluvies, he obſerved the Veſſels of the Pia Mater particularly very much diſtended with thick Blood, and in a manner varicoſe. In Lethargics eſpecially, *Joannes Faber Lyncius*, as *Harendez*, *Lib.* 4. *Cap.* 18. teſtifies, obſerved the Membranes of the Brain inflamed.

For the Illuſtration of the Nature of theſe Affections, we will add ſome Obſervations relative to them. *Wepfer* and *Peyer* have taught us how to procure Sleep, by Art, in Dogs, by a greater or leſs Compreſſion of the Brain, when deprived of the Cranium: And there is a very remarkable Inſtance of a Beggar at *Paris*, who, by ſome Accident, had loſt Part of his Skull, ſo that his Brain was laid bare: He, from a ſlight Compreſſure of the Brain, ſuffer'd a Dimneſs of Sight; from one a little more violent, a Ringing in his Ears; from one ſtill more violent, a Vertigo, and Sleepineſs; and, when the Preſſure ceaſed, he was again freed from theſe Symptoms. This Obſervation is greatly illuſtrated by the common Practice of Trepaning; by which, in Subjects affected with a Sleepineſs, from an Extravaſation of the Blood, made between the Cranium and the Brain, and the conſequent Preſſure, the ſtagnating Humour being diſcharged by the Help of the Trepan, we are aſſured, from Obſervations of undoubted Credit, that the Senſes immediately return, and all Drowſineſs is removed. From hence we certainly conclude, that the material Cauſe of ſleepy Affections is primarily and originally contained within the cortical Subſtance of the Brain.

Now, from Phyſiology, we learn, that natural Sleep depends upon a more diminiſhed, and more languid Influx of the nervous Fluid into the Nerves deſtined to Senſation, and voluntary Motions; and that this languid Influx is partly owing to the Relaxation of the Nerves themſelves, partly to a Want of nervous Fluid, partly to the ſlow Circulation of the Blood through the Veſſels of the Brain, and Membranes. Upon comparing this with what has been ſaid in the preceding Paragraphs, it follows, that the immediate Cauſe of ſleepy Affections is a very languid and diminiſhed Influx of the nervous Fluid, from the cortical Subſtance of the Brain, into its Medulla; and from thence into the Nerves deſtined to Senſe and Motion. The Cauſes of the preternatural Impediment of this Influx ſeem principally three; firſt, either a too great Want of the Fluid itſelf; or, ſecondly, a Laxity of the Tubes which convey it; or, laſtly, a Preſſure upon the cortical Subſtance of the Brain; and this ariſes either from the Blood paſſing ſlowly through the Brain, and the Meninges thereof, or abſolutely ſtagnating, or ſome foreign Matter incumbent on the ſaid cortical Subſtance, by which the Medulla, everywhere joined to the Cortex, is preſſed together, and, conſequently, cannot receive a ſufficient Quantity of the Fluid.

But, ſince there are ſeveral Species of ſleepy Affections, let us inquire into each of them more accurately. A Coma Vigil is an intermediate Diſeaſe between a Pervigilium, and ſleepy Affections. Where there is an inſatiable Deſire of Sleep, though it cannot be obtained, it is a Symptom either of an Hemiplegia, or acute Fevers, eſpecially when attended with an Inflammation of the Dura Mater, and often precedes a Phrenſy. Any one will eaſily perceive, that the Cauſe of this muſt be mixed, by which the Influx of the nervous Fluid into one Part of the Brain is more languid, into another more increaſed. Let us, therefore, conſider, whether ſuch a Cauſe can take place in theſe Diſorders. As to acute Fevers, we argue thus: If in them a Coma Vigil generally precedes a Phrenſy, which proceeds from an Inflammation of the Membranes of the Brain, and, in our Country, very often ſymptomatically attends malignant eruptive Fevers; if, likewiſe, it is joined with an hot and fervent Pain, it ſeems very probable, that a Coma Vigil in thoſe Fevers is cauſed by a Beginning Inflammation in one Part of the Membranes ſurrounding the Brain: But as the Inflammation ſuppoſes an increaſed Collection of Blood in a certain Place, and a Stagnation, it neceſſarily follows, that ſome of the cortical Part of the Brain is compreſſed thereby, and conſequently that the Influx of the Fluid into the Medulla is diminiſhed, with the ſubſequent Effect of Somnolency. While this happens in one Part of the Brain, yet in another, from the Blood being quickly agitated by a febrile Motion, an uninterrupted Secretion of the nervous Fluid continues; which, the more copious it is, the more does it bring on Watchings; nor does it ſuffer the preſent Inclination to ſleep to be put in Execution. Whatever, therefore, in acute Fevers can increaſe the Orgaſm of the Blood, and aſſiſt its more copious Progreſs to the Head, that contributes remotely to bring on a Coma Vigil, as ſpirituous, hot, alexipharmic Medicines, a Regimen too hot, and Refrigeration of the Extremities in the Small-pox.

There is no Difficulty in accounting for the Method, by which a Coma Vigil may be joined with an Hemiplegy: For if we conſider, that in this Affection the Beginning of the Nerves is compreſſed only on one Side, and ſo the Influx of the moveable Fluid into one Side only impeded, while the other is free, we ſhall ſoon underſtand, likewiſe, that the Cauſe of the Watching may exiſt in one Place, or Side, and of the Somnolency in another, of which the Coma Vigil conſiſts; becauſe the nervous Juice, the Secretion being prevented on one Side, is carried in greater Plenty to the other; which is proved, among other things, by the convulſive Agitations of the ſound Side. But why are not all Perſons afflicted with an Hemiplegy, ſeized with a Coma? Read what we have collected above from *Bonetus*, and you will find, that a Compreſſure on the Beginning of the Nerves only, is not always attended with Somnolency, unleſs the cortical Subſtance of the Brain be at the ſame time vitiated.

A Coma Somnolentum, an Affection more frequent than a Lethargy, and always without a Fever, ought to have ſuch a Cauſe as is capable of ſtopping the Paſſage of the nervous Fluid from the cortical Subſtance to the Medulla, not only in one Part, but throughout the whole Brain. 1. Such is the too great Relaxation of the Canals conveying the Blood thro' the Brain, on account of which the Blood can neither circulate briskly, nor can a ſufficient Quantity of nervous Fluid be ſecreted; as it commonly happens in plethoric old Men. 2. A difficult Circulation of the Blood, eſpecially when thick and impure, thro' the Head, and from thence a Compreſſion of the Brain. Hence plethoric Perſons are ſleepy; hence ſcorbutic and hypochondriac Perſons frequently fall into this Drowſineſs, and the more when the Humours are compelled more plentifully to the Head by Spaſms of the lower Belly. And from hence too we muſt derive the Origin of that Species of Coma Somnolentum, which, according to *Riverius*, ſometimes happens to Children afflicted with the Worms in the Inteſtines; for in this Caſe the vital Juices are forced to the ſuperior Parts by Spaſms of the Abdomen. Hence very plethoric Perſons, upon the Acceſs of any Cauſe moving and expanding the Blood exceſſively, as Drunkenneſs, are often plunged into a profound Sleep, and abſolutely deſtroyed by it. 3. An exceſſive Collection of Serum in the Brain, and its Membranes, and an Extravaſation thereof; whence injudicious Suppreſſions and Exſiccations of Runnings of the Ears, a Coryza, and Ulcers, contribute to this kind of Diſorder; nor is it uncommon for a Coma Somnolentum inſtantly to follow an Iſchury, or entire Suppreſſion of the Urine, which, the Flux of Urine being reſtored, immediately ceaſes.

The firſt Species of a Carus, which ſeldom, and only in very plethoric Perſons, occurs in the Beginning or Vigour of acute Fevers, principally thoſe of the continual Kind, depends upon the exceſſive Abundance and Ebullition of the Blood, by which the Veſſels of the Brain, and its Membranes, are ſo expanded, that they compreſs the ſoft Subſtance of the Brain, and impede the Entrance of the nervous Juices into the medullary Part, throughout the whole Head: Hence that Juice is the more copiouſly forced through the Cerebellum into the Parts which have the Conduct of the vital Functions, and renders the Syſtole of the Heart more vehement. Hence it is evident, that all heating and powerful Remedies applied in thoſe Fevers, a Neglect of Veneſection, and an imprudent Exhibition of Narcotics in order to procure Sleep in Fevers, muſt neceſſarily contribute to produce a Carus.

Many Cauſes conſpire to the Generation of the other Species of a Carus, which follows after the Cure of acute Fevers: For it is to be obſerved, that the fluid, as well as the ſolid Parts are ſurpriſingly altered by a febrile Heat; the Solids are deprived of their natural Vigour and Tone; the Fluids, by the Violence of a continual Attrition, are reſolved, and acquire a Conſiſtence not over-agreeable to the vital Oeconomy. For the more humid and generous Part of the vital Juices, no Nutriment being added, is diſſipated, and conveyed through various Parts out of the Body; and hence reſults a Deficience of the nervous Fluid, a vapid, and, as it were, gelatinous Conſiſtence of the Lymph and Serum, and a Coagulation of the Blood itſelf. By a Concurrence, therefore, 1. Of the Weakneſs of the Veſſels. 2. Of a Want of nervous Juices. 3. Of a Compreſſure of the Brain, made by the Blood paſſing through it with Difficulty, it muſt neceſſarily follow, that a preternatural Drowſineſs, with a Diminution of the Senſes, will ariſe: Which happens more eaſily, if, during the Fever, powerful Remedies, which weaken the Solids, or abſolute Narcotics, have been adminiſtred. And if theſe Defects of the Fluids and Solids are increaſed, as is common in the third Species of a Carus, the coagulated and unactive Juices at length ſtagnate in the debilitated Veſſels, are extravaſated, and thus bring on unavoidable Death.

The Cauſes of a Lethargy are the ſame which we have aſſigned for a Coma Somnolentum, except that they are more violent, and penetrate deeper into the cortical Subſtance of the Brain, ſo that they not only induce a Sleepineſs, but the external and internal Senſes, likewiſe, become languid. The Whole turns upon this, that in a Coma, as well as a Carus, there is, as yet, no Extravaſation of Blood, or Serum; but this is, at length, produced as an Effect, and found in Subjects opened after Death. There is in theſe Species of ſleepy Affections a difficult and debilitated Circulation of the Blood through the Veſſels of the Meninges and Brain, and a greater or leſs Degree of Stagnation of the ſerous Parts. But in a Lethargy there is either a Separation of the thin Serum made thro' the Pores of the Arteries, or an abſolute Extravaſation.

But a Lethargy is diſtinguiſhed from a Carus in this; that the Patients, being rouſed in the former, anſwer; in the latter, they do not. There is, likewiſe, a Difference between an Apoplexy and Somnolency; for in an Apoplexy the Reſpiration is difficult, and it terminates in a Palſy, which does not happen in a Carus. It differs, likewiſe, from a Syncope, in which the Pulſe is ſmall, or very obſcure and languid, and the Face cadaverous; in carotic Patients the Pulſe is large and ſtrong, and the Colour of the Face appears rather florid: Nor does it differ leſs from an hyſteric Fit, becauſe ſuch Patients are without all Reſpiration, and afterwards underſtand and remember: But in a Carus they neither underſtand, nor remember in the Fit; they have their Eyes always ſhut, or, if they are open'd, they cloſe them immediately.

As from the Premiſes, the ſpecial and immediate Cauſes of ſleepy Affections are very evident; ſo, in general, it ought to be known, that all thoſe things conduce to the Production of them, which promote a difficult Circulation of the Humours through the Veſſels of the Brain and Meninges, and a Stagnation thereof, and impair the elaſtic Force of the Veſſels and Membranes. Among the remote Cauſes may be reckoned cacochymic, cachectic, ſcorbutic Indiſpoſitions of the Body; a Debility, occaſioned by too much Grief, Sorrow, or a Diſeaſe of long Continuance, or enormous Profuſion of Blood; an Abuſe of inebriating Liquors, Spirit of Wine, Beer too ſpirituous and full of Hops; frequent Surfeits; inhabiting a moiſt Apartment, where the Air is denſe and vapid; and a humid and cloudy Conſtitution of the Air; Winds blowing long from the Weſt; the Winter Seaſon; and an Abuſe of Tobacco.

Beſides, it may be frequently obſerved in Practice, that a Coma Somnolentum, or even a Lethargy, is excited in ſanguineo-phlegmatic Subjects of a groſs Habit, and full of Blood, from a Suppreſſion of the Hæmorrhoids, Menſes, or any uſual and critical Hæmorrhage whatſoever. Nor is it uncommon for the ſame Affections to be generated by checking habitual Morning-ſweats, or thoſe which are critical; and, alſo, by a Suppreſſion of any ſerous Excretions, or by a ſudden Extenuation of œdematous Legs and Feet. Not to mention, that in thoſe whoſe Brains are weak, if too large Quantities of ſpirituous Liquors are taken, or if the Body is much refrigerated whilſt heated with ſuch Liquors, a profound Sleep, with a Stupor, may be produced; which, however, ceaſes in a ſhort time, without any Danger. Comatous and lethargic Affections are, alſo, excited by a Ceſſation of arthritic or podagric Pain, which before returned once or twice in a Year: And I have ſeen a Lethargy, accompanied with a convulſive Aſthma, immediately ceaſe, together with the Aſthma, upon the Return of the Pain to the Joints. Among the Cauſes of theſe Diſorders we may, likewiſe, number the exceſſive and unſeaſonable Uſe of vaporous Subſtances; for in weak Subjects I have often obſerved heavy and more or leſs dan-

dangerous Somnolences produced by Wormwood and Opiates, given in large Quantities, by Narcotics, Smoak of Sulphur, and the Vapour of burning Coals, confined in too narrow a Space. The exceſſive Uſe of fragrant Things, likewiſe, is prejudicial. *Strabo*, *Lib.* 16. tells us, that the Inhabitants of *Sabæa* fall into this Diſorder, from the Odour and Fragrancy of the Flowers and Fruits produced in that Country. I have known Inſtances, where the Smell has been entirely loſt, by a continued Uſe of ſweet-ſcented Subſtances, becauſe theſe ſeem to induce a Relaxation of the Membranes of the Brain, and nervous Membranes of the Noſe. To the Cauſes of ſleepy Affections, alſo, belong Violences done to the Head: Thus *Galen*, *Lib. de Inſtr. Odor. Cap.* 6. enumerates among theſe, the Compreſſure of the Brain made by the Surgeon, who perforated the Cranium, and Membrane inveſting the Brain: And I, ſays *Mercurialis*, *in Prælect. Batav. p.* 22. once ſaw a Perſon, injured by a Surgeon with an unſeaſonable Perforation of the Cranium, become immediately carotic.

The Prognoſtic of theſe Affections is not always of the happy Kind; but more or leſs fatal, according to the Violence of the Cauſes: And indeed, a Coma Vigil often preſages a Phrenſy, and Convulſions; and, in malignant Fevers, often changes into a mortal Sleep: But a ſound Sleep, as *Hippocrates* remarks, in *Coac. Prænot.* ſometimes, in Fevers, preſages a certain and firm Criſis, and is not bad. When Pains attend a Carus, according to the ſame *Hippocrates*, they portend a Convulſion: The older, more weak, and more impregnated with impure Juices, the Bodies are, the more Danger does a Coma portend; and eaſily, as *Mercatus* ſays, *Lib.* 1. *Cap.* 12. terminates in a fatal Lethargy. A Carus is the more dangerous, the more violent the attending Fever is, and the worſe its Symptoms are, and the more crude the Urine. However, the firſt and ſecond Species are often cured; the third is always mortal. A Lethargy is never without Danger; but that is worſt, which is accompanied by a Tremor of the Limbs, and a cold Sweat of the Face.

The Cure.

A Phyſician, in the Cure of ſleepy Diſeaſes, ſhould regard theſe three Intentions; firſt, to rouſe the Patient from his Sleep; next, to remove the Difficulty of Circulation, the Stagnation or Extravaſation of the Blood in the Head; and, thirdly, to reſtore the loſt Strength of the Membranes, and Veſſels of the Brain.

For ſhaking off Drowſineſs, and awaking the Patient, thoſe Remedies are efficacious, which act upon the nervous Parts, by agitating them, vellicating and inducing a tremulous and oſcillatory Motion, through the whole nervous Syſtem: Such are, 1. Powerful Acids; and, of theſe, the Preference muſt be given to the Spirit of Verdegriſe, (which is nothing but a moſt concentred Spirit of Vinegar) mixed with Eſſence of Caſtor: This, applied to the Noſe, in ſtimulating and penetrating, is ſuperior to all others 2. Volatile Salts, as urinous Spirit of Sal Ammoniac, prepared with Quick-lime; which being applied to the Vertex, or, what is ſtill better, put into the Noſe, excites Sternutation, and greatly ſhakes off the Torpor and Drowſineſs. 3. Fetid things, as Galbanum, Partridge-feathers, and others, burnt; ſo that the ſtrong Scent may affect the Noſe. 4. Cold Water ſuddenly poured all over the Head, which, by ſtrengthening, at the ſame time, the Membranes of the Brain, readily diſpels Sleep. 5. Cataplaſms prepared of ſtrong Vinegar, Rue, Bay-leaves, Tops of Savory, Muſtard-ſeed, Caſtor, and Camphire, applied to the Head, when ſhaved, the Forehead, and the Temples.

The Efficacy of theſe is promoted, and, at the ſame time, the ſerous Colluvies, if it is offenſive, is derived from the Head, 1. By Sternutatories; the beſt of which is Salt of white Vitriol, if ten Grains of it are diſſolved in half an Ounce of Marjoram-water, and drawn up the Noſe. 2. By Veſicatories of Cantharides, ſomewhat large, and laid on the Feet and Neck; for theſe both give Motion to the ſolid nervous Parts, and make a Revulſion of the ſerous Humours. 3. By Cupping-glaſſes, either with or without Scarification. 4. By ſtrong Frictions of the inferior Parts. 5. By acrid Clyſters. 6. Acrid and ſtimulating Clyſters are, in ſuch Caſes, of very great Service, to which Sal Gemmæ, common Salt, or the Root of Squills, are added, with a View of increaſing the Stimulation.

The Patient, by the Help of theſe, being rouſed from his Drowſineſs, it remains, that an equal Circulation of the Humours through the whole Body be reſtored, and then the debilitated Parts ſtrengthen'd. The firſt End is anſwered by frequent Bleeding, whilſt the Sleepineſs laſts, if the Veſſels are turgid with Blood; and much more ſhould it be perform'd, when the Sleepineſs is conquer'd, in order to prevent a Relapſe: Then, likewiſe, if the firſt Paſſages are loaded with Excrements, or ſeized with Spaſms, the Body ought to be open'd with a gentle Laxative. Nervous, mixed with diaphoretic, Medicines, contribute to diſperſe the Stagnations of the Humours, and, alſo, to ſtrengthen the infirm Parts: Among theſe, the Eſſence of Aloes-wood and Amber, with the Spirit of Lilies of the Valley, of Sal Ammoniac, and acrid Tincture of Antimony, are of great Efficacy. And Salt of Hartſhorn, with Salt of Amber, Cinnabar of Antimony, and Bezoardic Mineral, in the Form of a Powder, have very great and ſalutary Effects.

Laſtly, Relapſes into ſleepy Diſorders may be prevented, partly by a Removal of the Cauſes producing them: And ſince a Suppreſſion of the ſanguine Excretions, or habitual arthritic Paroxyſms, contribute very much to the Generation of theſe Diſorders, he will not do amiſs who endeavours to recal theſe Fluxes and Pains, and preſerve a regular Succeſſion of them. In Diet; Idleneſs, Drunkenneſs, Meats difficult of Digeſtion, and ſpirituous Things, muſt be avoided. Let the Body be exerciſed carefully: All Repletion is to be avoided; and Faſting, and eating ſparingly, is of Uſe: The Patient muſt entirely abſtain from Fiſh, Milk, and Cheeſe; and, amongſt Fruits, all that are watery muſt be abſtained from: He muſt eat more roaſted than boiled Fleſh. Bread muſt be entirely cleanſed of the Darnel, with which it is often intermixed. Let old infirm Men uſe Wine, as their Milk: Let them not protract their Sleep too long; let them be cautious of Affections of the Mind; let them frequently enjoy the Converſation of their Friends; let them pleaſe themſelves with convenient Journeys; let them take care to preſerve the Excretions, as well by Stool, as by the Pores of the Skin; and let them not forget the uſual Bleeding, at their ſtated Times.

Practical Cautions.

As the Cauſes of ſleepy Diſorders, and the Species of them, are very different, ſo the Method of Cure is various: Let us therefore conſider, what may be proper for each Species. A Coma Vigil, as it ariſes commonly, in acute Fevers, from an exceſſive Quantity of Blood, whilſt an Inflammation of the Membranes of the Brain is approaching, ſo it abſolutely requires ſuch Remedies as may not be prejudicial to the Fever: And, for this End, there ſhould be a large Quantity of Blood taken away; if the Fever has not continued beyond the third or fourth Day, as *Gabelchoverus*, *Lib.* 1. *&* 8. and *Foreſtus*, *Lib.* 10. *Obſ.* 34. affirm. After Bleeding, the Body, if it is obſtructed, ſhould be open'd with Clyſters, which muſt not be very acrid; and then Remedies ſhould be given, which, by diluting and cooling the Humours, check the Heat thereof: For this Purpoſe, the abſorbent Powders, gently nitrous Medicines, in a Draught with diaphoretic Antimony, and diapnoic and analeptic Waters, wild Emulſions of Poppies, and acidulated Remedies, are of great Uſe in malignant Fevers. I, alſo, approve very much of the Medicine recommended by *Lotichius*, which conſiſts of Rob of Currants, three Ounces, diſſolved in two Pints of Spring-water, and render'd gratefully acid, by an Addition of Spirit of Vitriol.

Sweet Spirit of Nitre, by its cooling and gently anodyne Quality, is of great Uſe: Nor are external Applications to be neglected; as Cataplaſms prepared with Vinegar, or the Unguentum Alabaſtrinum, applied to the Temples; live Animals diſſected, and laid on the Head: Not neglecting a quiet and mild Regimen.

As a Coma Vigil, familiar in an Hemiplegy, is of longer Continuance, ſo it is more difficult to be cured. He will perform but little, who attempts the Symptom only, and neglects the principal Diſorder: Nothing remains, but to cure the Hemiplegia by proper Methods; for then natural Sleep will ſpontaneouſly follow.

A Carus, particularly the firſt Species of it, requires plentiful Bleeding, if the proper Opportunity is not ſuffer'd to elapſe; then the Patient muſt be rouſed by Clyſters, render'd ſtimulating by Squills; by Veſicatories; by putting diſtilled Vinegar into the Noſtrils; and then, internally, the Orgaſm of the Humours muſt be compoſed by cooling fixed Diaphoretics, and Acids. The ſecond Species of the Carus, as it is often critical, demands ſcarce any Aſſiſtance from Medicine; but, being left to itſelf, terminates in Health. The third, and moſt dangerous, ſcarce admits of a Cure; yet it is proper to try, whether the Patient can be moved by Veſicatories, and then to have recourſe to Diluters and Analeptics.

A Coma Somnolentum is very properly divided into ſerous and ſanguine. The firſt requires either the natural ſerous Excretions to be reſtored; or artificial ones to be ſubſtituted in their room. A Suppreſſion of Urine is to be removed by proper Remedies: Gouty Fits are to be invited by Frictions of the Feet, Veſicatories, relaxing Applications, and warm Baths. Of great Uſe, likewiſe, are Sternutatories, by diſcharging the Serum through the Noſe, and ſtimulating the Nerves to Motion. When a viſcid Phlegm offends the Stomach, an artificial Vomit is ſerviceable; for which Purpoſe, half a Scruple, or a whole Scruple, of powder'd Squills, or a few Grains, two, for Example, of emetic Tartar, may be given ſucceſsfully, mixed with ſome laxative Potion.

On the contrary, a Coma Somnolentum, which deduces its Origin from an hot Cauſe, that is, a difficult Paſſage of the Blood through the Head, or a Stagnation, as commonly happens in hypochondriac and ſcorbutic Perſons, requires greater Circumſpection: For all hot and ſpirituous Remedies are to be avoided,

avoided, as Poiſons; and, inſtead of theſe Clyſters, Bleeding, gentle Laxatives, cooling and nervous Powders, and others of that Kind, ſhould be ſubſtituted: And all theſe are proper for a Lethargy; only that often requires more efficacious exciting Remedies.

Whatever ſleepy Affections proceed from an Extravaſation of the Blood or Serum within the Meninges and Cranium, produced by external Violence, cannot be cured, before the extravaſated Humour is diſcharged by trepanning: Though, before this Operation, Bleeding, if the Quantity of Blood is redundant, is highly proper.

A red Face, Eyes turgid with Blood, tumid Veins, and ſtrong Pulſations of the Arteries, indicate Bleeding to be very proper in ſleepy Affections: After this, if the florid Colour of the Countenance, and Strength of the Pulſe, continue, there is Hope of a Recovery; but at the ſame time it will be neceſſary once more to open a Vein, becauſe inſufficient Bleeding is capable of doing Miſchief. The thicker the Blood is ſuppoſed to be, the larger Inciſion ſhould be made in the Vein, that there may be a more extenſive Outlet for it.

After Bleeding, the Body muſt be opened, either by a Laxative given internally, or a Clyſter; nor indeed, without theſe previous Evacuations, ought any other Kind of Remedies, as Strengtheners, Diaphoretics, or Sternutatories, to be adminiſtred, becauſe, by them, a greater Motion and Impetus of the Humours to the Head is excited.

In every ſleepy Diſorder it is proper to avoid warm Baths, vaporous Subſtances, and ſuch as incline, by their fragrant and ſtrong Smell, to Sleep. Much more abſurd is it to uſe Narcotics, ſulphureous Remedies, Opiates, or Medicines in which Saffron or Poppies are Ingredients. To this Claſs belong theriacal Medicines, which the Antients uſed to preſcribe in theſe Affections; for this is adding Fuel to the Fire.

External Volatiles, generally applied to the Noſe, ſhould never be uſed unleſs in Somnolencies proceeding from a cold ſerous Cauſe; and, therefore, we muſt abſtain from theſe in all Sleepineſs attending a Fever, or which ariſes from an eryſipelatous, purpurine, or eruptive Matter conveyed to the Brain; for, in theſe Caſes, fix'd, but, at the ſame time, penetrating Acids are uſed with more Succeſs. Of this Kind is the Oxyrrhodium, which *Avicenna* and *Rhaſis* long ago recommended; to which Marjoram and Rue may be added.

Though the drinking of hot Mineral Waters, and much more the Acidulæ, ſhould not be abſolutely adviſed in idiopathic Diſeaſes of the Head; yet in Somnolencies which affect hypochondriac Perſons, from a ſuppreſſed Flux of the Hæmorrhoids, or a Receſs of the Gout, I have found a ſurpriſing Quality in the *Caroline* Springs, thoſe particularly which break out near the Mill, in reſtoring the gouty Paroxyſms, and diſpelling Drowſineſs.

We muſt, above all things, take care not to uſe Sternutatories in the Beginning of this Diſorder, to rouſe the Patient from Sleep, eſpecially in plethoric Perſons; becauſe, by an unſeaſonable Remedy of this Kind, a greater Afflux of Humours to the Head is cauſed, and from thence there is great Danger of an Apoplexy. *Frederic Hoffman.*

A Carus is a ſlight Apoplexy, but an highly profound Sleep, accompanied with a Fever, ariſing principally from ſuch Cauſes as compreſs the Brain, as yet uninjured; or ſuch as obſtruct it, but are, at the ſame time, more eaſily removed than in an Apoplexy. In a Carus there is ſome, though a fleeting and tranſitory, Perception; and ſome, though a ſmall Degree of, Senſation.

Hence, upon the Removal of a Carus, the Patient has his Health reſtored, unleſs, perhaps, a kind of Shaking of the Head ſhould remain for ſome time.

The Cure may be collected from the Article APOPLEXIA. The Coma Vigil, the Coma Somnolentum, and the Cataphora, ſeem to be only ſlight and gentle Species of a Carus.

But a Lethargy is a ſlight Species of Apoplexy, ariſing from a cold, viſcid, and aqueous Cauſe; for which Reaſon the Knowledge and Cure of it is to be gathered under the Article APOPLEXIA and PARALYSIS. *Boerhaave. Aphor.*

LETHE, λήθη. Forgetfulneſs. This, when it occurs in Fevers, is, by *Hippocrates*, eſteemed of very bad Preſage.

LEVATOR *Scapulæ proprius*, by *Winſlow* called *Angularis*.

This is a long and pretty thick Muſcle, about two Fingers in Breadth, lying above the ſuperior Angle of the Scapula, along the poſterior lateral Part of the Neck of that Bone.

It is inſerted above, in the Extremities of the tranſverſe Apophyſes of the four firſt Vertebræ of the Neck, by four fleſhy Branches ending in ſhort Tendons. Sometimes the ſecond, ſometimes the third, or both, and ſometimes the fourth of theſe Branches are wanting; theſe Defects being made up by the Largeneſs of the reſt.

From thence theſe Branches run down a little obliquely, and then, uniting together, they are inſerted into the ſuperior Angle of the Scapula, and in the Edge of its Baſis, from thence to the ſmall triangular Space, being there covered a little by the Rhomboides.

This Muſcle is eaſily divided into two, through its whole Length. It is covered by the Trapezius; and its Inſertions in the Neck are ſometimes mixed with thoſe of the neighbouring Muſcles.

The Angularis, by its Inſertion in the ſuperior Angle of the Scapula, moderates the Deſcent of that Angle, while the Trapezius and Serratus major raiſe the Acromium. Afterwards, when theſe two Muſcles ceaſe to act, the Angularis raiſes the ſuperior Angle, and, by that means, depreſſes the Acromium.

Hence we ſee, that this Muſcle is improperly called *Levator Scapulæ proprius*, ſince it does not raiſe, but depreſſes the Scapula. That Name would agree better to the Serratus major. Whether this Muſcle can have any Share in moving the Neck, the Scapula, in which it is inſerted, being kept immoveable by other Muſcles, I cannot at preſent determine. *Winſlow's Anatomy.*

LEVATORES ANI. Theſe Muſcles riſe fleſhy from each Side of the Oſſa Pubis, internally within the Pelvis, as alſo from Part of the Os Iſchium and Sacrum: From theſe Places, like Lines drawn from a Circumference towards a Centre, its Fibres deſcend over the Muſculi Marſupiales, to their Implantation at the lower End of the Inteſtinum Rectum in the Anus. The Uſe of theſe Muſcles is principally to ſuſpend and draw the Anus upwards, leſt the Fæces ſhould be burdenſome to the Sphincter. In their Deſcent on each Side forwards, from the Oſſa Pubis, they paſs cloſe over the Glandulæ proſtatæ, in a manner embracing them; by which Mechaniſm they are rendered capable of compreſſing them; and, by a Retraction of the Anus, at the ſame time act on the Veſiculæ ſeminales, in order to promote the Emiſſion of the ſeminal Juices, in Coition. *Cowper.*

LEUCACANTHA. A Name for the *Carlina; cauleſcens; flore magno albicante.*

LEUCADENDROS, *Africana, arbor tota argentea, ſericea, foliis integris.* A Name for the *Conocarpodendron; foliis argenteis, ſericeis, latiſſimis.*

LEUCADENDROS, *Africana. Arbor argentea, ſummo folio crenato.* A Name for the *Conocarpodendron; folio craſſo, nervoſo, lanuginoſo, ſupracrenato, ibique limbo rubro; flore aureo; cono facile deciduo.*

LEUCADENDROS, *Africana, ſive Scolymocephalos, folio anguſtiori, apicibus tridentatis.* A Name for the *Conocarpodendron; folio rigido, anguſto, apice tridentato, rubro; flore aureo.*

LEUCADENDROS *ſimilis Africana arbor, argentea, folio ſummo crenaturis florida.* A Name for the *Hypophyllocarpodendron; foliis lanuginoſis; in apice trifido, rubro, quaſi floreſcens.*

LEUCANIA. The ſame as LAUCANIA.

LEUCANTHEMUM.

The Characters are;

It agrees in every thing with the Chryſanthemum, except in the white Colour of its Semiflorets.

Boerhaave mentions eleven Species of this Plant; which are,

1. Leucanthemum; radice repente; foliis latioribus, ſerratis. *T.* 492.

2. Leucanthemum; vulgare. See BELLIS MAIOR.

3. Leucanthemum; vulgare; caule villis caneſcente, *T.* 492.

4. Leucanthemum; quæ Bellis ſylveſtris; barbulis fiſtuloſis. *Ind.* 35.

5. Leucanthemum; Canarienſe; ſapore Pyrethri. *H. C. Leucanthemum; Canarienſe, foliis Chryſanthemi, ſapore Pyrethri.* T. 666. *Chamæmelum, Canarienſe, ceratophyllum, fruticoſius, glauco folio craſſiore, ſapore fervido, Magola ab incolis dictum.* M. H. 3. 35. 7.

The Root, Leaves, Flowers, or Wood, chewed in the Mouth, are of ſo penetrating a Taſte, as to cauſe an Inundation of Lymph in the Mouth, as if it proceeded from a Fountain; for which Reaſon they are of excellent Service in the Tooth-ach: The freſh Leaves, in particular, are properly applied to a pained Tooth; for I take this Plant to be both reſolvent and aperitive. It is taken for Pyrethrum, or Pellitory of *Spain*, and not without Reaſon: This, however, is not the Pyrethrum of the Shops, but may ſerve inſtead of it in dry Diſeaſes of the Viſcera and Inteſtines. *Cæſalpinus* highly commends an Ointment of this Plant for the Itch. *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave.*

6. Leucanthemum; folio Abſinthii breviore; Alpinum. *Juſſ.*

7. Leucanthemum; folio Abſinthii; Alpinum. *Ciaſſi.*

8. Leucanthemum; Luſitanicum; Chamæmeli folio craſſiore.

9. Leucanthemum; montanum; foliis Chryſanthemi. *T.* 492.

10. Leucanthemum; Tanaceti folio; flore majore. *Tanacetum, inodorum, flore majore.* C. B. P. 132. *Matricaria, tanacetifolia: flore majore, ſemine umbilicato.* T. 493.

11. Leucanthemum; Bellidis facie; umbelliferum; ſemine pappoſo. *Bellis, major, ramoſa, umbellifera, Americana.* Park. Theat. 528. *Aſter, annuus, ramoſus, albus, latifolius, Canadenſis.* M. H. 3. 122. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 108.

LEUCAS *Montana.* A Name for the *Galeopſis*; *ſive Urtica muerſ, flore luteo.*

LEUCE, λεύκη. A Species of Leproſy. See LEPRA.

LEUCELECTRUM. White Amber. *Blancard.*

LEUCISCOS, λεύκισκος. The Name of a Fiſh of the Mullet-kind. *Galen, de Aliment. Facultat. Lib.* 3. *Cap.* 25

LEUCOCHRUS, λευόχρους, according to *Gorraus*, is a ſort of Wine, made of dried Raiſins, firſt trodden, then macerated in Sea-water, and afterwards caſt into white Muſt.

LEUCOGRAPHIS, λευογραφὶς, is the Name of a Stone, otherwiſe called *Maroxus* and *Galaxia.* It is found in *Egypt*, and being of a ſoft Contexture, and eaſy to be diſſolved, is uſed by the Whitſters, in bleaching their Linen. It is ſuppoſed to be of an emplaſtic Quality, and to be good for ſuch as are troubled with Spitting of Blood, the Cœliac Paſſion, or Pains in the Bladder, being taken in Water; alſo for Women labouring under a Flooding, if taken as before, or applied in a Peſſary. It is an Ingredient, alſo, in ophthalmic Medicines of a ſoft Compoſition, for it fills up the hollow Ulcers of the Eyes [κοιλώμαλα, ſee COELOMA] and repreſſes Defluxions; and, made into a Cerate, it cicatrizes Ulcers in the tender Parts of the Body. *Dioſcorides, Lib.* 5. *Cap.* 152.

LEUCOIUM.

The Characters are;

It has a long, flat, bicapſular Pod, which is full of ſmooth, flat, orbiculated Seeds, which are generally marginated, or bordered round the Edges; the Flowers are beautiful and ſweet-ſcented.

Boerhaave mentions thirty-one Species of the Plant, none of which have any medicinal Virtues attributed to them at preſent, that I know of, except the firſt and twenty-ſecond.

The firſt is the

Leucoium; incanum; majus. *C. B. P.* 200. *Raii Hiſt.* 1. 779. *Boerh. Ind. A.* 217. *Tourn. Inſt.* 220. *Leucoium album.* Offic. Ger. 372. *Leucoium ſimplex ſativum.* Park. Theat. 258. *Leucoium hyemale & diu durans album.* J. B. 2 874. STOCK-GILLY-FLOWER.

This is a Plant which grows almoſt in every Garden, and, therefore, is ſo well known, that it needs little to be ſaid about it. It has long, narrow, hoary, or whitiſh Leaves, ſet alternately on the Stalks. The Flowers are large, of four Leaves a piece, ſometimes white, ſometimes red, and frequently ſtriped, of a pleaſant ſweet Scent. The Seed is flat and round, growing in long hoary Pods, divided in two in the Middle, by a long Partition. It grows only in Gardens, and flowers a great Part of the Summer.

The Flowers are uſed, though very rarely. *Dioſcorides* commends them for Ulcers, and Chaps in the Fundament, and Inflammations of the Matrix. *Galen* affirms, that they help the Infirmities of the Liver and Spleen, and provoke the Menſes, and haſten the Birth.

The twenty-ſecond is the

Leucoium; luteum; vulgare. *C. B. P.* 202. *Tourn. Inſt.* 221. *Boerh. Ind. A.* 2. 18. *Cheri, Leucoium luteum.* Offic. *Leucoium luteum, vulgo Cheiri flore ſimplici.* J. B. 2. 872. Raii Hiſt. 1. 872. Synop. 3. 291. *Keiri, ſive Leucoium vulgare luteum.* Park. Theat. 625. Parad. 256. *Viola lutea.* Ger. 371. Emac. 456. WALL-FLOWER.

Wall-flowers have a thick, woody, crooked Root, of a whitiſh Colour, from which ſpring many woody brittle Stalks, beſet with ſmall, oblong, ſharp-pointed Leaves; and having on their Tops ſeveral pretty large yellow four-leaved Flowers, of a pleaſant ſweet Scent: They are followed by long ſlender Pods, or Seed-veſſels, containing ſmall, rediſh, flat Seed: It grows upon old Walls and Buildings, and flowers in *April.*

The Flowers, which are the only Part uſed, are cordial and cephalic, and ſtrengthen the Nerves, help the Apoplexy and Palſy, cure the Green-ſickneſs, and procure the Menſes.

Officinal Preparations are only the Oil, by Infuſion of the Flowers, which is warming and comforting, and good for Pains in the Limbs. *Miller's Bot. Off.*

It is bitter, of a ſaltiſh herby Taſte, and reddens the blue Paper pretty much. By the chymical Analyſis, it yields, beſides ſeveral acid Liquors, ſome concreted volatile Salt, and a good deal of Oil and Earth: Thus this Plant is filled with Sal Ammoniac, Sulphur, and terreſtrial Parts.

The Flowers are principally uſed to provoke the Urine, and open the Bowels. The Infuſion of them cures the Green-ſickneſs, provokes the Menſes, and relieves the Palſy. The Oil of the Flowers, made by Infuſion, is reſolving, and good for the Rheumatiſm. *Martyn's Tournefort.*

The Flowers are of fine Parts, diſcuſs, exterge, are anodyne, expel the Fœtus and Secundines, on which Account they are reckoned, by *Galen*, 7 *Simpl.* among thoſe Medicines which the *Greeks* call φθόεια [*Phthoria*, from φθίσις, a uſual Word in *Hippocrates*, for Abortion], or ſuch as deſtroy the Fœtus, and procure Abortion. Preparations in Uſe are a Conſerve of the Flowers, a diſtilled Water, and the Oil of the Flowers by Infuſion, which is a Preſervative againſt the Apoplexy, gives Relief under the Palſy, and is an excellent Anodyne in Wounds and Inflammations of the nervous Parts, and internal Diſtempers of the Uterus. A Biſhop of *Trent* made uſe of a Conſerve of the Flowers, taken in Water of the ſame, with very good Succeſs, as a Preſervative againſt the Apoplexy and Palſy. *Raii Hiſt. Plant.*

Of the Flowers is prepared a cephalic and cordial Syrup, which is more to be commended for its Smell than Virtues. The Wall-flower is recommended for provoking the Menſes and Lochia. In *Italy* they anoint the Region of the Pubes with the Oil of the Flowers, in order to facilitate the Birth. *Hiſt. Plant. aſcript. Boerhaave.*

For provoking the Menſes, or expelling the dead Fœtus and Secundines, or for opening Obſtructions of the Liver, even in an inveterate Jaundice, there is ſcarce a more effectual Remedy than the Flowers of Cheiri, taken twice every Day, in warm Beer. *Hoffman, de Præſt. Remed. domeſtic.*

LEUCOIUM is, alſo, a Name for ſeveral Sorts of ALYSSOIDES, ALYSSUM, LUNARIA, THLASPIDIUM, and HESPERIS.

LEUCOIUM BULBOSUM. A Name for ſeveral Sorts of NARCISSO-LEUCOIUM.

LEUCOLACHANON, according to *Blancard*, is the wild Valerian.

LEUCOMA, λεύκωμα, from λευκὸς, white. A Diſorder of the Eye; the ſame as Albugo. See ALBUGO, and OCULUS.

LEUCONYMPHÆA.

The Characters are;

The End of the Pedicle opens into a large, herbaceous, tetraphyllous Calyx, which expands in form of a radiated Star. The Flower has twenty or more white large Petals, beautifully expanded like a Roſe; within theſe are ſeated great Numbers of petaloidal Stamina, furniſhed with incurvated Teſticuli. The Ovary grows on a Placenta latent within the Calyx, and is divided into twenty Capſules, or Cells, by the like Number of perpendicular Interclóſures, which Cells are ſtuffed with Multitudes of Seeds: This Ovary is, alſo, ſurrounded with twenty Tubes, in the Middle of which is an obtuſe Apex. The reſt of the Characters are thoſe of the Nymphæa.

Boerhaave mentions two Species of this Plant; which are,

1. Leuconymphæa; Nymphæa; alba major. *C. B. P.* 193. *Tourn. Inſt.* 260. *Boerh. Ind. A.* 281. *Nymphæa alba.* Offic. Ger. 672. Emac. 819. Raii Hiſt. 2. 1320. Synop. 3. 368. J. B. 3. 770. *Nymphæa alba major vulgaris.* Park. Theat. 1251. *Nenuphar.* Chab. 561. *Aguape Braſilienſibus.* Marcgr. 21. *Aguape.* Piſon. (1648.) 91. *Aguape ſive Nymphæa.* Ejuſd. (1658.) 219. WHITE WATER-LILY.

The white Water-lily has many large, round, thick Leaves, lying on the Top of the Water; not at all indented about the Edges, ſtanding on long thick Foot-ſtalks; they ſpring from a large white Root, ſending forth many Fibres, and ſticking faſt in the Earth, at the Bottom of the Water. The Flowers grow, likewiſe, on long round Stalks, that ariſe immediately from the Root; they are large, in Shape like a Tulip before it opens, conſiſting of ſeveral Rows of Leaves, the outermoſt being greeniſh, but the reſt of a pure white Colour, with yellow Stamina in the Middle; they are followed by large round Heads, full of broad, flat, ſhining Seed: It grows, in Rivers and large Lakes, and flowers in *June.* The Root and Flowers, and ſometimes the Leaves, are uſed.

They are cooling and drying, and accounted good to ſtay all kinds of Fluxes and Looſeneſſes, the Gonorrhœa, and nocturnal Pollutions, by their ſoftening cooling Qualities allaying the Acrimony of the Seed, and thereby rendering Perſons leſs diſpoſed to Venery. The Leaves are good to be applied to hot Tumors and Inflammations. *Miller's Bot. Off.*

The Root is a little glutinous, bitter, and gives a deep-red Tincture to the blue Paper.

By the chymical Analyſis it yields a good deal of Acid, and very little concreted volatile Salt; ſo that it is no Wonder it ſhould be ſweetening. The Flowers are diſtilled, and a Syrup, and a Conſerve, are made of them. The Roots are frequently uſed in the cooling Ptiſan, for the Heat of Urine, and Inflammation of the Kidneys, and other Bowels. The Syrup is a little narcotic; its Doſe is an Ounce. *Martyn's Tournefort.*

Many are very cautious of uſing this Plant, for fear of extinguiſhing all amorous Deſires, and rendering themſelves impotent; for it is found by Experience, they ſay, that the Uſe of the Seed, and the Root, renders Perſons very cold and dull as to Venereal Inclinations. *Pliny, Lib.* 25. *Cap.* 7. writes, that they who take it twelve Days ſucceſſively, find themſelves deprived both of the ſeminal Fluid, and the Power of Coition. The Root of Leuconymphæa, boiled in black Wine, and drank, ſtops the immoderate Flux of the Menſes, even when the Diſorder has been regarded as deſperate. *Trag.* The *Turks*, they ſay, macerate the Flowers in Water for a Night; and think that, if they rub their Noſtrils with the ſame Water, or drink of it, they ſhall be preſerved from many ſevere Diſtempers. We prepare a Conſerve and Syrup of the white Flowers, which procure Sleep, but more ſlowly than the Poppy. *Simon Paul.*

The Water of Nenuphar, with Camphire, has been found effectual in an Excoriation of the Palate or Uvula, and Tongue,

from an hot aduſt Humour. *Ex Obſ. Marc. Cumani a Velſchio editis. Raii Hiſt. Plant.*

2. Leuconymphæa; minor. *Nymphæa alba, minor.* J. B. 3. 773.

LEUCOPHAGIUM. The Name of a ſort of Aliment, ſaid to be good in a Conſumption. It is prepared of ſweet Almonds macerated in Roſe water, and the Fleſh of a Capon, or of a Partridge, boiled, contuſed, and paſſed through a Sierce. *Caſtellus.*

LEUCOPHLEGMATICA, from λευκὸς, white, and φλέγμα, Phlegm An univerſal, or partial, white flabby Tumor of the Body. See HYDROPS, and FIBRA.

LEUCOPHYLLON, λευκόφυλλον. The Name of a Compoſition deſcribed by *Aetius, Tetrab.* 4. *Serm.* 4. *C.* 113. and recommended as a good Application to the Neck and Arm-pits; I ſuppoſe, as a Perfume. It is compounded of one Pound of Earth of *Samos*, with Styrax, *Indian* Leaf, and Opobalſamum, of each two Ounces: Pound and work together the Styrax and Opobalſamum, and triturate and ſift the Leaf; then mix them thoroughly together in the Mortar, and add thereto a ſufficient Quantity of Juice of Roſes; and ſo uſe it.

LEUCOPYRON, λευκόπυρον. The Name of a Malagma, *Galen, Lib.* 1. *Cap.* 7. *de Conyc. M. per Gen.*

LEUCORRHOEA, from λευκὸς, white, and ῥέω, to flow. The Fluor Albus.

LEVIATHAN PENIS. The Penis of a Whale. It is recommended againſt the Fluor Albus, and Dyſentery.

LEVIRAIA. That Species of Thornback which is furniſhed with Prickles only on the Tail.

LEVISTICUM. A Name for the *Liguſticum; vulgare; foliis Apii.*

LEXIPHARMACON, λεξιφάρμακον, imports the ſame as ANTIDOTUS. From λήγω, to ceaſe, and φάρμακον, a Poiſon.

LEXIPYRETOS, λεξιπύρετος, from λήγω, to ceaſe, and πυρετὸς, a Fever. Febrifuge, cauſing a Fever to ceaſe.

LIBANION, λιβάνιον. The Name of a Collyrium, in *Paulus Ægineta, Lib.* 3. *Cap.* 22. and *Lib.* 7. *Cap.* 16.

LIBANOS. The ſame as LIBANOTOS.

LIBANOTIS. Offic. *Libanotis Ferulæ folio, ſemine anguloſo.* C. B. P. 158. *Libanotis Cachryophorus quibuſdam floribus luteis.* J. B. 3. 40. Raii Hiſt. 1. 424. *Libanotis Galeni Cachrys verior.* Ger. 858. (quoad deſcript.) Emac. 1010. *Libanotis Ferulæ folio, ſive Cachryfera, ſive Cachrys vera.* Park. Theat. 881. *Cachrys ſemine fungoſo ſulcato, plano majore, foliis Peucedani anguſtis.* Tourn. Inſt. 325. FENNEL-HERB, FRANKINCENSE.

It grows on the Mountains of *Italy* and *Sicily*, and flowers in *May*. The Root and Seed are uſed in Medicine. The Seed is called CACHRY, the Virtues of which ſee under that Word. As to the Root, I find nothing ſingular relating to its Uſe.

LIBANOTIS is, alſo, a Name for ſeveral Sorts of LASERPITIUM.

LIBANOTIS ALPESTRIS. A Name for the *Ferula*; *Alpeſtris*; *foliis Seſelios Maſſilienſis.*

LIBANOTIS ALSATICA. A Name for the *Oreoſelinum*; *Apii folio*; *majus.*

LIBANOTIS LATIFOLIA. A Name for the *Siler*; *foliis Aquilegiæ.*

LIBANOTOS, λιβανωτὸς. Frankincenſe. See THUS.

LIBELLA. The Name of a Fiſh of the cetaceous kind, repreſented, by *Galen, Lib.* 3. *C.* 31. *de Aliment. Facultat.* as hard, unſavoury, and mucoſe.

LIBIDO. The Itch is ſometimes thus called.

LIBOS, λίβος. Any thing inſtilled into the Eyes. *Galen's Exegeſis.*

LIBRA. A *Roman* Weight, divided into twelve *Unciæ*, or Ounces; in Imitation of which the later *Greeks* had their *Litra*, which they divided after the ſame manner: This appears from *Voluſianus Metius, Galen*, and others. The Value of the *Roman Libra* is determined from the Value of the DENARIUS; which ſee.

The *Libra Auri*, or *Pondo*, of the *Romans*, and *Mna* of the *Greeks*, when it is nummary, or put for a Sum of Money, always ſignifies an hundred *Drachmæ*. *Arbuthnot.* See DRACHMA.

The modern Pounds are various, in different Countries; but the common Apothecaries Pound is twelve Ounces. A Pound in Pharmacy is, likewiſe, a Meaſure for Liquids: and then it is underſtood to conſiſt of ſixteen Ounces. See PONDUS.

LIBURNUM. See VIBURNUM.

LIBYANON, λιβύανον. An Epithet of ſeveral Collyria deſcribed by *Galen, Lib.* 4. *Cap.* 7. *de C. M. S. L.* And by *Aetius, Tetrab.* 2. *Serm.* 3. *Gorræus* thinks λιβάνιον, in *Paulus Ægineta*, is wrote, by Miſtake, for λιβυανὸν.

LICHANOS, λιχανὸς, is the fore Finger.

LICHAS, λιχὰς. A Meaſure of Length, equal to ten; the Breadth of fourteen Fingers.

LICHEN.

The Characters are;

It is of a thin, coriaceous, membranous, and ſometimes of an horny ſort of Contexture; ſometimes it expands itſelf into chartaceous ramous Lamellæ; ſometimes ſhoots forth into round and ſmooth Branches. The ſeminal Veſſels are very copious; they are of the Figure of a Sawcer, and filled with Plenty of duſty Seed. See a fuller Deſcription of Lichen under the Article BOTANY, in the Explanation of botanic Terms.

Boerhaave mentions thirty-eight Species of this Plant; which are,

1. Lichen; Dioſcoridis & Plinii ſecundus; colore cinereo. *Col.* 1. 331.

2. Lichen; Dioſcoridis & Plinii ſecundus; colore viridante. *Col.* 1. 331.

3. Lichen; Dioſcoridis & Plinii ſecundus; colore flaveſcente. *Col.* 1. 331.

4. Lichen; Cruſtæ modo arboribus adcreſcens; pullus. *Tourn. Inſt.* 548. *Boerh. Ind. A.* 16. *Lichen arboreus pullus.* Offic. *Lichenoides cruſta folioſa ſcutellata pullus.* Raii Synop. 3. 72. *Muſcus cruſtæ, aut Lichenis modo arboribus adnaſcens.* Ejuſd. Synop. I. 14. II. 23. Hiſt. 1. 16. TREE-LIVERWORT.

This Lichen grows to Trees, and is uſed inſtead of the *Lichen*; *arboreus*; *ſive Pulmonaria*; *arborea.*

5. Lichen; Cruſtæ modo arboribus adnaſcens; tenuiter diviſus. *T.* 548.

6. Lichen; Cruſtæ modo aſſeribus adnaſcens; latior; mollior; vix vaſculoſus; cinereus.

7. Lichen; Cruſtæ modo aſſeribus adnaſcens; latior; mollior; vix vaſculoſus; roſeus.

8. Lichen; Cruſtæ modo aſſeribus adnaſcens; latior; mollior; vix vaſculoſus; eleganter variegatus ex roſeo, albo, nigreſcente.

9. Lichen; Cruſtæ modo ſaxis adnaſcens; verrucoſus; cinereus; & veluti exuſtus. *T.* 549.

10. Lichen; maritimus. *Boerh. Ind. A.* 16. *Lichen cinereus.* Offic. *Lichen cinereus terreſtris.* Raii Cat. Angl. 185. Hiſt. 1. 117. Synop. 3. 23. *Lichen pulmonarius, ſaxatilis, rufeſcens, ſuperne planus, inferne reticulatus.* Tourn. Inſt. 549. *Lichenoides peltatum terreſtre cinereum majus foliis diviſis.* Raii Synop. 3. 76. GROUND LIVERWORT. *Dale.*

This is a Plant conſiſting only of thick, crumpled, hollow Leaves, of an Aſh-colour on the upper Side; but underneath, where it is faſtened to the Earth by ſmall Fibres, it is ſomewhat whiter. It bears no Flowers, nor perfect Seed; but is found upon dry barren Places all the Year long.

This Plant is but lately come into Requeſt, being accounted a Specific againſt the Bite of a mad Dog, and other enraged Animals. For which Reaſon the College have now given a Powder, in which that is the principal Ingredient, under the Title of *Pulvis Antilyſſus. Miller's Bot. Off.* See HYDROPHOBIA.

11. Lichen; primus. *Boerh. Ind. A.* 17. *Hepatica ſtellata.* Offic. *Hepatica terreſtris.* Ger. 1375. Emac. 1565. Item, *Hepatica altera.* Ger. ib. *Hepatica ſtellata.* Ger. Emac. ib. Item, *Hepatica petræa.* Ger. 1576. Emac. ib. *Lichen, ſive Hepatica fontana.* J. B. 3. 758. *Lichen petræus latifolius, ſive Hepatica fontana.* C. B. 362. *Lichen petræus ſtellatus.* Ejuſd. Raii Hiſt. 1. 125. Synop. 40. *Lichen, ſive Hepatica vulgaris.* Park. 1314. *Lichen, ſeu Hepatica minor vulgaris.* Ejuſd. STAR LIVERWORT.

It grows in moiſt and ſhady Places. The whole Plant is uſed, and agrees in Virtues with the *Lichen*; *petræus*; *cauliculo pileolum ſuſtinente.* This is more in Uſe among the common People than among the Phyſicians. *Dale.*

12. Lichen; ſecundus. *Lob. Ic.* 2. 246.

13. Lichen; tertius. *Lob. Ic.* 2. 246.

14. Lichen; caulifer; petræus; cauliculo calceato. *M. H.* 3. 623.

15. Lichen; Petræus; cauliculo pileolum ſuſtinente. *C. B. P.* 362. *Dill. Cat.* 210. *Buxb.* 185. *Boerh. Ind. A.* 17. *Hepatica vulgaris Lichen.* Offic. *Lichen, ſive Hepatica vulgaris.* Raii Hiſt. 1. 124. Synop. 40. *Lichen petræus pileatus.* Park. 1315. LIVERWORT.

It grows in moiſt and ſhady Places, by the Banks of Rivers; and the entire Plant is in Uſe. This Herb is an extraordinary Hepatic, and is principally uſed in Obſtructions of the Liver and Bladder, whoſe Signatures it bears in its Leaves; whence it becomes of Service in hectic Diſorders, the Jaundice, the Itch, Lichen, Gonorrhœa, and Fevers; outwardly applied, it ſtops Hæmorrhages in Wounds. *Schroder.*

Liverwort has an aqueous Taſte, with ſomething of Bitterneſs and Aſtringency. *Cæſalpinus* obſerved it to be a gentle Purger of groſs and aduſt Humours, if taken in great Quantities, for Inſtance, two Pints of the Decoction; by which Remedy, repeated for many Days together, he ſaw many cured of a malignant Scabies, and phagedenic Ulcers. But every Day there muſt be a freſh Decoction, in which Whey is to be principally uſed, becauſe it ſoon loſes its Virtue. *C. Hoffman* believes, that it has no more of a peculiar purgative Virtue belonging to it than Whey; but Whey itſelf, taken in large Quantities, is often cathartic. *Raii Hiſt. Plant.*

16. Lichen; ſeu Hepatica lunulata, ἡπατοφυλλόκαρπος. *D. Dale, Raii Synop.* 41.

17. Lichen;

17. Lichen; verrucoſus. *D. Doody, Raii Synop.* 41.

18. Lichen; qui Muſco-fungus; terreſtris; minor; criſpus; foliis ſupernè è flavo-vireſcentibus, infernè albicantibus. *M. H.* 3. 632. *Sect.* 15. *T.* 7. 3.

19. Lichen; qui Muſco-fungus; terreſtris; minor; fuſcus; foliis è latitudine crenatis; Muſco-innaſcens. *M. H.* 3. 632. *Sect.* 15. *T.* 7. 4.

20. Lichen; qui Muſco-fungus; Lichenoides; arborum; Hibernicus; ſcutellatus. *M. H.* 3. 633. *Sect.* 15. *T.* 7. 3.

21. Lichen; qui Muſco-fungus; arboreus; cinereus; ſcutellatus; marginibus piloſis. *M. H.* 3. 634. *Sect.* 15. *T.* 7. 6.

22. Lichen; arboreus; ſive Pulmonaria arborea. *J. B.* 3. 759. *Tourn. Inſt.* 549. *Boerh. Ind. A.* 17. *Muſcus Pulmonarius.* Offic. C. B. 361. *Muſcus arboreus pulmonarius.* Raii Hiſt. 1. 116. Synop. 22. *Muſcus pulmonarius ſive Lichen arborum.* Park. 1313. *Lichen arborum.* Ger. 1377. Emac. 1566. *Lichen arboreus ſive Impetigo morbus, & Mentagra quædam, atque Pulmonaria arborea fungoſa.* Aldrov. Dendr. 176. *Lichenoides peltatum arboreum maximum platyphyllum.* Raii Synop. 3. 76. TREE LUNGWORT, OAK-LUNGS.

This Moſs, or Lichen, is made up of flat, wrinkled, tough Leaves, greeniſh above, and aſh-coloured underneath, having ſeveral round, rediſh-brown Spots on the Superficies, in which the Seed is ſuppoſed to lie. It is of a bitteriſh reſtringent Taſte.

It is accounted drying and binding, good to ſtop inward Bleeding, and the too great Flux of the Menſes: The common People make great Uſe of this Lung-wort, eſteeming it to be good for the Lungs, to help Coughs, Conſumptions, and other Diſorders of the Breaſt, boiling it in Pectoral Drinks, and making Syrups of it. It is commended in the *German Ephemerides, Anno* 3. *Obſ.* 290. as an extraordinary Remedy againſt the yellow Jaundice. *Miller's Bot. Off.*

It grows to Trees, eſpecially the Oak; and is ſaid to heal recent Wounds.

23. Lichen; arboreus; varius magnitudine, ramis, foliis, colore; ex variis arboribus lectus Hyeme ſeviſſima.

24. Lichen; cinereus; cornua damæ referens. *T.* 549.

25. Lichen; latifolius; ramoſus; minor; hirſutus. *T.* 551. 325.

26. Lichen; qui Muſco-fungus; arboreus; anguſtior; ſcutellatus; & peltatus. *M. H.* 3. 634. *Sect.* 15. *T.* 7. 3.

27. Lichen; pulmonarius; cinereus; mollior; in amplas lacinias diviſus. *T.* 549. 325.

28. Lichen; cinereus; latifolius; ramoſus. *T.* 550.

29. Lichen; cinereus; arboreus; marginibus fimbriatis. *T.* 550.

30. Lichen; pyxidatus; major. *Tourn. Inſt.* 549. *Boerh. Ind. A.* 18. *Muſcus pyxidatus.* Offic. Ger. 1371. Emac. 1560. Park. 1308. J. B. 3. 767. Raii Hiſt. 1. 113. *Muſcus pyxoides.* C. B. 361. *Lichenoides tubuloſum pyxidatum cinereum.* Raii Synop. 3. 69. CUP MOSS.

This Moſs, or Lichen, has many hoary whitiſh-green ſmall Leaves, ſpread on the Surface of the Earth; among which ariſe little, whitiſh, dusky, hollow Cups, a quarter of an Inch high, ſhewing neither Flower nor Seed; they grow upon dry barren Ground, and hilly Banks.

This Moſs is reckoned a Specific againſt the Whooping or Chincough in Children, being given them in a Decoction ſweeten'd with Sugar, or ſome pectoral Syrup.

31. Lichen; pyxidatus; minor. *T.* 549.

32. Lichen; pyxidatus; minimus.

33. Lichen; pyxidatus; teres; acetabulis minoribus, repandis. *T.* 549.

34. Lichen; pyxidatus; non ramoſus; acetabulis fimbriatis. *T.* 549.

35. Lichen; pyxidatus; prolifer. *T.* 549.

36. Lichen; pyxidatus; prolifer; acetabulorum; fimbriis tumentibus, coccineis.

37. Lichen; pyxidatus; acetabulorum oris fuſcis & tumentibus. *T.* 549.

38. Lichen; pyxidatus; acetabulorum oris nigerrimis & tumentibus. *Boerh. Ind. alt. Plant. Vol.* 1.

All the Plants under the Name of *Lichen*, are endued with an heating, ſtrengthening, and ſomewhat aſtringent Virtue: Hence, where Corroboratives are required, theſe are uſually preſcribed: They are effectual, alſo, in Hæmorrhages; and are ſaid to be a very good Remedy for the Aſthma, and an inveterate Cough. *Hiſt. Plant. aſcript. Boerhaave.*

LICHEN, in Phyſiology, is a ſort of Leproſy.

LICHEN, alſo, ſignifies certain callous Subſtances, or Warts, which grow on the Legs of Horſes. See EQUUS.

LICHEN MARINUS. A Name for the *Opuntioides marina; quæ Corallina latifolia; & Opuntia marina.*

LICHENASTRUM. See the Explication of Botanical Terms under the Article BOTANY.

LICHENOIDES. See the Explication of Botanical Terms under the Article BOTANY.

LICHI, LICI, or LUMYEN. The ſame as LETCHI.

LICINIA. Tents.

LIEN.

The Spleen is a bluiſh Maſs, ſomething inclined to red, and of a long oval Figure, being about ſeven or eight Fingers-breadth in Length, and four or five in Breadth. It of a ſoftiſh Subſtance, and is ſituated in the Left Hypochondrium, between the great Extremity of the Stomach, and the neighbouring falſe Ribs, under the Edge of the Diaphragm, and above the Left Kidney.

It may be naturally divided into Sides, Edges, and Extremities. Its Sides are two; one external and ſomewhat convex; the other internal, and irregularly concave. It has two Extremities; one poſterior, which is pretty large; and one anterior, which is ſmaller, and more depreſſed; two Edges, one ſuperior, and one inferior; on both which there are, in ſome Subjects, ſeveral Inequalities.

The inner or concave Side is divided by a longitudinal Groove, or Sciſſure, into two Planes, or half Sides, one upper, the other lower; and by this Groove the Veſſels or Nerves enter in human Subjects. The ſuperior half Side is broader, and more concave, than the inferior, being proportioned to the Convexity of the great Extremity of the Stomach. The inferior half Side lies backward on the Left Kidney, and forward on the Colon; and ſometimes this Side of the Spleen appears to have two ſuperficial Cavities, one anſwering to the Convexity of the Stomach, the other to that of the Colon. The convex Side of the Spleen is turned towards the Left Ribs.

It is connected to the Stomach by the Veſſels called Vaſa Brevia, to the Extremity of the Pancreas by Ramifications of the ſplenic Artery and Vein, and to the Omentum by Ramifications, which the ſame Artery and Vein ſend to the Spleen, and which run in the longitudinal Groove.

It is connected to the Edge of the Diaphragm, by a particular membraneous Ligament of different Breadths in different Subjects, fixed in its convex Side, ſometimes near the upper Edge, and ſometimes near the lower. This Ligament is ſituated tranſverſly with reſpect to the whole Body, and longitudinally with reſpect to the Size of the Spleen. In ſome Subjects it is connected by other Ligaments to the Stomach and Colon, but in all this there are conſiderable Varieties.

The Figure of the Spleen is not always regular, and is as various as the Size. Sometimes it has conſiderable Sciſſures both in the Sides and Edges, and ſometimes it has Appendices. I have ſometimes found a kind of ſmall diſtinct Spleens, more or leſs round, and connected ſeparately to the Omentum, at ſome Diſtance from the anterior Extremity of the ordinary Spleen.

The Structure of the Spleen is not eaſy to be unfolded in Man, and is very different from that of the Spleens of Brutes, upon which both public and private Lectures are commonly read.

Its Coverings adhere to it ſo cloſely in Man, that it is difficult to diſtinguiſh the common from the proper Coat; whereas in ſome Brutes, ſuch as Oxen and Sheep, nothing is more eaſy; for in ſuch Animals we find two Coats ſeparated by a cellular Subſtance. This Covering ſeems to be no otherwiſe a Continuation of the Peritonæum, than by the Intervention of the Omentum and Meſocolon; and even in Man the two Coats may be diſtinguiſhed, where the Veſſels enter by the longitudinal Sciſſure. In Man, the Subſtance of the Spleen is almoſt wholly vaſcular, that is, compoſed of the Ramifications of all kinds of Veſſels. In Oxen, the Subſtance of the Spleen is chiefly reticular, and in Sheep it is cellular. In Oxen and Sheep, there are no venous Ramifications; but inſtead of them, only open Sinuſes, diſpoſed like Branches, except a ſmall Portion of a venous Trunk perforated on all Sides, at the Extremity of the Spleen.

In the human Spleen we ſee ſomething like glandular Corpuſcles, as in thoſe of other Animals; and there are numerous venous Ramifications through its whole Extent. Between theſe Ramifications we every-where obſerve an Appearance of extravaſated Blood, lying in a kind of filamentary, tranſparent, and very delicate Subſtance expanded through the whole Spleen.

This filamentary Subſtance having ſurrounded all the Ramifications, terminates in almoſt imperceptible Cells, which communicate with each other, ſo that if we blow through a ſmall Hole made in the membranous Covering, the whole Spleen will immediately be inflated.

The Surface of the Spleen of Oxen and Calves is viſibly full of a great Number of lymphatic Veſſels, which may, at any time, be eaſily demonſtrated; but in Man it is a very difficult Matter either to diſcover or demonſtrate them.

The Spleen Artery, which is one of the principal Branches of the Cœliaca, runs along the lower Side of the Pancreas, and paſſes from thence in a winding Courſe to the Spleen. The ſplenic Vein, which is larger than the Artery, is but little inflected in this Part of its Courſe.

This Artery and Vein having got beyond the Extremity of the Pancreas, ſend out ſeveral Rami together, which immediately afterwards divaricate in the ſame Plane, run in the membranous Duplicature of the neighbouring Portion of the Omentum, and, laſtly, interſect each other in their common Plane, all the Way to the Sciſſure of the inner or concave Side of the Spleen.

Theſe arterial and venous Rami enter the Subſtance of the Spleen together by the ſame Sciſſure; being accompanied by the cellular Subſtance, belonging to the membranous Duplicature of the Omentum. We may likewiſe obſerve, that, at this Place, the Coat

Coat of the Spleen ſends, from its concave Side, a Portion of a Lamina, which is incurvated in the Sciſſure, and penetrates into the Subſtance of the Spleen.

The Nerves of the Spleen are very numerous, and come from the Plexus ſplenicus already deſcribed. Theſe Nerves ſend out, at different Diſtances round, all the arterial Ramifications of the Subſtance of the Spleen, a great Number of Filaments, in form of an irregular Net-work.

The Arteries, Veins, and Nerves, having entered the Spleen, are there divided and ſubdivided into a great Number of Ramifications, and accompany each other to the very laſt Extremities of their Diviſions. They are contained in a kind of common cellular Capſula or Vagina, which firſt ſurrounds all the three, and then ſends off particular Septa between them. This Capſula ſeems to be formed by a Continuation of the cellular Subſtance of the Omentum, and of that particular Lamina of the Coat of the Spleen above-mentioned.

The capillary Extremities of all theſe vaſcular Ramifications, both arterial and venous, end in the filamentary Cells already mentioned. *Malpighi* conſidered them as diſtinct Capſulæ or Folliculi, containing the ſame Number of ſmall Glands. They all communicate together, ſo that where-ever we pierce the Coat of the Spleen, we may, through that Hole, inflate the whole Viſcus.

In Oxen and Sheep there are no venous Ramifications, as I have ſaid. The Vena Splenica having entered the great Extremity of theſe Spleens, runs, firſt of all, for about half an Inch, or an Inch, and afterwards, inſtead of an ordinary Vein, we find a Canal perforated on all Sides. The Beginning of this Canal has ſtill ſome Remains of the Coats of a Vein; but the Form of it is ſoon loſt, and then we find nothing but Sinuſes or Sulci in the reticular Subſtance in Oxen, and in the cellular Subſtance in Sheep.

The ſplenic Artery and Nerves are there ramified in a particular Vagina, as in Men; and the Extremities of theſe particular Ramifications ſeem to ſwim or float in the Cells, and to fill their filamentary Subſtance with Blood. At the Ends of ſeveral of theſe Capillaries, I have obſerved ſmall Corpuſcles diſpoſed like Bunches of Grapes; and I have ſeen two ſmall Tubes going out from each Corpuſcle, one long and open, the other ſmall and ſhort, which was loſt in the Sides of the Spleen.

I imagine, that the long Tube, the Extremity of which I was not able to find, may be the Origin of a lymphatic Veſſel, eſpecially becauſe theſe Veſſels are ſo very numerous and viſible in an Ox's Spleen, as has been already ſaid. Theſe ſmall Corpuſcles may eaſily be diſcovered in an Ox's Spleen, when boiled by a particular Method. They are, indeed, much larger before than after boiling, but they are not ſo ſolid, and ſubſide more eaſily when cut. The ſame ſort of Corpuſcles may be diſcover'd in the human Spleen, but they are ſo extremely ſmall as not to be viſible without a Microſcope.

For the Uſes of the Spleen, ſee HEPAR. *Winſlow's Anatomy.*

DISORDERS OF THE SPLEEN.

When the Spleen is affected, the Part ſwells, together with the Left adjacent Region, which becomes hard, and renitent to the Touch; there is a Tenſeneſs, alſo, of the Belly, and ſomewhat of a Tumor of the Legs. Ulcers are either incurable, or, at leaſt very difficult to be healed; the Patient cannot walk faſt, or run, without a Pain, and ſome Difficulty.

This Diſeaſe is increaſed by Reſt, and, therefore, Labour and Exerciſe are neceſſary, due Care being taken, that their Exceſs does not excite a Fever; Unctions, Frictions, and Sweating are, alſo, neceſſary. All ſweet things are hurtful, and ſo are Milk, and Cheeſe, but Acids are extremely proper. It will be convenient, therefore, to drink ſtrong Vinegar by itſelf, or what is better, impregnated with Squills: Salt Meats are, alſo, to be eaten, and Olives harden'd in Pickle. Lettuces dipt in Vinegar, or Endive, and Beets, in the ſame, together with Muſtard, wild Radiſh, and Parſnip, are proper vegetable Diet; and for Fleſh-meats, the Hoofs and Noſes of Beaſts, lean Birds, with whatever Hunting ſupplies of the ſame Kind, are to be choſen. Fomentations to be uſed are, in the Morning, faſting, a Decoction of Wormwood, after Food, Water from the Smith's Forge, in which red-hot Iron has been quenched, which is of principal Efficacy for repreſſing the Spleen, as is obſerved from the ſmall Spleens of thoſe Animals which are bred by the Smiths. Thin, auſtere Wine may be drank, and, in general, all Meats and Drinks, which have a Virtue of provoking Urine, are to be uſed, ſome of the principal of which are the Seed of Trefoil, Cumin, Apium, wild Thyme, Cytiſus, Thyme, Hyſſop, and Savory; for theſe Simples ſeem beſt qualify'd for expelling the Humor. The Spleen of an Ox is proper to be eaten, and, among Herbs, Rockets and Creſſes, which have a peculiar Virtue of extenuating the Spleen.

Outward Applications, for alleviating the Diſorder, are the *Glandes Unguentariæ*, which the *Greeks* call *μυροβάλανοι*, or an Epithem may be prepared of Linſeed, and the Seeds of Naſturtium, mixed with Oil and Wine; or of green Cypreſs and Caricæ; or of Muſtard, with an Addition of the Fat of a Male Goat's Kidneys, to the Weight of a fourth Part, bruiſed together in the Sun, and immediately applied. Capers may be many ways adapted to this Diſorder, for they may be conveniently taken, or their Pickle may be drank with Vinegar; or for outward Application, the bruiſed Root, or its Bark, or the Capers themſelves bruiſed with Honey, may be uſed. Malagmas, alſo, are adapted to this Purpoſe. *Celſus, Lib. 4. Cap. 9.*

WOUNDS OF THE SPLEEN.

When the Spleen is wounded, there is an Eruption of black Blood from the Left Side; the Hypochondria, with the Stomach on the ſame Side, become hard; the Patient is ſeized with a great Thirſt, and a Pain reaching to the Clavicle, as in Wounds of the Liver. *Celſus, Lib. 5. Cap. 26.* See VULNUS.

INFLAMMATION OF THE SPLEEN.

An Inflammation of the Spleen, which, indeed, but rarely happens, is attended with an hard and throbbing Tumor, a Pain of the Left Hypochondrium, and a continual and violent Fever. There is, alſo, an extreme Heat and Thirſt, and the Tongue is covered with a blackiſh Mucus; there is an utter Loſs of Appetite, with a difficult, and, as it were, imperfect Reſpiration, like that of Children, when they fall a ſobbing through Anger. If the Part be affected with an Abſceſs, or an Ulcer, it may be diſcovered by much the ſame Symptoms, as when the Liver is thus affected. *Lomm. Med. Obſ.*

LARGE SPLEENS.

They who have large Spleens are affected with a Putrefaction of the Gums, and fetid Breath; but a large Spleen, not attended with a fetid Breath, nor an Hæmorrhage, ſubjects the Patient to malignant Ulcers, and black Cicatrices, in the Legs. But if there be, alſo, a manifeſt Abſceſs in the Face, with a grave or deep Tone of Voice, or a Pain of the Teeth, we muſt expect an Hæmorrhage from the Noſe. They who have the Parts under their Eyes very much elevated, are found to have great Spleens, and if they are beſides affected with Swellings in the Feet, a Dropſy is to be ſuſpected; but we are to examine, alſo, the Belly and Loins. *Hippocr. Prædict. Lib. 2. p. 111.*

The principal Action of the Spleen ſeems to be,

1. That the pure arterial Blood, abounding with Lymph, may, in the moſt minute Glands, prepare a highly ſubtle Lymph, ſecrete it, and through proper Emunctories diſcharge it into the Cellulæ of the Spleen, and, perhaps, partly, alſo, into the ſplenic Vein.

2. The Spleen ſeems to return the Blood, remaining after this Action, by minute Veins, which convey it to the common ſplenic Vein.

3. The Number of ſmall Arteries which line the Sides of theſe Cellulæ, perhaps, diſcharge a Blood attenuated by their arterial Structure, and full of Lymph, into the open Cavities of theſe Cellulæ, as is obſerved to happen in the Cellulæ of the human Penis.

4. The nervous Fluid is thought to be copiouſly and perpetually convey'd to this Organ, to be there depoſited, and mixed with the Blood.

5. 'Tis probable, that all theſe Humours, thus prepared, blended and becoming ſtagnant for a Moment, are compreſs'd, mix'd, and attenuated, as in the Lungs, by the Force of the arterial Blood, by the Impetus of the nervous Fluid, by the Contraction of the two proper Membranes, and the Vagina of the Spleen, by the Conſtriction of the Fibres, which, in this Part, are very numerous, and by the Agitation of the Diaphragm, and abdominal Muſcles, Veſſels and Viſcera.

By theſe Cauſes, the Blood is in the Spleen fluid, diſſolved, full of Spirits, abounding with Lymph, with Difficulty form'd into Concretions, intimately mix'd, not eaſily ſeparated into heterogeneous Parts, and of a purple or rediſh Colour: Such is the Blood convey'd from the Spleen, thro' the large ſplenic Vein.

This, therefore, is the Effect of the Spleen; for which Reaſon it has not, like the other Viſcera, an Emiſſary for diſcharging the particular Humour generated in its Fabric, but diſcharges all, mix'd together.

'Tis highly obvious, that the Effects of this Action are produced in the Spleen, tho' they are by no means ſubſervient to it. But ſince all the Humours, thus prepared, are convey'd into the Vena Porta and Liver, 'tis obvious, that the Spleen muſt be ſubſervient to the Liver, and conſequently, that its Uſe cannot be explained till the Effects and Office of the Liver are previouſly known. See BILES and HEPAR.

It is remarkable that an Animal, whoſe Spleen is cut out, deſtroy'd, or greatly obſtructed, is much more ſalacious than uſual for ſome time; and makes Water much more frequently; becauſe the Blood conveyed otherwiſe to the Spleen, is then carried to the Organs of Generation and Kidneys. It is farther obſervable, that ſuch an Animal is more voracious; and, in Mankind, very ſubject to violent Fits of Laughter. The firſt Circumſtance is occaſion d by a greater Afflux of Blood and Spirits to

the Stomach; the ſecond, by a greater Quantity of Spirits derived to the Diaphragm, by the Phrenic Nerves.

LIENTERIA.

This is a Diſorder proceeding from a preternatural Smoothneſs of the Inteſtines, in conſequence of which what is diſcharged by Stool, greatly reſembles the Aliments, both in Colour and Subſtance. The Cauſe of it, according to *Fernelius*, is not an obſtructed or hinder'd Diſtribution of the Aliments, but a Weakneſs of the firſt Concoction, in conſequence of which the Aliments paſs thro' the Inteſtines unchanged.

Bontius, in his Treatiſe *de Medicina Indorum*, *L.* 3. *Cap.* 12. tells us, that in the *Indies* this Diſorder often conſumes the Patient without any manifeſt Cauſe, without any Fever, or at leaſt with a very ſlow one, and without any violent Senſe of Pain, ſince a kind of Weight is only perceived about the Navel and Hypochondria. This Diſorder, ſays the ſame Author, beſides the Obſtruction of the Viſcera, has, alſo, another latent Cauſe in the Meſeraic Veins, or in the Subſtance of the Meſentery itſelf; in which large Abſceſſes often happen, as I myſelf have often ſeen, in diſſecting the Carcaſes of thoſe who have died of this Diſorder. Nay, ſays he, I have often found the whole Meſentery conſumed, whilſt the Inteſtines cohered, or rather were confounded, in an irregular Manner, with each other, by means of ſlender membranaceous Pellicules. 'Tis, alſo, obſervable, ſays he, that a Lientery is generally accompanied with a Bulimy or Fames canina; for which Reaſon the Aliments are diſcharged by Stool, little, or not at all, changed or concocted.

Franciſcus Sylvius, in his *Praxis*, *Lib.* 1. *Cap.* 16. tells us, that the Chyle, ſecreted from the Fæces by the periſtaltic Motion of the Inteſtines, is not only propel'd downwards, but, alſo, by the ſame Force, expreſs'd and ſtrained thro' their fleſhy and ſpongious Cruſt, into the lacteal Veſſels. This Percolation of the Chyle is injur'd, and more or leſs obſtructed or diminiſhed in a Diſcharge of chylous Excrements, or a Lientery; firſt, when the Orifices of the lacteal Veſſels are block'd up, or obſtructed, by a pituitous or viſcid Humour; or, ſecondly, when here and there the fleſhy Cruſt of the Inteſtines is abraded, and the ſubjacent Part of the Inteſtine covered with a Cicatrix; by which means the Pores conveying the Chyle to the lacteal Veſſels are clos'd up, as ſometimes happens after violent Dyſenteries, eſpecially thoſe affecting the ſmall Inteſtines, as I have often obſerved in diſſecting the Bodies of thoſe who died of this Diſorder. A Lientery is generally ſucceeded by a kind of remarkable Leanneſs, or Extenuation of the whole Body, which continues to the End of the Patient's Life, and from which the moſt corpulent are not exempted.

Fernelius, in his *Pathologia*, *Lib.* 6. *Cap.* 10. tells us, that a Lientery is produced by a Conſent of other Parts affecting the Stomach. Thus Phlegm diſcharged from the Brain, becauſe it is of a refrigerating and ſoftening Nature, and Bile diſcharged from the Liver, and irritating the Stomach, may precipitate the Aliments as yet crude and inſufficiently concocted, into the Inteſtines. Thus, alſo, ſays that Author, I have frequently obſerved a violent Lientery, like that which happens in thoſe who, by a long Diſorder, are brought near to Death, produced by large Abſceſſes of the Abdomen, a Vomica of the Lungs, and a Suppuration of the Breaſt and Kidneys, with a Diffuſion of a fetid and malignant Nidor into the Heart and Stomach.

Lommius, in his *Medicinal Obſervat.* tells us, that that Species of Flux is not without Danger, in which, as in a Diarrhœa, concocted Humours are not diſcharged, but rather the Aliments and Drinks taken, evacuated without Pain, crude, unequal, and ſo ſoon as ſcarcely to loſe any thing of their original Form; ſince they have no Admixture either of Blood or Bile. The *Greeks* call this Diſorder λειντεια, the *Latins Lævitas Inteſtinorum*, and we a Lientery. In this Diſeaſe the Patient reaps no Advantage from his Aliments, and falls into a bad Habit of Body. The whole Hypochondria are preternaturally hot, and the Patient labours under a violent Loathing of Aliments. A Lientery ſometimes proceeds ſlowly, and ſometimes quickly. It is more eaſily removed from young, than from old Perſons, eſpecially if a copious Diſcharge of Urine is excited, and the Body begins to be nouriſhed by the Aliments. But it is with the greateſt Difficulty removed from old Patients, eſpecially when it ſucceeds long-protracted Gripes. In a Lientery the Danger is ſtill greater, if the Patient goes to Stool ſo often, both in the Day and Night, as to be incapable of ſleeping on that Account. Beſides, if the Matter diſcharged is entirely crude, or black, or ſmooth and fetid like Ox's Dung; if the Appetite is loſt, and the Deſire of Drinking augmented; if the Diſcharge of the Patient's Urine is not proportioned to the Quantity of the Liquor drank; if his Mouth is exulcerated; if his Face is red, and diverſified with Spots of a great Variety of Colours; and if his Abdomen is ſoft, ſordid, and corrugated, certain Death is not far off, if the Patient is old, and has labour'd under the Diſorder for a conſiderable Time. In a long-protracted Lientery, acid Eructations happening, are accounted a good Sign; and there are ſome Hopes of the Patient's Recovery to be entertained, when the Diſcharge of the Urine begins to correſpond to the Quantity of the Liquor drank; and the Body to be nouriſhed, whilſt, at the ſame time, the Patient is without a Fever, and free from Spots. As in all Fluxes, ſo alſo in a Lientery, the Diſorder is thought to be at an End, when there is no longer any Rumbling of the Inteſtines, and when the Stools are ſucceeded by a kind of Diſcharge of Flatulences. The Patient, who, being for a long time afflicted with a Lientery, diſcharges certain Animals by Stool, with violent Gripes and Pains, becomes tumid, when theſe ceaſe. If, in a Lientery, a Pain of the Side, and a Difficulty of Breathing, come on, a ſubſequent Conſumption is to be dreaded. This Diſorder is often epidemical in a corrupted State of the Atmoſphere, and frequently cuts off thoſe who are ſpent by long Sickneſs. A Lientery, alſo, ſometimes ſucceeds a Vomica of the Lungs, an Abſceſs of the Abdomen, or a Suppuration of the Breaſt or Kidneys, in which Caſes it never fails to prove mortal.

According to *Ettmuller*, the principal Intention of Cure in a Lientery is to ſtrengthen and corroborate the Stomach, which End is moſt effectually obtained by Rhubarb, Preparations of Coral and Quinces. All the Medicines recommended againſt Vomiting are, alſo, proper in this Diſorder. *Waldſchmidius* informs us, that the moſt ſimple and eaſily prepared Stomachics are more beneficial in a Lientery, than thoſe of the compound Kind. The moſt proper Stomachics are, according to that Author, preſerv'd Nutmeg, preſerv'd Ginger, the White of an Egg boiled with Vinegar, and Wormwood-wine prepar'd with Maſtich. See COELIACA PASSIO.

LIGAMENTUM.

A Ligament is a white, fibrous, cloſe, compact Subſtance, more flexible than a Cartilage, not eaſily ruptured or torn, and which does not yield, or at leaſt very little, when pull'd.

It is made up of very ſmall, and very ſtrong Fibres, which, by their different Texture and Diſpoſition, form narrow Cords, broad Bands, or thin Webs; and theſe ſerve to bind, contain, limit, and defend the other Parts, both hard and ſoft.

Of the Ligaments which belong to the Bones and Cartilages alone, we may eſtabliſh two general Claſſes; the firſt containing thoſe Ligaments which are of Uſe only to the Bones in which they are inſerted; the other containing thoſe which ſerve for other Parts, beſides the Bones in which they are fixed, and principally for the Muſcles. If we have regard to the Bones only, theſe laſt are improperly termed Ligaments, as not doing the Office of ſuch, and, conſequently, reſembling the true Ligaments only in Texture.

Of thoſe Ligaments which are fixed in Bones or Cartilages alone, and are not employ'd about the other Parts; ſome belong wholly to the Articulations or moveable Bones; and others have nothing to do with the Articulations.

The Ligaments, which belong particularly to the moveable Articulations, and may therefore be called articular Ligaments, are of ſeveral Kinds.

Some are deſigned only to fix and ſtrengthen the Joints, and to ſecure the Bones, in their different Motions, from parting from each other, as it happens in Luxations. Theſe Ligaments are like Ropes, more or leſs flat; or like Bands, ſometimes narrow, and ſometimes of a conſiderable Breadth: And tho' ſome of them are thin, they are all very ſtrong, and yield but little. The Ligaments of the Articulations by Ginglymus, and thoſe which tie the Bodies of the Vertebræ together, are of this Kind.

Some contain a very fluid mucilaginous Liquor, commonly called Synovia, which continually moiſtens the Articulations. Theſe are not ſo properly Ligaments as Ligamentary Webs, bound immediately round the Articulations, and fixed to the Extremities of the articulated Bones, and thus forming Capſulæ or Bags to contain that Liquor, and hinder it from running out.

Theſe may very well be named capſular Ligaments. They lie within the former Sort, being cloſely united to their internal Surface, and are to be met with in all the moveable Joints, as in that of the Ulna with the Os Humeri, and thoſe of the Bones of the Carpus with each other. But they are more like Membranes, than Ligaments properly ſo called.

Some perform both the former Offices, that of a Band to keep the Bones together, and of a Capſula to hold the Mucilage. Theſe ſurround the orbicular Articulations, as that of the Os Humeri with the Scapula, and of the Os Femoris with the Os Innominatum.

All the Parts of theſe Ligaments are not of equal Thickneſs, ſo that they appear to be made up of two kinds of Ligaments, inſeparably united or glew'd together; one capſular, which ſurrounds the whole Articulation; and ſeveral true Ligaments, extended at different Diſtances over the other, and cloſely united to it. The Name of orbicular Ligaments is not general enough, becauſe it does not agree to the Bones of the Tarſus, Carpus, and others.

I do not think it proper to rank among theſe the membranous Vagina, belonging to the Chanel or Groove in the upper Part of the Os Humeri.

Some are hid by the Joints themſelves, and by the capſular Ligaments, as that belonging to the Head of the Os Femoris, called improperly Ligamentum Teres, and the crucial Ligaments of the Tibia.

The Ligaments, which ſerve to connect Cartilages with Bones, might be reckoned another Species of articular Ligaments; and of theſe ſome are proper, as thoſe belonging to the ſemilunar Cartilages of the Knee, and to the cartilaginous Trochlea of the Orbit. Others are common, as all thoſe to which the inter-articular Cartilages are faſtened by their Circumferences.

The other Ligaments of the firſt Claſs, or thoſe fixed to Bones, without any Relation to the Articulations, are of two kinds.

Some of them are looſe, and ſerve only to ſet Bounds to the Motions of Bones; ſuch as thoſe that tie the Clavicles to the coracoide Apophyſes; thoſe that go from one Clavicle to the other; and thoſe between the ſpinal Apophyſes of the Vertebræ.

Some of them are tight, and ſtretched either between the Parts of the ſame Bone, as the Ligaments between the Acromium and coracoide Apophyſis, or between ſeveral Bones united together without Motion, as thoſe that are fixed by one Extremity to the Os Sacrum, and by the other to the Os Iſchium.

The Ligaments of the ſecond general Claſs, or thoſe which, being fixed to Bones or Cartilages, are, likewiſe, of Uſe to other Parts, are two Kinds. Some of them are fixed to Bones or Cartilages only; and ſome are, likewiſe, fixed to other Parts, or other Parts are fixed to them.

Thoſe of the firſt Kind ſerve principally to incloſe, check, limit, and ſtrengthen the Muſcles and Tendons, and ſometimes to change their Directions.

The annular Ligaments are of this Kind, and they antiently had their Name, not ſo much from their Figure as from their Uſe, which is much the ſame with that of the Rings through which the Reins of Horſes paſs; for it is after the ſame manner that theſe Ligaments bridle the Tendons of many Muſcles, and thus hinder them from ſtarting from their Places, in violent Motions; and, in ſome Circumſtances, change their Directions.

The annular Ligaments are either particular and ſimple, or common, and made up of ſeveral ſingle ones; as we ſhall ſee in thoſe of the Carpus and Thumb: Some of them are like Vaginæ, or Sheaths; as thoſe on the internal and flat Side of the firſt and ſecond Phalanges of the Fingers.

Some of them are only ſemi-annular; as that of the ſuperciliary Notch of the Orbit, when there is a Ligament there; and that of the Notch of the ſuperior Coſta of the Scapula.

To theſe might be referred the Ligaments between the Acromium and coracoide Apophyſis of the Scapula, and between the Os Sacrum and Os Iſchium, which have been already mentioned in the firſt Claſs.

Thoſe of the other Kind, which come under this ſecond Claſs, comprehend the Ligaments fixed to other Parts, as well as to the Bones; and theſe again are of two Sorts.

Some of them are fixed to one or more Bones, with different Degrees of Tenſion; and ſerve on each Side for the Inſertion of Muſcles, ſupplying, in that reſpect, the Place of Bones.

Of this Kind are the interoſſeous Ligaments of the fore Arm and Leg, the Obturator Ligament, the Ligament extended on each Side of the Os Humeri, from the Neck to the Condyles, the poſterior and lateral Ligaments of the Neck, and the ligamentary Membranes of the poſterior Foramina of the Os Sacrum.

To theſe may be added, the Ligaments commonly termed Aponeuroſis; ſuch as thoſe of the Temples, Scapula, Os Humeri, Ulna, Palm of the Hand, Thigh, Leg, and Sole of the Foot: All theſe may, in general, be termed Aponeurotic Ligaments, Ligamentary Aponeuroſes, Ligamentary Septa, or Ligamentary Vaginæ: But they ought to be carefully diſtinguiſhed from the Aponeuroſes of the Muſcles and Tendons. The Ligamentum Suſpenſorium of the Muſculus Styloglooſſus belongs to this Place.

Other Differences of Ligaments may be deduced from their Conſiſtence, Solidity, Thickneſs, Situation, and Figure: Some Ligaments are almoſt cartilaginous; as thoſe which ſurround the Head of the Radius, and the ſmall Head of the Ulna, a Portion of the orbicular Ligament of the Head of the Os Femoris, and the annular Vaginæ of the Fingers.

Some of them have a particular Elaſticity, by which they are capable of being drawn out by a ſufficient Force, and of contracting again, when left to themſelves. This Elaſticity differs from that of Cartilages; which laſt is hardly perceivable, but by compreſſing or bending them to a certain Degree. It differs likewiſe from that of the other Ligaments, in that it is not only very conſiderable in living Bodies, but remains ſuch after Death.

Of this Kind are the Supercilium of the Cotyloide Quality, the Ligaments which tie the Os Hyoides to the Styloide Apophyſes, the poſterior Cervical Ligament; the Ligaments which connect the ſharp Edges of the ſpinal Proceſſes of the Vertebræ to one another, and thoſe ſeated at the Baſes of theſe Apophyſes, next the great Canal of the Vertebræ, eſpecially in thoſe of the Loins. *Winſlow's Anatomy.*

LIGATIO. A Bandage or Ligature, or the Stiffneſs of a Joint; ſee ANCYLE: Or it imports an Impotence, whimſically ſuppoſed to be induced by Magic.

LIGATURA. The ſame as LIGATIO.

LIGNIPERDA. An aquatic Inſect, found incloſed in a Straw, or ſome ſuch Subſtance. The Fiſhermen eſteem it as a good Bait for a Trout. It is recommended as an Amulet for a Quartan, if hung about the Neck, by the Superſtitious.

LIGNUM { ALOES, AQUILÆ, ASPALATHUM } See { AGALLOCHUM. AGALLOCHUM. ASPALATHUS, and AGALLOCHUM.
